Variants of Concern in Kauai County	26
Variants Being Monitored in Kauai County	27

Introduction

Whole genome sequencing (WGS) involves a set of laboratory methods used to determine the full genome sequence of an organism or virus, which in the case of Severe Acute Respiratory Syndrome Coronavirus 2 (SARS-CoV-2), the virus that causes Coronavirus Disease 2019 (COVID-19), is approximately 30,000 letters, each letter a nucleotide code denoted as A, C, G, or T.

The genome sequence of a virus can reveal mutations that make it unique. Mutations are changes in a genome sequence (usually one-letter changes) that occur naturally over time.

Collecting the genome sequences of virus specimens can reveal information about the relatedness of viruses and the similarities shared among groups of viruses. Groups of same-species viruses that share a set of genome mutations are referred to as a lineage.

Scientists compare viral genomes to better understand virus transmission, how viruses can spread from person to person. Sequencing also allows public health officials to monitor viruses involved in outbreaks, characterize outbreaks, detect clusters of cases, and monitor new lineages. Novel mutations can emerge with new lineages and scientists refer to these new lineages as emerging variants.

Some of these variants are classified by the Centers for Disease Control and Prevention (CDC) as a Variant of Concern (VOC) and others as Variants Being Monitored (VBM), because of their attributes, which, for example, can be increased transmissibility, decreased neutralization by antibodies generated during previous infection or vaccination, and/or increased severity of disease. The CDC has extensive information about SARS-CoV-2 variant classification (<https://www.cdc.gov/coronavirus/2019-ncov/cases-updates/variant-surveillance/variant-info.html>), which is updated as new evidence becomes available.

Sequencing can only be performed on specimens that contain SARS-CoV-2 RNA, which means only specimens used for molecular tests (such as PCR) can be included. Therefore, this report is limited to confirmed PCR-positives only. The genomes that are sequenced and compared are those of the virus, not humans.

Sequencing can be performed on stored specimens at any time. Therefore, the dataset used for this report is dynamic and batches of stored specimens that are newly sequenced will be added to the dataset as sequencing occurs. Because of this, trends based on historical data can change over time.

In February 2021, State Laboratories Division, Hawaii Department of Health increased sequencing efforts done on PCR-positive specimens to improve the State's ability to detect new variants and conduct genomic surveillance of SARS-CoV-2. According to the CDC, approximately 6% of PCR-positive cases in the State of Hawaii have been sequenced since testing began (<https://covid.cdc.gov/covid-data-tracker/#published-sars-cov-2-sequences>).

Acknowledgements

This report integrates genomes sequenced since Jan 1, 2021 by:

Institution	Program/partner	Count	Percent
State Laboratories Division		14600	72.796%
Centers for Disease Control and Prevention	National SARS-CoV-2 Strain Surveillance (NS3)	412	2.054%
	Quest Diagnostics Incorporated	1186	5.913%
	Laboratory Corporation of America	1503	7.494%

Honolulu County	Maui County	Hawaii County	Kauai County	unknown	Total
54	11	3	0	148	216

Notes:

- In support of genomic surveillance efforts, PCR-positive specimens are routinely provided to State Laboratories Division (SLD) by commercial laboratories that operate throughout the State of Hawaii, including Clinical Labs of Hawaii (CLH), Diagnostic Laboratory Services, Inc. (DLS), Kaiser Permanente Hawaii, and S&G Labs Hawaii. The specimens are then processed, sequenced, and analyzed by the Laboratory Preparedness and Response Branch (LPRB) within SLD.
- In coordination with SLD, the School of Life Sciences, University of Hawaii at Manoa provided sequencing and analysis services for 861 PCR-positive specimens processed by the LPRB.
- As of September 14, 2022, Aegis Sciences Corporation* reports SARS-CoV-2 genome sequences independently of the Centers for Disease Control and Prevention (CDC).
- County information is not provided for specimens sequenced by CDC programs/partners and by Tripler Army Medical Center.

Summary and key notes

- This report reflects sequenced PCR-positive specimens only, and not all PCR-positive cases in the State of Hawaii are sequenced.
- Each successfully sequenced specimen produces one consensus SARS-CoV-2 genome sequence that is further analyzed to determine the variant.
- State Laboratories Division reported 407 additional SARS-CoV-2 genome sequences since the previous report was generated (9/27/2022).
- CDC programs/partners reported 34 additional SARS-CoV-2 genome sequences from the State of Hawaii since the previous report was generated (9/27/2022).
- Aegis Sciences Corporation* reported 148 additional SARS-CoV-2 genome sequences from the State of Hawaii since the previous report was generated (9/27/2022).
- 861 historical SARS-CoV-2 genome sequences from the State of Hawaii, sequenced and analyzed by the School of Life Sciences, University of Hawaii at Manoa, were integrated since the previous report was generated (9/27/2022).
- SARS-CoV-2 variant nomenclature is defined by a World Health Organization (WHO) label (letters of the Greek Alphabet, i.e., Alpha, Beta, Gamma, Delta, etc.), Phylogenetic Assignment of Named Global Outbreak (PANGO) lineage (alphabetical prefix and a numerical suffix), and/or Nextstrain clade (year of emergence followed by the next available letter in the alphabet, i.e., 20A, 20B, etc.). In this report, variant counts are reported using the WHO label and PANGO lineage nomenclatures only.
- For PANGO lineage nomenclature, ‘the numerical suffix has three hierarchical levels (primary, secondary, and tertiary). Each full stop (period or dot) within the numerical suffix represents “descendant of”. Descendants of lineages with tertiary suffixes are assigned to the next available alphabetical prefix, in alphabetical order.’ More details can be found at <https://www.pango.network/the-pango-nomenclature-system/statement-of-nomenclature-rules/>.
- In this report, an asterisk (*) following a lineage designation (e.g., BA.5*) signifies inclusion of the respective lineage (e.g., BA.5) and all of its sub-lineages (or descendants). Furthermore, an asterisk following the dot of a lineage designation (e.g., BA.*, BA.5.*, etc.) signifies only inclusion of lineages with an additional numerical suffix following the respective dot.
- Omicron has represented 100% of the variants circulating in the State of Hawaii since 1/28/2022.
- Classifications of Omicron lineages are in flux. The parent lineage of Omicron is B.1.1.529; primary sub-lineages of B.1.1.529 have BA.* designations (i.e., BA.1, BA.2, BA.5 etc.). Primary sub-lineages of BA.2.12.1, BA.2.75.1, BA.2.75.3, BA.2.75.6, BA.5.1.10, BA.5.2.1, and BA.5.3.1 have BG.*, BL.*, BM.*, BY.*, BK.*, BF.*, and BE.* designations, respectively. Primary sub-lineages of BE.1.1.1 have BQ.* designations. Omicron XE, XZ, XAC, and XAP are recombinant lineages containing genetic material from BA.1* and BA.2*.
- Lineages called using pangolin v4.1.3, pangolin-data v1.15.1, and usher v0.5.4.
- BA.5* remains the dominant lineage family circulating in the State of Hawaii, representing ~88% of the sequenced specimens collected in the state from 9/11/2022 to 9/24/2022.

Variants of Concern (VOC) and Variants Being Monitored (VBM)

Evidence to date shows that vaccination generally leads to milder cases, not requiring hospitalization, for all Variants of Concern and Variants Being Monitored that are described here, even if the efficacy of antibodies is diminished against some of these variants compared to the original version of the virus.

Also, *none* of these variants are classified as a “*Variant of High Consequence (VOHC)*”, according to CDC variant categories (<https://www.cdc.gov/coronavirus/2019-ncov/variants/variant-info.html#Consequence>), which is a category that would imply a variant has the ability to evade diagnosis, significantly reduce the vaccines’ effectiveness and protection against severe disease, significantly reduce susceptibility to treatments, or lead to more severe disease and increased hospitalizations.

Variants of Concern detected in the State of Hawaii

Omicron variant (B.1.1.529, BA.*, BE.*, BF.*, BG.*, BK.*, BL.*, BM.*, BQ.*, BY.*, XE, XZ, XAC, and XAP lineages)

B.1.1.529 was reported to the WHO on November 24, 2021 and first detected in specimens collected on November 11, 2021 in Botswana and on November 14, 2021 in South Africa. The WHO labeled B.1.1.529 “Omicron” and classified it as a VOC on November 26, 2021. The United States designated Omicron as a VOC on November 30, 2021 and reported its first case on December 1, 2021. Omicron contains more changes in the spike protein than have been observed in other variants. Several of these mutations, including S477N, N501Y, and E484K, have been associated with increased infectivity and decreased neutralizing activity of monoclonal antibodies and convalescent sera. Evidence indicates that Omicron spreads more easily than previous variants. More information can be found at <https://www.cdc.gov/coronavirus/2019-ncov/variants/omicron-variant.html>.

B.1.1.529 is the parent lineage of Omicron; primary sub-lineages of the Omicron parent lineage have BA.* designations (i.e., BA.1, BA.2, BA.5, etc.). Primary sub-lineages of BA.2.12.1, BA.2.75.1, BA.2.75.3, BA.2.75.6, BA.5.1.10, BA.5.2.1, and BA.5.3.1 have BG.*, BL.*, BM.*, BY.*, BK.*, BF.*, and BE.* designations, respectively. Primary sub-lineages of BE.1.1.1 have BQ.* designations. XE, XZ, XAC, and XAP are recombinant lineages in which portions of their genomes are derived from BA.1* and BA.2*. SARS-CoV-2 recombinants that receive a PANGO classification have an X* lineage designation. Omicron lineage families correspond to Nextstrain clades 21M, 21K, 21L, 22A, 22B, 22C, and 22D (<https://ncov-clades-schema.vercel.app/>).

Due to acquired mutations within the spike protein, each successively dominant Omicron lineage family (BA.1*, BA.2*, BA.2.12.1*, and BA.5*) has been increasingly better at evading antibodies elicited by vaccinations and/or prior infections. Notable information regarding each of their defining mutations can be found at <https://covariants.org/variants> (21K, 21L, 22C, and 22B, respectively).

Variants Being Monitored detected in the State of Hawaii

Alpha variant (B.1.1.7 and Q.* lineages)

B.1.1.7 was first identified in the United Kingdom and the WHO labeled it “Alpha” on May 31, 2021. This variant contains the N501Y mutation and a short deletion in the spike protein. Upon its emergence, the Alpha variant was shown to be significantly more transmissible (~50%) than the original SARS-CoV-2 virus. The Alpha variant corresponds to Nextstrain clade 20I.

Beta variant (B.1.351 and B.1.351.* lineages)

B.1.351 was first identified in South Africa and the WHO labeled it “Beta” on May 31, 2021. This variant has the E484K spike mutation, which is associated with increased evasion of antibodies elicited by vaccination or previous infection by earlier variants. The Beta variant corresponds to Nextstrain clade 20H.

Gamma variant (P.1 and P.1.* lineages)

P.1 was first identified in Brazil and the WHO labeled it “Gamma” on May 31, 2021. This variant also contains the N501Y mutation, like B.1.1.7, but not the deletion in the spike protein. The Gamma variant corresponds to Nextstrain clade 20J.

Delta variant (B.1.617.2 and AY.* lineages)

B.1.617.2 was first identified in India and the WHO labeled it “Delta” on May 31, 2021. This variant contains the L452R mutation in the spike protein, which has been shown to escape neutralization by monoclonal antibodies and some convalescent sera, as well as a few additional spike mutations predicted to have functional consequences (e.g. T478K).

B.1.617.2 is the parent lineage of Delta; sub-lineages of Delta have the AY.* designation (i.e., AY.1, AY.2, AY.3, etc.). Delta lineage families correspond to Nextstrain clades 21A, 21I, and 21J.

Epsilon variant (B.1.429 and B.1.427)

The closely related lineages, B.1.429 and B.1.427, were first identified in California and designated initially as CA VUI1. The WHO labeled them “Epsilon” on May 31, 2021. This variant is associated with increased viral shedding compared to the original SARS-CoV-2 virus, and contains the L452R mutation in the spike protein, which has been shown to escape neutralization by monoclonal antibodies and some convalescent sera. The Epsilon variant corresponds to Nextstrain clade 21C.

Zeta variant (P.2)

P.2 was first identified in Brazil and contains a spike mutation (E484K), which is also present in B.1.351, that can potentially make it less responsive to antibodies. The Zeta variant corresponds to Nextstrain clade 20B/S.484K.

Iota variant (B.1.526)

B.1.526 was first identified in New York and was classified by the CDC as a VBM due to indications of increased transmissibility. The WHO labeled it “Iota” on May 31, 2021. Some of the genomes (but not all) of this variant contain the E484K mutation. The Iota variant corresponds to Nextstrain clade 21F.

Mu variant (B.1.621 and B.1.621.1)

Lineage B.1.621 was first identified in Columbia in January 2021 and has a couple of mutations in common with the Beta (B.1.351) and Gamma (P.1) variants, which have been associated with increased transmissibility (N501Y) and a level of decreased vaccine efficiency (E484K). The MU variant corresponds to Nextstrain clade 21H.

State of Hawaii

Total variants identified

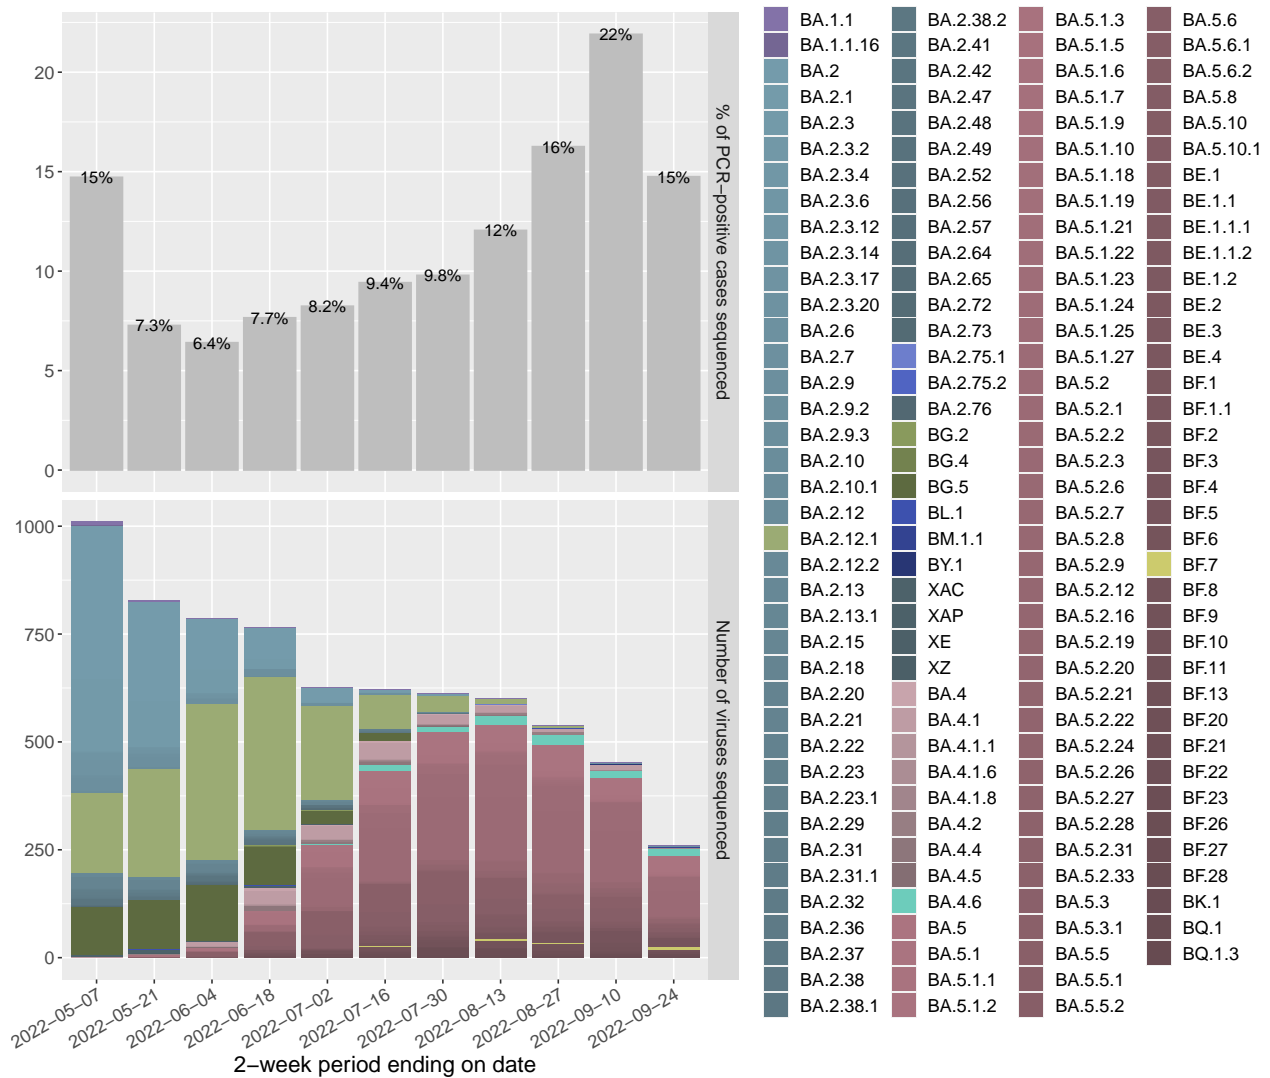

Figure Notes:

- The graph shows the total number of variants by lineage detected in the State of Hawaii in each 2-week interval ending on the date shown (date represents when the specimen was collected from a patient).
- Omicron (BA.*, BE.*, BF.*, BG.*, BK.*, BL.*, BM.*, BQ.*, BY.*, XE, XZ, XAC, and XAP) is a *Variant of Concern*.
- The gray bar graph (top) shows the percentage of PCR-positive cases from each 2-week time interval that were sequenced.
- The color bar graph (bottom) shows the number of viruses sequenced (one sequenced virus equates to one PCR-positive case) from each 2-week time interval.
- SARS-CoV-2 genome sequencing may not be a random sample of all cases. This graph does not estimate prevalence in the population.
- Sequencing can be performed on stored patient specimens at any time, so these numbers may change as additional specimens are sequenced.

Estimated proportions of variants circulating in the State of Hawaii

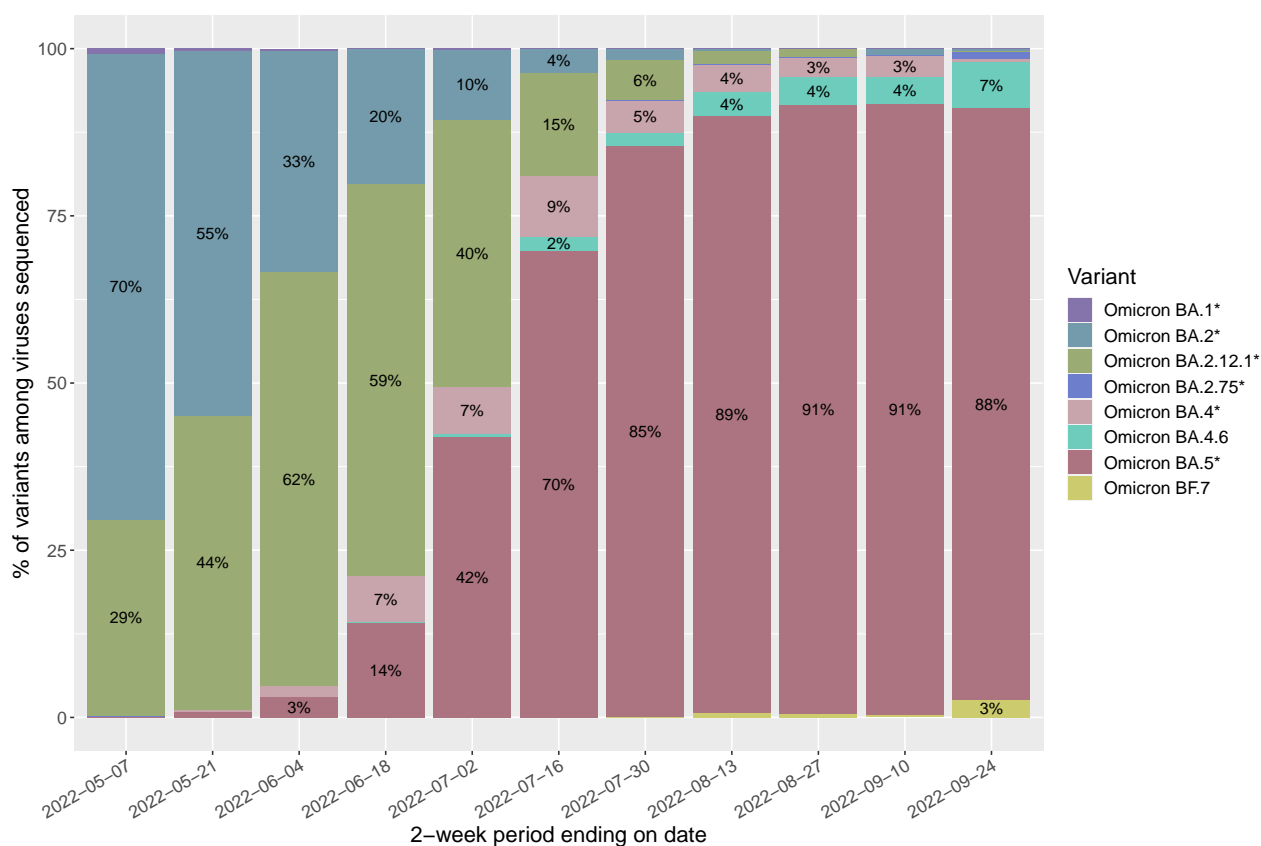

Figure Notes:

- The graph shows biweekly percentage estimates of SARS-CoV-2 variants circulating in the State of Hawaii, grouped in 2-week intervals (based on the date of specimen collection); percentage estimates are rounded to the nearest whole number.
- Not all positive SARS-CoV-2 specimens are sequenced and sequenced specimens are not a random selection of all COVID-19 cases in the State of Hawaii. This graph has been generated only counting specimens that were selected randomly for the purpose of surveillance, to avoid over-representing the specimens that were selected for investigations of clusters.
- The last 2-week interval numbers will most likely change, as a number of specimens that are currently being processed will be added.
- Sequencing of certain specimens can be delayed for technical reasons. Therefore, the dataset used for this report is dynamic and specimens that are newly sequenced will be added to the dataset as sequencing occurs. Because of this, trends based on historical data can change over time.
- Omicron BA.1* includes BA.1 and its sub-lineages (BA.1.*).
- Omicron BA.2* includes BA.2, its sub-lineages (BA.2.*), XE, XZ, XAC, and XAP; excludes BA.2.12.1* and BA.2.75*.
- Omicron BA.2.12.1* includes BA.2.12.1 and its sub-lineages (BG.*).
- Omicron BA.2.75* includes BA.2.75 and its sub-lineages (BA.2.75.*, BL.*, BM.*, and BY.*).
- Omicron BA.4* includes BA.4 and its sub-lineages (BA.4.*); excludes BA.4.6.
- Omicron BA.5* includes BA.5 and its sub-lineages (BA.5.*, BE.*, BF.*, BK.*, and BQ.*); excludes BF.7.

Variants of Concern in the State of Hawaii

Variant	Lineage	Area of emergence	Cumulative sequences	Earliest specimen collection date	Most recent specimen collection date
Omicron			12104		
	BA.1.1	South Africa/Botswana	1740	27 Nov 2021	19 Jun 2022
	BA.2.12.1	USA/Canada	1613	21 Mar 2022	26 Aug 2022

Table Notes:

- Lineage “Other AY.*” represents an aggregation of different AY.* lineages in which each alone accounts for <2% of the cumulative Delta sequences from the State of Hawaii.

Honolulu County

Total variants identified

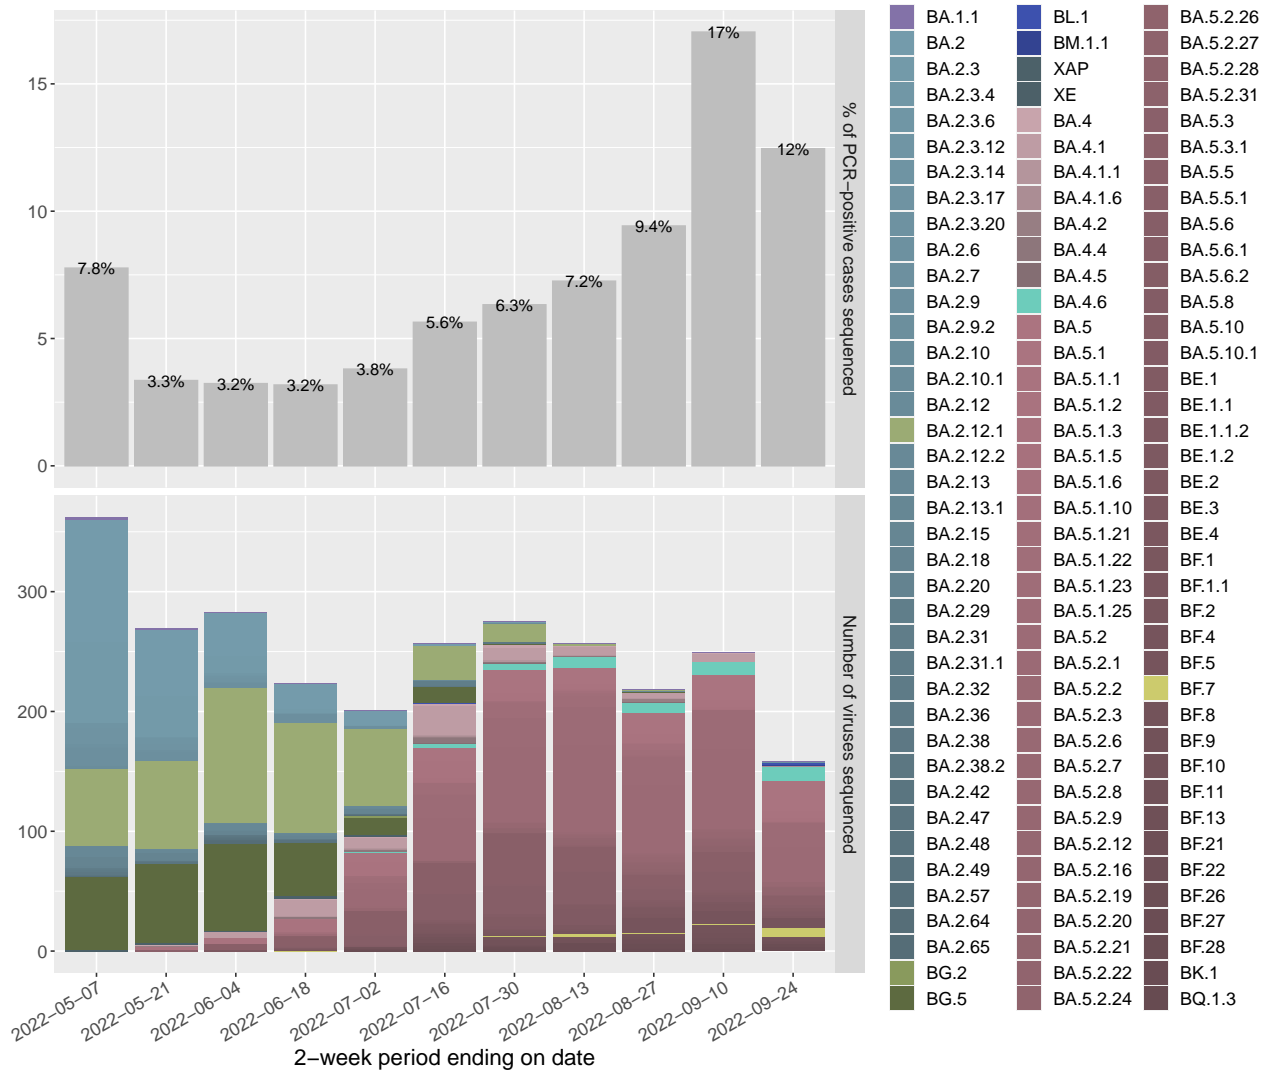

Figure Notes:

- The graph shows the total number of variants detected in Honolulu County in each 2-week interval ending on the date shown (date represents when the specimen was collected from a patient).
- Omicron (BA.*, BE.*, BF.*, BG.*, BK.*, BL.*, BM.*, BQ.*, XE, and XAP) is a *Variant of Concern*.
- The gray bar graph (top) shows the percentage of PCR-positive cases from each 2-week time interval that were sequenced.
- The color bar graph (bottom) shows the number of viruses sequenced (one sequenced virus equates to one PCR-positive case) from each 2-week time interval.
- SARS-CoV-2 genome sequencing may not be a random sample of all cases. This graph does not estimate prevalence in the population.
- Sequencing can be performed on stored patient specimens at any time, so these numbers may change as additional specimens are sequenced.

Estimated proportions of variants circulating in Honolulu County

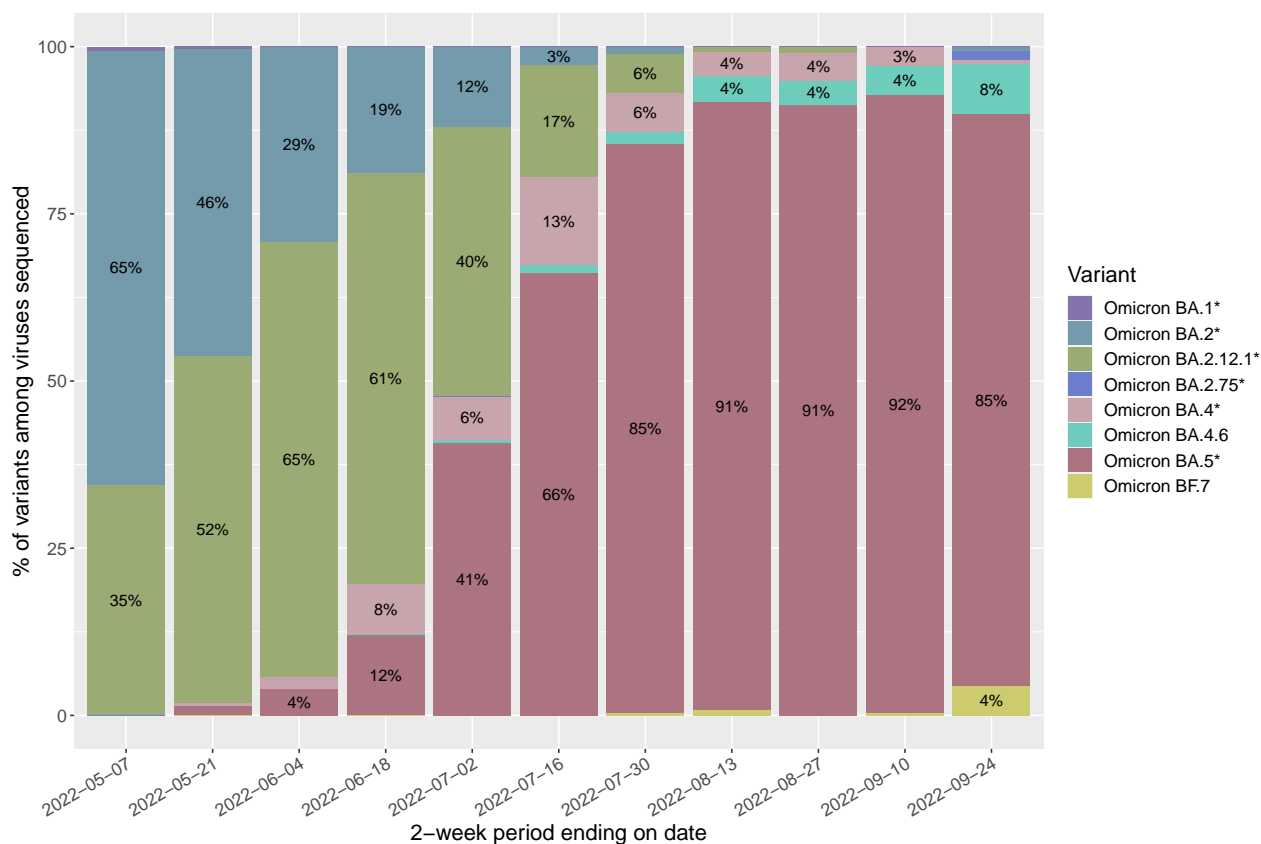

Figure Notes:

- The graph shows biweekly percentage estimates of SARS-CoV-2 variants circulating in Honolulu County, grouped in 2-week intervals (based on the date of specimen collection); percentage estimates are rounded to the nearest whole number.
- Not all positive SARS-CoV-2 specimens are sequenced and sequenced specimens are not a random selection of all COVID-19 cases in Honolulu County. This graph has been generated only counting specimens that were selected randomly for the purpose of surveillance of community variants, to avoid over-representing the specimens that were selected for investigations of clusters.
- Sequencing of certain specimens can be delayed for technical reasons. Therefore, the dataset used for this report is dynamic and specimens that are newly sequenced will be added to the dataset as sequencing occurs. Because of this, trends based on historical data can change over time.
- Omicron BA.1* includes BA.1 and its sub-lineages (BA.1.*).
- Omicron BA.2* includes BA.2, its sub-lineages (BA.2.*), XE, and XAP; excludes BA.2.12.1* and BA.2.75*.
- Omicron BA.2.12.1* includes BA.2.12.1 and its sub-lineages (BG.*).
- Omicron BA.2.75* includes BA.2.75 and its sub-lineages (BA.2.75.*, BL.*, and BM.*).
- Omicron BA.4* includes BA.4 and its sub-lineages (BA.4.*); excludes BA.4.6.
- Omicron BA.5* includes BA.5 and its sub-lineages (BA.5.*, BE.*, BF.*, BK.*, and BQ.*); excludes BF.7.

Variants of Concern in Honolulu County

Variant	Lineage	Area of emergence	Cumulative sequences	Earliest specimen collection date	Most recent specimen collection date
Omicron			4985		
	BA.1.1	South Africa/Botswana	683	27 Nov 2021	11 May 2022

Table Notes:

- Lineage “Other AY.*” represents an aggregation of different AY.* lineages in which each alone accounts for <2% of the cumulative Delta sequences from Honolulu County.

Maui County

Total variants identified

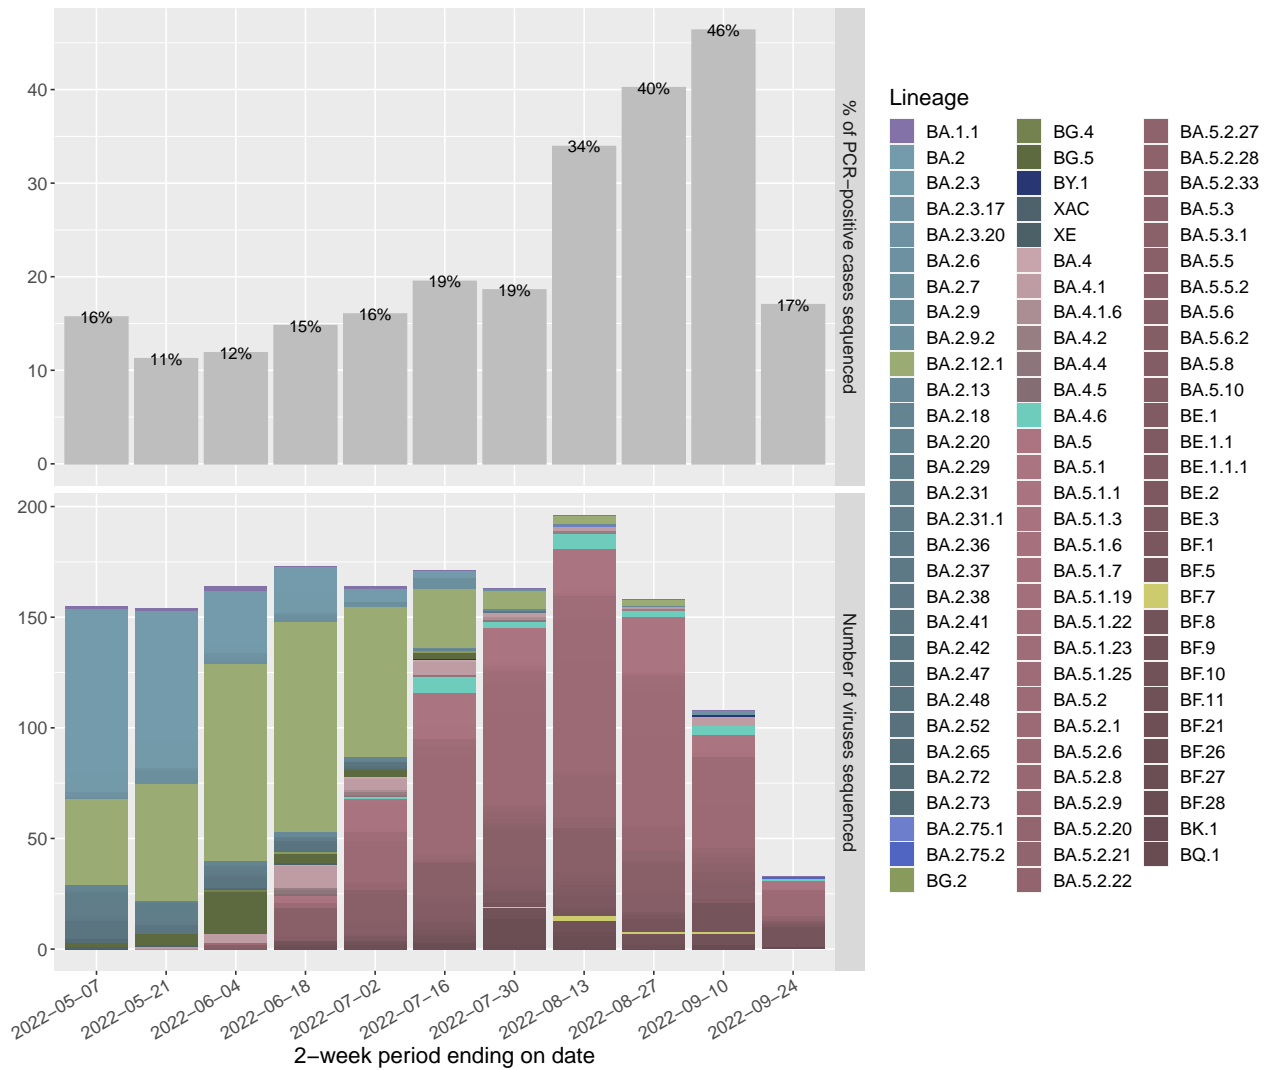

Figure Notes:

- The graph shows the total number of variants detected in Maui County in each 2-week interval ending on the date shown (date represents when the specimen was collected from a patient).
- Omicron (BA. *, BE. *, BF. *, BG. *, BK. *, BQ. *, BY. *, XE, and XAC) is a *Variant of Concern*.
- The gray bar graph (top) shows the percentage of PCR-positive cases from each 2-week time interval that were sequenced.
- The color bar graph (bottom) shows the number of viruses sequenced (one sequenced virus equates to one PCR-positive case) from each 2-week time interval.
- SARS-CoV-2 genome sequencing may not be a random sample of all cases. This graph does not estimate prevalence in the population.
- Sequencing can be performed on stored patient specimens at any time, so these numbers may change as additional specimens are sequenced.

Estimated proportions of variants circulating in Maui County

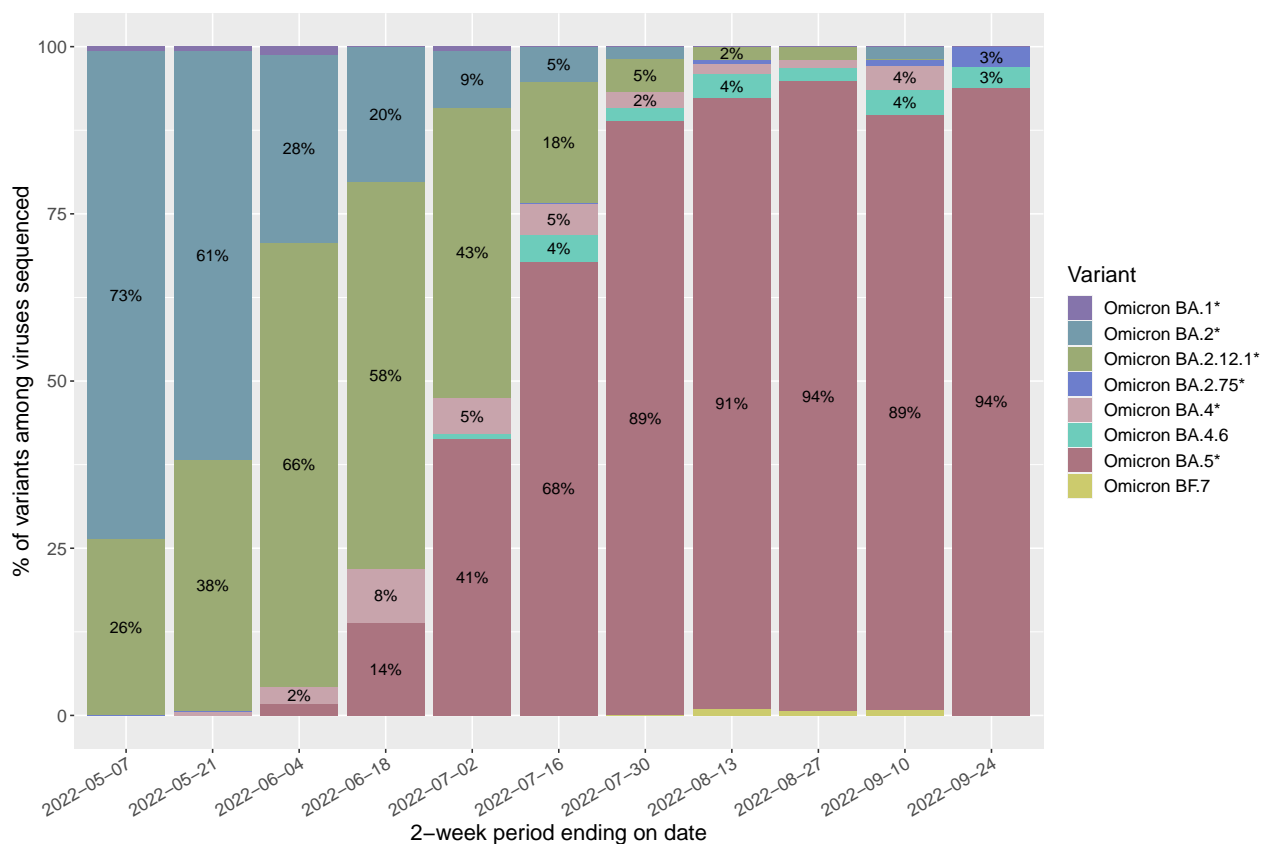

Figure Notes:

- The graph shows biweekly percentage estimates of SARS-CoV-2 variants circulating in Maui County, grouped in 2-week intervals (based on the date of specimen collection); percentage estimates are rounded to the nearest whole number.
- Not all positive SARS-CoV-2 specimens are sequenced and sequenced specimens are not a random selection of all COVID-19 cases in Maui County. This graph has been generated only counting specimens that were selected randomly for the purpose of surveillance of community variants, to avoid over-representing the specimens that were selected for investigations of clusters.
- Sequencing of certain specimens can be delayed for technical reasons. Therefore, the dataset used for this report is dynamic and specimens that are newly sequenced will be added to the dataset as sequencing occurs. Because of this, trends based on historical data can change over time.
- Omicron BA.1* includes BA.1 and its sub-lineages (BA.1.*).
- Omicron BA.2* includes BA.2, its sub-lineages (BA.2.*), XE and XAC; excludes BA.2.12.1* and BA.2.75*.
- Omicron BA.2.12.1* includes BA.2.12.1 and its sub-lineages (BG.*).
- Omicron BA.2.75* includes BA.2.75 and its sub-lineages (BA.2.75.* and BY.*)
- Omicron BA.4* includes BA.4 and its sub-lineages (BA.4.*); excludes BA.4.6.
- Omicron BA.5* includes BA.5 and its sub-lineages (BA.5.*, BE.*, BF.*, BK.*, and BQ.*); excludes BF.7.
