

The State of Hawai`i Arthritis Report

What the BRFSS 2000 Shows

State of Hawai`i Department of Health
Hawai`i Arthritis Control Program

SEPTEMBER 2001

About the cover:

The image was originally used to repel life-threatening illnesses. The triangular eyes are prisms which deflect disease causing energy. The ever present serpent oversees the difficult journey toward rebirth.

The sculpture by Kelino Akiwi was inspired by the images of ancient Hawaiian wood carvers. Kelino says, “We must acknowledge the Ancient Ones and learn from the time-honored wisdom of indigenous peoples. Although arthritis is not a life-threatening dis-ease, some forms can be serious. Acknowledging our ancient Hawaiian wisdom to manage arthritis is one belief the Hawai`i Arthritis Control Program values.

ALOHA

Hawai`i Arthritis Control Program

In addition to 37 other states, Hawai`i was one of the fortunate recipients to establish its own Arthritis Control Program in 1999 to increase the awareness of arthritis and other related conditions within the island community. However, unlike many other conventional programs, the Hawai`i Arthritis Control Program chose to integrate medicine of the Eastern and Traditional Native Hawaiian Healing with allopathic medicine (biomedicine or “Western” healthcare). This is based on the belief that because of Hawai`i’s unique diversity, climate, longevity, and demographics, the residents have a unique perception of healthcare. Thus, it is not unusual for Hawai`i residents to seek help in one of the many different healing modalities Complementary Alternative Medicine (CAM) has to offer such as, Traditional Native Hawaiian healing, spiritual and faith healing, acupuncture, massage therapy, chiropractic, Traditional Chinese healing, Reiki, etc.

Below is the Mission Statement of the Hawai`i Arthritis Control Program (also translated Hawaiian and Tagalog):

“To lessen the burden of arthritis for residents of Hawai`i, we, as ohana, value a community based emphasis on unconditional respect for the individual, with caring and compassion, and encouraging self-management of a persons disease through integrative practices and philosophies, with an openness to spirituality.”

The mission statement would not have been possible without the establishment of the Hawai`i Arthritis Control Program Advisory Committee (HACP). Their endless contribution and collaboration of ideas helped the program come to life. The committee is made up of 24 members and were chosen to represent the values and customs of healthcare of the residents of Hawai`i. The group consists of state and local health departments, health professionals and practitioners, physicians, academia, and consumers. Not only are they diverse professionally, but also ethnically in order to further illustrate the unique variety of people residing in Hawai`i. As a result, the HACP strongly believes in integration as the best way to control arthritis for the state of Hawai`i.

Please note that the following pages are data from the Hawai`i State Department of Health 2000 Behavioral Risk Factor Surveillance System (BRFSS). This report is the result of that survey and describes the magnitude and the factors that increase the risk of arthritis. A special mahalo (thank you) goes to Florentina Reyes-Salvail and Ming Qiu Yu who compiled this report to make it possible for all of us to understand the burden of arthritis in Hawai`i.

Acknowledgement

We would like to thank the residents of the State of Hawai'i for participating in the Behavioral Risk Factor Surveillance System 2000. Their participation made this Arthritis report possible as well as assist the Department of Health in carrying out its mission of planning, assurance and assessment.

We also would like to thank Claire Hughes, PhD for her lead role in bringing the Hawai'i Arthritis Control Program into reality and a foresight in adding the arthritis module questions in the BRFSS 2000; Colleen Minami, MSN, Acting Branch Chief of Chronic Disease and Management Branch, Patrick Sonoda, Public Health Administrative Officer of Community Health Division, Barbara Yamashita, Chief of Community Health Division, Virginia Pressler, M.D., M.B.A., Deputy Director for Health Resources and Betty Wood, PhD, DOH epidemiologist for their moral support; (Lu)² Bagnol, MPH, Arthritis Control Program Project Coordinator for tirelessly working for the betterment of the health condition of the arthritic population and the program's Advisory Committee, **Florentina Reyes-Salvail, M.S.** for her lead in preparing and writing this report, **Ming Qiu Yu, PhD** for data processing including table preparation and graphs that is part of this report and **Xiaowu Lu, PhD** for making this report part of the web.

Highlights of Arthritis in Hawai`i

- 23% or nearly 204,000 adults have arthritis
 - 14% or about 124,000 were told by a doctor that they have arthritis.
 - Nearly 39% of doctor diagnosed arthritic adults are being treated.
 - Of the adults with doctor diagnosed arthritis, close to 49,500 or 5% manifest chronic joint pains in the past twelve months but half of these adults or approximately 24,500 are not currently being treated by a doctor for arthritis.
- Arthritis prevalence rate increases with age.
- The females have higher prevalence rates than the males.
- The Whites have the highest prevalence rate (26.7%) and the Hawaiians are a close second (24.7%) after age-adjustment.
- There are socio-economic differences as indicated by education, employment and income.
- Osteoarthritis is the most common type of arthritis. However, rheumatoid arthritis is very common among the Filipino population.
- About 128,000 adults with arthritis also have other chronic conditions such as diabetes, asthma or being overweight.
- Adults with arthritis are just about the same as other adults in the consumption of fruits and vegetables measured in the BRFSS.
- The percentage of arthritic adults who ever smoke is greater than for those without arthritis (53.3% vs. 41.1%).
- Nearly 69,000 or 33% of arthritic adults indicated limitation of activities due to joint symptoms.
- Adults with arthritis whose activities are limited due to chronic symptoms are more likely to be physically inactive (33%). On the other hand, those who indicated no limitation are just about the same as the non-arthritic adults in their level of physical inactivity (24.3% vs. 22.1%).
- Arthritis affects also mental well being in addition to physical well being. Nearly 31% of the arthritic adults indicated that their mental or both mental and physical health was not good during the past 30 days.
- Those with arthritis and joint pains are limited in their activities for almost two weeks in the past 30 days (13.5 mean days) in comparison to just about a week for those with no arthritis.
- More than half of the arthritic adults are still employed (54%). However, about 5% arthritic adults or 9,700 are unable to work.

Introduction

The State of Hawai'i has a total landmass of 6,425 square miles and extends approximately 1,523 miles northwest to southeast from the tiny coral atoll Kure Island down to Cape Kumukahi, the eastern most point of the island of Hawai'i. There are seven inhabited islands in the State. The islands are O'ahu also known as the county of Honolulu, Hawai'i, also known as the Big Island and is the Hawai'i county, Kaua'i and Ni'ihau known as the Kaua'i county and Maui, Lana'i and Moloka'i known as the Maui county. These islands can be reach only by air or boat. The islands are group into counties. According to the 2000 census data, the State has an estimated resident population of 1,211,537. Of this total, 72.3% reside in Honolulu county, 12.3% on Hawai'i county, 4.8% on Kaua'i county, and 10.6% in Maui county. Each of these islands is endowed

with a magnificent, natural environment - clear ocean waters, sandy beaches, unique plants and animal life, and majestic mountains that rise abruptly from the sea. The State is also favored with a mild tropical weather of 60 - 90 degrees all year long. This weather is interspersed at times with tropical hurricanes and changes in trade winds directions. With all these attributes, the State is a

paradise in the Pacific attracting many nationalities from all over the world some for a visit but for others to stay. Many of the nationalities that chose to stay or their children marry with other ethnic nationalities or native Hawaiian. According to the US 2000 Census, more than one in five (21.4%) residents are of mixed ancestry. Of this mix group a large portion are Part Hawaiians. The remaining unmixed proportion (78.6%) consist largely of Caucasian at 24.3%, Japanese at 16.7%, Filipino at 14.1%, Hawaiian at 6.6%, Chinese at 4.7% and other groups of different ethnicities too numerous to mention although small in numbers comprising 12.2%. These diverse cultures brings with them variety of languages and or dialects, religions, cultural practices and beliefs about health and lifestyles.

In sum, the State of Hawai`i's natural geographical beauty and location, natural environment and multi-ethnic residents have a profound impact on the growth of its population and also health. The onset of and severity of chronic health conditions is associated with growing old. The population of the State is aging as reflected in the following table.

Aging Population Indicator	Census Years, State of Hawai`i			
	1970	1980	1990	2000
Median age in years	25.0	28.3	32.5	35.3
Number age 65 years old and over	43,983	76,150	123,727	160,601
Percent 65 years old and over	5.7	7.9	11.2	13.3
State Total Population	769,913	964,691	1,108,229	1,211,537

As reflected from the preceding table, the median age of the population rose by over ten years from 25 years in 1970 to 35.3 by year 2000. Similarly, the population age 65 years and over grew in absolute numbers and as a percentage of the total State population. The State of Hawai`i must be prepared to face this aging population and the associated health conditions and burdens aging may bring. One of these chronic health conditions is arthritis. The purpose of this report is to give a vivid picture of the state of arthritis in the State in terms of

- prevalence rates by socio-economic-demographic variables.
- most common types of doctor diagnosed arthritis by ethnicity.
- comparison of the population with arthritis in terms of healthful behaviors with those without arthritis

- other existing chronic conditions and
- assessing the impact or effects of arthritis indirectly by comparison with non-arthritic population

All the data and information presented in this report is from the State of Hawai'i Behavioral Risk Factor Surveillance System year 2000 (BRFSS 2000). The Behavioral Risk Factor Surveillance System (BRFSS) is a federally funded surveillance program of the Center for Disease Control (CDC). The State of Hawai'i has been participating in this surveillance since the late 1980's. The survey is state-based random-digit-dialed telephone survey of the non-institutionalized civilian population with respondent adults being aged ≥ 18 years. The BRFSS is designed to monitor the prevalence of the major behavioral risks among adults associated with premature morbidity and mortality. In year 2000, the State of Hawai'i Department of Health (DOH) included the recommended BRFSS/CDC arthritis module questions to provide initial data regarding the state of arthritis in the State. The results from these arthritis questions as well as the relationship of the results of these questions with other relevant BRFSS questions are presented in this report. Most of the charts presented in the report are not age adjusted. Age-adjusted results are mentioned in the narrative only when there is a change in patterns. The age-adjusted tables as well as all the tables relating to the charts or figures presented in this report and the arthritis module questions can be found in the appendices.

Arthritis Defined

In this report the health condition called arthritis is derived from the three questions asked in year 2000 Behavioral Risk Factor Surveillance System (BRFSS), namely:

1. During the past 12 months, have you had pain, aching, stiffness or swelling in or around a joint?
 - a. Yes
 - b. No **Go to 3**

2. Were these symptoms present on most days for at least one month?
 - a. Yes
 - b. No

3. Have you ever been told by a doctor that you have arthritis?
 - a. Yes
 - b. No **Go to Other State-added Questions**

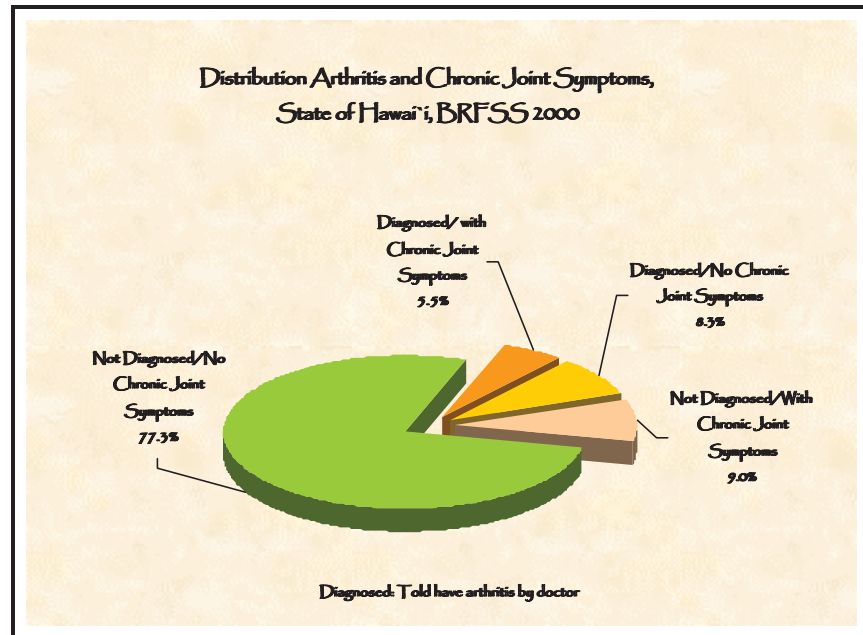

Thus, an adult who responded that he or she have pain or stiffness that are present for most of the days of the month or who have been told by a doctor that he or she have arthritis is considered to have arthritis in this report. This broad arthritis definition will be used throughout the report unless otherwise stated.

Arthritis Prevalence

State

Close to 23% of adults have arthritis (22.7%). This translates to about 204,000 arthritic adults.

About 124,000 or 14% reported being told by a doctor that they have arthritis. Of this number, nearly 49,500 or 5% manifest chronic joint pains in the past twelve months.

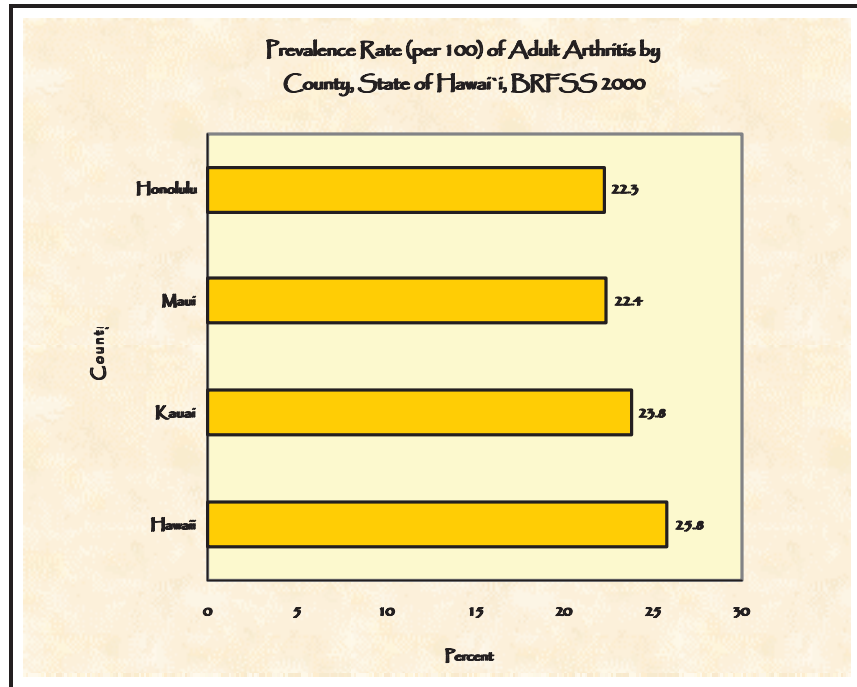

Geographic and Socio-Demographic Arthritis Prevalence

Anyone can have an arthritic condition. However, there are subgroups of the population who are more prone to have arthritis than others.

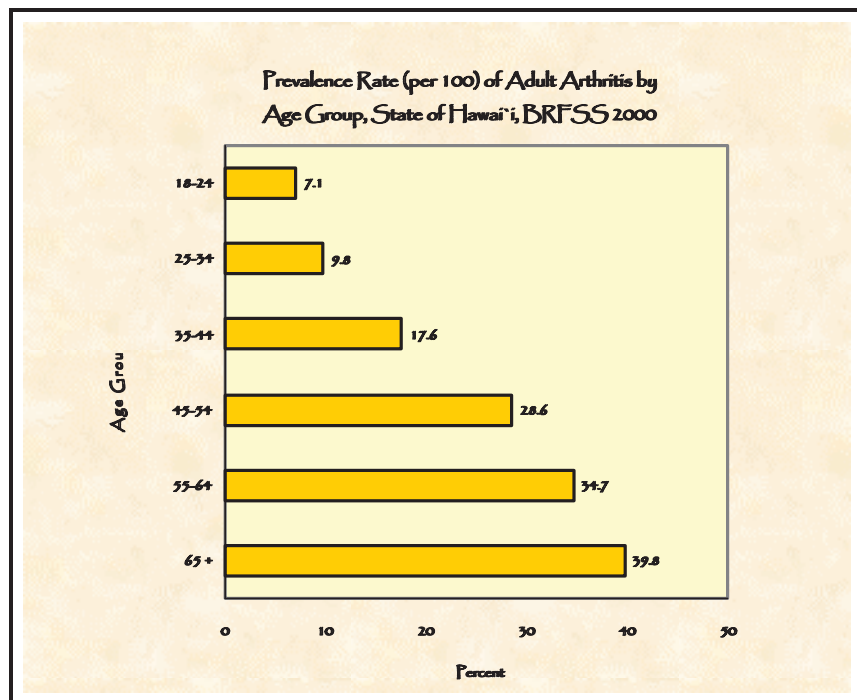

County Prevalence

The prevalence of arthritis is not associated with the county of residence or geographic location. Although, the county of Hawai'i appears to have the highest prevalence rate, this rate is not much different when compared to the other three remaining counties.

Age

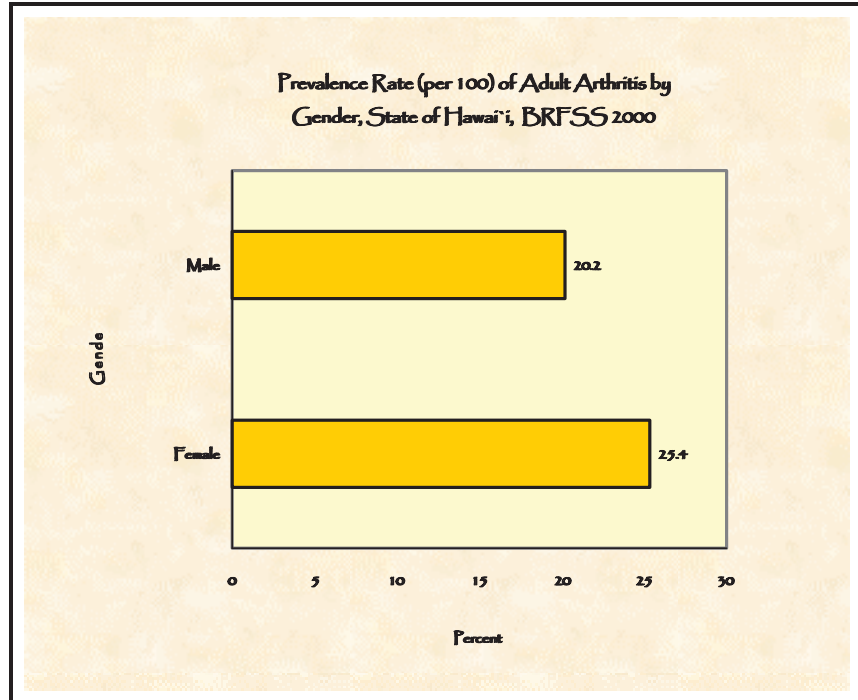

Individuals are likely to be affected by arthritis as they grow older and this relationship is quite significant. In Hawai'i, about one in ten residents who are 25 to 34 years old are arthritic (9.8%). That number increases four times by retirement age. About four in ten residents who are 65 years old and over are arthritic (39.8%).

Gender

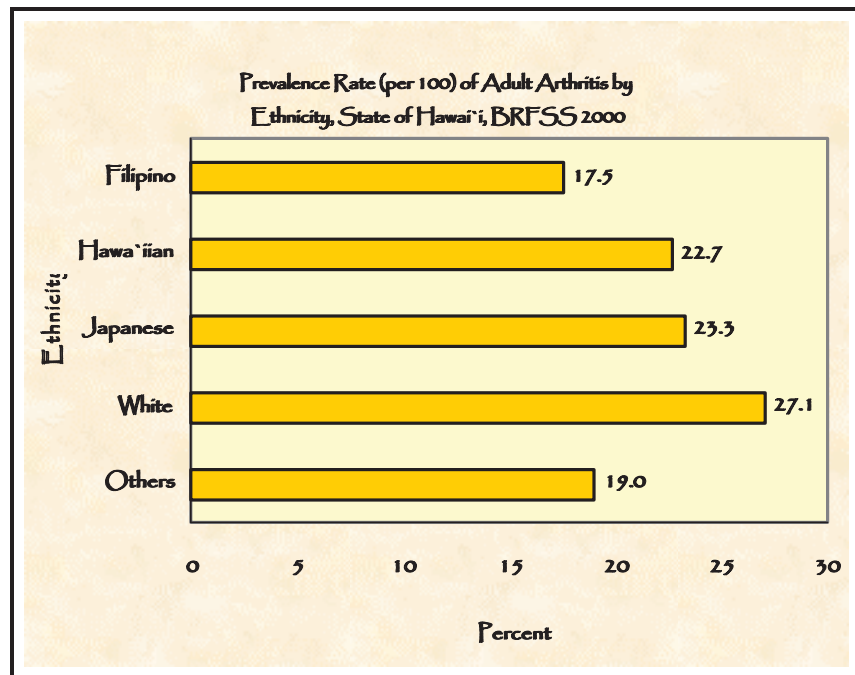

Gender is also significantly associated with the presence of arthritis. Women are more likely to be arthritic than men. One in every four women residents has arthritis in contrast to one in every five men.

Ethnicity

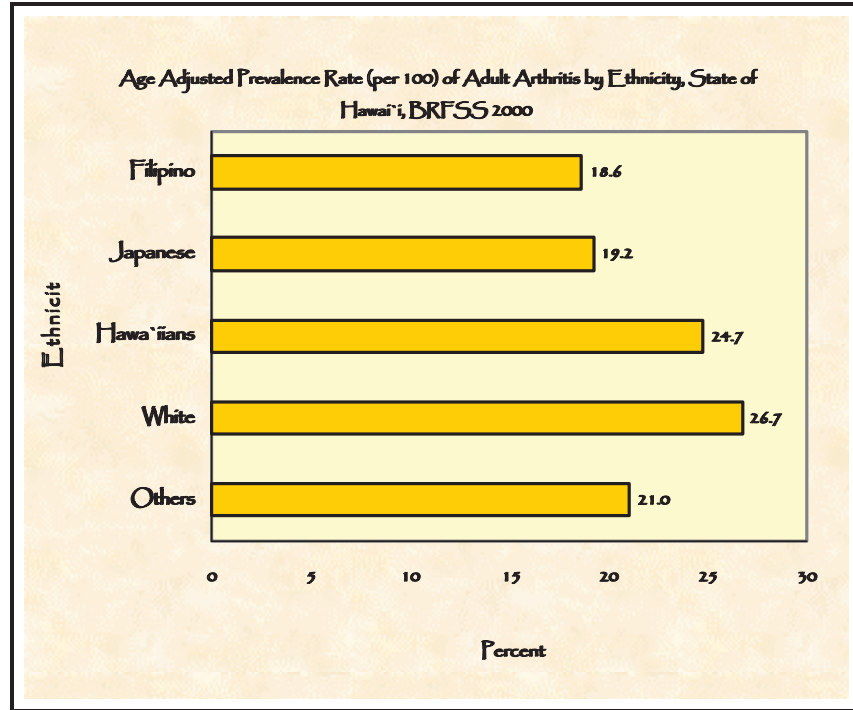

Ethnic origin is also significantly related to presence of arthritis. The Filipinos has the lowest arthritis rate, in contrast, the Whites has the highest rate. This pattern persists even when the rates are age adjusted* (shown in the next chart).

Hawaiians and the Japanese prevalence rate is about the same as shown in the opposite chart.

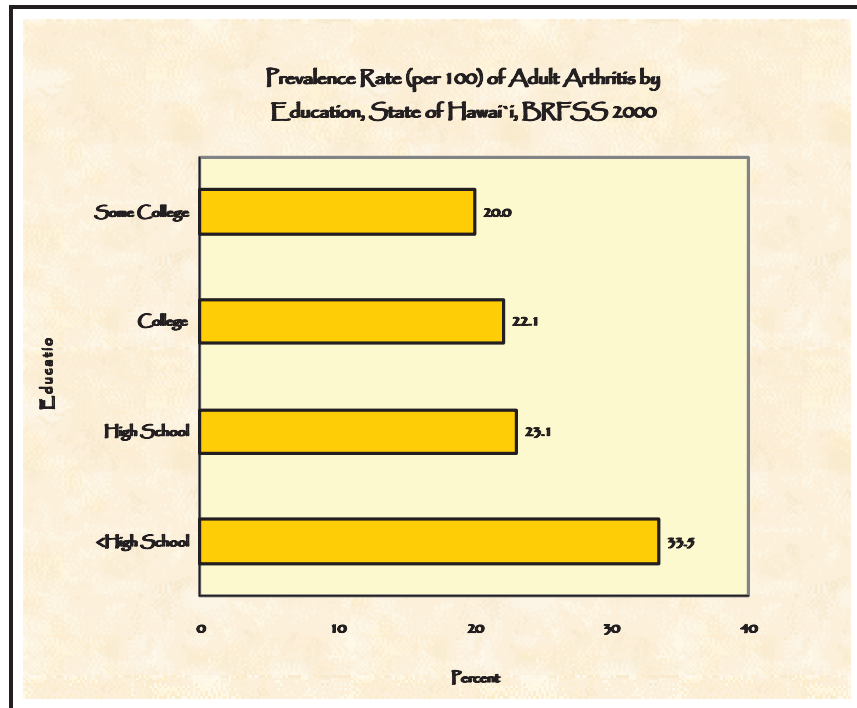

However, with age adjustment* as shown in the opposite chart, the disparity between these two ethnic groups widens (Hawaiian arthritis rate 24.7% vs. the Japanese rate 19.2%).

*Age adjustment assumes that all the ethnic groups have the same age distribution based on the State of Hawai'i total age population distribution of census year 2000 as standard.

Education

About one in three adults who did not graduate from high school have arthritis. This group of individuals has the highest arthritis rate. The 33.5% when adjusted for age drops to 28.5% indicative that these individuals are older than the others with higher education. However, the rate for this non high school graduates remains the highest.

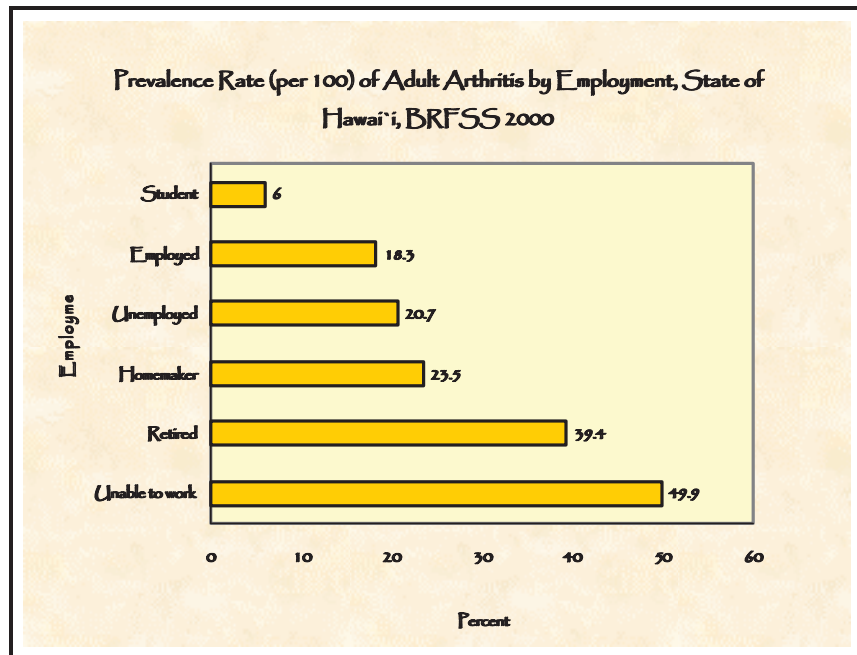

Employment

The prevalence rate of arthritis is highest among those unable to work, close to 50%, which translates to about 9,700 adults.

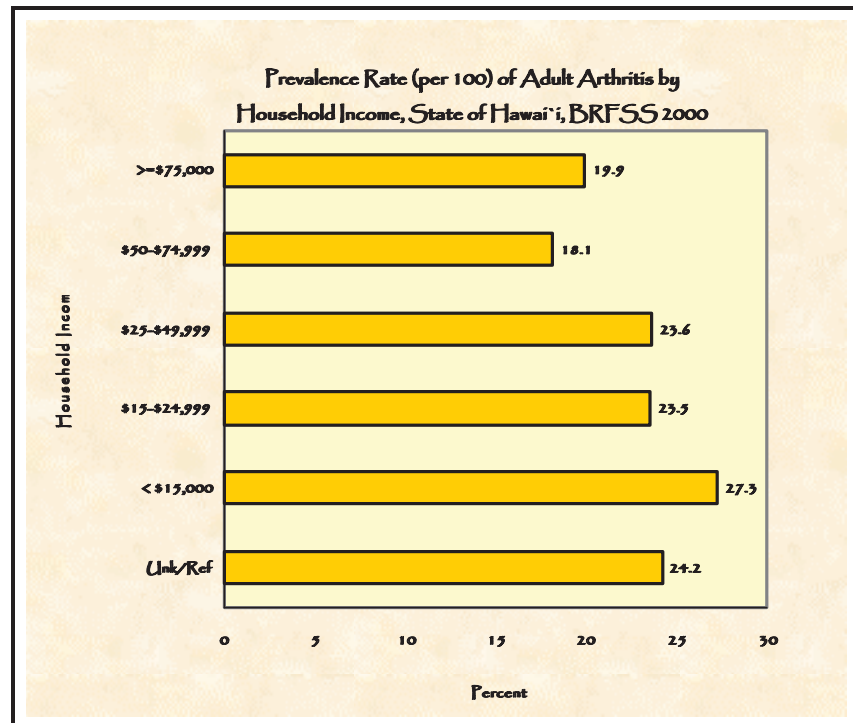

With age adjustment, the rate for this group remains the highest at 46.5%. In contrast, the arthritis prevalence rate for those who are gainfully employed remained low at 18% range even with age adjustment.

The retired prevalence rate drops from 39% to 24% with age adjustment. In addition, the age adjusted rate for the unemployed and the retired are about the same.

Income

Those with income \$50,000 or higher has lower arthritis prevalence rate. In contrast, those with income below \$50,000 have higher rate. Note that the adults with income below \$5,000 have the highest rate and remain so even with age adjustment.

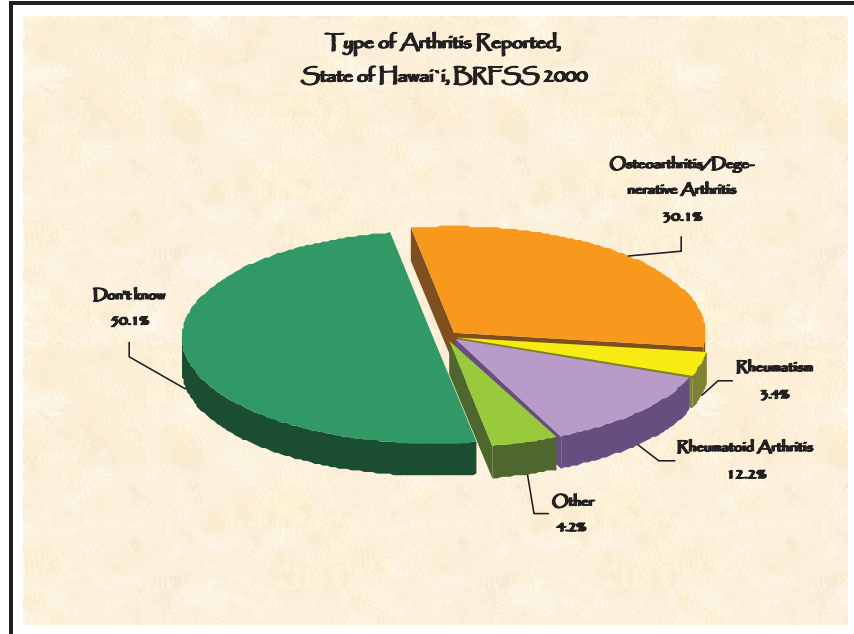

Those who were diagnosed

Types of Arthritis

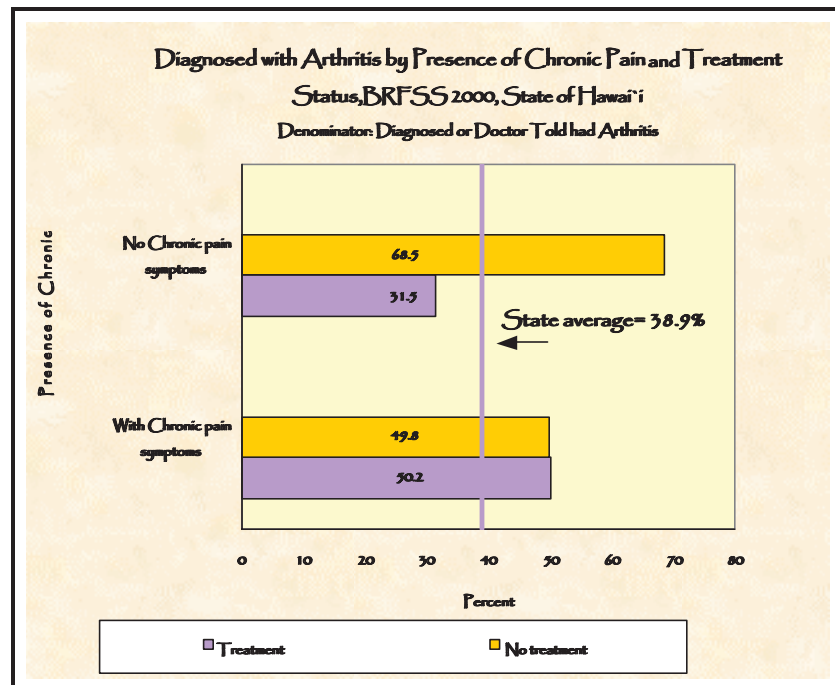

One in every two Hawai'i arthritic residents do not know the type of their arthritis.

The most common type of arthritis in Hawai'i is osteoarthritis.

Doctor is currently treating arthritis

About two out of every five adults with diagnosed arthritis are currently being treated (38.9%). Adults with no chronic pain symptoms are less likely to be currently being treated for arthritis (68.5%) than those with chronic pain symptoms (50.2%). However, almost half of those with chronic pains are not currently being treated also.

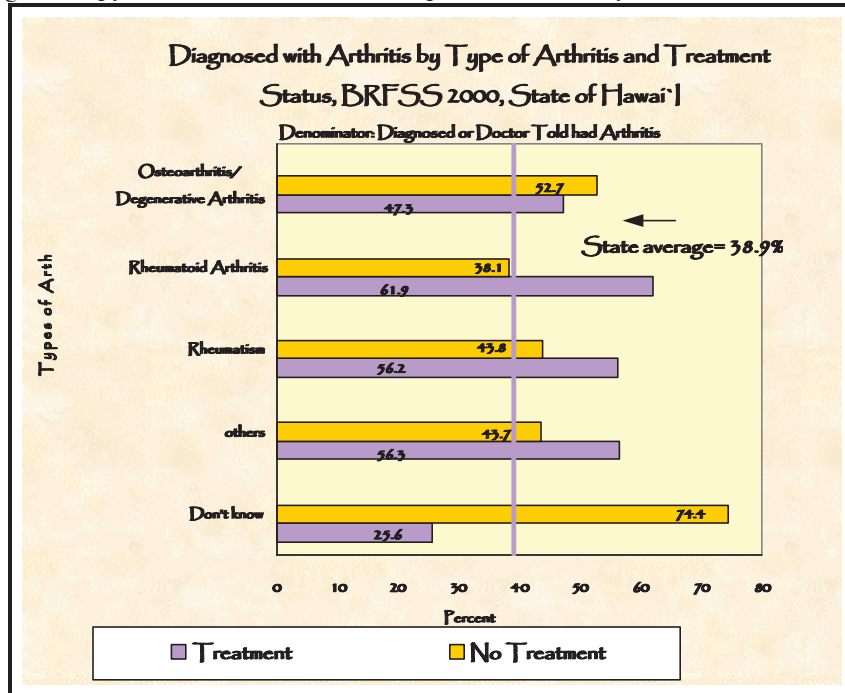

This translates to about 24,500 arthritic adults with chronic pains that are not currently being treated by a doctor. Of these adults nearly 15,700 have limited activities because of this joint pain symptoms. It appears that medical cost or insurance is not related to treatment. The proportions

of adults with health coverage among those currently being treated for arthritis and those who are not being treated are about the same (96.9% vs. 97.3%). Similarly, the proportions who said that there was a time during the last 12 months that they needed to see a doctor but could not because of medical cost is about the same (6.5% vs. 6.8%). The reasons why the adults with arthritis are not currently being treated by a doctor should be explored. It could be that these adults are receiving or seeking alternative non-medical treatment such as acupuncture, herbs, Native Hawaiian medicine, massage therapy, etc. which is a common practice for many Hawai'i residents.

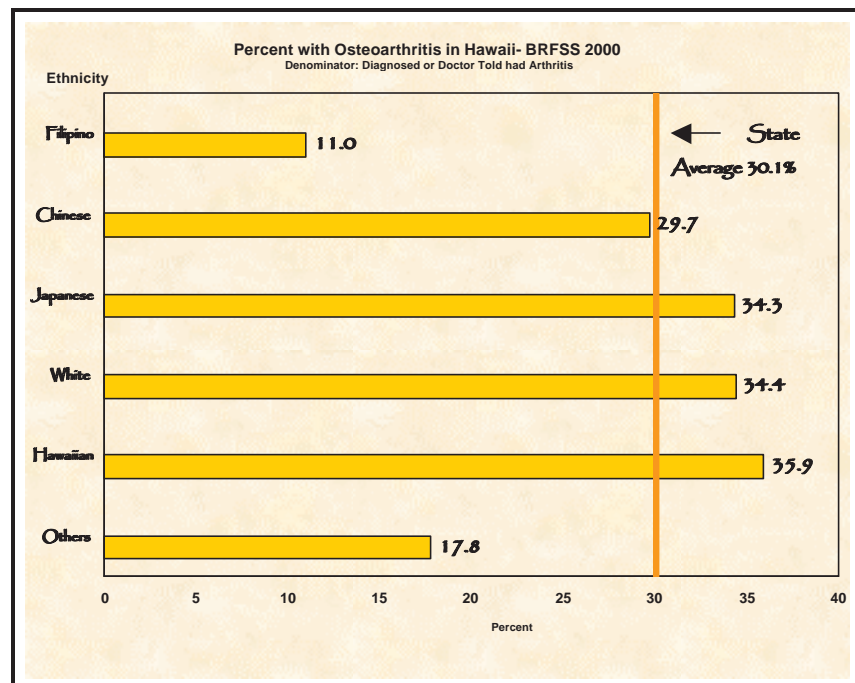

Current Treatment & Types of arthritis

Adults who know the type of their arthritis are more likely to receive treatment. Nearly 25% of arthritic adults who do not know what type of arthritis they have are receiving treatment for their condition. In contrast, more than half of those with rheumatism, rheumatoid arthritis and other forms of arthritis are currently being treated.

Type of Arthritis & Ethnic Differences

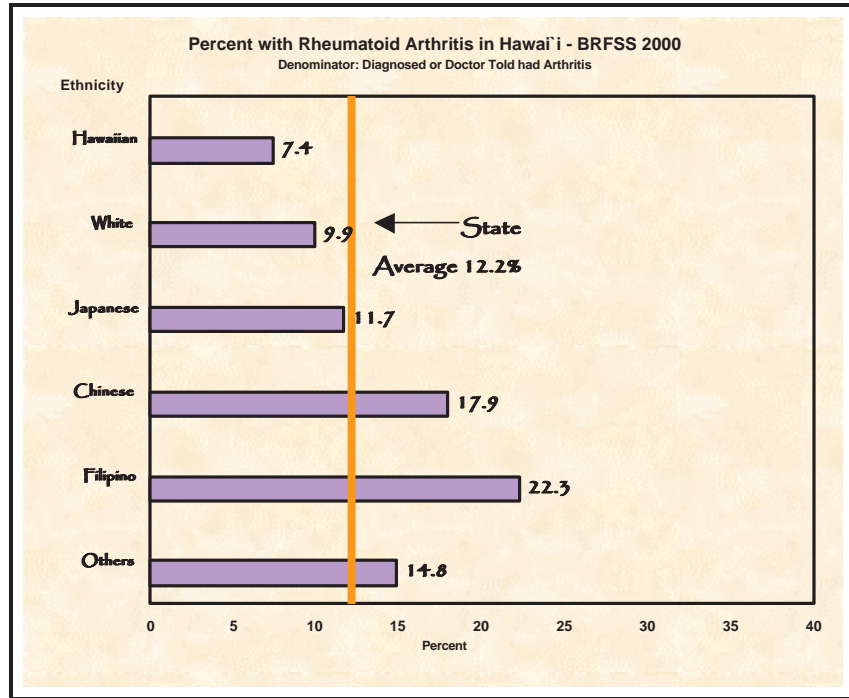

It is interesting to note that the prevalence of different types of arthritis varies with ethnic groups. Osteoarthritis is the most common form of arthritis. There are hardly any differences in osteoarthritis rates among the Japanese, Whites and Hawaiians. It is also quite common among the Chinese.

The Chinese osteoarthritis rate is very close to the State's rate (29.7% vs. 30.1%). In contrast, about one in ten arthritic Filipinos has osteoarthritis (11%). This pattern is reverse when looking at rheumatoid arthritis prevalence.

The Chinese and the Filipinos have rheumatoid arthritis rate higher than the State's rate. However, the Filipinos have the highest prevalence rate for rheumatoid arthritis. More than one in five diagnosed arthritic Filipinos has rheumatoid arthritis (22.3%).

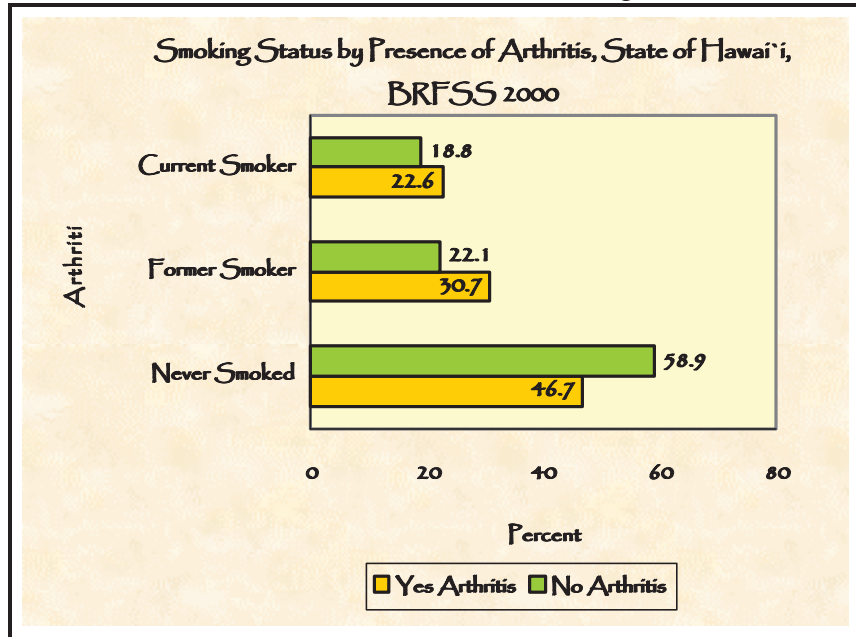

Arthritis and Healthful Behaviors

The succeeding charts compares the behavior of adults with arthritis and without arthritis to better understand individuals with arthritis and determine appropriate outreach strategy.

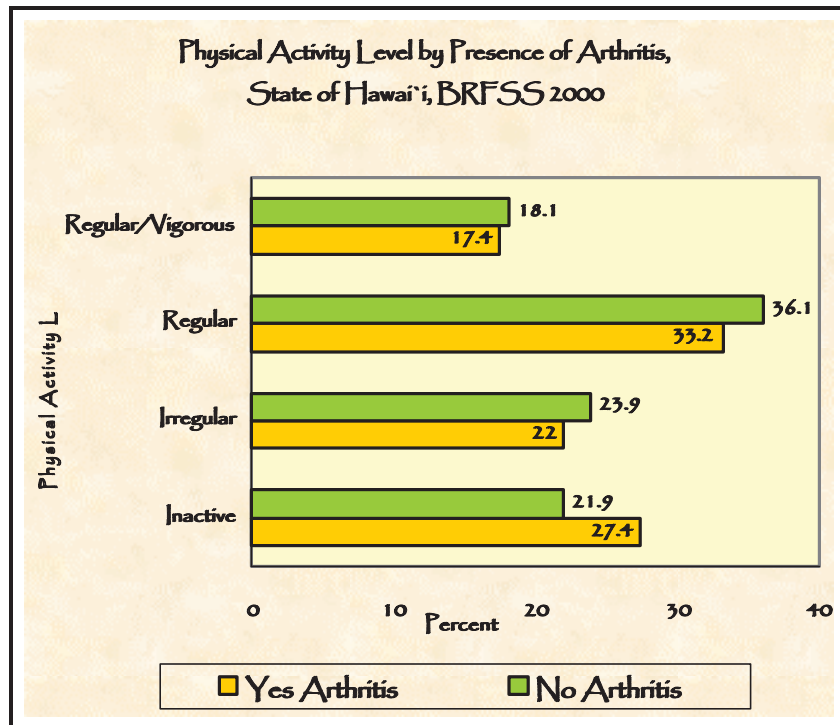

Smoking

Close to 59% of non-arthritic adults never smoked versus 47% of adults with arthritis. It is comforting to note that many of the arthritic sufferers have quit smoking (former smokers). However, the proportion currently smoking is still higher than non-arthritic adults (22.6% vs. 18.8%).

Physical Activity

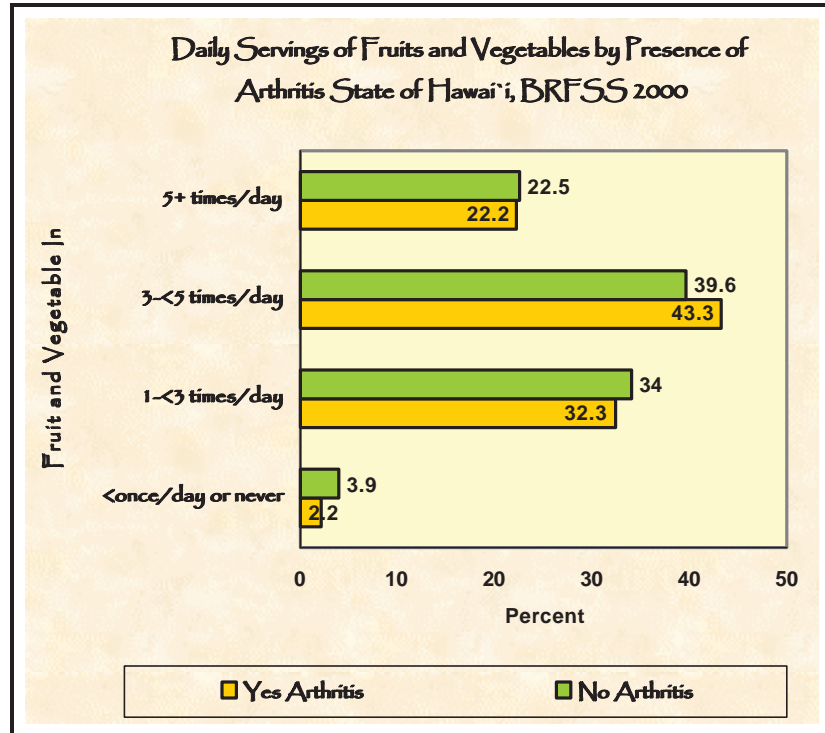

More than one in five arthritic sufferers lead an inactive lifestyle compared to those without arthritis (27.4% vs. 21.9%). However, it is comforting to note that about one in two of these arthritic adults do regular to regular and vigorous physical activity.

Fruits and Vegetables

Arthritic adults are no different from non-arthritic adults in consumption of fruits and vegetables as listed from the BRFSS questions. However, the specific type of vegetables like eggplant or tomatoes or food items that may exacerbate the arthritis symptoms such as internal organs or tripe which are popular among several ethnic groups in Hawai'i were not asked in the BRFSS. The

inclusion of questions regarding food that may trigger arthritic symptoms should be included to better assessed the diet of arthritic individuals.

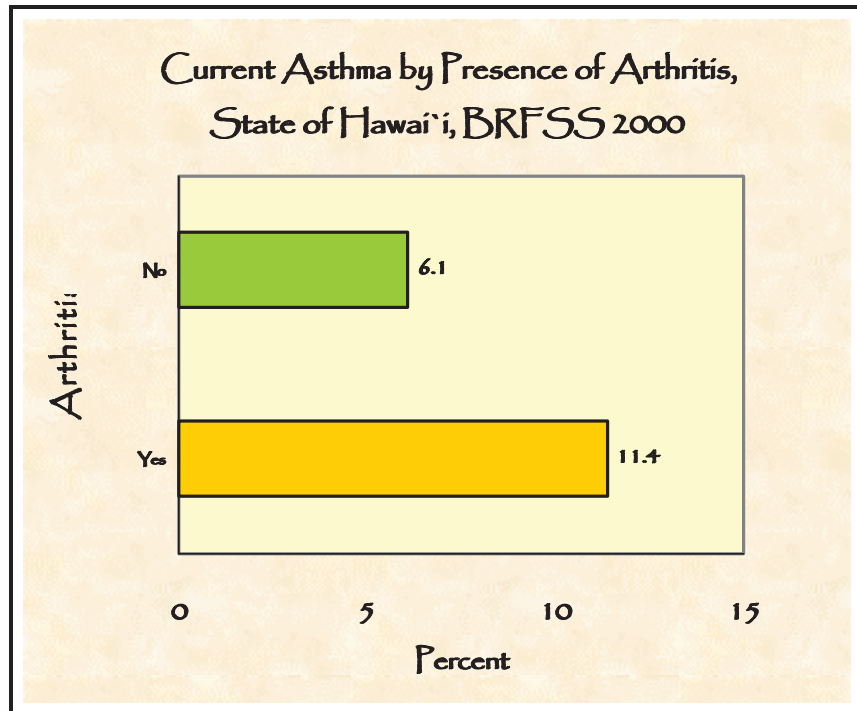

Arthritis and Other Chronic Conditions

Adults with arthritis may have other chronic conditions. The BRFSS 2000 have information on three chronic conditions namely current asthma, diabetes and overweight. Nearly 14% adults or 128,000 have arthritis and at least have one of these conditions. The association is reflected in Figures

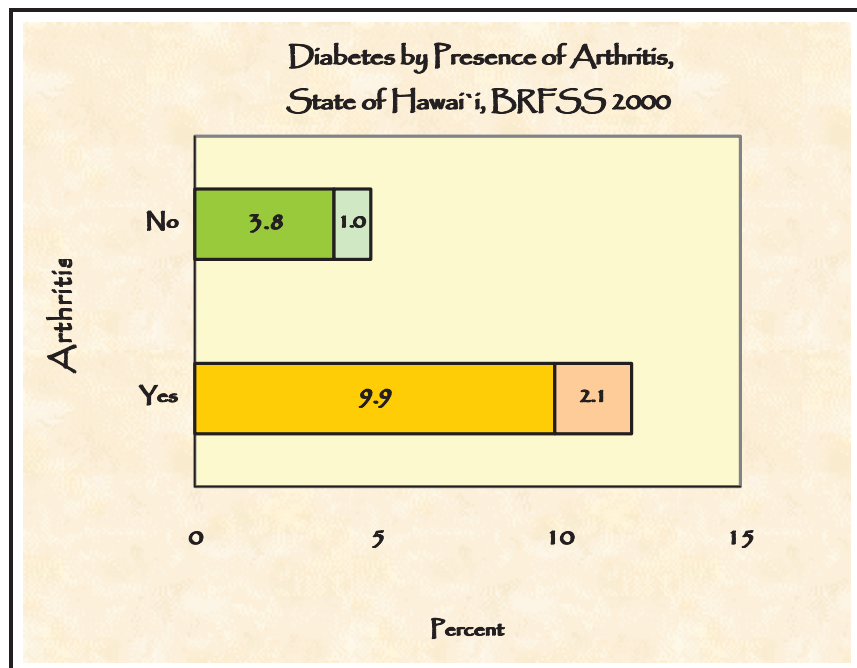

Asthma

Nearly 11% adults with arthritis also have current asthma. In contrast, only about 6% of adults without arthritis have current asthma.

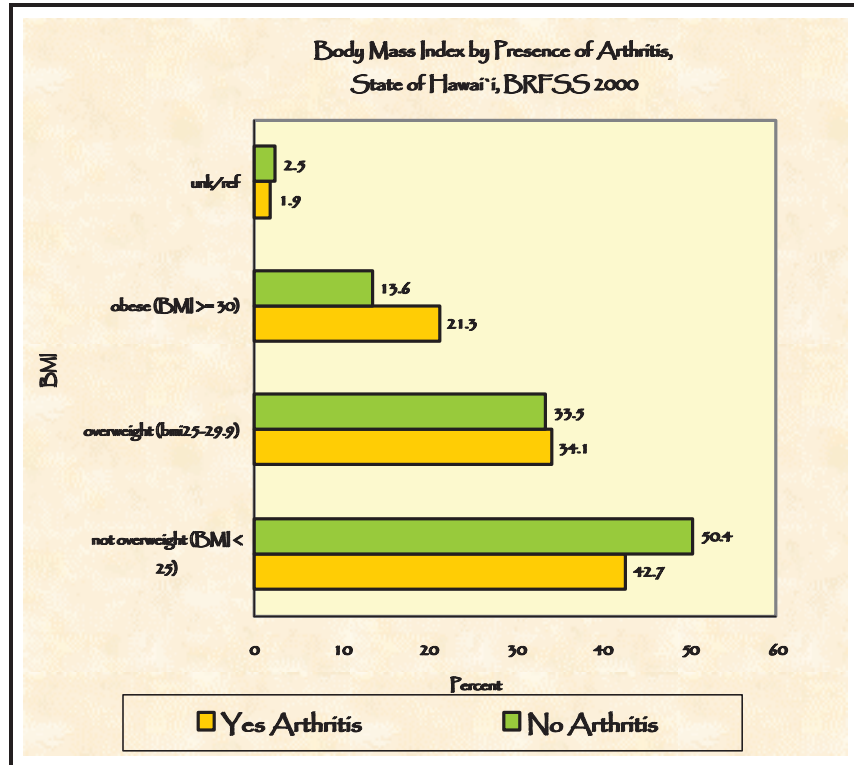

Diabetes

Among adults with arthritis close to 10% have diabetes and another 2% have diabetes during pregnancy. This percentage is more than double those without arthritis (3.8% and 1% diabetes during pregnancy respectively).

Overweight and Obese

As can be seen in the opposite figure, 50% of adults without arthritis are not overweight versus 43% of the arthritic adults. The arthritic adults who are overweight are more likely to be obese compared to the non-arthritic adults (21.3% vs. 13.6% respectively).

Arthritis Impact and effects

The disabling effect of arthritis is manifested in not carrying out usual activities or being limited in the amount of work done. This is particularly true for those who suffer from joint symptoms. Nearly 69,000 arthritic adult residents indicated limitation of activities due to joint symptoms (LMTAJS). The succeeding charts illustrate the impact of arthritis on physical activities.

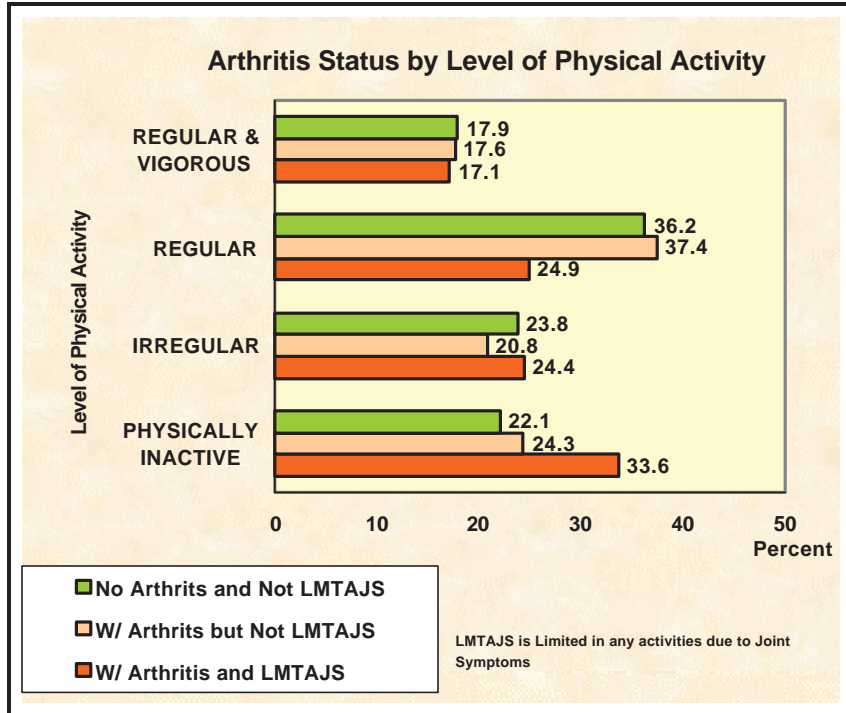

...on Physical Activities

Not able to do physical activity

The opposite chart and succeeding charts are comparisons of physical activity measures by arthritis status.

Physical inactivity for the arthritic adults who indicated that their chronic joint symptoms limited them in their activities is significantly higher (33.6%) than the group with no arthritis (22.1%) or with arthritis but do not have joint symptoms as reason

for activity limitation (24.3%). Those with no arthritis and those with arthritis but are not limited in any activities due to joint symptoms (LMTAJS) are not significantly different from each other in their level of physical activity.

Difficulty climbing stairs.

Difficulty walking.

Limited in doing moderate activities

About 9 out of 20 adults with arthritis and reported that they are limited in doing any kind of activities due to joint symptoms can do moderate activities (44.4%). A few of the adults with arthritis but not LMTAJS also cannot carryout moderate activities. This group of adults may have other health conditions in addition to arthritis.

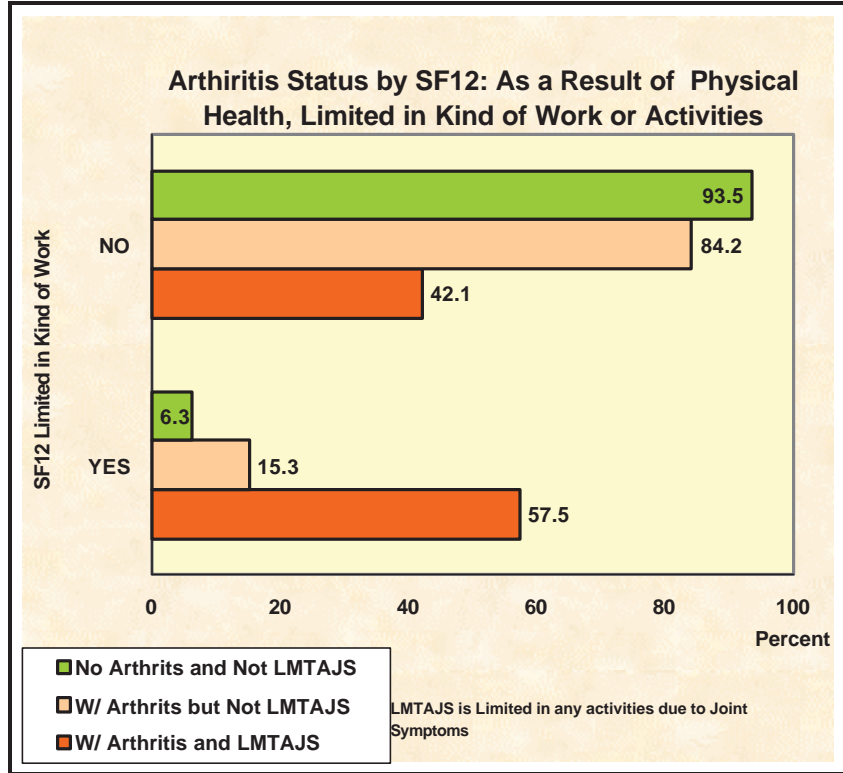

Limited in climbing several flights of stairs

Arthritic adults with joint symptoms as reason for limitation are also having difficulty climbing several flights of stairs. Among those with joint symptoms, only 41% can climb several flights of stairs compare to those with no arthritis or with arthritis but without joint symptoms as limiting factor for doing any activity (93.4% and 84.9%).

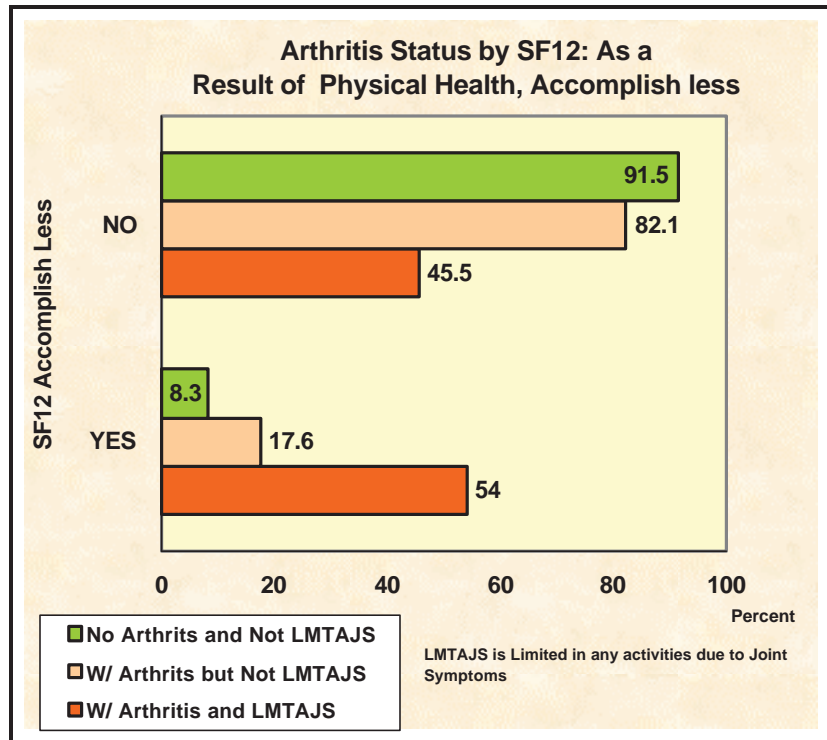

During the past 4 weeks limited in the kind of work or activities because of physical health

More than half of arthritic adults who are LMTAJS (57.5%) are more than three times more likely to be limited in the amount or kind of work or activities that they do than those who do not have arthritis (6.3%) or without joint symptoms as reason for activity limitation (15.3%).

During the past 4 weeks accomplished less regular work due to physical health

About half of those with arthritis and indicated that joint symptoms limited them in any way in any activities (54%) are likely to accomplish less regular work. In contrast, about 8% can accomplish less regular work among those who do not have arthritis or 18% for adults with arthritis but no joint symptoms as reason for activity limitation.

During the past 4 weeks how much did pain interfere with normal work

The adults with arthritis are more likely to experience pain as interfering with their normal work compare to those without arthritis. This is even more heightened when the arthritic adults were limited in their activities due to joint symptoms as shown in the opposite chart. Nearly 77% in the non-arthritic adults indicated that pain

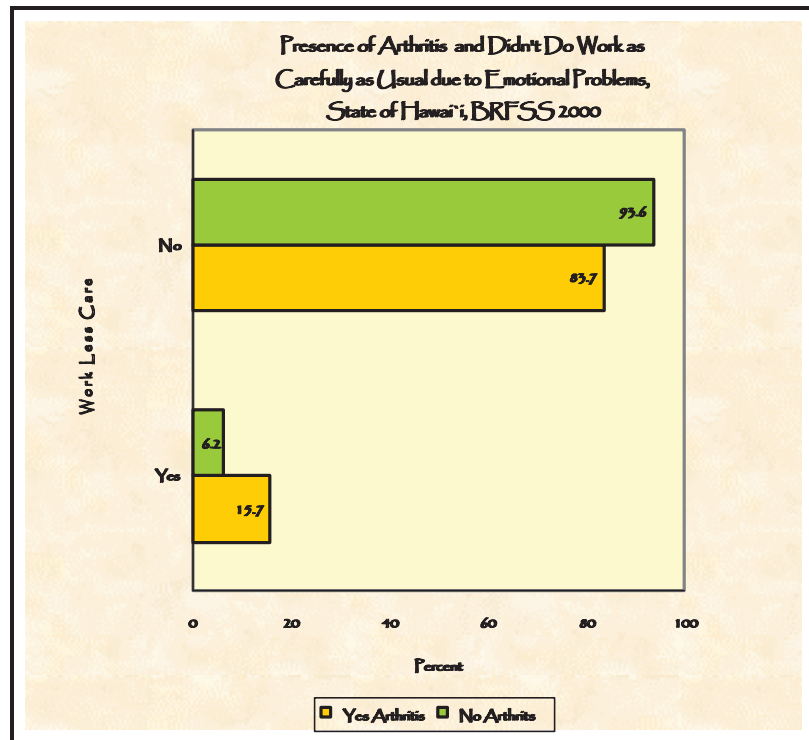

'not at all' interfere in their normal work. In contrast, adults with arthritis have a much lower proportion, 52% for those with no joint symptoms and about 20% for arthritic adults with activity limitations due to joint symptoms. More than one in three adults in this group (35.1%) expressed moderate to quite a bit interference of pain in their normal work and another 9% indicated the interference is extreme. These are much higher proportions than those without joint symptoms.

...on Mental or Emotional Health

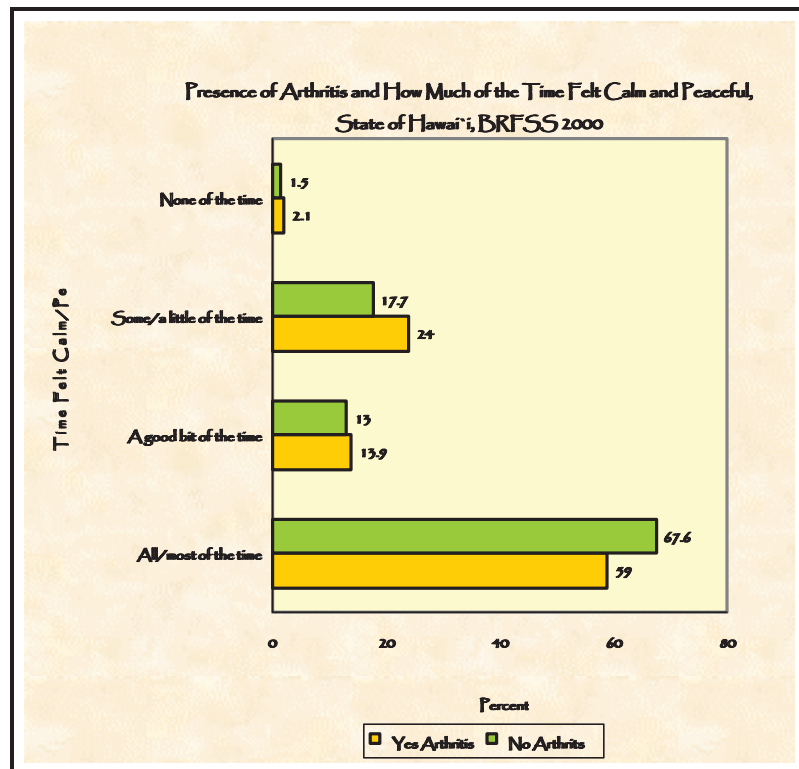

During the past 4 weeks.....
Did not do work as carefully as usual due to emotional problems

Although not a common occurrence, the proportion of adults with arthritis self-reporting that they did not do work as carefully as usual due to emotional health is higher compare to those with no arthritis (15.7% vs. 6.2%).

During the past 4 weeks.....
How much of the time you felt calm and peaceful

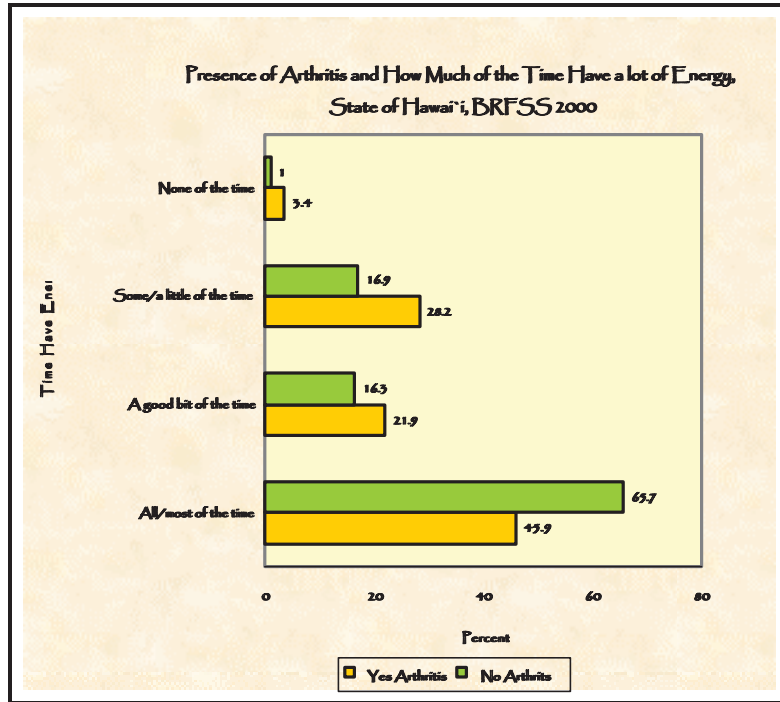

The proportion of adults feeling calm and peaceful most of the time during the past four weeks is higher among those without arthritis (67.6%) compare to those with arthritis (59%).

During the past 4 weeks.....
 How much of the time you have a lot of energy

Less than half of the adults with arthritis have a lot of energy (45.9%). In contrast, nearly two out of three adults without arthritis have a lot of energy most of the time (65.7%).

During the past 4 weeks.....
 How much of the time you felt downhearted and blue

Less than 50% of the adults self-reported that they are downhearted and blue 'none of the time'. The adults with arthritis are more likely to be downhearted and blue some or a little of the times than those who do not have arthritis (51.8% vs. 46.1%).

Overall effects on physical or emotional/mental health

During the past 4 weeks.....

How much of the time physical or emotional problems interfered with your social activities

While physical and emotional problems do not interfere with social activities of the majority of the adults, it appears to be interfering with the social activities of arthritic adults than non-arthritic adults. Nearly 82% non-arthritic adults self-reported *none of the time* vs. 68% of the arthritic adults.

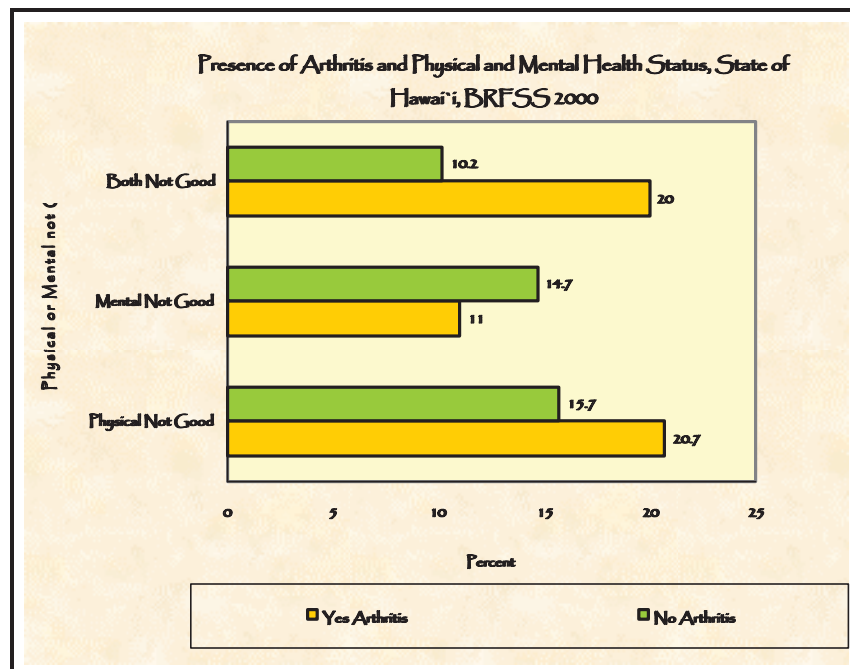

Health Status

During the Past 30 days

Over all, those with arthritis are likely to have physical health that is not good during the past 30 days compare to those with no arthritis (20.7% vs. 15.7%). Those with arthritis are also more likely to experience **both** physical and mental health that is not good compare to those with no arthritis

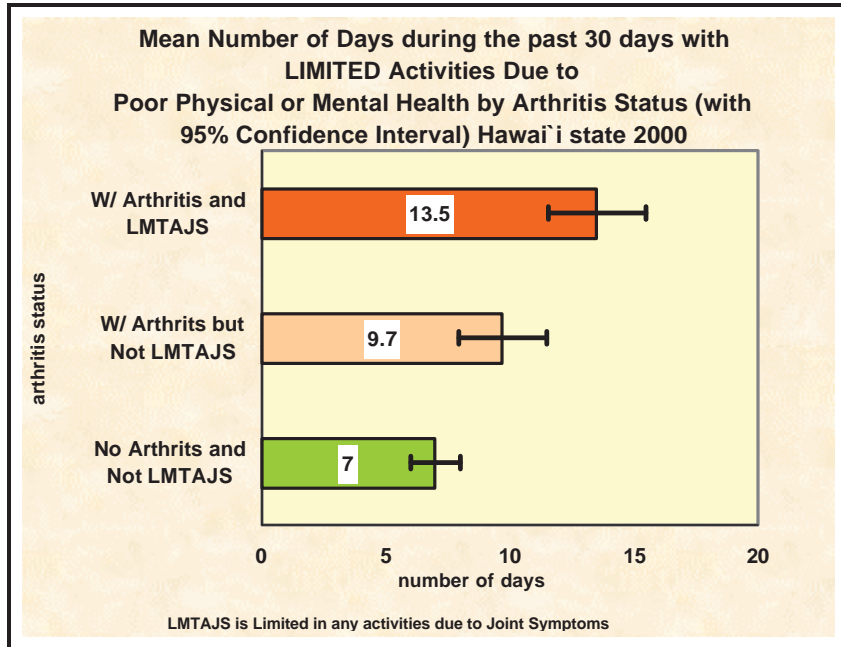

(20% vs. 10.2%). Thus, the effect of arthritis may not only be physical limitations and physical pain but may also be mental. The percentage of adults with arthritis who self-reported that their

mental health is not good during the past 30 days is 31%, higher than those with no arthritis (24.9%).

Days of Limited Activities

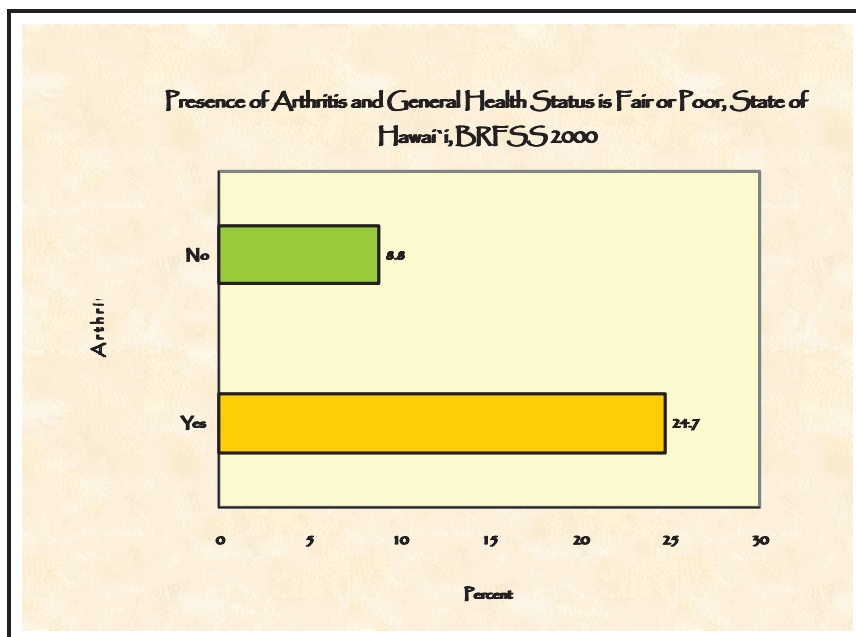

The question “*During the past 30 days for how many days did poor physical health or mental health keep you from doing your usual activities, such as self-care, work, or recreation?*” and the arthritis question, “*Are you now limited in any way in any activities because of joint symptoms?*” is jointly analyzed. Those who have joint symptoms are not able to do usual activities in almost two weeks (13.5 days).

The impact of arthritis can be summarized in this chart.

Self-reported general health status

In reply to the question “*Would you say your general health is (excellent, very good, good, fair, poor)?*”, about 25% of the arthritic adults indicated that their general health is fair or poor (24.7%) versus less than 10% of the non-arthritic adults (8.8%).

Conclusions and Recommendations

This report showed that the adult prevalence of arthritis in Hawai'i is 23%, which translates to about 204,000 adults age 18 years old and over. More than half of the arthritic adults are still employed (54%). Only 14% of the adults were told by a doctor that they have arthritis and only about 2 out every five diagnosed arthritics are currently being treated. In addition, half of those who are doctor diagnosed and are being treated also have chronic joint pains but the other half with chronic joint pains is not currently being treated. In order for the Hawai'i Arthritis Control Program to reach out for these individuals, it is important to know the reasons why these arthritic individuals with chronic joint pains are not being treated or seeking treatment (approximately 24,500 adults). Knowing the reasons for non-treatment particularly for those with joint pain symptoms is even more important considering that this group of individuals are highly limited in their activities as illustrated in the *Impact* section of this report. It appears that medical cost or health insurance is not related to doctor arthritis treatment. Given the fact that the State residents are multi-ethnic, there can be a number of reasons. It could be that the arthritic adults who are in pain are receiving or seeking alternative non-medical treatment such as acupuncture, massage, herbal medicine, or Native Hawaiian medicine. It could also be that these individuals rather buy over the counter painkiller like Tylenol. It could also be that some will rather endure the pain and wait for it to go away than see a medical doctor since arthritis is not a life and death situation. Finally, it could also be that they cannot find an arthritis doctor (there are 14 board-certified rheumatologist in the state; all practice on Oahu. Once to twice a month, a few physicians go to just a couple of the neighbor islands), or it could be a language barrier. The reasons for not being treated should be part of the arthritis module questions. It is a goal to add to the 2002 BRFSS arthritis modules, "Do you use any Complementary Alternative Medicine to manage your arthritis?"

There are differences in the management of arthritis depending on the types of arthritis. However, half of those with doctor-diagnosed arthritis do not know what type of arthritis they have. Thus, there is a need to educate the population about the different types or forms of arthritis.

Certain types of arthritis are more common to certain ethnic groups. Osteoarthritis is the most common form of arthritis and very common among the Whites, the Hawaiians and Japanese. Rheumatoid arthritis is very common among the Filipinos. This pattern may be attributed to heredity or to food items that are consumed. The comparison of servings of fruits and vegetables consumed (as measured from the BRFSS fruits and vegetables composite index, *_ftindx*) by the arthritic adults and non-arthritic adults indicates no significant difference in the two groups. However, there are certain fruits and vegetables, those belonging to the nightshade family that may trigger arthritic pain. The nightshade group of fruits and vegetables is not asked in the BRFSS. In addition to nightshade vegetables, there are certain food items that may trigger arthritic pain such as tripe, kidney and other internal organs as well as shellfish food like shrimps and crabs, common foods consumed in Hawai'i. It is recommended that questions relating to consumption of nightshade vegetables as well as animal internal meat organs and/or food sensitivities and allergies be part of the arthritis module questions.

There are nearly 128,000 arthritic adults (about 14%) who also have at least one of the chronic conditions asked in the BRFSS such as diabetes, asthma or being overweight/obese. In addition, the arthritic adults are more likely to have inactive lifestyle mainly because of their joint pains as

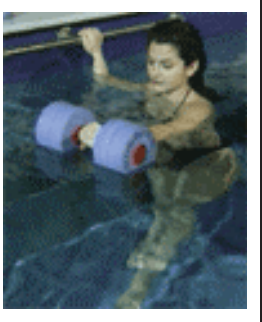

illustrated in the *Impact* section. The joint pains may probably explain why the arthritic adults are more likely to be former or current smokers than non-arthritic adults. However, one will never know which comes first, the unhealthy behavior or the arthritis condition.

There are socio-economic-demographic differences in the arthritis prevalence rates even when the data is adjusted for age using the US 2000 Census for Hawai'i (see Appendix C). The females generally have higher rates than the males; the Whites and the Hawaiians have higher rates than all the other ethnic groups. The high school graduates or higher education have lower rates than non-high school graduates; those with income \$ 50,000 or more have lower rates than those with income less than \$50,000; and those who are employed have lower rates than the unemployed, retirees, unable to work or students/homemaker.

The effects of arthritis are not only on the physical aspect but also on the emotional or mental health aspect as shown in the *Impact* section. In sum, it affects the quality of life particularly of those in their mid-life or approaching the sunset of their lives. During the past 30 days time frame, arthritic sufferers are limited in their activities due to poor physical or mental health for almost 14 days or two weeks in comparison to just about a week for those without arthritis. It is imperative that the palliative care or education to manage and control arthritis pain is made available for the arthritic individuals and their caregiver so that they have a better quality of life. In line with this education process, one of the ways is through the Internet. There is this Internet site <http://arthritis.about.com/> that covers a wide variety of topics relating to arthritis.

The Hawai'i Arthritis Control Program and its diverse Advisory Committee, under the Department of Health's Community Health Division and Chronic Disease Management and Control Branch, has developed a State plan which is a companion document to this report. It is hope that this report lends support to the cycle of planning, evaluation, and assessment of the Arthritis Control Program and informational to the general public.

<p>Aquatic exercise is easier on the joints. To strengthen the joints and muscles, engaged in aquatic exercise.</p>		<p>Swimming is a good exercise particularly for arthritic person.</p>

Appendix A – Arthritis Module Questions

Module 14: Arthritis

- M14.1. During the past 12 months, have you had pain, aching, stiffness or swelling in or around a joint?
- Yes
 - No **Go to M 14.4**
- M14.2. Were these symptoms present on most days for at least one month?
- Yes
 - No
- M14.3. Are you now limited in any way in any activities because of joint symptoms?
- Yes
 - No
- M14.4. Have you ever been told by a doctor that you have arthritis?
- Yes
 - No
- M14.5. What type of arthritis did the doctor say you have?
- Osteoarthritis/degenerative arthritis
 - Rheumatism
 - Rheumatoid Arthritis
 - Lyme disease
 - Other
 - Never saw a doctor
- M14.6. Are you currently being treated by a doctor for arthritis?
- Yes
 - No

Appendix B - Glossary of Terms

Level of physical activity refers to adults who exercise and the categories are as follows:

Physically inactive are those who did not do any exercise as measure from the question
During the past month, did you participate in any physical activities or exercises such as running, calisthenics, golf, gardening, or walking for exercise?
This is also described as no leisure-time physical activity reported during the past month.

The rest of this categories are derived from the whole set of exercise questions. See the CDC web site for the BRFSS 2000 questionnaire <http://www.cdc.gov/nccdphp/brfss/pdf-ques/2000brfss.pdf>.

Irregular activity is any physical activity or pair of activities done for less than 20 minutes or less than three times per week during the past month.

Regular activity is any physical activity or pair of activities done for a total of 20 minutes or more three times or more per week during the past month, but less than 50% of functional capacity.

Regular and **vigorous** activity is any physical activity or pair of activities that require rhythmic contraction of large muscle groups at 50% or more of functional capacity for a total of 20 minutes or more three times or more per week during the past month.

BMI stands for body mass index. It is computed as weight is kilograms divided by heights in meters squares (W/H^{**2}).

Overweight are those with BMI from 25.0 to 29.9.

Obese are those with BMI from 30 to higher.

_frtindx is a derived variables from a series of fruits and vegetables questions asked in the BRFSS 2000. To see the questions go to this Internet site <http://www.cdc.gov/nccdphp/brfss/pdf-ques/2000brfss.pdf>.

_FRTINDEX (Index of fruit and vegetable consumption)

Less than 1 per day or never:	Respondents reporting they never consume fruits or vegetables or consume less than 1 serving per day
1 to less than 3 times per day:	Respondents reporting they consume 1 to less than 3 servings of fruits and vegetables per day.
3 to less than 5 times per day:	Respondents reporting they consume 3 to less than 5 servings of fruits and vegetables per day.
5 or more times per day:	Respondents reporting they consume 5 or more servings of fruits and vegetables per day.

NA/Refused: Respondents who “don’t know” or “refused” to answer all of the fruit and vegetable questions prohibiting calculation of the daily servings level.
