**Subject: Par East Refinery (Par East) CSP 0212-01-C  
Par West Refinery (Par West) CSP 0088-01-C, 0088-02-C, & 0088-03-C  
Revised Greenhouse Gas (GHG) Emission Reduction Plan**

Dear Ms. Rossio:

As requested by the Hawaii Department of Health's (HDOH's) letter dated July 9, 2019, enclosed are revised Greenhouse Gas Emission Reduction Plans (GHGERPs) for the Par Hawaii Refining (Par) refineries located at 91-325-Komohana Street in Kapolei (CSP: 0212-01-C), referred to herein as "Par East," and 91-480 Malakole Street Bldg CCB in Kapolei (CSPs: 0088-01-C, 0088-02-C, & 0088-03-C), referred to herein as "Par West", originally submitted to HDOH on May 13, 2019 and April 4, 2019, respectively.

The resubmitted GHGERPs for Par East and Par West rely on the baseline emissions from the Par West legacy boilers (F-5201, F-5202, and F-5203) and show a 16% reduction in GHG emissions, based on partnering between Par facilities.

If you have any questions, please contact Benton Widlansky at 547-3993 or Ted Metrose at 547-3930.

I certify that I have knowledge of the facts herein set forth, that the same are true, accurate and complete to the best of my knowledge and belief. Please feel free to contact me at 547-3991 if you have any questions.

Sincerely,

A handwritten signature in blue ink that reads "Richard Creamer".

Richard Creamer  
Vice President

# GHG Emission Reduction Plan

## September 2019

### 1.0 Introduction

Par Hawaii Refining (Par) is submitting a revised greenhouse gas emission reduction plan (GHGERP) for its refinery located at 91-325 Komohana St., in Kapolei, HI, referred to herein as “Par East” Refinery. The Par East Refinery operates under Covered Source Permit No. 0212-01-C, and because the refinery has the potential to emit greenhouse gas (GHG) emissions equal to or above 100,000 tons per year CO<sub>2</sub>e, Par has prepared a revised GHGERP for the director’s approval, to account for a number of changes.

The Par East Refinery has a capacity of 95,000 bpd (barrels per day) and is located within the Campbell Industrial Park (CIP) at Barber’s Point. The refinery was originally built in 1972 and currently produces a wide range of products including propane, various grades of gasoline; kerosene-based jet aviation fuels; diesel motor fuels; a variety of distillate and residual fuel oils for ocean going ships and power plants; asphalt, and petroleum based feed stock that is converted to synthetic natural gas (SNG) at the Hawaii Gas Company’s SNG Plant.

Since the facility’s original GHGERP was submitted on September 30, 2015, many changes have taken place. In addition to collecting and reporting 3 additional years of GHG emissions from the Par East Refinery, in December of 2018 Par acquired additional refining assets from Island Energy Services (IES) and expanded its overall capacity to process crude oil at both facilities. A new Distillate Hydrotreater was permitted and built at the Par East Refinery. The state’s Renewable Portfolio Standards (RPS), which were intended to increase the amount of renewable fuel used by utilities to generate power have been effective and reduced the demand for fuel oil from the state’s two refineries. In addition to the contributing to the cessation of refining operations by IES, the impacts of the state’s RPS are reflected in a state-wide GHG inventory and projected future statewide emissions<sup>1</sup> report that was issued in January 2019.

### 2.0 Baseline Emissions

Hawaii Administrative Rules (HAR) Section 11-60.1-204(d)(1) requires that the GHG emission reduction plan specify a facility-wide baseline annual emission rate. According to the rule, the baseline rate would be based on calendar year 2010 unless another proposed baseline period is approved by the HDOH. The regulation allows alternative baselines based on all or select data within the five-year period ending in 2010. Because the refinery had a large-scale shut down during the refinery-wide turn-around beginning in July that year, 2010 is not representative of normal operations and is not a representative year for baseline emissions. As an alternative, Par proposes to use 2007 as the most recent year, representative of operating history, for the facility-wide baseline annual emission rate.

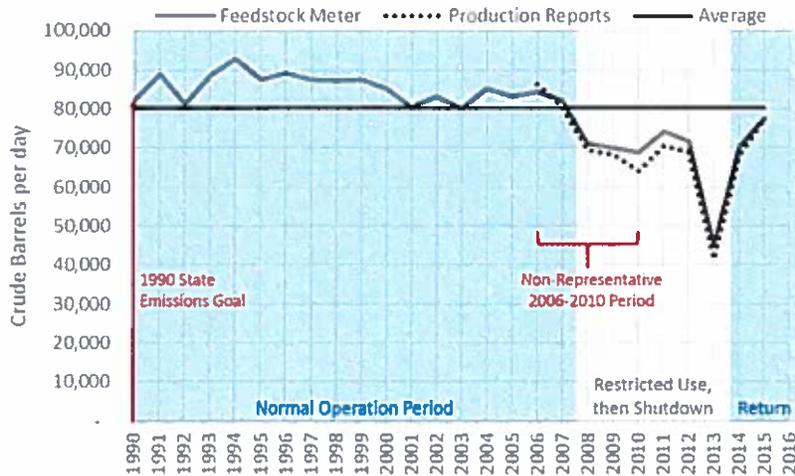

As provided in previous correspondence, Figure 1 shows the Par refinery history of crude run rates since 1990, the basis year for the GHG reduction rule. The proposed baseline year of 2007 is the most recent

---

<sup>1</sup> Hawaii Greenhouse Gas Emissions Report for 2015, Final Report, January 2019, Prepared for the Hawaii State Department of Health by ICF and UH ERO

year within the period of 2006 to 2010 specified in HAR 11-60.1-204(d)(1) which is excludes the effects of the recession and the refinery-wide turn-around year of 2010.

**Figure 1- Crude Processing Rate History**

As detailed in Appendix A, baseline direct emissions in 2007, totaled 808,740 short tons (ST) CO<sub>2</sub>e (or 733,676 metric tons (MT) CO<sub>2</sub>e). The procedures employed to calculate emissions were very similar to the method set by the Federal Mandatory Reporting Rule (40 CFR 98), and were based on fuel consumption records which served as the foundation for annual emission estimates previously submitted to and reviewed by the Hawaii Department of Health.

### 3.0 Proposed Facility-wide GHG Emissions Cap

The proposed baseline GHG emission levels, as indicated in Appendix A for 2007 are 733,676 MT, equivalent to 808,740 ST of total CO<sub>2</sub>e per year. As there are no biogenic emissions in the proposed baseline, pursuant to HAR 11-60.1-204(c), the default facility-wide cap would be 16% less. The Par East refinery proposes to accept this cap of 16% reduction, which would equal 616,288 MT, or 679,341 ST CO<sub>2</sub>e per year.

### 4.0 Feasibility of Available Control Measures

In the initial GHGERP, the facility identified best available control technologies as required by HAR §11-60.1-204(d)(3), as well as an assessment of the technical feasibility of each measure pursuant to HAR §11-60.1-204(d)(4). However, an updated assessment is not included in this revised plan, because Par East does not seek an alternate cap.

### 5.0 Proposed Control Strategy

Par plans to partner the Par West and Par East facilities to collectively achieve the State's GHG emission reduction target. Because many of the process units will no longer be operated at Par West and because some of the crude oil that Par Hawaii had planned to process at Par East will now be processed at Par West, on a joint basis the two Par refineries will be able to meet the 16 percent reduction.

The combined facility and partnering baseline, and annual GHG emission limit is summarized in Table 1.

**Table 1. Partnering Baseline and Proposed GHG Emission Limits**

Facility	Permit No.	Emissions (MT)	
		Baseline CO <sub>2</sub> e	CO <sub>2</sub> e Cap (16% reduction to Baseline)
Par East	0212-01-C	733,676	616,288
Par West	0088-01-C 0088-02-C 0088-03-C	348,273	292,549
Combined		1,081,949	908,837

The GHG emission limits proposed in Table 1 could be revised modestly downward per the alternate baseline described in the Par West GHGERP and is summarized in Table 2.

**Table 2. Alternate Partnering Baseline and Proposed GHG Emission Limits**

Facility	Permit No.	Emissions (MT)	
		Baseline CO <sub>2</sub> e	CO <sub>2</sub> e Cap (16% reduction to Baseline)
Par East	0212-01-C	733,676	616,288
Par West	0088-01-C 0088-02-C 0088-03-C	326,172	273,984
Combined		1,059,848	890,272

The Par East facility will be the main permit for the partnered facilities. The Total Partnering GHG emissions limit will be listed on CSP 0212-01. The Par West CSPs (which are expected to be consolidated into one), will reference the Par East CSP for its GHG emission limits.

## **Appendix A -- 2007 Emissions Data**

Biomass Fuels - Liquid					
Ethanol	0.084	mmBtu/gallon	68.44	1.10E-03	1.10E-04
Biodiesel (100%)	0.128	mmBtu/gallon	73.84	1.10E-03	1.10E-04
Rendered Animal Fat	0.125	mmBtu/gallon	71.06	1.10E-03	1.10E-04
Vegetable Oil	0.120	mmBtu/gallon	81.55	1.10E-03	1.10E-04

**Notes (Table C-1):**  
 1 The HHV for components of LPG determined at 60 °F and saturation pressure with the exception of ethylene.  
 2 Ethylene HHV determined at 41 °F (5 °C) and saturation pressure.  
 3 Use of this default HHV is allowed only for: (a) Units that combust MSW do not generate steam, and are allowed to use Tier 1; (b) units that derive no more than 10 percent of their annual heat input from MSW and/or tires; and (c) small batch incinerators that combust no more than 1,000 tons of MSW per year.  
 4 Reporters subject to subpart X of this part that are complying with § 98.243(d) or subpart Y of this part may only use the default HHV and the default CO<sub>2</sub> emission factor for fuel gas combustion under the conditions prescribed in § 98.243(d)(2)(i) and (d)(2)(ii) and § 98.252(a)(1) and (a)(2), respectively. Otherwise, reporters subject to subpart X or subpart Y shall use either Tier 3 (Equation C-5) or Tier 4.  
 5 Use the following formula to calculate a wet basis HHV for use in Equation C-1:  $HHV_w = ((100-M)/100) \cdot HHV_d$  where  $HHV_w$  = wet basis HHV,  $M$  = moisture content(percent) and  $HHV_d$  = dry basis HHV from Table C-1.

**Notes (Table C-2):**  
 NOTE: Those employing this table are assumed to fall under the IPCC definitions of the "Energy Industry" or "Manufacturing Industries and Construction". In all fuels except for coal the values for these two categories are identical. For coal combustion, those who fall within the IPCC "Energy Industry" category may employ a value of 1g of CH<sub>4</sub>/mmBtu.
