EXECUTIVE SUMMARY

This quarterly groundwater monitoring report presents the results of the Second Quarter 2017 groundwater monitoring event conducted during April 2–3, 2017, and the results of previous monthly monitoring events conducted during February 6–9 and March 6–8, 2017, at the Red Hill Bulk Fuel Storage Facility ("the Facility"), Joint Base Pearl Harbor-Hickam (JBPHH), Hawai‘i. The Facility is located in Hālawa Heights on the island of O‘ahu. There are 18 active and 2 inactive underground fuel storage tanks located at the Facility. The State of Hawai‘i Department of Health (DOH) Facility Identification (ID) number is 9-102271. The DOH Release ID numbers are 990051, 010011, 020028, and 140010.

The groundwater sampling was conducted as part of the Red Hill groundwater long-term monitoring (LTM) program, and performed under the Comprehensive Long-Term Environmental Action Navy (CLEAN) IV contract task order 0053. Data collected for this groundwater monitoring event also support Sections 6 and 7 of the *Administrative Order on Consent in the Matter of Red Hill Bulk Fuel Storage Facility, EPA Docket Number RCRA 7003-R9-2015-01 and DOH Docket Number 15-UST-EA-01*, Attachment A, Statement of Work (EPA Region 9 and DOH 2015). The purpose of the sampling is to assess the condition of groundwater beneath the Facility, and to ensure the United States Department of the Navy remains in compliance with DOH Underground Storage Tank (UST) release response requirements as described in Hawai‘i Administrative Rules (HAR) Chapter 11-281 Subchapter 7, Release Response Action. The sampling was conducted in accordance with the Naval Facilities Engineering Command (NAVFAC) Pacific Environmental Restoration Program *Project Procedures Manual* (DON 2015b), the DOH *Technical Guidance Manual for the Implementation of the Hawaii State Contingency Plan* (DOH 2016b), and the Administrative Order on Consent (AOC) Statement of Work Sections 6 and 7 *Work Plan/Scope of Work* (WP/SOW) (DON 2017a). A *Sampling and Analysis Plan* (SAP) (DON 2017b,d) was also prepared for AOC Statement of Work Sections 6 and 7 that contains updated information for the groundwater sampling.

This report presents the activities conducted and sampling results for sampling locations both inside and outside the tunnels and combines the information into one report to facilitate review and provide a better understanding of the groundwater characteristics at the site.

Monthly sampling of the Red Hill monitoring network was initiated in November 2016 in response to information obtained that the Red Hill Shaft pumps had been relatively inoperable since February 2016 due to equipment (i.e., transformer) malfunction. Pumping at a reduced capacity was initiated in November 2016 using temporary equipment, and the pumping resumed to normal capacity in December 2016. To evaluate potential impacts the changed pumping conditions may have on chemical of potential concern (COPC) concentrations in groundwater at and around the Facility, monthly sampling was conducted in November and December 2016 and in February and March 2017 in conjunction with the scheduled quarterly sampling in January and April 2017. The next additional monthly monitoring events were conducted in May and June 2017, followed by a quarterly event in July 2017. Results of the monthly monitoring events are included in the scheduled quarterly monitoring reports.

During February 6–9, 2017, AECOM Technical Services, Inc. (AECOM) personnel conducted the second split sampling event with DOH and NAVFAC Hawaii oversight. AECOM collected groundwater samples from one sampling point at Red Hill Shaft (RHMW2254-01) and 11 monitoring wells in the Red Hill groundwater monitoring network (RHMW01 to RHMW09, HDMW2253-03, and OWDFMW01). One primary and one duplicate sample were collected from sampling point RHMW2254-01 and from wells RHMW08 and RHMW09.

During March 6–8, 2017, AECOM personnel conducted the third split sampling event with DOH and NAVFAC Hawaii oversight. AECOM collected groundwater samples from the sampling point at Red Hill Shaft and the 11 monitoring wells. One primary and one duplicate sample were collected from sampling point RHMW2254-01 and from well RHMW08.

During April 3–4, 2017, AECOM personnel collected groundwater and split samples from the sampling point at Red Hill Shaft and from ten monitoring wells. Monitoring well HDMW2253-03 was not sampled during the April 2017 event due to ongoing testing of an experimental transition-zone monitoring device being performed by the Commission on Water Resource Management (CWRM) and the University of Hawai'i; the testing is expected to continue through August 2017. One primary and one duplicate sample were collected from sampling point RHMW2254-01 and from well RHMW08.

Analytical results from the groundwater monitoring events were compared to the current LTM screening criteria – criteria agreed upon by the Parties to the AOC and presented in the February 4, 2016, AOC Statement of Work Sections 6 and 7 scoping completion letter (EPA Region 9 and DOH 2016), and updated (where applicable) with the most current DOH Tier 1 Groundwater Environmental Action Levels (EALs) for sites where groundwater is a potential or current drinking water resource and the nearest surface water body is greater than 150 meters from the release site (DOH 2016a). Analytical results for wells RHMW01, RHMW02, and RHMW03 were also compared to the Site-Specific Risk-Based Levels (SSRBLs) for total petroleum hydrocarbons (TPH)-diesel-range organics (TPH-d) (4,500 micrograms per liter [µg/L]) and benzene (750 µg/L), as established in the Red Hill *Groundwater Protection Plan* (GWPP) (DON 2014) and presented in the February 4, 2016, AOC Statement of Work Sections 6 and 7 scoping completion letter (EPA Region 9 and DOH 2016). Analytical results for the February and March 2017 monthly monitoring events and April 2017 quarterly monitoring event are summarized as follows:

- *RHMW2254-01, RHMW04, RHMW05, RHMW07, RHMW09,* and *HDMW2253-03:* No COPCs were detected in any of the three events.
- *RHMW01:* Concentrations of TPH-d (83–150 µg/L) were detected in all three events. The February 2017 result (150 µg/L) exceeded the screening criterion (100 µg/L).
- *RHMW02:* Concentrations of TPH-d (940–1,200 µg/L), 1-methylnaphthalene (20–22 µg/L), 2-methylnaphthalene (16–17 µg/L), and naphthalene (49–57 µg/L) exceeding the screening criteria (100 µg/L, 6 µg/L, 10 µg/L, and 17 µg/L, respectively) were detected in all three events. The concentrations of TPH-d did not exceed the SSRBL of 4,500 µg/L. Concentrations of TPH-g (57–73 µg/L) below the screening criterion (100 µg/L) were detected in all three events. Concentrations of total xylenes (0.23 µg/L) and TPH-o (84 µg/L) below the screening criteria (20 µg/L and 100 µg/L, respectively) were detected in the February and April 2017 events, respectively.
- *RHMW03:* Concentrations of TPH-d (47–67 µg/L) and TPH-o (41–71 µg/L) below the screening criterion of 100 µg/L were detected in all three events.
- *RHMW06:* A concentration of TPH-o (47 µg/L) below the screening criterion of 100 µg/L was detected in the March 2017 event.
- *RHMW08:* Concentrations of TPH-d (25–27 µg/L) and TPH-o (23–31 µg/L) below the screening criterion of 100 µg/L were detected in the February and March 2017 events.
- *OWDFMW01:* A concentration of TPH-o (44 µg/L) below the screening criterion of 100 µg/L was detected in the February 2017 event.

The historical groundwater contaminant concentrations indicate relatively stable COPC concentrations since the First Quarter 2016 event.

The natural attenuation parameter (NAP) results also present evidence of anaerobic biodegradation occurring at RHMW02 at significant levels, based on the depleted dissolved oxygen, very high dissolved methane concentrations, and depleted sulfate concentrations. The concentrations of NAPs at RHMW01 and RHMW03 indicate that biodegradation is also occurring.

Based on the groundwater monitoring results and in accordance with AOC Statement of Work Sections 6 and 7, continued groundwater monitoring at the wells in the Red Hill groundwater monitoring network is recommended.

1. Introduction

This quarterly groundwater monitoring report presents the results of the Second Quarter 2017 groundwater monitoring event conducted during April 3–4, 2017, and the results of previous monthly monitoring events conducted during February 6–9 and March 6–8, 2017, at the Red Hill Bulk Fuel Storage Facility (“the Facility”), Joint Base Pearl Harbor-Hickam (JBPHH), O‘ahu, Hawai‘i (Figure 1). The purpose of the sampling is to (1) assess the condition of groundwater beneath the Facility with respect to chemical constituents associated with jet fuel propellant (JP) and marine diesel fuel (F-76), and (2) ensure that the Navy remains in compliance with State of Hawai‘i Department of Health (DOH) Underground Storage Tank (UST) release response requirements as described in Hawai‘i Administrative Rules (HAR) Chapter 11-281 Subchapter 7, Release Response Action (2000). The DOH Facility Identification (ID) number for the Facility is 9-102271. The DOH Release ID numbers are 990051, 010011, 020028, and 140010.

The groundwater sampling was conducted as part of the long-term groundwater and soil vapor monitoring program at the Facility for Naval Supply Systems Command Fleet Logistics Center (NAVSUP FLC) Pearl Harbor, under Naval Facilities Engineering Command (NAVFAC) Contract Number N62742-12-D-1829. The sampling was conducted in accordance with the NAVFAC Pacific Environmental Restoration Program *Project Procedures Manual* (DON 2015b), the DOH *Technical Guidance Manual for the Implementation of the Hawaii State Contingency Plan* (TGM) (DOH 2016b), and the AOC Statement of Work Sections 6 and 7 *Work Plan/Scope of Work* (WP/SOW) (DON 2017a). A *Sampling and Analysis Plan* (SAP) (DON 2017b,d) was also prepared for Administrative Order on Consent (AOC) Statement of Work Sections 6 and 7 that contains updated information for the groundwater sampling.

This report presents the activities conducted and sampling results for sampling locations both inside and outside the Facility tunnels and combines the information into one report to facilitate review and provide a better understanding of the groundwater characteristics at the site. Cumulative historical monitoring results for the Red Hill monitoring network are presented in tables and charts in Appendix A. Field activity and analytical documentation for the Second Quarter 2017 sampling events are presented in Appendix B and Appendix C, respectively.

Monthly sampling of the Red Hill monitoring network was initiated in November 2016 in response to information obtained that the Red Hill Shaft pumps had been relatively inoperable since February 2016 due to equipment (i.e., transformer) malfunction. Pumping at a reduced capacity was initiated in November 2016 using temporary equipment, and the permanent equipment is scheduled to be replaced in 2017, at which time pumping will return to normal capacity. To evaluate potential impacts the changed pumping conditions may have on chemical of potential concern (COPC) concentrations in groundwater at and around the Facility, monthly sampling was conducted in November and December 2016 and in February and March 2017 in conjunction with the scheduled quarterly sampling in January and April 2017. The next additional monthly monitoring events were conducted in May and June 2017, followed by a quarterly event in July 2017. Results of the monthly monitoring events are included in the scheduled quarterly monitoring reports.

1.1 Site Description

The Facility is located on Federal government land (zoned F1- Military and Federal) in Hālawa Heights, approximately 2.5 miles northeast of Pearl Harbor (Figure 1). It is located on a low ridge on the western edge of the Ko‘olau Mountain Range that divides Hālawa Valley from Moanalua Valley. The Facility is bordered on the north by Hālawa Correctional Facility and private businesses, on the southwest by the United States (U.S.) Coast Guard reservation, on the south by

residential neighborhoods, and on the east by residential neighborhoods in Moanalua Valley. A quarry is located less than one-quarter mile to the northwest. The Facility occupies 144 acres of land, and the majority of the ground surface of the site lies at an elevation of approximately 200–500 feet (ft) above mean sea level (msl).

The Facility contains 18 active and 2 inactive underground fuel storage tanks that are operated by NAVSUP FLC Pearl Harbor. Each tank has a capacity of approximately 12.5 million gallons. The bottoms of the Facility's tanks are located approximately 100 ft above the basal aquifer. The fuel storage tanks currently contain JP-5, North Atlantic Treaty Organization (NATO)-grade F-24 jet fuel, and F-76. The current status of each tank is summarized in Table 1-1.

Table 1-1: Current Status of the Facility's Fuel Storage Tanks as of April 2017

Tank Identification	Fuel Type	Status [a]	Capacity [b]
F-1	Empty	Inactive	12.5 million gallons
F-2	F-24	Active	12.5 million gallons
F-3	F-24	Active	12.5 million gallons
F-4	F-24	Active	12.5 million gallons
F-5	F-24	Active	12.5 million gallons
F-6	F-24	Active	12.5 million gallons
F-7	JP-5	Active	12.5 million gallons
F-8	JP-5	Active	12.5 million gallons
F-9	JP-5	Active	12.5 million gallons
F-10	JP-5	Active	12.5 million gallons
F-11	JP-5	Active	12.5 million gallons
F-12	JP-5	Active	12.5 million gallons
F-13	Empty [c]	Active	12.5 million gallons
F-14	Empty [c]	Active	12.5 million gallons
F-15	F-76	Active	12.5 million gallons
F-16	F-76	Active	12.5 million gallons
F-17	Empty	Active	12.5 million gallons
F-18	JP-5	Active	12.5 million gallons
F-19	Empty	Inactive	12.5 million gallons
F-20	JP-5	Active	12.5 million gallons

F-24 NATO-grade F-24 jet fuel
F-76 Marine Diesel Fuel
JP-5 Jet Fuel Propellant No. 5
[a] Active status indicates a tank is currently available for use, but does not necessarily indicate the tank is currently filled. Inactive status indicates a tank is currently not available for use.
[b] Tank capacity in this table is estimated, and is not considered a tank-rated capacity or maximum allowable fill volume.
[c] Currently being converted from F-76 to JP-5.

One sampling point at Red Hill Shaft (RHMW2254-01) and four groundwater monitoring wells (RHMW01 through RHMW03 and RHMW05) are located within the Facility's lower access tunnel (Figure 1). Seven groundwater monitoring wells (RHMW04, RHMW06 through RHMW09, HDMW2253-03, and OWDFMW01) are located outside the Facility tunnel system.

1.2 PHYSICAL SETTING

The Facility is located on the southwest flank of the Ko‘olau shield volcano and is underlain by primarily Ko‘olau volcanic series basalts. Climatological conditions in the area of the Facility consist of warm to moderate temperatures and low to moderate rainfall. The average annual precipitation is approximately 40 inches, which occurs mainly between November and April (Giambelluca, Nullet, and Schroeder 1986). Average temperatures range from the low 60s to high 80s (degrees Fahrenheit) (Juvik and Juvik 1998).

The Facility is located at the boundary between the Waimalu Aquifer System of the Pearl Harbor Aquifer Sector and the Moanalua Aquifer System of the Honolulu Aquifer Sector. The aquifer is classified as a basal, unconfined, flank-type; and is currently used as a drinking water source. The aquifer is considered fresh, with less than 250 milligrams per liter (mg/L) of chloride, and is considered an irreplaceable resource with a high vulnerability to contamination (Mink and Lau 1990).

The nearest drinking water supply well is Navy Supply Well 2254-01, located within the Facility lower tunnel. Navy Supply Well 2254-01 is located approximately 2,600 ft topographically downgradient of the fuel storage tanks (Figure 1) and provides potable water to the JBPHH Water System, which serves approximately 65,200 military customers. NAVFAC Hawaii Public Works Department operates the infiltration gallery and Navy Supply Well 2254-01. Sampling point RHMW2254-01 is located inside the infiltration gallery of Navy Supply Well 2254-01.

The nearest body of surface water is Hālawa Stream, which is an ephemeral stream present along the north side of the facility. Wells RHMW01 through RHMW03, RHMW05, and RHMW09 are all located greater than 150 meters from any portion of Hālawa Stream. Sampling point RHMW2254-01 and wells RHMW04, RHMW06 through RHMW08, HDMW2253-03, and OWDFMW01 are located within 150 meters of a portion of Hālawa Stream. The distance of each well and sampling point to Hālawa Stream is presented in Table 1-2. Both Hālawa Stream and Moanalua Stream (located in Moanalua Valley east of the Facility) are losing streams located approximately 100 ft or more above the groundwater table. However, the bottoms of the fuel tanks are located at least 50 ft below the bottom of the streams (a cross section diagram depicting these elevations is presented in the Red Hill Monitoring Well Installation WP; DON 2016). Thus, analytical results for the long-term monitoring (LTM) program are compared to the screening criteria based on Table D-1b Environmental Action Levels (EALs) (groundwater EALs for sites where groundwater is a current or potential drinking water resource, and the nearest surface water body is greater than 150 meters from release site) because there are no indications of any complete pathways to ecological receptors in the nearby water bodies, despite some of the wells being within 150 meters of Hālawa Stream.

Table 1-2: Distance of Wells/Sampling Point to Hālawa Stream

Well/Sampling Point	Distance to Hālawa Stream (meters)
RHMW2254-01	85
RHMW01	232
RHMW02	299
RHMW03	271
RHMW04	81
RHMW05	225
RHMW06	104
RHMW07	81

Well/Sampling Point	Distance to Hālawa Stream (meters)
RHMW08	64
RHMW09	376
HDMW2253-03	64
OWDFMW01	143

1.3 BACKGROUND

The Facility was constructed by the U.S. Government in the early 1940s. Twenty underground fuel storage tanks and a series of tunnels were constructed. The tanks were constructed of concrete with a steel liner, and in the past have stored Navy special fuel oil, Navy distillate, aviation gasoline, and motor gasoline (DON 2010). The tanks currently contain JP-5, F-24, and F-76. The fueling system is a self-contained underground unit that was installed into native rock composed primarily of basalt with some interbedded tuffs and breccias (DON 2010). Each tank measures approximately 250 ft in height and 100 ft in diameter. The upper domes of the tanks lie at a depth varying between 100 ft and 200 ft below ground surface (bgs).

1.3.1 Previous Groundwater Monitoring Results

Results of the Red Hill groundwater LTM program spanning from 2005 to January 2017 are summarized in Table 1-3. Historical results indicate that most COPCs, and in general the highest detected COPC concentrations, occur in well RHMW02. Cumulative results of historical groundwater monitoring are tabulated in Appendix A.1, and graphs of COPC concentrations over time are presented in Appendix A.2. Groundwater sampling locations are depicted on Figure 1.

Previous sampling results through January 2017 are summarized below:

- RHMW2254-01 is a sampling point located inside the infiltration gallery of Navy Supply Well 2254-01. Samples collected during the first two quarterly monitoring events in 2005 had lead concentrations above the screening criterion (DOH Tier 1 action levels), but these samples were not filtered prior to analysis and thus the results were not considered appropriate for a risk assessment. In 2008, a concentration of total petroleum hydrocarbons (TPH)-diesel range organics (TPH-d) was initially reported as 102 micrograms per liter (µg/L) but was later validated to 102 µg/L non-detect. Detections of TPH-d, TPH-gasoline range organics (TPH-g), TPH-residual range organics (TPH-o), and polynuclear aromatic hydrocarbons (PAHs) occurred occasionally during quarterly monitoring events between 2005 and January 2017, but no COPCs have been detected above the screening criteria.
- RHMW01, an in-tunnel monitoring well located southwest of the tank farm, was installed in 2001 (DON 2002). TPH-d has been detected consistently, with the most recent screening criterion exceedance during the Fourth Quarter 2016 event; however, TPH-d never exceeded the Site-Specific Risk-Based Level (SSRBL). The SSRBLs for total petroleum hydrocarbons (TPH)-diesel-range organics (TPH-d) (4,500 µg/L) and benzene (750 µg/L) are established in the Red Hill *Groundwater Protection Plan* (GWPP) (DON 2014) and presented in the February 4, 2016, AOC Statement of Work Sections 6 and 7 scoping completion letter (EPA Region 9 and DOH 2016). TPH-o exceeded the screening criterion in 2005, and 1-methylnapthalene exceeded the screening criterion once in 2009.

Table 1-3: Summary of Groundwater Detections

			RHMW2254-01						Inside Tunnel Wells							Outside Tunnel Wells

- RHMW01, an in-tunnel monitoring well located southwest of the tank farm, was installed in 2001 (DON 2002). TPH-d has been detected consistently, with the most recent screening criterion exceedance during the Fourth Quarter 2016 event; however, TPH-d never exceeded the Site-Specific Risk-Based Level (SSRBL). The SSRBLs for total petroleum hydrocarbons (TPH)-diesel-range organics (TPH-d) (4,500 µg/L) and benzene (750 µg/L) are established in the Red Hill *Groundwater Protection Plan* (GWPP) (DON 2014) and presented in the February 4, 2016, AOC Statement of Work Sections 6 and 7 scoping completion letter (EPA Region 9 and DOH 2016). TPH-o exceeded the screening criterion in 2005, and 1-methylnapthalene exceeded the screening criterion once in 2009.
- RHMW02, an in-tunnel monitoring well located next to Tank 6, was installed in 2005 (DON 2007). TPH-d exceeded the screening criterion in all monitoring events and exceeded the SSRBL in 2008, 2014, and 2015. TPH-g exceeded the screening criterion during monitoring events in 2006, 2007, 2010, and 2012. TPH-o exceeded the screening criterion during monitoring events in 2015 and 2016. 1-Methylnapthalene, 2-methylnapthalene, and naphthalene exceeded their screening criteria frequently during monitoring events between 2005 and 2017.
- RHMW03, an in-tunnel monitoring well located next to Tank 14, was installed in 2005 (DON 2007). TPH-d exceeded the screening criterion during monitoring events in 2005 to 2010, 2015, and 2016, but never exceeded the SSRBL. TPH-o exceeded the screening criterion during monitoring events in 2015 and 2016.
- RHMW04, an outside-tunnel monitoring well located northeast of the tank farm, was installed in 2005 as a background monitoring location (DON 2007). TPH-d exceeded the screening criterion once during the initial monitoring event in 2005.
- RHMW05, an inside-tunnel monitoring well located southwest of the tank farm and southeast of sampling point RHMW2254-01, was installed in 2009. TPH-d exceeded the screening criterion during monitoring events in 2009 and 2010.
- RHMW06, an outside-tunnel monitoring well located north of the tank farm, was installed in 2014 in response to the January 2014 release (DON 2015a). No COPCs have been detected above the screening criteria.
- RHMW07, an outside-tunnel monitoring well located north of the tank farm, was installed in 2014 in response to the January 2014 release (DON 2015a). TPH-o was detected above the screening criterion during one monitoring event in 2016.
- RHMW08, an outside-tunnel monitoring well located west of Tank 1, was installed in 2016 as part of the AOC Statement of Work Sections 6 and 7 investigation (DON 2017a). No COPCs have been detected above the screening criteria.
- RHMW09, an outside-tunnel monitoring well located south of Tank 2, was installed in 2016 as part of the AOC Statement of Work Sections 6 and 7 investigation (DON 2017a). No COPCs have been detected above the screening criteria.
- HDMW2253-03 (Hālawa Deep Monitor Well 2253-03), an outside-tunnel well located north of the tank farm at the Hālawa Correctional Facility, was installed in 2000 by the State of Hawai‘i Department of Land and Natural Resources (DLNR). TPH-d exceeded the screening criterion during quarterly monitoring events in 2010, 2012, 2013, and 2014.
- OWDFMW01, located at the former Oily Waste Disposal Facility west of Navy Supply Well 2254-01, was installed in 1998 (DON 2000). TPH-d exceeded the screening criterion during quarterly monitoring events in 2010 and between 2012 and 2016. TPH-o exceeded the screening criterion during monitoring events in 2015 and 2016.

1.3.2 Previous Reports

The Red Hill groundwater LTM reports listed in Table 1-4 were previously submitted to DOH. Starting from the Fourth Quarter 2016 groundwater monitoring event, the information for both the inside-tunnel and outside-tunnel wells have been combined into one report.

2. Groundwater Monitoring Activities

During February 6–9, March 6–8, and April 3–4, 2017, groundwater samples were collected from one sampling point at Red Hill Shaft (RHMW2254-01) and from 11 monitoring wells in the Red Hill groundwater monitoring network (RHMW01 through RHMW09, HDMW2253-03, and OWDFMW01). All samples were collected in accordance with the AOC Statement of Work Sections 6 and 7 WP/SOW (DON 2017a) and SAP (DON 2017b,d). The WP/SOW and SAP are consistent with DOH UST release response requirements (HAR 11-281), NAVFAC Pacific Environmental Restoration Program Procedure I-C-3, *Monitoring Well Sampling* (DON 2015b), and the Red Hill *Groundwater Protection Plan* (GWPP) (DON 2014). Prior to purging and sampling, organic vapor readings from each well were measured using a MiniRAE 2000 photoionization detector (PID) and a 4-gas meter. A methane analyzer was also used to determine the percent volume of methane in the well headspace at inside-tunnel sampling locations. The depth to groundwater was measured using a Solinst oil/water interface probe. No sheen was detected in any of the wells, but slight non-petroleum and petroleum odors were observed at RHMW01 and RHMW02. Methane was not detected in any of the sampling locations.

2.1 GROUNDWATER SAMPLING

During the February and March 2017 monitoring events, one sample was collected from each of the 11 wells and one sampling point. During the April 2017 event, a sample was collected from each of 10 wells and one sampling point; HDMW2253-03 was not sampled during this event due to ongoing testing of an experimental transition-zone monitoring device being performed by DLNR's Commission on Water Resource Management (CWRM) and the University of Hawai'i; the testing is expected to continue through August 2017.

During the February and March 2017 monthly monitoring events, split sampling was conducted at all of the sampling locations in support of the U.S. Environmental Protection Agency (EPA) split-sampling SAP (EPA 2017). One set of the split volumes collected for the groundwater and field QC samples was sent directly to Agriculture and Priority Pollutants Laboratories, Inc. (APPL) by the sampling team, and the remaining set of split samples were relinquished to DOH custody to be sent to the EPA Region 9 laboratory.

Prior to collecting groundwater samples, the monitoring wells were purged of standing water in the well casings. Sampling point RHMW2254-01 and wells RHMW02 through RHMW09 each contain a dedicated bladder pump, which was used to purge the well and to collect samples. A rental bladder pump was used to purge the well and collect samples from RHMW01, HDMW2253-03, and OWDFMW01. The groundwater wells were purged using low flow sampling methodology at flow rates of approximately 0.15–0.30 liter per minute to minimize drawdown.

To operate the pump, a portable air compressor with an in-line filter was connected to a QED MP10 MicroPurge Basics Controller box, which was then connected to the pump. The compressor was turned on to power the pump, and the controller was used to adjust the pumping rate to less than 1 liter of water per minute. Compressed nitrogen gas was used to purge all wells.

Water quality parameters were monitored on a periodic basis during well purging using a YSI 6920. Parameters measured included hydrogen activity (pH), temperature, specific conductivity, dissolved oxygen (DO), turbidity, oxidation reduction potential (ORP), and salinity. The water quality parameters were evaluated to assess whether the natural characteristics of the aquifer formation water were present within the monitoring wells before collecting the samples. A minimum of four readings were collected at each well during the purging process. When possible, water level measurements were collected during purging to detect any indication of drawdown; if drawdown was detected approaching 0.2 ft, the rate of low-flow purging was reduced. Purging was considered complete when at least three consecutive water quality measurements stabilized within the specified range for each parameter noted in groundwater sampling logs (Appendix A.1) and in accordance with NAVFAC Pacific Environmental Restoration Program Procedure I-C-3, *Monitoring Well Sampling* (DON 2015b). The readings were recorded on the groundwater sampling logs (Appendix B.1). Field notes were taken to document the monitoring event (Appendix B.2).

When the water quality parameters stabilized, groundwater samples were immediately collected from the wells using the bladder pumps. During the February and March 2017 split sampling events, the groundwater samples were completely collected no more than 5 hours after purging was completed. During the April 2017 monitoring event, groundwater samples were completely collected no more than 2.75 hours after purging. Groundwater samples were collected into sampling containers that were pre-preserved (as necessary) and provided by the analytical laboratory. The analytical suites for the February and March 2017 monthly events and the Second Quarter 2017 groundwater monitoring event are shown in Table 2-1. Samples collected for ferrous iron and dissolved lead analysis were filtered in the field using new, individual 0.45-micron filters attached at the end of the pump discharge tubing.

Table 2-1: Groundwater Sampling Program for the February and March 2017 Monthly Events and the Second Quarter 2017 Monitoring Event

Parameter	Analytical Method	Analyte(s)	Screening Criterion (µg/L)	RHMW2254-01	RHMW01	RHMW02	RHMW03	RHMW04	RHMW05	RHMW06	RHMW07	RHMW08	RHMW09	HDMW2253-03	OWDFMW01

[a] Expanded list of analytes were analyzed for RHMW09 during the February and April 2017 monitoring events. The full suite analyte list is presented in Appendix C.1.

[b] Screening criteria from DOH Tier 1 EALs, Table D-1b, Groundwater Action Levels (groundwater is a current or potential drinking water resource, and surface water body is not located within 150 meters of release site) (DOH 2016a).

[c] Lead scavengers will be collected from the indicated wells for at least 1 year of sampling, and may be discontinued if sample results are below the Groundwater Action Levels established in the February 4, 2016, scoping completion letter (EPA Region 9 and DOH 2016).

[d] Screening criterion from EPA Tap Water Regional Screening Levels, target hazard quotient (THQ) = 1.0, May 2016 (EPA 2016).
[e] Additional general groundwater chemistry parameters were collected to profile the groundwater at RHMW09 during the February 2017 monitoring event (Appendix C.1).
[f] Dissolved and total silica were collected to profile the groundwater at RHMW09 during the April 2017 monitoring event (Appendix C.1).

2.2 FIELD QUALITY ASSURANCE/QUALITY CONTROL

A quality assurance/quality control (QA/QC) program was implemented in the field in accordance with the NAVFAC Pacific *Project Procedures Manual* (DON 2015b), the DOH TGM (DOH 2016b), the project WP (DON 2015c), the AOC Statement of Work Sections 6 and 7 WP/SOW (DON 2017a), and the SAP (DON 2017b,d) to support generating data of known and defensible quality. The QA/QC program was designed to minimize error, provide early identification and correction of potential problems, and evaluate the performance of the sampling program.

Every morning, field instruments were calibrated prior to starting field activities. The PID was calibrated with 100 parts per million (ppm) isobutylene calibration gas. The 4-gas meter was calibrated with 100 ppm isobutylene calibration gas and a 4-gas meter calibration gas. The 4-gas meter calibration gas was comprised of 50 ppm carbon monoxide, 25 ppm dihydrogen sulfide, 19 percent (%) oxygen and 50% of the lower explosive limit of methane. The methane analyzer was calibrated using methane calibration gas composed of 35% carbon dioxide, 50% methane, and the balance nitrogen. The water quality meter was calibrated with auto calibration solution prior to recording measurements.

To assess the effectiveness of the equipment decontamination process after sampling, at least one equipment blank sample was collected in the field during each monitoring event. A field blank sample was also collected to assess the quality of the store-bought Menehune Water Company distilled water used to collect the equipment blank. Prior to each monitoring event, equipment blank samples were collected from the two rental bladder pumps in the warehouse to assess the cleanliness of the rental equipment after the initial equipment decontamination process.

The field blank was collected by pouring distilled water directly into sample containers. The equipment blanks were collected by pouring distilled water into a decontaminated rental bladder pump then into sample containers. The field blank and equipment blank samples were analyzed for the same COPCs as the groundwater samples.

To assess the precision of the data collection activity, including sampling and analysis, two field duplicates were collected. During the February, March, and April 2017 events, one duplicate was collected from RHMW2254-01 and one from RHMW08, at the same approximate time as their respective primary samples. During the February and April 2017 events, one duplicate was also collected from RHMW09 at the same approximate time as its respective primary sample for full suite analyses.

During the February through April 2017 events, one trip blank was collected at each sampling location in order to more accurately represent the condition of the samples in each shipment. The hermetically sealed trip blank samples were supplied "pre-filled" by APPL and remained in the sample cooler during the field event and transport to and from the site.

2.3 SAMPLING HANDLING AND ANALYSIS

The samples were labeled and logged in accordance with NAVFAC Pacific Environmental Restoration Program Procedure III-E, *Record Keeping, Sample Labeling, and Chain-of-Custody Procedures* (DON 2015b). Immediately after collection, all samples were labeled, logged in the field logbooks, custody sealed, sealed with tape, and placed in a resealable plastic bag. To meet method recommended hold time for nitrate analysis, efforts were made to ship the groundwater and field QC samples collected in the morning of each monitoring event to the laboratory the same day as sample collection; samples not shipped on the day of collection were transported to the warehouse and stored in a secure cold storage device for shipment the next day.

Before shipping, samples were placed in a cooler with double-bagged wet ice and logged onto a chain-of-custody (CoC) form. Split sampling was conducted during the February and March 2017 events. An identical duplicate set of samples was collected from each well following the same handling procedures. Prior to sealing the coolers, DOH personnel chose one of the identically packed coolers and took custody of the samples. DOH sent their set of custody-sealed coolers via express courier overnight shipping to the EPA Region 9 laboratory in Richmond, CA. The remaining set was sent by field personnel via express courier overnight shipping in custody-sealed coolers to APPL in Clovis, CA. Similarly, samples and COC forms from the Second Quarter 2017 monitoring event (April 2017) were shipped via overnight courier in custody-sealed coolers to APPL. Sample transport and custody details are provided in the CoC records in the laboratory reports in Appendix C.2.

2.4 DECONTAMINATION

Decontamination activities were performed in accordance with NAVFAC Pacific Environmental Restoration Program Procedure I-F, *Equipment Decontamination* (DON 2015b). A staging and decontamination area was established near each well location. Non-disposable sampling equipment was decontaminated at the beginning of each day and after purging and sampling each well. The decontamination process included washing and scrubbing the equipment with stiff-bristled nylon brushes in a non-phosphate detergent (e.g., Alconox) solution, followed by rinsing once with isopropyl alcohol and twice with distilled water. Liquid wastes generated during decontamination activities were captured and containerized in properly labeled U.S. Department of Transportation-approved 55-gallon drums or other suitable temporary containers, and managed as investigation-derived waste (IDW).

2.5 INVESTIGATION-DERIVED WASTE MANAGEMENT

IDW generated during the monitoring events consisted of purged groundwater from the monitoring wells and decontamination water. The IDW was handled, stored, and labeled in accordance with NAVFAC Pacific Environmental Restoration Program Procedure I-A-6, *Investigation-Derived Waste Management* (DON 2015b). Approximately 120 gallons of fluid from all wells and all three events were containerized in three, clearly labeled 55-gallon capacity drums, covered with a tarp, and stored on site in an area designated by the Navy. IDW is pending disposal. Disposable personal protective equipment and sampling equipment and supplies were collected in plastic trash bags and disposed of as municipal waste.

3. Data Quality Assessment

A data quality assessment, which consists of a review of the overall groundwater sample collection and analysis process, was performed in order to determine whether the analytical data generated met the quality objectives for the project. The data quality assessment was performed in accordance with the AOC Statement of Work Sections 6 and 7 WP/SOW (DON 2017a) and SAP (DON 2017b,d). The field QC program consisted of standardized sample collection and management procedures, and the collection of field duplicate samples, matrix spike (MS) samples, and trip blank samples. The laboratory QA program consisted of the use of standard analytical methods and the preparation and analyses of MS/MS duplicate (MSD) samples, surrogate spikes, blanks, and laboratory control samples (LCSs)/LCS duplicates (LCSDs).

3.1 GROUNDWATER LEVEL MEASUREMENTS

Depths to groundwater were gauged from the notched and surveyed top of casing using a Solinst oil/water interface probe in sampling point RHMW2254-01 and wells RHMW01 through RHMW09, HDMW2253-03, and OWDFMW01 prior to sampling (Table 3-1). The oil/water interface probe was decontaminated between well measurements by washing with a non-phosphate detergent solution and rinsing with isopropyl alcohol and distilled water to prevent cross-contamination. Groundwater elevations beneath the site ranged from 18.01 to 25.7 ft msl. Because questions on the accuracy of surveyed measuring points have been raised, the wells will be resurveyed in 2017. PID readings at the wellheads ranged from 0.0 to 2.3 ppm. No measurable non-aqueous-phase liquid (NAPL) was observed during the groundwater monitoring event. Cumulative graphs of historical depth to water readings are presented in Appendix A.4.

Table 3-1: Groundwater Elevations

Monitoring Well Number	Location (relative to tunnel)	Water Level Measurement Date	PID Reading at Wellhead (ppm)	Depth to Water (ft btoc)	Top of Casing Elevation (ft msl)	Groundwater Elevation (ft msl)

[c] Source: DON 2015a.
[d] Source: AECOM internal Global Positioning System (GPS) survey (July 28, 2016).
[e] Monitoring well HDMW2253-03 was not sampled during the April 2017 monitoring event (Section 2.1).
[f] RHMW2254-01 groundwater elevation is considered anomalous, likely due to sampling point pipe slippage.

3.2 ANALYTICAL RESULTS

The samples were analyzed for TPH-d and TPH-o using EPA Method 8015C; TPH-g, benzene, toluene, ethylbenzene, and xylenes (BTEX), and 1,2-dichloroethane using EPA Method 8260C; 1,2-dibromoethane using EPA Method 8011; PAHs using EPA Method 8270D SIM; phenol using EPA Method 8270D; and 2-(2-methoxyethoxy)-ethanol using a proprietary laboratory procedure. Additionally, RHMW09 groundwater samples that were collected during the February 2017 and April 2017 events were also analyzed for full suite VOCs by EPA Method 8260C, full suite SVOCs by EPA Method 8270D, full suite PAHs by EPA Method 8270D SIM, and general groundwater chemistry parameters by EPA Method 6010C, EPA Method 300.0, and SM4500-SiD. Copies of the laboratory reports are presented in Appendix C.2. Copies of the third-party data validation reports are presented in Appendix C.3.

Analytical results were compared to the current LTM screening criteria as established by the February 4, 2016, AOC Statement of Work Sections 6 and 7 scoping completion letter (EPA Region 9 and DOH 2016) and updated with the most current DOH Tier 1 EALs in Table D-1b, Groundwater Action Levels (groundwater is a current or potential drinking water resource, and surface water body is not located within 150 meters of release site) (DOH 2016a) where appropriate. The results of the February 2017, March 2017, and April 2017 monitoring events are summarized in Table 3-2 through Table 3-4, and QC sample results are presented in Table 3-5 through Table 3-7.

In general, COPCs were not detected in RHMW2254-01, RHMW04, RHMW05, RHMW07, RHMW09, and HDMW2253-03. However, TPH-d, 1-methylnapthalene, 2-methylnapthalene, and naphthalene remain above screening criteria in RHMW02. Figure 2 presents detections and exceedances in COPC concentrations, and Figure 3 presents the natural attenuation parameter (NAP) results at all wells. A cumulative groundwater COPC table containing analytical chemistry results from the beginning of the LTM program is presented in Appendix C.1. A description of laboratory data qualifiers, definitions of the terms detection limit (DL), limit of detection (LOD), and limit of quantitation (LOQ), and basic concepts of those terms are presented in the Fact Sheet included as Appendix C.4.

Analytical results for the February, March, and April 2017 monitoring events are summarized below:

- *RHMW2254-01, RHMW04, RHMW05, RHMW07, RHMW09,* and *HDMW2253-03:* No COPCs were detected in any of the three events.
- *RHMW01:* Concentrations of TPH-d (83–150 µg/L) were detected in all three events. The February 2017 result (150 µg/L) exceeded the screening criterion (100 µg/L). The TPH-d concentrations did not exceed the SSRBL of 4,500 µg/L.
- *RHMW02:* Concentrations of TPH-d (940–1,200 µg/L), 1-methylnaphthalene (20–22 µg/L), 2-methylnaphthalene (16–17 µg/L), and naphthalene (49–57 µg/L) exceeding the respective screening criteria were detected in all three events. The concentrations of TPH-d did not exceed the SSRBL of 4,500 µg/L. Concentrations of TPH-o (84 µg/L), TPH-g (57–73 µg/L), and total xylenes (0.23 µg/L) below the respective screening criteria were detected in all three events.
- *RHMW03:* Concentrations of TPH-d (47–67 µg/L) and TPH-o (41–71 µg/L) below the respective screening criteria were detected in all three events. The TPH-d concentrations did not exceed the SSRBL of 4,500 µg/L.
- *RHMW06:* A concentration of TPH-o (47 µg/L) below the screening criterion was detected in the March 2017 event.
- *RHMW08:* Concentrations of TPH-d (25–27 µg/L) and TPH-o (23–31 µg/L) below the respective screening criteria were detected in the January and February 2017 events.
- *OWDFMW01:* A concentration of TPH-o (44 µg/L) below the screening criterion was detected in the February 2017 event.

Bold text indicates detected value.

Exceeds screening criterion.

[a] SSRBL applies to RHMW01, RHMW02, and RHMW03.

– - not analyzed or not applicable

µg/L - micrograms per liter

FD - field duplicate

J - estimated value

mg/L - milligrams per liter

N - normal (primary) sample

SSRBL - site-specific risk-based level

U - nondetect value

Bold text indicates detected value.

– - not analyzed or not applicable

µg/L - micrograms per liter

EB - equipment blank (rinsate)

FB - field blank (source water)

J - estimated value

mg/L - milligrams per liter

TB - trip blank

U - nondetect value

3.3 RECENT GROUNDWATER CONTAMINANT CONCENTRATIONS

The historical groundwater contaminant concentrations for TPH-g, TPH-d, TPH-o, BTEX, 1-methylnaphthalene, 2-methylnaphthalene, and naphthalene are illustrated in Appendix A.2. No graphs were created for lead scavengers, fuel additives, analytes that have been discontinued and are no longer COPCs for the LTM program, and additional analytes for the full suite analyses from RHMW09. A table of cumulative historical groundwater results is included as Appendix A.1. Figure 4 shows the COPC concentration graphs. Figure 5 displays graphs of NAP measurements starting from the Fourth Quarter 2016 event.

The following summary of groundwater contaminant concentrations focuses on the 2016 and 2017 groundwater results, before and during the reduced or no pumping status of Navy Supply Well 2254-01 pumps that began in February 2016.

- *RHMW2254-01:* COPCs (TPH-d and TPH-o) were detected only in the December 2016 monitoring event; this event was the first time TPH-d had been detected since the First Quarter 2016 monitoring event. Although the method reporting limits for TPH-d were above the screening criterion in several results prior to August 2010, TPH-d has not been detected in RHMW2254-01 at a concentration above the screening criterion of 100 µg/L.
- *RHMW01:* TPH-d was the only COPC that exceeded the EAL of 100 µg/L, and groundwater COPC concentrations have generally been declining since the First Quarter 2016 monitoring event with some fluctuations occurring in 2017. TPH-d has historically been detected at concentrations above the screening criterion (100 µg/L) during most monitoring events. More recent results have been below the screening criterion since the November 2016 monitoring event with the exception of the TPH-d concentration during the February 2017 monitoring event.
- *RHMW02:* TPH-g, TPH-d, TPH-o, 1-methylnaphthalene, 2-methylnaphthalene, and naphthalene have historically been detected at concentrations above the respective screening criteria (100 µg/L, 100 µg/L, 100 µg/L, 6 µg/L, 10 µg/L, and 17 µg/L, respectively). Starting from the Second Quarter 2016 monitoring event, concentrations of TPH-d decreased to a level below the SSRBL of 4,500 µg/L, which was exceeded during quarterly events in 2015 and the First Quarter 2016 event. The concentrations of TPH-g, TPH-d, 1-methylnaphthalene, 2-methylnaphthalene, and naphthalene are showing a general decline since the First Quarter 2016 monitoring event; similarly, TPH-o, which was historically detected at RHMW02 and at concentrations above the screening criterion, has been detected at or below the screening criterion since the November 2016 monitoring event.
- *RHMW03:* TPH-d and TPH-o, which have historically been detected at concentrations above the screening criteria (both 100 µg/L), were detected below screening criteria and show a general decline in concentrations since the Second Quarter 2016 monitoring event.
- *RHMW04, RHMW05, RHMW09, and HDMW2253-03:* No COPCs were detected in the February through April 2017 events (HDMW2253-03 was not sampled in the April 2017 event).
- *RHMW06:* COPC results were generally consistent with the historical data for RHMW06. TPH-o was detected below the screening criterion (100 µg/L) in the March 2017 event, but was not detected in the other 2016 and 2017 monitoring events.
- *RHMW07:* COPC results were generally consistent with the historical data for RHMW07 with the exception of TPH-o from the Third Quarter 2016 monitoring event that exceeded the screening criterion (100 µg/L). The unusually high concentration of TPH-o from that

event was significantly higher than results for other monitoring events. Similar to other wells, most COPCs have not been detected since the First Quarter 2016 monitoring event.

- *RHMW08:* No COPCs were detected during RHMW08's first monitoring event (October 2016), but TPH-d and TPH-o were detected below the screening criteria (both 100 µg/L) in subsequent monitoring events until the March 2017 monitoring event. No COPCs were detected in the April 2017 event.
- *OWDFMW01:* TPH-d has periodically been detected significantly above the screening criterion since the start of monitoring activities at OWDFMW01 in 2009. The low concentrations of TPH-d since Second Quarter 2016 groundwater monitoring event are consistent with the pattern of very high detections historically followed by sharp declines in concentration during the monitoring events directly after the spike. The recent concentrations of TPH-o also show a decline since the Second Quarter 2015 monitoring event, when it began to be consistently analyzed as part of the COPC list for the well.

3.4 DATA VALIDATION AND ASSESSMENT

The analytical laboratory data were submitted to a third-party data validator (Laboratory Data Consultants, Inc.) for data validation and assessment. The objective of data validation is to provide data of known quality for project decisions. Data quality is judged in terms of precision, accuracy, representativeness, completeness, comparability, and sensitivity (PARCCS) and performed in accordance with the data validation procedures in the NAVFAC Pacific Environmental Restoration Program *Project Procedures Manual* (DON 2015b) and consistent with the protocol in the Department of Defense (DoD) QSM Version 5.0 (DoD 2013). A number of factors may affect the quality of data, including sample collection methods, sample analysis methods, and adherence to established procedures for sample collection, preservation, management, shipment, and analysis. Data validation reports are presented in Appendix C.3.

Precision

Precision is defined as the reproducibility of replicate measurements. Precision is evaluated by relative percent difference (RPD) of field duplicates, LCS/LCSD, and MS/MSD results. Field duplicate and MS/MSD samples were collected at a rate of approximately 10% of primary samples. Field duplicates were sent to the laboratory along with the primary samples.

No COPCs were detected in the following primary and field duplicate samples for RHMW2254-01, thus no RPDs can be calculated for these samples: ERH205 and ERH206 (February 2017); ERH257 and ERH258 (March 2017); and ERH292 and ERH293 (April 2017).

Only TPH-d and TPH-o were detected in the following RHMW08 primary and field duplicate samples with acceptable RPDs: ERH220 and ERH221 (February 2017) with RPDs 4% and 10% for TPH-d and TPH-o respectively; and ERH262 and ERH263 (March 2017) with a RPD of 8% for both TPH-d and TPH-o. All calculated RPDs were within the 50% measurement performance criteria (MPC). No other COPCs were detected in the RHMW08 primary and field duplicate samples during the February and March 2017 events, and no COPCs were detected in primary and field duplicate samples ERH297 and ERH298 (April 2017 event).

No COPCs were detected in the following RHMW09 primary and field duplicate samples: ERH225 and ERH247 (February 2017); and ERH307 and ERH314 (April 2017). However, acetone was detected in primary sample ERH307 but not in the duplicate sample ERH314, yielding RPD at 200%, exceeding the MPC (Table 3-8).

No other precision concerns identified during validation affected sample results. Data usability of the samples is discussed in Section 3.5.

Accuracy

Accuracy is defined as the degree of conformity of a measurement to a standard or true value. Accuracy is evaluated through measurement of the percent recovery (%R) of an analyte in a reference standard or spiked sample. Accuracy limits for surrogates, laboratory control spike, MS, and MSD samples are either prescribed by the DoD or established by the individual laboratory. The acceptance criteria for accuracy are dependent on the analytical method and are based on historical laboratory or DoD data.

The MS and MSD percent recoveries (%R) exceeded laboratory acceptance limits for the following: 1,2-dichlorobenzene, TPH-g, dissolved silica, chloride, and fluoride in ERH307 (RHMW09, April 2017 event). Results for 1,2-dichlorobenzene, TPH-g, and dissolved silica were qualified as estimated due to possible low bias introduced by the matrix, and results for chloride and fluoride were qualified as estimated due to possible high bias.

No other accuracy concerns were identified during validation affected sample results. Data usability is discussed in Section 3.5.

Representativeness

Representativeness is the degree that data accurately and precisely represents a characteristic of a population, parameter variations at a sampling point, or an environmental condition. Representativeness was achieved by conducting sampling in accordance with the sample collection procedures described in the AOC Statement of Work Sections 6 and 7 WP/SOW, including standardized sample collection methods identified in NAVFAC Pacific Environmental Restoration Program Procedure I-C-3, *Monitoring Well Sampling* (DON 2015b).

Representativeness is also evaluated through the compliance with the method-recommended sample holding time and sample preservation methods, and through the analysis of blank samples, including method blank and trip blank samples. For the February to April 2017 monitoring events, all sample holding times and sample preservation were consistent with EPA SW-846 method recommendations and DoD QSM Version 5.0 (DoD 2013).

All samples were associated with a method blank and trip blank. No COPCs were found in the laboratory method blanks and trip blanks with the exception of the following: sodium in laboratory blanks during the February 2017 event; alkalinity in the laboratory blanks during February through April 2017 events; 1,2,4-trimethylbenzene, m-xylene, toluene, and total xylenes in the RHMW09 trip blanks during the February 2017 event; and calcium and magnesium in the laboratory blanks during

the April 2017 event. Due to the laboratory blank contamination, the ERH248 (RHMW09 field blank sample, February 2017) sodium result was qualified as non-detect. No data were qualified for alkalinity, 1,2,4-trimethylbenzene, m-xylene, toluene, total xylenes, calcium, and magnesium as these were either not detected in any of the associated samples or the sample concentrations exceeded 5 times the concentration found in the laboratory or trip blank.

For RHMW01, OWDFMW01, and HDMW2253-03, field blank and equipment blanks were collected and analyzed to demonstrate field equipment decontamination efficiency. Additionally, field blanks were collected and analyzed to demonstrate ambient conditions at RHMW09 during the February 2017 and April 2017 (full suite analyte) events. The only COPCs found in the field and equipment blanks were: magnesium and calcium were detected in the February 2017 field blank; TPH-d and TPH-o in the February 2017 equipment blanks; TPH-o in the March 2017 field and equipment blanks; and chloride, magnesium, sodium, calcium, and dimethyl phthalate in the RHMW09 April 2017 field blank. The associated analytes were not qualified as the analytes are either not detected or were at concentrations greater than 5 times the concentration found in the field or equipment blanks with the exception of the following: TPH-d in ERH227 (OWDFMW01, February 2017) and dimethyl phthalate in ERH307 (RHMW09, April 2017) were qualified as non-detect (U) due to equipment and field blank contamination.

All holding times were met with the exception of the following: three February 2017, three March 2017, and two April 2017 nitrate results were qualified as estimated due to extraction up to 52.18 hours after the sample collection dates, thus exceeding the 48-hour method recommended holding time. These eight results were qualified as estimated (J) due to the hold time exceedance.

The representativeness of the data is considered acceptable after qualification for holding time. Data usability is discussed in Section 3.5.

Completeness

Completeness is defined as the overall percentage of valid analytical results (including estimated results) compared to the total number of analytical results reported by the analytical laboratory.

Of the 2,333 total results reported, none of the results was rejected. The completeness of the data (100%) met the 90% completeness goal.

Comparability

Comparability expresses the confidence with which one data set can be compared to another data set. Comparability can be related to accuracy and precision because these quantities are measures of data reliability. Data with acceptable precision and accuracy are considered comparable if collection techniques, analytical procedures, methods and reporting are equivalent.

All samples collected from October 2010 to February 2015 were analyzed by Calscience Environmental Laboratories in Garden Grove, CA (now Eurofins Calscience). Samples collected from April 2015 through July 2016 were analyzed by ALS Environmental in Kelso, WA. Samples collected from October 2016 to present were analyzed by APPL in Clovis, CA. Analytical method detection limits (MDLs), limits of detection (LODs), and LOQs starting from the Fourth Quarter 2016 event were lower for most analytes than they had been during previous events. The method used to analyze TPH-g was changed from 8015 to 8260 to improve sensitivity. The significantly improved reporting limits should be considered when results are compared to data from previous events.

The laboratory used standard analytical methods for all of the analyses. In all cases, the DLs and LODs attained were below the specified LOQs. Target analytes detected below the LOQs flagged (J) by the laboratory should be considered estimated. The comparability of the data is regarded as acceptable.

Sensitivity

The LOQs are established by the laboratory based on the LODs or instrument DLs, historical data, and EPA limits established for the various methods. The LOQs and LODs for samples may require adjustment by the laboratory due to matrix interference or if high levels of target analytes necessitate dilution before analysis. Matrix interference and sample dilutions have the effect of decreasing sensitivity and increasing the LOQs/LODs. No results in this data set have increased LOQs or LODs that have impacted sensitivity and data usability.

3.5 DATA ASSESSMENT AND USABILITY CONCLUSIONS

The PARCCS criteria were evaluated, and with some exceptions, all criteria were met. Results associated with QC data that failed acceptance criteria are discussed in detail in Section 3.4 of this report. Data quality issues that need to be taken into account for project decisions are summarized below.

The 200% RPD for the acetone result was caused by a non-detect result in one of the samples in the field duplicate pair. The field duplicate imprecision indicate that sampling bias may exist in the collected sample volumes, but that the exact nature of the bias (high or low) cannot be determined due to the nature of the RPD exceedance. Due to the imprecision, there is uncertainty in the true concentration of the acetone. Nonetheless, the acetone concentration of 1.8 µg/L was just above the laboratory's detection limit and is four orders of magnitude lower than the DOH Tier 1 EAL (Table D1-b, Groundwater Action Levels) and the EPA Tapwater Regional Screening Level of 14,000 µg/L.

The MS and MSD %R exceedances for 1,2-dichlorobenzene, TPH-g, dissolved silica, chloride, and fluoride in the April 2017 RHMW09 groundwater sample indicate possible bias due to matrix effects. The affected results were flagged as estimated to denote the possible bias and are deemed usable.

The sodium result for the RHMW09 field blank sample and the dimethyl phthalate result for the RHMW09 groundwater sample were also both qualified as non-detect due to laboratory blank and field blank contamination, respectively. Similarly, the TPH-d contamination in the equipment blank for the February 2017 event affected TPH-d results for OWDFMW01, flagging the result as non-detect. It is of note that other existing TPH-d data for OWDFMW01 indicate that the TPH-d results are consistent with recently previous events, thus it is possible that the field blank contamination may have little actual contribution to the TPH-d results. Additionally, the affected TPH-d result is below the screening criteria. However, as the contributed contamination cannot be quantified, per the validation procedures of the NAVFAC Pacific Environmental Restoration Program *Project Procedures Manual* (DON 2015b) results less than 5 times the blank concentration are flagged as non-detect.

The holding time exceedances for the nitrate results indicate a possible low bias may have been introduced to the data. However, the data were deemed usable with qualification as the sample extractions did not exceed the method-recommended holding time by a factor of 2. The usability of the nitrate data is deemed acceptable after the data are qualified as estimated.

The third-party data assessment concludes that all data generated during this event are usable for the intended purpose, with the limitations described above.

4. Natural Attenuation Parameter Evaluation

The natural attenuation evaluation uses lines of evidence, as follows:

- The use of historical groundwater primary indicators (COPC data) to demonstrate contaminant concentration over time.
- The use of secondary indicators (hydrogeologic and geochemical data) can demonstrate natural attenuation processes are active at the site, and the rate at which such processes will reduce contaminant concentration to screening levels.
- The analysis of TPH-d and TPH-o with and without the use of silica gel cleanup to determine fraction of polar weathered hydrocarbons and total recoverable hydrocarbons.

Two of the objectives of analyzing for the NAPs are to assess whether natural attenuation is occurring on site, and whether there is the potential for natural attenuation to reduce the concentrations of the petroleum-related constituents in groundwater. The decline in TPH concentrations at RHMW01, RHMW02, and RHMW03 within the last seven groundwater events may be attributable to changed aquifer conditions and pumping scenarios at the Red Hill Shaft, characteristic contaminant pulse from a declining source, natural attenuation, changes in precipitation, or a combination of one or more of these factors. Secondary lines of evidence for natural attenuation are based on additional information collected during the groundwater monitoring events and include DO, ORP, pH, specific conductance, dissolved ferrous iron, methane, nitrate, and sulfate.

Fuel hydrocarbons can be biodegraded by microorganisms in the subsurface under aerobic or anaerobic conditions. Biodegradation is the result of microbial-mediated redox reactions in which coupling of oxidation of an electron donor and reduction of an electron acceptor occurs.

Biodegradation of fuel hydrocarbons causes changes to the groundwater geochemistry. During aerobic biodegradation of hydrocarbons, DO concentrations are depleted as aerobic respiration occurs because DO is the most thermodynamically favored electron acceptor used in biodegradation. ORP is a measure of electron activity and is an indicator of the relative tendency of a solute species to gain or lose electrons. Higher ORP measurements suggest aerobic respiration is occurring.

In methanogenic anaerobic respiration, potential electron acceptors include nitrate, ferric iron, sulfate, and carbon dioxide. Use of the electron acceptors proceeds along a natural succession in the order listed above because of decreasing energetic efficiency (Leeson et al. 2004). Nitrate is the most thermodynamically favored electron acceptor of the anaerobic pathways, biodegrading to nitrite (followed by nitrogen gas) and carbon dioxide. Ferric iron in soil can be consumed by anaerobic biodegradation when both DO and nitrate have been depleted in anaerobic groundwater, yielding dissolved ferrous iron in groundwater. Sulfate can be consumed by anaerobic degradation after DO, nitrate, and ferric iron are depleted, yielding precipitated iron sulfides. Lower concentrations of sulfate in groundwater compared to background levels indicate that sulfate reduction is an ongoing biological process for petroleum hydrocarbon degradation within plume areas. When all the soluble electron acceptors (i.e., DO, nitrate, ferric iron, and sulfate) are depleted, groundwater conditions become conducive to fermentation and methane is generated by methanogenesis.

Alkalinity is a general indicator of buffering capacity of an aquifer system against pH changes due to attenuation processes in the groundwater. Alkalinity is used in conjunction with pH measurements to determine if the groundwater is sufficient to neutralize metabolic acids produced by biodegradation.

Production of carbon dioxide during biodegradation causes carbonate minerals to dissolve, increasing alkalinity concentrations in the groundwater.

Both aerobic and anaerobic biodegradation may be occurring at the site and COPC such as naphthalene are known to degrade both aerobically and anaerobically, and geochemical parameters indicative of biodegradation may vary with location and with time (Wiedemeier et al. 1999).

For the February through April 2017 monitoring events, the field water quality data parameters are included on the field sampling logs (Appendix B.1). Table 3-2 through Table 3-4 summarize DO, ORP, and other geochemical parameters (ferrous iron, methane, nitrate, and sulfate) indicative of evidence of biodegradation. Graphs of the DO, ORP, and NAPs are presented in Appendix A.3.

Unweathered petroleum tends to contain nonpolar hydrocarbons that, when weathered in the environment create polar hydrocarbons as byproducts of biological sources and processes. Silica gel cleanup is commonly used to separate polar from nonpolar hydrocarbons. Polar compounds will preferentially adsorb to silica, while non-polar compounds will not. DOH TGM Section 9.3.1.2, Total Petroleum Hydrocarbons, discusses the use of silica gel cleanup to separate out the polar TPH fraction and compare the remaining non-polar TPH fraction to the screening criteria: "*Comparison of data for groundwater samples tested with and without silica gel cleanup could be useful for assessing the state of natural biodegradation within a plume of petroleum-contaminated groundwater and optimizing remedial and monitoring actions*" (DOH 2016b). TPH-d and TPH- with silica gel cleanup was performed in select groundwater samples in November and December 2016 and discussed in the *First Quarter 2017 Quarterly Groundwater Monitoring Report* (DON 2017c); however, groundwater samples were not analyzed for TPH-d and TPH-o with silica gel clean-up during the February through April 2017 groundwater monitoring events.

4.1 Evaluation Using Groundwater COPC Concentrations

The groundwater COPC concentrations illustrated in Appendix A.2 indicate a general decline in concentration in most monitoring wells since the First Quarter 2016 monitoring event. The general decline seems to start immediately after the First Quarter 2016 monitoring event. Historical TPH-d concentrations from 2007 and onwards show, especially in RHMW02, that seasonal increase and decreases occur respectively during the beginning and end of wet-season sampling (October through May). However, the recent decline in concentrations may also be attributable to other factors such as the reduced pumping activity at the Red Hill Shaft starting from February 2016.

4.2 Evaluation Using Natural Attenuation Parameters

NAPs were collected during the groundwater monitoring field activities and include DO, ORP, ferrous iron, methane, nitrate, sulfate, and chloride. These parameters indicate the conditions under which natural attenuation is likely occurring.

4.2.1 Dissolved Oxygen and Oxidation Reduction Potential

The February and April 2017 DO and ORP concentrations for most wells were generally consistent with previous measurements. The background (RHMW04) DO measurement for the February to April 2017 monitoring events ranged between 8.64 and 9.01 mg/L, and ORP ranged between 147.7 and 209.3 millivolts (mV). DO concentrations for RHMW01, RHMW02, and RHMW03 were consistently depressed and the ORP values were consistently negative.

In RHMW01 and RHMW02, DO was depleted in the groundwater, and when evaluated in conjunction with other NAPs such as the high dissolved methane concentrations (between 470 µg/L

to 16,000 µg/L), the observed depletion indicates that anaerobic respiration is likely occurring. DO and ORP conditions at RHMW03 are indicative of conditions conducive to biodegradation, although methane was not detected at RHMW03.

4.2.2 Nitrate

Nitrate is the most thermodynamically favored electron acceptor of the anaerobic pathways, in which petroleum hydrocarbons are biodegrading to nitrogen gas. RHMW01 and RHMW02 consistently have had nitrate at concentrations below 1 mg/L. This suggests that anaerobic respiration is likely occurring. The rest of the wells have nitrate at concentrations greater than the background level of 2.5 to 2.7 mg/L in RHMW04, which when evaluated in conjunction with the DO and ORP results, suggests that no attenuation is likely occurring (for wells that show no TPH detections) or that aerobic conditions are likely occurring such as at RHMW03 where DO and ORP are depressed but nitrate is not.

4.2.3 Ferrous Iron

Bacteria will typically break down ferric iron in soil once oxygen is depleted, which causes ferrous iron to be detected in groundwater. Elevated levels of ferrous iron indicate that the groundwater environment can sustain iron reduction for anaerobic respiration. During the February through April 2017, ferrous iron was present in wells RHMW01, RHMW02, RHMW05, RHMW08, and HDMW2253-03 at concentrations ranging from 0.16 mg/L to 3.0 mg/L. Ferrous iron was not detected in any other wells.

The ferrous iron concentrations in RHMW01 and RHMW02 are in line with other NAPs discussed above, suggesting that anaerobic respiration may be occurring at these locations. The ferrous iron at RHMW08 may be indicative of anaerobic biological activity; however, other NAP results do not indicate attenuation. The presence of ferrous iron and other NAPs at RHMW05 and HDMW2253-03 are likely not indicative of anaerobic biological activity at these locations because TPH has not been reported for these wells in the last eight monitoring events. Future groundwater monitoring events will provide more data to evaluate the ferrous iron trends at all the monitoring well locations.

4.2.4 Methane

An additional line of evidence for biological degradation of petroleum hydrocarbons includes the presence of methane, a reaction byproduct of fermentative biological reactions. Methane was detected in the samples from RHMW01 and RHMW02 at concentrations ranging from 470 µg/L to 1,300 µg/L and 5,700 µg/L to 16,000 µg/L, respectively. This evidence of methane concentrations suggests that methanogenic, anaerobic biodegradation is occurring in these wells. Methane was not detected in any of the other wells/sampling location.

4.2.5 Sulfate

Sulfate is usually consumed by bacteria only when DO, nitrate, and ferric iron have been depleted. Concentrations of sulfate lower than background concentrations, when evaluated in conjunction with depressed DO and nitrate concentrations, suggest that anaerobic activity is occurring. The concentrations of sulfate in groundwater at RHMW01 and RHMW02 were 4.6–5.1 mg/L and 1.0–1.1 mg/L, respectively, which are much lower than the sulfate concentrations in RHMW04 (10.3–11 mg/L). The sulfate results in RHMW01 and RHMW02 suggest that anaerobic activity is likely actively occurring. The concentrations of sulfate at the other wells are equal to or greater than the background concentration at RHMW04.

4.2.6 Chloride

Chloride is a general water quality parameter and is also usually produced by anaerobic dechlorination of chlorinated compounds. Elevated levels of chloride may indicate that dechlorination is occurring, but only if background concentrations of chloride in the aquifer do not mask the production of chloride due to dechlorination. In addition, elevated chloride levels may also inhibit certain microbial activity. As such, chloride is generally considered as an indicator parameter only. Chloride concentrations in RHMW2254-01 (sampling point near Navy Supply Well 2254-01) and RHMW04 (background well) were approximately 2 times higher than chloride concentrations in RHMW01, RHMW02, and RHMW03 (the monitoring wells where biodegradation is likely occurring based on results of other NAPs). Additionally, chloride concentrations in RHMW05 through RHMW08, OWDFMW01, and HDMW2253-03 are higher than in RHMW04. Thus, chloride results may not provide a strong line of evidence to support conclusions on natural attenuation at the facility. Future groundwater monitoring events will provide more data to evaluate the chloride trends at all the monitoring well locations.

4.2.7 Alkalinity

Alkalinity was added to the NAP list during the November 2016 monitoring event. Total and bicarbonate alkalinity concentrations in RHMW02 and RHMW03 are significantly higher than in other monitoring well locations. During the February through April 2017 events, the alkalinity in RHMW02 ranged from 193 mg/L to 206 mg/L, and in RHMW03 from 281 mg/L to 289 mg/L, which are much higher than the background concentrations ranging from 77.7 mg/L to 79.3 mg/L. The elevated alkalinity in RHMW02 and RHMW03 may be attributable to natural attention process occurring at these locations.

In contrast, high alkalinity concentrations were detected in OWDFMW01 (ranging from 165 mg/L to 174 mg/L), but the location did not have other NAP measurements that support evidence of natural attenuation. Thus the alkalinity concentrations in OWDFMW01 may be attributed to the groundwater conditions existing at OWDFMW01, which profiles as very hard water and is very different compared to the other monitoring locations as discussed in Section 3.4 of the *First Quarter 2017 – Quarterly Groundwater Monitoring Report* (DON 2017c).

5. Summary, Conclusions, and Recommendations

5.1 SUMMARY

During the February 6–9 and March 6–8, 2017, monitoring events, groundwater samples were collected from one sampling point at Red Hill Shaft (RHMW2254-01) and 11 monitoring wells in the Red Hill groundwater monitoring network (RHMW01 through RHMW09, HDMW2253-03, and OWDFMW01). During the April 3–4, 2017, event, groundwater samples were collected the same locations with the exception of HDMW2253-03 due to ongoing testing of an experimental transition-zone monitoring device being performed by the CWRM and the University of Hawai'i; the testing is expected to continue through August 2017. One primary and one duplicate sample were collected from sampling point RHMW2254-01 and well RHMW08 in all three events, and a field duplicate sample was also collected from RHMW09 during the February and April 2017 events.

The groundwater sampling was conducted as part of the long-term groundwater monitoring program at the Facility. Analytical results for the sampling locations with the highest and most frequent historical detections are summarized as follows:

- *RHMW01:* Concentrations of TPH-d (83–150 µg/L) were detected during all three events. The February 2017 result (150 µg/L) exceeded the screening criterion (100 µg/L). The TPH-d concentrations did not exceed the SSRBL of 4,500 µg/L.
- *RHMW02:* Concentrations of TPH-d (940–1,200 µg/L), 1-methylnaphthalene (20–22 µg/L), 2-methylnaphthalene (16–17 µg/L), and naphthalene (49–57 µg/L) exceeding the respective screening criteria were detected in all three events. The concentrations of TPH-d did not exceed the SSRBL of 4,500 µg/L. Concentrations of TPH-o (84 µg/L), TPH-g (57–73 µg/L), and total xylenes (0.23 µg/L) below the respective screening criteria were detected in all three events.
- *RHMW03:* Concentrations of TPH-d (47–67 µg/L) and TPH-o (41–71 µg/L) below the respective screening criteria were detected in all three events. The TPH-d concentrations did not exceed the SSRBL of 4,500 µg/L.
- *OWDFMW01:* A concentration of TPH-o (44 µg/L) below the screening criterion was detected in the February 2017 event.

A table of cumulative historical groundwater results is presented in Appendix A.1, and historical groundwater COPC concentration graphs are presented in Appendix A.2. The historical groundwater COPC concentration graphs indicate a general decline in COPC concentrations since the First Quarter 2016 event.

The NAPs present evidence of anaerobic biodegradation occurring at RHMW02 at significant levels based on depleted DO, very high dissolved methane concentrations, depleted nitrate and sulfate concentrations, and high alkalinity concentrations. The concentrations of NAPs at RHMW01 and RHMW02 also suggest that biodegradation is also occurring. Other monitoring wells showed very low or no TPH detections, which when evaluated into consideration with the NAP results indicate that biodegradation is unlikely to be occurring.

5.2 Conclusions and Recommendations

During the February, March, and April 2017 monitoring events, there were no SSRBL exceedances, although TPH-d exceeded the DOH EAL screening criterion at RHMW01 and RHMW02. 1-methylnaphthalene, 2-methylnaphthalene, and naphthalene also exceeded the respective DOH EAL screening criteria at RHMW02. RHMW08 showed low detections of TPH-d and TPH-o during the November 2016 through March 2017 events, but these COPCs were not detected during the April 2017 event. TPH-d at OWDFMW01 was at a high during Third Quarter 2015 and has dropped to non-detect in the April 2017 event, similar to the pattern seen during the quarterly monitoring events in 2012. Groundwater contaminant concentrations in other wells generally remained at non-detect or at low concentrations and did not change significantly from the previous event.

Based on the groundwater monitoring results and in accordance with AOC Statement of Work Sections 6 and 7, continued groundwater monitoring at the wells in the Red Hill groundwater monitoring network is recommended. Monthly sampling of the Red Hill monitoring network was initiated in November 2016 in response to information obtained that the Red Hill Shaft pumps have been relatively inoperable since February 2016 due to equipment (i.e., transformer) malfunction. Pumping at a reduced capacity was initiated in November 2016 using temporary equipment, and the pumping resumed to normal capacity in December 2016. To evaluate potential impacts the changed pumping conditions may have on COPC concentrations in groundwater at and around the Facility, samples were collected monthly starting in November 2016 through April 2017, with the January 2017 and April 2017 events being the regularly scheduled quarterly monitoring events. Split

sampling was also conducted during the January through March 2017 events. Results of the monthly monitoring events are included in the scheduled quarterly monitoring reports.

It is recommended that the groundwater monitoring program continue testing for the NAPs at each monitoring event, and that it continue to include silica-gel-cleaned TPH-d and TPH-o analysis if (1) TPH-d and TPH-o results increase by a factor of 2 from the previous monitoring event and the results are above screening criteria, or (2) upon the first finding of TPH-d and TPH-o in the newly installed monitoring wells. At this time, pumping effects of Red Hill Shaft will be evaluated and included in relevant and applicable deliverables pursuant to AOC Statement of Work Sections 6 and 7.

Additional monthly groundwater monitoring events were performed in May and June 2017, followed by the Third Quarter 2017 monitoring event performed in July 2017.

Appendix A.1 Table Notes:

DOH Tier 1 Environmental Action Levels, Table D-1b. Groundwater Action Levels (Groundwater IS a current or potential drinking water resource, surface water body IS NOT located within 150 meters of release site)

Background historical data are from February 2005 to July 2012.

Non-detects (from October 2012 on) are the LOD values.

Results for October 2015 sampling have been adjusted to reflect corrections from hits in the laboratory blank.

1	The holding time until analysis was exceeded by 1 day; the results may be biased low.
*	Duplicate sample
**	Samples analyzed passed the EPA recommended holding time.
***	Samples ES087 and ES088 possibly switched prior to analysis.
****	TPH-g analyzed by either 8015 or 8260.
*****	Analyzed by either 8260, 8260 SIM, or 8011.
a	MDL values were used for non-detects.
b	MRL values were used for non-detects.
c	No analytical lab reports found, could not verify results.
d	No analytical lab reports available, used summary table from DOH Quarterly GW Reports.
e	Results from stilling basin, pumps offline
f	Results from stilling basin, pumps online
g	Analyzed by Method 6010B
h	Analyzed by Method 6020
i	The MRL/MDL was elevated due to a chromatographic interference
k	Analyzed by Method 200.8
µg/L	micrograms per liter
Grey highlight	Exceeds EAL
Bold	Detected value
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
D	The reported result is from a dilution.
F	The compound was identified but the concentration was above the MDL and below the RL.
ICH	Initial calibration verification recovery above method CL for this analyte.
ICJ	Initial calibration verification recovery below method CL for this analyte.
IH	Calibration verification recovery below method CL for this analyte.
IJ	Calibration verification recovery above method CL for this analyte.
J	Estimated value
U	The compound was analyzed for but not detected at or above the stated limit. The stated limit is the LOD unless otherwise specified.
HD, Y, L, O, Z, H, ++	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
S	Surrogate recovery was outside quality control limits.
V	Unusual problems found with the data not defined elsewhere. Description of the problem can be found in the associated quarterly monitoring analytical data validation report.
X	Possible high bias due to matrix interference
Tb	The analyte was also detected in the associated trip blank at a similar concentration.

Appendix A.2:
Graphs of Cumulative Groundwater COPC Results

This page intentionally left blank

RHMW2254-01

All units in micrograms per liter (ug/L or parts per billion).

RHMW01

All units in micrograms per liter (ug/L or parts per billion).

RHMW02

All units in micrograms per liter (ug/L or parts per billion).

Appendix A.2. Groundwater COPC Graphs

All units in micrograms per liter (ug/L or parts per billion).

Appendix A.2. Groundwater COPC Graphs

RHMW04

All units in micrograms per liter (ug/L or parts per billion).

Appendix A.2. Groundwater COPC Graphs

RHMW05

All units in micrograms per liter (ug/L or parts per billion).

Appendix A.2. Groundwater COPC Graphs

Detected Concentration

Non-Detect Concentration

Regulatory Screening Level

All units in micrograms per liter (ug/L or parts per billion).

Appendix A.2. Groundwater COPC Graphs

All units in micrograms per liter (ug/L or parts per billion).

Appendix A.2. Groundwater COPC Graphs

RHMW08

All units in micrograms per liter (ug/L or parts per billion).

Appendix A.2. Groundwater COPC Graphs

RHMW09

All units in micrograms per liter (ug/L or parts per billion).

HDMW2253-03

All units in micrograms per liter (ug/L or parts per billion).

Appendix A.2. Groundwater COPC Graphs

Detected Concentration
Non-Detect Concentration
Regulatory Screening Level

All units in micrograms per liter (ug/L or parts per billion).

Appendix A.3:
Graphs of Cumulative NAP Results

This page intentionally left blank

RHMW2254-01 NAPs

RHMW01 NAPs

RHMW02 NAPs

RHMW03 NAPs

D = detected value DO = dissolved oxygen ND = not detected at the laboratory limit of detection
Methane in parts per billion (ppb or micrograms per liter). All others in parts per million (ppm or milligrams per liter).

RHMW04 NAPs

RHMW05 NAPs

RHMW06 NAPs

RHMW07 NAPs

D = detected value DO = dissolved oxygen ND = not detected at the laboratory limit of detection
Methane in parts per billion (ppb or micrograms per liter). All others in parts per million (ppm or milligrams per liter).

Appendix A.3. Natural Attenuation Parameters Graphs

RHMW08 NAPs

RHMW09 NAPs

HDMW2253-03 NAPs

OWDFMW01 NAPs

D = detected value DO = dissolved oxygen ND = not detected at the laboratory limit of detection
Methane in parts per billion (ppb or micrograms per liter). All others in parts per million (ppm or milligrams per liter).

[a] Depth to groundwater values from Appendix A Groundwater Tables GW-9, GW-10, GW-14, GW-15, and GW-17 through GW-24 in:
Department of the Navy. 2007. *Existing Data Summary and Evaluation Report for Groundwater Flow and Contaminant Fate and Transport Modeling, Red Hill Bulk Fuel Storage Facility, Joint Base Pearl Harbor-Hickam, O'ahu, Hawai'i; March 5, 2017 [Revision 00].* Prepared by AECOM Technical Services, Inc., Honolulu, HI. Prepared for Defense Logistics Agency Energy, Fort Belvoir, VA, under Naval Facilities Engineering Command, Hawaii, JBPHH HI.

Appendix B.2:
Field Notes,
Second Quarter 2017

This page intentionally left blank

Jan GW Sampling - Tunnel 1/12/17

1115 (cont.) DI water from Merehurene.
JK arrives onsite

1240 Sampling complete. JK mobilizes samples out of tunnel.

1300 Demob out of tunnel.

1330 Exit tunnel.
DOH follows TQ + samples (taken by MH in truck) to warehouse.

1400 Arrive at warehouse to demob

1600 leave warehouse - end of day.

1/12/17

Feb GW Sampling - Tunnel 2/6/17

0515 AM and TQ meet at warehouse

0520 Begin calibrations. See logs for
- YSI water quality meters (2)
- 4gas + PID meters (2)
- PID
- Gem 2000 plus
- All calibrations ok

0600 CB, GM, & MH meet at warehouse to mobilize equipment.

0630 leave for site.

0655 Arrive at Adit 3 to unload.

0730 TQ gives safety brief
Weather: 76°, windy, partly cloudy

0740 Begin to mob equipment into tunnel.

0800 JK arrives onsite. TQ gives briefing

0815 NAVSUPP arrives to provide access to Red Hill Shaft. Mob to RHMW 2254-01 and begin set up.

0905 Begin purging. See log.

0935 Collect sample ERH20 and trip blank at RHMW 2254-01.

Feb GW Sampling-Tunnel 2/6/17
Note trip blank ERH204 has lab provided custody seal written with a sharpie on dark HCl vials

0950 Collect ERH205 from RHMW-2254-01 - primary, MS/MSD, dup. Change flow rate foo 100 mL/min after first five VOAs
Change flow rate back to 300 mL/min

1100 Red Hill Shaft person arrives. Note: pumps are not currently on.

1115 Leak heard in connection between nitrogen hose and control box. Cannot fix. AM exits tunnel to call Jack K.

1150 Collect sample ERH232 ambient blank at RHMW 2254-01. Leak fixed. AM returns with additional nitrogen.

1340 End sample time.

1415 Demob from RHMW2254-01.

1445 AM, JK & TQ take equipment from Adit 3 to MW05 and MW02 for next day's sampling.

Feb GW Sampling 2/6/17

1530 All exit from Tunnel Adit #3

1605 AM & TQ arrive at warehouse to demob equipment

1700 leave warehouse - end of day.

2/6/17

Feb GW Sampling 2/7/16

0515 AM&TQ arrive at warehouse
0525 Begin Calibrations - See logs.
- PID (x2)
- YSI (x2)

0600 MH&GM arrive at warehouse.
0620 AM&TQ leave warehouse
0650 Arrive onsite at Adit #3
Check rebreather packs
s/n 12083223 - 3000 ok
s/n 12071665 - 3000 - ok
0700 Load gear into tunnel.
0715 Hensel Phelps operating train offers to help mobilize equipment. AM proceeds to MW05 with train operator and equipment. TQ waits for Navy/DOH/UH to arrive.
0730 Weather - Partly cloudy, ~76°
0805 TQ talks to SK who will mob into tunnel to pick up first samples. RL (Navy) calls to let

Feb GW Sampling-Tunnel 2/7/16

0805 (cont.) team know that DOH, Navy, and UH have badges and will be at Adit #3 in ~20 minutes
0835 Navy - Pete LaPlaca
DOH - Richard Takabat
DOH - William F
UH - Danny Powell
Arrive onsite
0840 TQ gives safety brief
0850 All mobilize into tunnel and proceed to MW05.
0910 Arrive at well MW05 and begin set up.
0935 Collect sample ERH211 trip blank at MW05.
0945 Changed flow rate to 200 ml/min
1020 Changed flow rate to 100 mL/min
Collect sample ERH212 from RHMW05.
1150 End sample time.
1200 Collect sample ERH235 for RHMW05 ambient blank.
1215 Begin mob to RHMW02.
1250 Start purging

Rite in the Rain

1310 Collect sample ERH215 trip blank for RHMW02.

1355 changed flow rate to 100 ml/min collect sample ERH 216 from RHMW02

1500 end sample time make to adit 5 to drop off samples and equipment

1540 @ adit 6; meet JK to drop off samples & equipment

1550 make to MW02 to set up equipment @ RHMW01 for tomorrow

1620 make to adit 3

1640 @ adit 3 DOH, NAVY, & UH leave site

Feb GW Sampling - Thurs 2/8/17

0525 AM & TQ arrive at warehouse and begin calibrations - see log.
- PID (x2)
- 4 gas + PID (x2) => one PID did not calibrate, will not use for readings
- YSI (x2)

1300 Drilling resumes

Feb GW Monitoring-Tunnel 2/8/17

1305 Demob from MW01 to RHMW03.
Dust 0.067 TWA 0.090
1330 Arrive at MW03 and setup
1335 Start pumping. See log.
1410 Collect sample [ERH230] trip blank for MW03.
1440 Collect sample [ERH231] from RHMW03 at flow rate 100 mL/min
1510 Collect sample [ERH243] as ambient blank for RHMW03.
1740 End sample at RHMW03.
1800 Demob from MW03.
1820 Exit at Adit 5 and meet team 2.
1830 Return to MW03 to get IDW and last of equipment.
1850 Exit tunnel and proceed to IDW staging area
1930 Arrive at warehouse to demob equipment
1745. Leave warehouse. End of day.

2/8/17

(9) 2/6/17

0640 - mob to RHMW04 & Red Hill Shaft.

0655 - CB, TQ, GM, AM, MH at Red Hill. CB mob to RHMW04. All others to Adit 3 to off load equipment for Tunnel well sampling. See Book 3 for Tunnel Details

0740 - MH + GM at RHMW04. MH gives tailgate briefing. Continue setting up to sample RHMW04.

0755 - Begin purging RHMW04. See Purge Log for details.

Objective: Sample RHMW04 and RHMW08.

Personnel: AECOM - CB, MH, GM.

Weather, Overcast, Breezy, Mid 70's.

0815 - collect Trip Blank, ERH207. See QC logbook for details.

0850 - collect ERH 208 from RHMW04. See QC logbook for details.

1035 - complete collecting ERH208; clean up site.

1100 - GM, MH + CB mob to RHMW08. JK mob to warehouse with ERH207 and ERH208

1105 - set up at RHMW08.

1135 - Begin purge at RHMW08. See purge log for details

1245 - Begin sampling ERH220 (primary) and ERH221 (Dup) at RHMW08. See QC logbook for details

1535 - complete collection of ERH220 and ERH221. ERH219 (Trip Blank) collected at 1140. Clean up site.

1600 - GM + MH mob to warehouse with ERH219, 220 and 221. CB mob to dispose of IDW.

1630 - CB mob to warehouse to off load.

1655 - All off site. End of field day

2/6/17

2/7/17 (10)

0640 - mob to Halawa Prison Parking Lot.

TQ + AM have moved to Adit 3. See logbook 3 for details of sampling RHMW02/05.

0700 - CB, MH + GM at Prison Parking Lot.

Objective: Collect GW from HDMW2253-03 and RHMW07.

Personnel: AECOM - CB, MH, GM
DLNR Water - Patrick

Weather: Mostly Sunny, Mid 70's.

0750 - DLNR Water commission + JK at parking lot, mob to HDMW2253-03

0800 - at well. CB gives tailgate then set up.

0853 - Begin purge at HDMW225303. See Purge log for details.

0900 - collect Trip Blank ERH213. Set up to collect Field Blank for 1.66" Bladder Pump.

0915 - collect Field Blank ERH228. See QC logbook for details.

1045 - stabilization. Turbidity was outside of 10% after cleaning optics on probe multiple times. ~~All off~~ CB. Visually, water is clear. Turbidity is less than 20NTU for all readings. All other parameters are stabilized. Collect ERH214. See QC logbook for details.

1 - complete sampling HDMW2253-03. Clean up and decon pump. JK mob to warehouse with ERH213, 214 and 228 for shipment to Lab. GM mob to set up at RHMW07.

1235 - collect ERH217, trip blank for Remable bladder pump + RHMW07

1245 - collect ERH229 - Equipment blank for 1.66" Bladder Pump.

1400 - mob to RHMW07. GM set up at RHMW06. Mob to RHMW06

1425 - Begin purge at RHMW06. See purge log for details

1525 - collect ERH210 from RHMW07. See QC logbook for details

1655 - complete sample collection at RHMW07. Clean up.

1725 - mob to IDW to dispose of purge water. GM mob to warehouse.

1740 - CB+MH mob to warehouse. All offsite.

1830 - complete offload at warehouse. End of field day

2/7/17

0620 - mob to RHMW07 from warehouse. CB, GM+MH.

0640 - onsite. CB gives tailgate safety briefing. TQ+AM mob to sample RHMW01 in Tunnel. See Book 3 for Tunnel well sampling details.

Objective: collect GW samples from RHMW07 and RHMW09.

Personnel: C Begeal, M. Hizley, G Mura.

Weather: Mostly Sunny, mid 70's, slight breeze.

0700 - set up at RHMW07.

0713 - Begin purge at RHMW07. See purge log for details

0715 - collect ERH209, trip blank for RHMW07.

0835 - collect ERH218 from RHMW07. See QC logbook for details.

0957 - complete sample collection. Clean up and mob to RHMW09.

1020 - Begin setup at RHMW09, GM takes ERH209/218 to warehouse

1040 - Begin purge at RHMW09. See purge log for details.

1100 - collect ERH224, trip blank for RHMW09. See QC logbook for details.

1220 - needed to change Nitrogen tank; parameters stabilized. Needed to ~~wa~~ clean optics multiple times due to changing turbidity. Spoke w/ JJJ regarding unstable turbidity, despite clear purge water and all other parameters stable. JJJ confirmed with T. Saguibo (RPM) that sample collection can proceed.

1230 - collect ERH225 (Primary/MS/MSD) and ERH247 (duplicate) from RHMW09. See QC logbook for details

1450 - collect ERH248 (Field Blank) for RHMW09. GM mob to warehouse w/ RHMW01 samples.

1530 - GM returns. Sampling ERH225/247 continues

1748 - complete collection of ERH225/247. Clean up site

1620 - mob to warehouse. GM, CB, MH offsite. TQ+AM offloading from Tunnel.

1910 - complete at warehouse. End of field day ~~2/8/17~~

(13) 2/9/17

0600 - at warehouse. MH+GM calibrate YSI's, CB calibrates PID. then load equipment.

0700 - All mob to OWDFMW01.

0730 - at OWDF MW01. CB gives tailgate safety briefing. Then setup to collect sample

Objective: Collect GW sample from OWDFMW01.

Personnel: CBegeal, M. Higley, G Mura.

Weather: Sunny, Mid 70's slight breeze.

0745 - setup.

0817 - Begin purging OWDFMW01. See CB purge log for details.

0815 - collect ERH226, trip blank for OWDFMW01, see QC log for details.

0950 - Begin collecting ERH227 at OWDFMW01. See QC log for details.

1145 - complete sampling ERH227. Cleanup.

1210 - All offsite. mob to warehouse.

1305 - End offload at warehouse. End of field day

2/9/17

3/6/17 (14)

0650 - mob to RHMW04.

0730 - Begin setup. CB gives tailgate safety briefing. See Tailgate log for details.

0751 - Begin purging RHMW04. See purge log for details

Personnel: CB, MH, GM.

Objective: collect groundwater at RHMW04 and RHMW08.

Weather: Sunny, 70's.

0802 - water at surface. collect ERH259 Trip Blank

0835 - Begin collection of ERH260. See QC log for details.

0948 - complete sample collection. Clean up sampling area.

1005 - mob to RHMW08.

1025 - at RHMW08 and set up to collect samples

1040 - Begin purging RHMW08. See purge log for details

1200 - collect sample ERH262 and ERH263 (Duplicate) from RHMW08.

1508 - complete sampling RHMW08. Clean up.

1520 - TQ called and said they have finished RHMW2254-01.

1530 - GM+MH mob to Adit 3 to assist TQ+KE. CB mob to IDW area then assists tunnel team

1700 - at warehouse. offload and stock up.

1745 - end of day

3/6/17

March GW Sampling - Tunnel 3/3/17

0800 KE & TQ arrive at warehouse for equipment prep.

0830 MH filling in for TQ (family emergency) Arrive warehouse with KS.

0920 KE & MH left warehouse to conduct equipment blank sampling at RHMW07

0940 Stopped at Menehune water company to pick up three 5-gallon bottles DI water. (deionized water)

1000 KE & MH arrive at RHMW07. MH conducted safety meeting.

1005 Set-up area to decontaminate and sample equipment (two bladder pumps - 1.66" and 0.675").

1010 Packed trip blank bottles (ERH 252)

1030 Sampled ERH 254 from bladder pump - 1.66" for outside wells

1120 Sampled ERH 253 from bladder pump - 0.675" for inside wells

1200 Packed all samples over ice and cleaned up site.

1215 Left RHMW07 back to warehouse

1230 KE & MH arrive at warehouse and placed all samples in warehouse fridge.

1245 Lunch

1315 KE & MH decontaminated remaining equipment (200' & 500' water level meters) and staged equipment/supplies for GW event.

1530 KE & MH left warehouse, end of field day.

3/3/17

Rite in the Rain

GW Sampling – Tunnel 3/6/17

0530 MH, GM, KE, & TQ arrive at warehouse.

0535 Calibrate – see logs
- YSIs (2)
- Methane Meter
- PID
- 4-gas
- 4-gas + PID

0620 CB arrives at warehouse

0630 All leave and mob to site.

0700 Arrive at Adit 3.

0705 Check re-breather packs
#12083273 – 3000 psi – OK
12071665 – 3000 psi – OK

0730 TQ gives safety brief – see log.
Weather: ~70°F, clear skies, sunny

0740 Begin mobilizing equipment into tunnel

0800 HP train utilized to mob gear to Red Hill Shaft.

0820 NAVSUP arrives to unlock shaft.

0825 Mobilize equipment into RHMWW 2254-01 and

GW Sampling – Tunnel 3/6/17

begin set up. Note: pumps are currently running.

0900 Take water level at RHMW 2254-01.

0915 Start pumping. See sampling log.

0930 Collect sample ERH255 trip blank for RHWM 2254-01.

0950 Changed flow rate to 90 mL/min
Collect sample ERH257 primary/MS/MSD and ERH258 duplicate from RHMW 2254-01.

1020 Pumps shut off during primary VOC sampling (9 VOA vials remaining)

1055 Changed flow rate to 275 mL/min and began collecting ambers.

1145 Collect sample ERH256 ambient blank using new 1 gallon Menehune DI water.

1430 Complete samples and close cover.

1450 Demob from Red Hill Shaft and lock door.

1515 Exit tunnel. Call CB and request a truck for support.

1530 Left message for Pete La Pidea

Rite in the Rain

GW Sampling Tunnel 3/6/17

1535 PL calls back. TQ requests to meet at Adit 5 for Tuesday sampling PL indicates earlier construction at Adit 5.

1540 Re-enter tunnel to mob gear to MW02.

1615 Arrive at MW02 and drop off gear. Hear report that elevator at Adit 5/6 is broken.

1630 Arrive at elevator - no problems.

1635 Sign at exit to Adit 5 says under construction. However NAVSUP personnel indicates exit is available to use.

1640 Exit Adit 5. HP worker indicates construction at Adit 5 exit will be from 0600 to 1530. Return to Adit 3 with wagons and will mob from Adit 3 tomorrow.

1650 Demob from Adit 3 and leave site.

1700 Call PL and tell Navy and

GW Sampling - Tunnel 3/6/17

DOH to meet at Adit 3 instead. Leave to return to warehouse

1725 Arrive at warehouse to drop off samples.

1800 Finish de-mob. End of day.

3/6/17

GW Sampling - Tunnel 3/7/17

0500 AM & KE Meet at warehouse and begin calibrations. See log.
- YSIs (x 2)
- PID
- 4 gas meter
- 4 gas meter + PID
- Methane meter

0630 Leave warehouse and mob to site.

0700 Arrive onsite and mob gear into tunnel

0740 TQ gives AECOM team safety briefing. Team mobs into MW03 to set up while TQ waits for DOH and Navy to arrive

0825 Navy and DOH arrive Onsite. TQ gives safety brief.

0830 Proceed into tunnel and mob to MW03.

0905 Arrive at MW03.

0920 Start pumping at RHMW03. Collect sample ERH266 trip blank.

1030 Collect sample ERH268 from RHMW03. Change flow rate to 100 mL/min.

1035 Collect sample ERH267 ambient blank using 1 gallon Menehune water.

1050 Change flow rate back to 250 mL/min and resume collecting amber bottles.

1200 Finish collecting sample at RHMW03. Demob and bring gear to MW02

1230 Arrive at MW02. AM and KE bring samples to Adit 3 for shipment.

1245 Begin pumping at RHMW02. See sample log.

1315 collect sample ERH264 trip blank

1330 Collect sample ERH265 from RHMW02.

1445 Finish collecting sample from RHMW02.

1505 Demob from RHMW02 with help from AM.

GW Sampling Tunnel 3/7/17

1515 Leave gear at MW01. HP containment set up with neg air over well. Asked if it could be shifted over for Wednesday morning

1600 Arrive at Adit 3 and demob.

1645 Brought IDW to drums

1700 Demob from site.

1730 Arrive at warehouse.

1800 Drop off samples and gear. End of day.

3/7/17

GW Sampling Tunnel 3/8/17

0500 Arrive at warehouse and begin calibrations - see log
- YSI (x2)
- PID
- 4 gas meter
- 4 gas meter + PID
- Methane meter

0630 Leave warehouse for site.

0730 Arrive onsite

0740 Calibrate Data Ram - see log.

0800 ~~Giv~~ TQ gives initial site briefing, re-breather demo and tailgate safety brief.

0830 Mobilize into tunnel and go to MW01.

0900 Arrive at MW01 and cannot find water level meter. Go to MW02 to retrieve the water level meter

0920 Set up at RHMW01 and begin pumping. See log.

1010 Collect sample GRH273 Trip blank.

1040 Swap nitrogen tank. Note:

Rite in the Rain

GW Sampling Tunnel 3/8/17

although labelled as "full" the tank only had 900 psi.

1120 Collect sample ERH275 from RHMW01.

1205 Collect sample ERH274 ambient blank.

1340 End sample at RHMW01 Mob to MW05.

1445 Start purging at RHMW05. See sample log.

1500 Collect sample ERH276 trip blank.

1510 Collect sample ERH278 from RHMW05. Changed flowrate to 100 mL/min.

1535 Collect sample ERH277 ambient blank.

1545 Changed flowrate back to 250 mL/min.

1655 End sample time. Demob from RHMW05.

1730 Bring samples to Adit 3.

1800 Bring rest of gear to Adit 3.

1815 Brought 15 gal to drum

staging area

1845 Leave site for warehouse

1915 Arrive at warehouse to demob.

2000 Finish demob and leave warehouse.

3/8/17

1525 - collect ERH210 from RHMW07. See QC logbook for details

1655 - complete sample collection at RHMW07. Clean up.

1725 - mob to IDW to dispose of purge water. GM mob to warehouse.

1740 - CB+MH mob to warehouse. All offsite.

1830 - complete offload at warehouse. End of field day

2/7/17

0620 - mob to RHMW07 from warehouse. CB, GM+MH.

0640 - onsite. CB gives tailgate safety briefing. TQ+AM mob to sample RHMW01 in Tunnel. See Book 3 for Tunnel well sampling details.

Objective: collect GW samples from RHMW07 and RHMW09.

Personnel: C Begeal, M. Hizley, G Mura.

Weather: Mostly Sunny, mid 70's, slight breeze.

0700 - set up at RHMW07.

0713 - Begin purge at RHMW07. See purge log for details

0715 - collect ERH209, trip blank for RHMW07.

0835 - collect ERH218 from RHMW07. See QC logbook for details.

0957 - complete sample collection. Clean up and mob to RHMW09.

1020 - Begin setup at RHMW09, GM takes ERH209/218 to warehouse

1040 - Begin purge at RHMW09. See purge log for details.

1100 - collect ERH224, trip blank for RHMW09. See QC logbook for details.

1220 - needed to change Nitrogen tank; parameters stabilized. Needed to ~~wa~~ clean optics multiple times due to changing turbidity. Spoke w/ JJJ regarding unstable turbidity, despite clear purge water and all other parameters stable. JJJ confirmed with T. Saguibo (RPM) that sample collection can proceed.

1230 - collect ERH225 (Primary/MS/MSD) and ERH247 (duplicate) from RHMW09. See QC logbook for details

1450 - collect ERH248 (Field Blank) for RHMW09. GM mob to warehouse w/ RHMW01 samples.

1530 - GM returns. Sampling ERH225/247 continues

1748 - complete collection of ERH225/247. Clean up site

1620 - mob to warehouse. GM, CB, MH offsite. TQ+AM offloading from Tunnel.

1910 - complete at warehouse. End of field day ~~2/8/17~~

(13) 2/9/17

0600 - at warehouse. MH+GM calibrate YSI's, CB calibrates PID. then load equipment.

0700 - All mob to OWDFMW01.

0730 - at OWDF MW01. CB gives tailgate safety briefing. Then setup to collect sample

Objective: Collect GW sample from OWDFMW01.

Personnel: CBegeal, M. Higley, G Mura.

Weather: Sunny, Mid 70's slight breeze.

0745 - setup.

0817 - Begin purging OWDFMW01. See CB purge log for details.

0815 - collect ERH226, trip blank for OWDFMW01, see QC log for details.

0950 - Begin collecting ERH227 at OWDFMW01. See QC log for details.

1145 - complete sampling ERH227. Cleanup.

1210 - All offsite. mob to warehouse.

1305 - End offload at warehouse. End of field day

2/9/17

3/6/17 (14)

0650 - mob to RHMW04.

0730 - Begin setup. CB gives tailgate safety briefing. See Tailgate log for details.

0751 - Begin purging RHMW04. See purge log for details

Personnel: CB, MH, GM.

Objective: collect groundwater at RHMW04 and RHMW08.

Weather: Sunny, 70's.

0802 - water at surface. collect ERH259 Trip Blank

0835 - Begin collection of ERH260. See QC log for details.

0948 - complete sample collection. Clean up sampling area.

1005 - mob to RHMW08.

1025 - at RHMW08 and set up to collect samples

1040 - Begin purging RHMW08. See purge log for details

1200 - collect sample ERH262 and ERH263 (Duplicate) from RHMW08.

1508 - complete sampling RHMW08. Clean up.

1520 - TQ called and said they have finished RHMW2254-01.

1530 - GM+MH mob to Adit 3 to assist TQ+KE. CB mob to IDW area then assists tunnel team

1700 - at warehouse. offload and stock up.

1745 - end of day

3/6/17

 3/7/17

0630 - mob to RHMW07. TQ, KE & AM have mob'd to tunnel. See logbook 3 for details on tunnel sampling.

0655 - at RHMW07. CB gives tailgate safety, then setup at RHMW07.

Objective: collect groundwater samples from RHMW07 and RHMW09.

Personnel: CB, MH, GM.

Weather: Sunny, 70's.

0730 - Begin purging RHMW07. See purge log for details. Collect ERH269 - Trip Blank. See QC logbook for details.

0820 - Begin sampling ERH270 from RHMW07. See QC logbook for details.

0938 - Finish sampling ERH260. Clean up then mob to RHMW09.

1000 - at RHMW10 and begin setup.

1015 - Collect ERH271 - Trip Blank. See QC logbook for details.

1020 - Begin purging RHMW09. See Purge log for details.

1035 - GM mob to warehouse w/ ERH259 and ERH260.

1125 - Begin sampling ERH272 from RHMW09. See QC log for details.

1305 - complete sampling. Clean up then mob to RHMW06

1330 - set up at RHMW06.

1345 - Begin purge at RHMW06. See purge log for details.

1450 - collect ERH284 from RHMW06. See QC logbook for details

1620 - complete sampling. AM takes all IDW to DM032. Clean up.

1640 - mob to AECOM Warehouse.

1730 - all equipment offloaded at AECOM warehouse. mobilize equipment for tomorrow. End of day.

3/7/17

0630 GM + AM mob to site.
0745 - CB meets GM + AM at Halawa Prison. TQ, FK in Tunnel. See Book 3 for Tunnel details.
0800 - RC of CWRM at prison. mob to HDMW2253-03.
Objective: collect GW sample from HDMW2253-03 and OWDFMW01.
Personnel - AECOM: AM, GM, CB
CWRM - RC
Weather: Partly Sunny, 70's.
0820 - set up at HDMW2253-03.
0857 - Start purging HDMW2253-03. See purge log for details.
0900 - collect ERH279 - Trip Blank. See QC logbook for details.
0935 - collect ERH281 - Field Blank. See QC logbook for details.
1015 - collect ERH280 from HDMW2253-03. See QC logbook for details.
1115 - complete sample collection. Clean up. then decon Bladder Pump.
1155 - collect ERH285 - Trip Blank
1210 - collect ERH282 - Equipment Blank HDMW2253-03 Bladder Pump. See QC log for details
1315 - cleaned up. Mob to OWDF MW01.
1335 - set up at ~~RHMW~~ CB 3/8/17 OWDF MW01.
1350 - Begin purging OWDFMW01. See purge log for details.
1400 - CB mob to RHMW10 to pick up IDW drum then to IDW area to dispose of purge water.
1505 - CB collect ~~RHMW~~ sample ERH286 from OWDFMW01.

1545 - AM goes to Adit 3 to relieve TQ in Tunnel.
1645 - AM goes into tunnel. TQ + KE off site. Tunnel crew is still sampling RHMW05. See Book 3 for further tunnel details.
1810 - complete sampling OWDF MW01. Tunnel team complete and out. Clean up site then mob to dispose of IDW.
1845 - all offsite. AM, FK, GM mob to warehouse. End of field day.

3/8/17

4/3/17 JV ~~3/4/17~~

red hill Ground water Sampling

weather: Partly cloudy, mod. trade winds, 80°-85°

Planned work: groundwater sampling @ RHMW04, 06, 07

0645 AECOM (MH, GM, CB) arrive at RHMW04, conduct safety briefing (see log), set up to collect equipment blanks. + ground water sample.

0830 collect ERH 288 (small pump EB), Trip Blanks ERH 287 & collected @ 0810. ~~SR~~

0911 start purge @ RHMW04 (see purge log)

0925 collect ERH 316 (big pump EB)

1005 collect ERH 295. TB is ERH294 ERH287 is Trip Blank for ERH316 and ERH288.

1100 Mob to RHMW06 + set up.

1120 begin purge

1115 collect ERH ~~#~~ 318 (trip blank)

1215 collect ERH 319

1310 finish ERH 319 clean up & mob to RHMW07.

1345 Collect ~~ERH~~ 304 trip blank

1347 start Purge @ RHMW07.

1440 - Finish purge. See purge log for details. Sample ERH 305

1520 - complete sample collection clean up then dispose of IDW.

1540 - mob to warehouse.

1640 - offloaded samples. End of day

4/3/17

Rite in the Rain

4/4/17

0700 - all onsite at RHMW09. See Book for Tunnel well sampling details. Set up at RHMW09 and MH gives tailgate briefing.
Objective: GW sampling at RHMW09, RHMW08 and OWDFMW01.
Personnel: AECOM - MH, CB, GM.
Weather: Partly Sunny, High 70's
0730 - collect ERH306 Trip Blank
- Start purging RHMW09. See purge log for details.
0745 - collect ERH315 - Field Blank for RHMW09. See QC logbook for details.
0850 - Sample ERH307 - Primary/MS/MSD and ERH314 - Duplicate from RHMW09 See QC logbook for details.
1125 - complete sampling at RHMW09
1140 - mob to OWDFMW01.
1200 - set up at OWDFMW01.
- CB mobs to warehouse w/ samples QM offsite
1245 - collect Field Blank ERH289 collected Trip Blank ERH320 @ 1225.
1320 - CB returns. continue purging

OWDFMW01. See purge log for details.
1335 collect ERH 321. Primary
1500 complete sampling @ OWDF MW01 Mob to RHMW08
1535 start purge, collect trip blank ERH 296.
1635 collect sample ERH 297 primary + ERH 298 Duplicate.
1742 Sample ERH 297 + ERH 298 complete. clean up dispose of IDW
1800 Mob to warehouse.
1835 Drop off samples @ warehouse. end field day

4/4/17.

Data Validatable Report

February 21, 2017

AECOM
1001 Bishop Street, Suite 1600
Honolulu, Hawaii 96813

Attn: Margie Thach

Title: Report of Data: Case 82117

Project: 60481245 CIV0053 Red Hill Fuel Storage. HI

Contract #: Prime contract # for DoD: NAVY CLEAN N62742-12-D-1829, CTO 0053
Subcontract: 14S-16234-HI16

Dear Ms. Thach:

Five water samples were received February 7, 2017. Written results for the requested analyses are being provided on this February 21, 2017.

Results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

If you have any questions or require further information, please contact your APPL Project Manager, Libby Cheeseborough, libby@applinc.com, at your convenience. Thank you for choosing APPL, Inc.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. These test results meet all requirements of NELAC and DoD QSM. Release of the hard copy has been authorized by the Laboratory Manager or her designee, as verified by the following signature.

CASE NARRATIVE

Case Narrative

ARF: 82117

Project: 60481245 CIV0053 Red Hill Fuel Storage. HI

Sample Receipt Information:

Five water samples were received February 7, 2017, at 1.0°C, 2.0°C, and 3.0°C. The sample group was assigned Analytical Request Form (ARF) number 82117. The following discrepancies were noted and reported to the client: three vials labeled ERH207 were unpreserved; a metals bottle was received for sample ERH208 though metals analysis was not requested; and sample ERH208 was received more than 24 hours after collection. No other exception was noted.

Sample Preparation and Analysis Information:

For the EPA 8015B analysis, the samples were extracted according to EPA method 3510C.

For the EPA 8270D SIM analysis, the samples were extracted according to EPA method 3510C.

For the EPA 8270D Phenol analysis, the samples were extracted according to EPA method 3510C.

For the APPL SOP ANA2MEE analysis, the samples were extracted according to EPA method 3535.

For the EPA 8260B BTEX and GRO analyses, the samples were purged according to EPA method 5030B.

For the RSK-175 analysis, the samples were allowed to equilibrate for 10 minutes at 40°C and a portion of the headspace was analyzed.

For the EPA 300.0, SM 2320B and 3500FeB analyses, the sample was prepared according to the methods.

Only the portion of the injection log relative to these samples is included. A full sequence log is available upon request. Measurement uncertainty can be reported upon request.

Analytical Exceptions, Deviations and Abnormalities.

EPA 8270D SIM: The ending CCV (file ID: 0214L044) was injected the next day because the instrument stopped after work hours.

APPL SOP ANA2MEE: Manual integrations were performed in accordance with APPL's SOP. 2-(2-methoxy)ethanol was manually integrated in the LCS. Chromatograms of before and after manual integration are enclosed.

Inorganic Analyses: The sample was received more than 24 hours after collection; it was analyzed for ferrous iron as soon as possible on the day received. A manual integration for chloride was performed in accordance with APPL's SOP. Chromatograms of before and after manual integration are enclosed. In the 170211A method blank, alkalinity was detected above one-half the LOQ. Corrective action: None, the concentration of alkalinity in the samples exceeds the blank concentration by ten-fold or more.

APPL Inc.
Abbreviations and Flags

FLAG	DESCRIPTION
#	Recovery or RPD outside control limits
*	Recovery or RPD outside control limits
B	Analyte detected in associated method blank
C1	Reason for correction: wrote incorrect response
C2	Reason for correction: calculated incorrectly
C3	Reason for correction: needs to be rechecked
C4	Reason for correction: data not usable
DO	Diluted out
E	Exceeds linear range
F	Estimated value
G1	Includes a wide range of hydrocarbons which does not match our gasoline standard
G10	Includes a match to hydrocarbon profiles within the range of mineral spirits
G11	Includes a match to hydrocarbon profiles within the range of JP-4
G12	Pattern does not match the gasoline standard; the carbon range for this sample is consistent with JP8
G13	Closely resembles the hydrocarbon profile of aviation gasoline
G14	Analyte concentration may be biased due to carry over
G2	Closely resembles the boiling point hydrocarbon profile consistent with weathered gasoline
G3	Includes higher boiling hydrocarbons
G4	Includes dominant peak(s) not indicative of petroleum hydrocarbons
G5	Is mainly dominant peak(s) not indicative of petroleum hydrocarbons
G6	Contains recognizable contaminant peak(s) which has been removed from quantitation
G7	Is mainly a match to hydrocarbons within the range of gasoline
G8	Closely resembles the boiling point hydrocarbon profile consistent with weathered gasoline
G9	Includes hydrocarbons within the range of kerosene
J	Estimated value
M	Matrix effect
MI1	Manual integration: integration does not follow baseline
MI2	Manual integration: non-target peak interference
MI3	Manual integration: to split a peak that was integrated as one peak by the computer.
MI4	Manual integration: to integrate a split peak
MI5	Manual integration: the whole peak or part of the peak was not integrated
MI6	Manual integration: computer integrated wrong peak
MI7	Manual integration: other – (See case narrative)
MDL	Method detection limit
ND	Not detected
NT	Non-target
Q	Acceptance criteria not met
T1 I	Includes wide range of hydrocarbons not indicative of diesel
T1 M	Is mainly wide range of hydrocarbons not necessarily indicative of diesel
T2 I	Includes lower boiling hydrocarbons, i.e. mineral spirits, kerosene, stoddard solvent, white gas
T2 M	Is mainly lower boiling hydrocarbons, i.e. mineral spirits, kerosene, stoddard solvent, white gas
T3 I	Includes higher boiling hydrocarbons, i.e. asphaltene, waster oil, motor oil, or weathered diesel fuel
T3 M	Is mainly higher boiling hydrocarbons, i.e. asphaltene, waster oil, motor oil, or weathered diesel fuel
T4 I	Includes dominant peak(s) not indicative of hydrocarbons
T4 M	Is mainly dominant peak(s) not indicative of hydrocarbons
T5	Contains recognizable contaminant peak(s) which has been removed from quantitation
T6	Is mainly a match to hydrocarbons within range of diesel fuel
T7	Closely resembles the boiling point hydrocarbon profile consistent with diesel fuel
T8	Includes a match to hydrocarbon profiles within range of diesel and kerosene fuel
T9 I	Includes non-diesel hydrocarbons within boiling point range of diesel fuel
T9 M	Is mainly non-diesel hydrocarbons within boiling point range of diesel fuel
U	Not detected
Y	Percent difference between primary and confirmation column > 40%

Subject: RE: 82117 Red Hill log in

Thank you, Renee!
Can you please add methane on ERH207 (AZ49655W)?

Thank you,

Margie Pascua Thach

COOLER RECEIPT FORM **ARF: 82117**

1) Project: 60481245 CIV0053 Red Hill Fuel Storage Date Received: 02/07/17

2) Coolers: Number of Coolers: 3

3) YES Were custody seals present and intact?
How many? 6 Name/Date on seal? See below

4) YES Was there a shipping slip? Carrier name: FED EX

5) Type of packing in cooler: X bubble wrap __popcorn __foam X plastic bags
X wet ice __dry ice __no ice __other

6) YES Were cooler temperatures acceptable?

7) Serial number of certified NIST thermometer use M65283

8) Cooler temp(s): In °C

1: 1.0	2: 2.0	3: 3.0	4:	5:	6:
7:	8:	9:	10:	11:	12:

CUSTODY SEAL
APPL, Inc.
(559) 275-2175
Initials MT
Date 2/6/17

Chain of custody:

9) YES Was a chain of custody received?

10) YES Were the custody papers complete/signed in the appropriate places?

Sample Labels:

11) YES Were all sample labels complete (sample ID, date/time of sampling, etc.)?

12) YES Did all container labels agree with custody papers?

Sample Containers:

13) YES Were all containers sealed in separate bags?

14) YES Did all containers arrive in good condition:(unbroken, no leakage, no cracked/broken lids)?

15) YES Were correct containers and preservatives used for the tests indicated?

16) YES Was a sufficient amount of sample sent for tests indicated?

17) Yes Were bubbles present in volatile samples?
If yes, the following were received with air bubbles:
Larger than a pea:
Smaller than a pea: AZ49655W02-W06,AZ49656W06,AZ49659W01-W06

Preservation Hold time:

18) Yes Was a sufficient amount of holding time remaining to analyze the samples?

19) Yes Was the pH taken of all non-VOA preserved samples and written on the sample container?

20) Yes Was the pH of acid preserved non-VOA samples < 2?

21) NA Was the pH of sodium hydroxide preserved samples for Cyanide > 12 and Sulfide >9?

22) Yes Were unpreserved VOA Vials received?

23) Yes Are unpreserved VOA vials noted in the ADD TEST FIELD on the ARF?
pH strip lot number: 90B2031
Lab notified if pH was not adequate:

Notes/Deficiencies:

Sample ERH207 - client label indicate HCL for all voa vials, but 3 of the 6 voa vials are unpreserved. They do not have any HCL stickers. Sample ERH208 - received 500 mL plastic with HNO3 for metals department, but no analysis listed on COC. Also, same sample, ferrous Iron received greater than 24 hours.

Personnel receiving samples: YL Second reviewer: SM
Personnel labeling samples:
Project manager notified: YL Date/Time of notification ~~2/6~~ YL 2/7/17 2/7/17 12:59
Name of client notified: Date/Time of notification

Data Validatable Report

February 22, 2017

AECOM
1001 Bishop Street, Suite 1600
Honolulu, Hawaii 96813

Attn: Margie Thach

Title: Report of Data: Case 82121

Project: 60481245 CIV0053 Red Hill Fuel Storage. HI

Contract #: Prime contract # for DoD: NAVY CLEAN N62742-12-D-1829, CTO 0053
Subcontract: 14S-16234-HI16

Dear Ms. Thach:

Thirteen water samples were received February 8, 2017. Written results for the requested analyses are being provided on this February 22, 2017.

Results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

If you have any questions or require further information, please contact your APPL Project Manager, Libby Cheeseborough, libby@applinc.com, at your convenience. Thank you for choosing APPL, Inc.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. These test results meet all requirements of NELAC and DoD QSM. Release of the hard copy has been authorized by the Laboratory Manager or her designee, as verified by the following signature.

CASE NARRATIVE

Case Narrative

ARF: 82121

Project: 60481245 CIV0053 Red Hill Fuel Storage. HI

Sample Receipt Information:

Thirteen water samples were received February 8, 2017, at 4.0°C, 4.0°C, 2.0°C, 2.5°C, 5.0°C, 3.0°C, 1.0°C, 1.0°C, and 0.5°C. The sample group was assigned Analytical Request Form (ARF) number 82121. The following discrepancies were noted and reported to the client: for sample ERH212, the COC listed the collection time as 10:20, but the container labels had 12:00 as the collection time; a metals bottle was received for four samples ERH205, ERH214, ERH220 and ERH212 though metals analysis was not requested; samples ERH205 and ERH220 were received more than 24 hours after collection. No other exception was noted.

Sample Preparation and Analysis Information:

For the EPA 8011 analysis, the samples were extracted according to the method.

For the EPA 8015B analysis, the samples were extracted according to EPA method 3510C.

For the EPA 8270D SIM analysis, the samples were extracted according to EPA method 3510C.

For the EPA 8270D Phenol analysis, the samples were extracted according to EPA method 3510C.

For the APPL SOP ANA2MEE analysis, the samples were extracted according to EPA method 3535.

For the EPA 8260B BTEX, 1,2-DCA, and GRO analysis, the samples were purged according to EPA method 5030B.

For the RSK-175 analysis, the samples were allowed to equilibrate for 10 minutes at 40°C and a portion of the headspace was analyzed.

For the EPA 300.0, SM 2320B and 3500FeB analyses, the samples were prepared according to the methods.

Only the portion of the injection log relative to these samples is included. A full sequence log is available upon request. Measurement uncertainty can be reported upon request.

Analytical Exceptions, Deviations and Abnormalities.

EPA 8270D SIM: The ending CCV (file ID: 0214L044) was injected the next day because the instrument stopped after work hours.

APPL SOP ANA2MEE: Manual integrations were performed in accordance with APPL's SOP. 2-(2-methoxy)ethanol was manually integrated in the LCS. Chromatograms of before and after manual integration are enclosed.

The RPD exceeded the 20% limit in MS/MSD.

Inorganic Analyses:

Two samples were received more than 24 hours after collection. They were analyzed for ferrous iron as soon as possible on the day received.

One manual integration for chloride was performed in accordance with APPL's SOP. Chromatograms of before and after manual integration are enclosed.

In the method blank, alkalinity was detected above one-half the LOQ. Corrective action: None, the concentration of alkalinity in the samples exceed the blank concentration by ten-fold or more.

APPL Inc.
Abbreviations and Flags

FLAG	DESCRIPTION
#	Recovery or RPD outside control limits
*	Recovery or RPD outside control limits
B	Analyte detected in associated method blank
C1	Reason for correction: wrote incorrect response
C2	Reason for correction: calculated incorrectly
C3	Reason for correction: needs to be rechecked
C4	Reason for correction: data not usable
DO	Diluted out
E	Exceeds linear range
F	Estimated value
G1	Includes a wide range of hydrocarbons which does not match our gasoline standard
G10	Includes a match to hydrocarbon profiles within the range of mineral spirits
G11	Includes a match to hydrocarbon profiles within the range of JP-4
G12	Pattern does not match the gasoline standard; the carbon range for this sample is consistent with JP8
G13	Closely resembles the hydrocarbon profile of aviation gasoline
G14	Analyte concentration may be biased due to carry over
G2	Closely resembles the boiling point hydrocarbon profile consistent with weathered gasoline
G3	Includes higher boiling hydrocarbons
G4	Includes dominant peak(s) not indicative of petroleum hydrocarbons
G5	Is mainly dominant peak(s) not indicative of petroleum hydrocarbons
G6	Contains recognizable contaminant peak(s) which has been removed from quantitation
G7	Is mainly a match to hydrocarbons within the range of gasoline
G8	Closely resembles the boiling point hydrocarbon profile consistent with weathered gasoline
G9	Includes hydrocarbons within the range of kerosene
J	Estimated value
M	Matrix effect
MI1	Manual integration: integration does not follow baseline
MI2	Manual integration: non-target peak interference
MI3	Manual integration: to split a peak that was integrated as one peak by the computer.
MI4	Manual integration: to integrate a split peak
MI5	Manual integration: the whole peak or part of the peak was not integrated
MI6	Manual integration: computer integrated wrong peak
MI7	Manual integration: other – (See case narrative)
MDL	Method detection limit
ND	Not detected
NT	Non-target
Q	Acceptance criteria not met
T1 I	Includes wide range of hydrocarbons not indicative of diesel
T1 M	Is mainly wide range of hydrocarbons not necessarily indicative of diesel
T2 I	Includes lower boiling hydrocarbons, i.e. mineral spirits, kerosene, stoddard solvent, white gas
T2 M	Is mainly lower boiling hydrocarbons, i.e. mineral spirits, kerosene, stoddard solvent, white gas
T3 I	Includes higher boiling hydrocarbons, i.e. asphaltene, waster oil, motor oil, or weathered diesel fuel
T3 M	Is mainly higher boiling hydrocarbons, i.e. asphaltene, waster oil, motor oil, or weathered diesel fuel
T4 I	Includes dominant peak(s) not indicative of hydrocarbons
T4 M	Is mainly dominant peak(s) not indicative of hydrocarbons
T5	Contains recognizable contaminant peak(s) which has been removed from quantitation
T6	Is mainly a match to hydrocarbons within range of diesel fuel
T7	Closely resembles the boiling point hydrocarbon profile consistent with diesel fuel
T8	Includes a match to hydrocarbon profiles within range of diesel and kerosene fuel
T9 I	Includes non-diesel hydrocarbons within boiling point range of diesel fuel
T9 M	Is mainly non-diesel hydrocarbons within boiling point range of diesel fuel
U	Not detected
Y	Percent difference between primary and confirmation column > 40%

HI Libby,
Yes, no analysis on the metals container. Also, for the question on the collection time, does log-in mean ERH212? That's the one that is supposed to have time 10:20. Please log in ERH212 with time 10:20; ERH211 should have time 09:35.

Thank you,

Subject: ARF 82121 Receiving Notes

Libby,

AECOM; CIV0053 Red Hill Fuel Storage

For samples ERH205, ERH214, ERH220, and ERH 212 We received a 500 plastic container w/HNO3, but none of those samples had metals analysis requested. For Sample ERH 211 the collection time on the COC is 10:20, but the collection time on the Container labels is 12:00. please see attached COC for more information regarding this project.

Thank you!
Stephanie Mast

COOLER RECEIPT FORM **ARF: 82121**

1) Project: 60481245 CIV0053 Red Hill Fuel Storage Date Received: 02/08/17

2) Coolers: Number of Coolers: 9

3) YES Were custody seals present and intact?
How many? 18 Name/Date on seal? ~~See Below~~ YL 2/8/17 Could not Salvage

4) YES Was there a shipping slip? Carrier name: FED EX

5) Type of packing in cooler: X bubble wrap ___ popcorn ___ foam X plastic bags
X wet ice ___ dry ice ___ no ice ___ other

6) YES Were cooler temperatures acceptable?

7) Serial number of certified NIST thermometer use M65283

8) Cooler temp(s): In °C

1: 4.0	2: 4.0	3: 2.0	4: 2.5	5: 5.0	6: 3.0
7: 1.0	8: 1.0	9: 0.5	10:	11:	12:

Chain of custody:

9) YES Was a chain of custody received?

10) YES Were the custody papers complete/signed in the appropriate places?

Sample Labels:

11) YES Were all sample labels complete (sample ID, date/time of sampling, etc.)?

12) YES Did all container labels agree with custody papers?

Sample Containers:

13) YES Were all containers sealed in separate bags?

14) YES Did all containers arrive in good condition:(unbroken, no leakage, no cracked/broken lids)?

15) YES Were correct containers and preservatives used for the tests indicated?

16) YES Was a sufficient amount of sample sent for tests indicated?

17) NA Were bubbles present in volatile samples?
If yes, the following were received with air bubbles:
Larger than a pea:
Smaller than a pea:

Preservation Hold time:

18) NO/Yes Was a sufficient amount of holding time remaining to analyze the samples?

19) ip 2-8-17 Yes Was the pH taken of all non-VOA preserved samples and written on the sample container?

20) Yes Was the pH of acid preserved non-VOA samples < 2?

21) NA Was the pH of sodium hydroxide preserved samples for Cyanide > 12 and Sulfide >9?

22) YL 2/8/17 YES ~~NO~~ Were unpreserved VOA Vials received?

23) YL 2/8/17 YES ~~NA~~ Are unpreserved VOA vials noted in the ADD TEST FIELD on the ARF?
pH strip lot number: 90B2031
Lab notified if pH was not adequate:

Notes/Deficiencies:

For samples ERH205, ERH214, ERH220, and ERH 212 We received a 500 plastic container w/HNO3, but none of those samples had metals analysis requested. For Sample sERH211 the collection time on the COC is 10:20, but the collection time on the Container labels is 12:00.

YL 2/8/17

Ferrous iron, received greater than 24 hours for samples ERH205, ERH212, ~~ERH214~~ and ERH 220 ip 2-8-17 YL 2/8/1

Personnel receiving samples: SM Second reviewer: YL

Personnel labeling samples: SM

Project manager notified: SM Date/Time of notification 2/8/17

GC - MultiLevel Review

ARF number(s) 82117, 82121, 82130

SAMPLE PREPARATION

Extraction/Preparation Method 2MEE APPL SOP MWE2MEE

The reviewer's initials below indicate the following criteria were met with the exceptions being noted in the comments:

HT met: HT date(s): 2/10/17 Ext. date: 2/09/17

Sample preservation is acceptable

Method and client-specific QC requirements were performed (DoD etc)

Information was entered into proper lab notebooks

Proper lab equipment was documented on extraction sheet

The client ID on the sample label matches the client ID on the APPL label

Soil samples were corrected for % Moisture (or Encores)	Yes	No	NA
Soil samples were prepared correctly for Incremental Sampling	Yes	No	NA
Sufficient sample was provided for matrix QC	Yes	No	NA

#1 Initials of reviewer/Date: Ken Gray 2/10/17

Comments: Sample water smell of strong odor diesel and had trouble filtering through cartridge. Sample color is clear Final extract color is tint of yellow.

INSTRUMENTATION LABORATORY

Analytical Method EPA 8270 APPL SOP ANA8270

The analyst(s) initials below indicate the following criteria were met with the exceptions being noted below:

Holding times were met for all analyses

Checked ARF and COC for specific reporting requirements

Correct quantitation method used

Calibrations include all pertinent analytes

Initial calibration in control

Internal standards in control (when applicable)

Second source calibrations in control

Continuing calibrations in control

DDT Degradation Check Passes (when applicable)

Tune within control (when applicable)

LCS(/LCSD) passes

Method blank/calibration blank passes

Matrix Duplicate and MS/MSD passes (when applicable) % RPD > QC

Surrogate(s) passes

Client-specific QC requirements met (DoD or client QAPP)

The units on the Form 1 were properly transcribed

Algorithm checked (LCS) Data File ID: 122OX011

Correct multiplier used to quantitate sample data

The dilutions agree (when applicable)

Soil samples were corrected for % Moisture (when applicable)

Samples were checked for TICs (when applicable)

Manual integration(s) were dated / signed (when applicable)

Sample results were reviewed in EnviroQuant

LA/MA Target Analyte Values were checked

#1 Initials of analyst(s)/Date: MA 2/15/17

Initials of data entry/Date: MA 2/15/17
