Omicron Variants Detected in Kauai County	26
Pre-Omicron Variants Detected in Kauai County	27

Introduction

Whole genome sequencing (WGS) involves a set of laboratory methods used to determine the full genome sequence of an organism or virus. For Severe Acute Respiratory Syndrome Coronavirus 2 (SARS-CoV-2)—the virus that causes Coronavirus Disease 2019 (COVID-19), the genome is approximately 30,000 letters long, each letter a nucleotide code denoted as A, C, G, or T.

The genome sequence of a virus can reveal mutations that make it unique. Mutations are changes in a genome sequence (usually one-letter changes) that occur naturally over time. A viral genome that contains one or more mutations is referred to as a variant.

Collecting the genome sequences of virus specimens can reveal information about the relatedness of viruses and the similarities shared among groups of viruses. A closely related group of viruses derived from a common ancestor is referred to as a lineage.

Sequencing of viral genomes allows scientists to better understand virus transmission and evolution, and how each may impact public health. Sequencing also allows public health officials to monitor and characterize outbreaks and clusters, detect new variants, and conduct genomic surveillance (analysis of trends, similarities, and differences in circulating variants).

Some SARS-CoV-2 variants are classified by the U.S. government SARS-CoV-2 Interagency Group (SIG) as either Variants of Concern (VOC), Variants of Interest (VOI), or Variants Being Monitored (VBM) based on their attributes (e.g., transmissibility and/or severity of disease) and prevalence. The Centers for Disease Control and Prevention (CDC) has extensive information about SARS-CoV-2 variant classification that is updated as new evidence becomes available (<https://www.cdc.gov/coronavirus/2019-ncov/variants/variant-classifications.html>).

Sequencing can only be performed on specimens that contain SARS-CoV-2 RNA, which means only specimens used for molecular tests such as PCR can be included. Therefore, this report is limited to confirmed PCR-positive cases only. The genomes that are sequenced and compared are those of the virus, not humans.

Sequencing can be performed on stored specimens at any time. Therefore, the dataset used for this report is dynamic and batches of stored specimens that are newly sequenced will be added to the dataset as sequencing occurs, thus trends based on historical data can change over time.

In February 2021, State Laboratories Division, Hawaii Department of Health increased sequencing efforts done on PCR-positive specimens to improve the State's ability to detect new variants and conduct genomic surveillance of SARS-CoV-2.

Acknowledgements

This report integrates genomes sequenced since 1 Jan 2021 by:

Institution	Program/partner	Count	Percent
State Laboratories Division		24639	78.991%
Centers for Disease Control and Prevention	National SARS-CoV-2 Strain Surveillance (NS3)	412	1.321%
	Quest Diagnostics Incorporated	1671	5.357%
	Laboratory Corporation of America	1645	5.274%
	Aegis Sciences Corporation	379	1.215%
	Helix/Illumina	185	0.593%
	Infinity Biologix	16	0.051%
	Mako Medical	20	0.064%
	Fulgent Genetics	8	0.026%
	UW Virology Lab	4	0.013%
Tripler Army Medical Center		1120	3.591%
University of Hawaii at Manoa		861	2.760%
Aegis Sciences Corporation*		232	0.744%
Total		31192	100.000%

County distribution of genomes sequenced by institution:

	Honolulu County	Maui County	Hawaii County	Kauai County	unknown	Total
State Laboratories Division (since 1 Jan 2021)	15886	3913	3585	882	373	24639
University of Hawaii at Manoa (22 Jan 2022 – 23 Aug 2022)	508	67	221	17	48	861
Aegis Sciences Corporation* (since 14 Sep 2022)	54	11	3	0	164	232

Notes:

- In support of genomic surveillance efforts, PCR-positive specimens are routinely provided to State Laboratories Division (SLD) by commercial/clinical laboratories that operate throughout the State of Hawaii, including Clinical Labs of Hawaii (CLH), Diagnostic Laboratory Services, Inc. (DLS), Kaiser Permanente Hawaii, and S&G Labs Hawaii. The specimens are then processed, sequenced, and analyzed by the Laboratory Preparedness and Response Branch (LPRB) within SLD.
- In coordination with SLD, the School of Life Sciences, University of Hawaii at Manoa provided sequencing and analysis services for 861 PCR-positive specimens processed by the LPRB.
- As of 14 Sep 2022, Aegis Sciences Corporation* reports SARS-CoV-2 genome sequences independently of the Centers for Disease Control and Prevention (CDC).
- County information is not provided for specimens sequenced by CDC programs/partners and by Tripler Army Medical Center.

Summary and Key Notes

- This report reflects sequenced PCR-positive specimens only, and not all PCR-positive cases in the State of Hawaii are sequenced.
- Each successfully sequenced specimen produces one consensus SARS-CoV-2 genome sequence that is further analyzed to determine the variant.
- 521 additional SARS-CoV-2 genome sequences were reported since the previous report was generated (23 Jan 2024); includes 501 from State Laboratories Division, 17 from Tripler Army Medical Center, and 3 from CDC programs/partners.
- SARS-CoV-2 variant nomenclature is defined by a World Health Organization (WHO) label (letters of the Greek Alphabet, e.g., Alpha, Beta, Gamma, Delta, etc.), Phylogenetic Assignment of Named Global Outbreak (PANGO) lineage (alphabetical prefix and a numerical suffix), and/or Nextstrain clade (year of emergence followed by the next available letter in the alphabet, e.g., 20A, 20B, etc.). In this report, variant counts are reported using the WHO label and PANGO lineage nomenclatures only.
- For PANGO lineage nomenclature, ‘the numerical suffix has three hierarchical levels (primary, secondary, and tertiary). Each full stop (period or dot) within the numerical suffix represents “descendant of”. Descendants of lineages with tertiary suffixes are assigned to the next available alphabetical prefix, in alphabetical order.’ More details can be found at <https://www.pango.network/the-pango-nomenclature-system/statement-of-nomenclature-rules/>.
- In this report, an asterisk (*) following a lineage designation (e.g., BA.5*) signifies inclusion of the respective lineage (e.g., BA.5) and its sub-lineages (or descendants, e.g., BA.5.*) unless otherwise specified.
- Due to the decreasing trend in the number of PCR tests being conducted, the availability of PCR-positive specimens has decreased statewide, resulting in smaller sample sizes for SARS-CoV-2 sequencing and variant reporting. Estimated variant proportions may not be truly representative for counties with low sequencing numbers.
- JN.1* (JN.1 and JN.1.*) remains the predominant variant statewide, representing 84% of estimated variant proportions for the latest 4-week collection period.

Variant Classifications

As SARS-CoV-2 continues to evolve, variants receive Variants of Concern (VOC), Variants of Interest (VOI), and Variants Being Monitored (VBM) classifications by the U.S. government SARS-CoV-2 Interagency Group (SIG) based on their attributes (e.g., transmissibility and/or severity of disease) and prevalence. VBM are variants circulating at very low levels or that are no longer detected, and thus do not pose an impending risk to public health. Therefore, a VOC or a VOI may be downgraded to a VBM after a significant and sustained decrease in prevalence over time. **As of 1 Sep 2023, no SARS-CoV-2 variants are classified as VOC in the U.S.** More information regarding these classifications can be found at <https://www.cdc.gov/coronavirus/2019-ncov/variants/variant-classifications.html>.

Variants of Interest (VOI) and Variants Being Monitored (VBM) in the State of Hawaii

Omicron (VOI and VBM | B.1.1.529 and descendant lineages)

B.1.1.529 was first detected in specimens collected on 11 Nov 2021 in Botswana and on 14 Nov 2021 in South Africa; the World Health Organization (WHO) labeled it “Omicron” on 26 Nov 2021. In the U.S., Omicron lineages were classified as VOC on 30 Nov 2021 and downgraded to VOI (only lineages carrying the F456L spike mutation) and VBM on 1 Sep 2023.

BA.1 and BA.2 were the dominant primary descendants (sub-lineages) of B.1.1.529. BA.2 later outcompeted BA.1 and gave rise to BA.2.12.1, BA.2.75, BA.4, and BA.5, all of which then gave rise to their own descendants. The co-circulation of different Omicron lineages over time has also given rise to numerous recombinant variants. A recombinant forms when the genomes of two lineages (infecting a person simultaneously) undergo recombination during the viral replication process, producing a variant that is distinct from both parent lineages. Recombinants that expand and later receive a PANGO nomenclature have an X* lineage designation (e.g., XBB).

The major Omicron parental lineages correspond to Nextstrain clades 21M (B.1.1.529), 21K (BA.1), 21L (BA.2), 22A (BA.4), 22B (BA.5), 22C (BA.2.12.1), 22D (BA.2.75), 22E (BQ.1), 22F (XBB), 23A (XBB.1.5), 23B (XBB.1.16), 23C (CH.1.1), 23D (XBB.1.9), 23E (XBB.2.3), 23F (EG.5.1), 23G (XBB.1.5.70), 23H (HK.3), and 23I (BA.2.86); their evolutionary relationship can be viewed at <https://ncov-clades-schema.vercel.app/>. Detailed information about Nextstrain clades and their relationship to various lineages can be found at <https://covariants.org/variants>.

Alpha (VBM | B.1.1.7 and Q.* lineages)

B.1.1.7 was first identified in the United Kingdom in Sep 2020; the WHO labeled it “Alpha” on 31 May 2021. B.1.1.7 is the parent lineage of Alpha; sub-lineages of B.1.1.7 have the Q.* designation. In the U.S., Alpha lineages were classified as VOC on 29 Dec 2020 and downgraded to VBM on 21 Sep 2021. The Alpha variant corresponds to Nextstrain clade 20I.

Beta (VBM | B.1.351 and B.1.351.* lineages)

B.1.351 was first identified in South Africa in May 2020; the WHO labeled it “Beta” on 31 May 2021. In the U.S., Beta lineages were classified as VOC on 29 Dec 2020 and downgraded to VBM on 21 Sep 2021. The Beta variant corresponds to Nextstrain clade 20H.

Gamma (VBM | P.1 and P.1.* lineages)

P.1 was first identified in Brazil in Nov 2020; the WHO labeled it “Gamma” on 31 May 2021. In the U.S., Gamma lineages were classified as VOC on 29 Dec 2020 and downgraded to VBM on 21 Sep 2021. The Gamma variant corresponds to Nextstrain clade 20J.

Delta (VBM | B.1.617.2 and AY.* lineages)

B.1.617.2 was first identified in India in Oct 2020; the WHO labeled it “Delta” on 31 May 2021. B.1.617.2 is the parent lineage of Delta; sub-lineages of B.1.617.2 have the AY.* designation. In the U.S., Delta lineages were classified as VOC on 15 Jun 2021 and downgraded to VBM on 14 Apr 2022. The major lineages of Delta correspond to Nextstrain clades 21A, 21I, and 21J.

Epsilon (VBM | B.1.429 and B.1.427 lineages)

The closely related lineages B.1.429 and B.1.427 were first identified in California in Mar 2020; the WHO labeled them “Epsilon” on 31 May 2021. In the U.S., Epsilon lineages were classified as VOC on 19 Mar 2021, and downgraded to VOI on 29 Jun 2021 and then to VBM on 21 Sep 2021. The Epsilon variant corresponds to Nextstrain clade 21C.

Zeta (VBM | P.2 lineage)

P.2 was first identified in Brazil in Apr 2020; the WHO labeled it “Zeta” on 31 May 2021. In the U.S., P.2 (Zeta) was classified a VOI on 26 Feb 2021 and downgraded to a VBM on 21 Sep 2021. The Zeta variant corresponds to Nextstrain clade 20B/S.484K.

Iota (VBM | B.1.526 lineage)

B.1.526 was first identified in New York in Nov 2020; the WHO labeled it “Iota” on 31 May 2021. In the U.S., B.1.526 (Iota) was classified a VOI on 26 Feb 2021 and downgraded to a VBM on 21 Sep 2021. The Iota variant corresponds to Nextstrain clade 21F.

Mu (VBM | B.1.621 and B.1.621.1 lineages)

Lineage B.1.621 was first identified in Columbia in Jan 2021; the WHO labeled “MU” on 30 Aug 2021. In the U.S., Mu lineages were classified as VBM on 21 Sep 2021. The MU variant corresponds to Nextstrain clade 21H.

State of Hawaii

Total Variants Identified

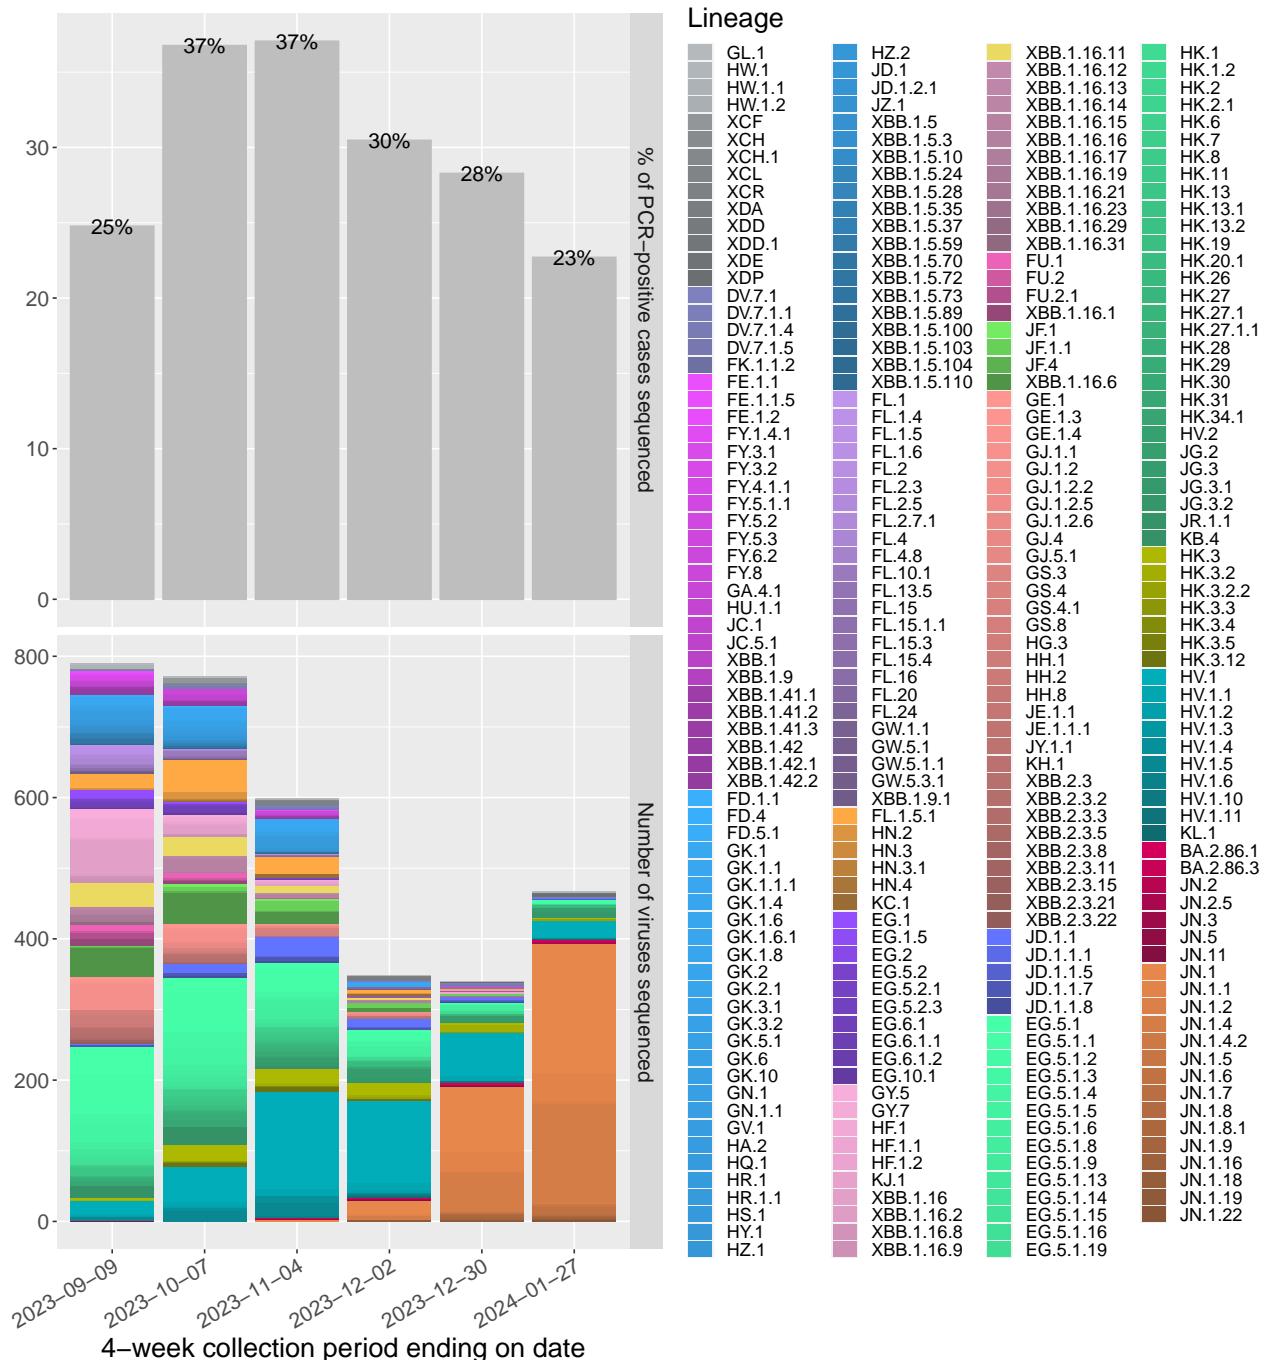

Figure Notes: Graph depicts SARS-CoV-2 variants by lineage identified in the State of Hawaii in the 4-week collection periods ending on dates shown (based on when the specimen was collected from a patient). Upper (gray) bars represent the percentage of PCR-positive cases from each period that were sequenced. Lower (color) bars represent the number of sequenced viruses from each period (numbers may change over time as additional sequences are reported; one sequenced virus equates to one PCR-positive case). This graph does not estimate prevalence in the population.

Estimated Variant Proportions for the State of Hawaii

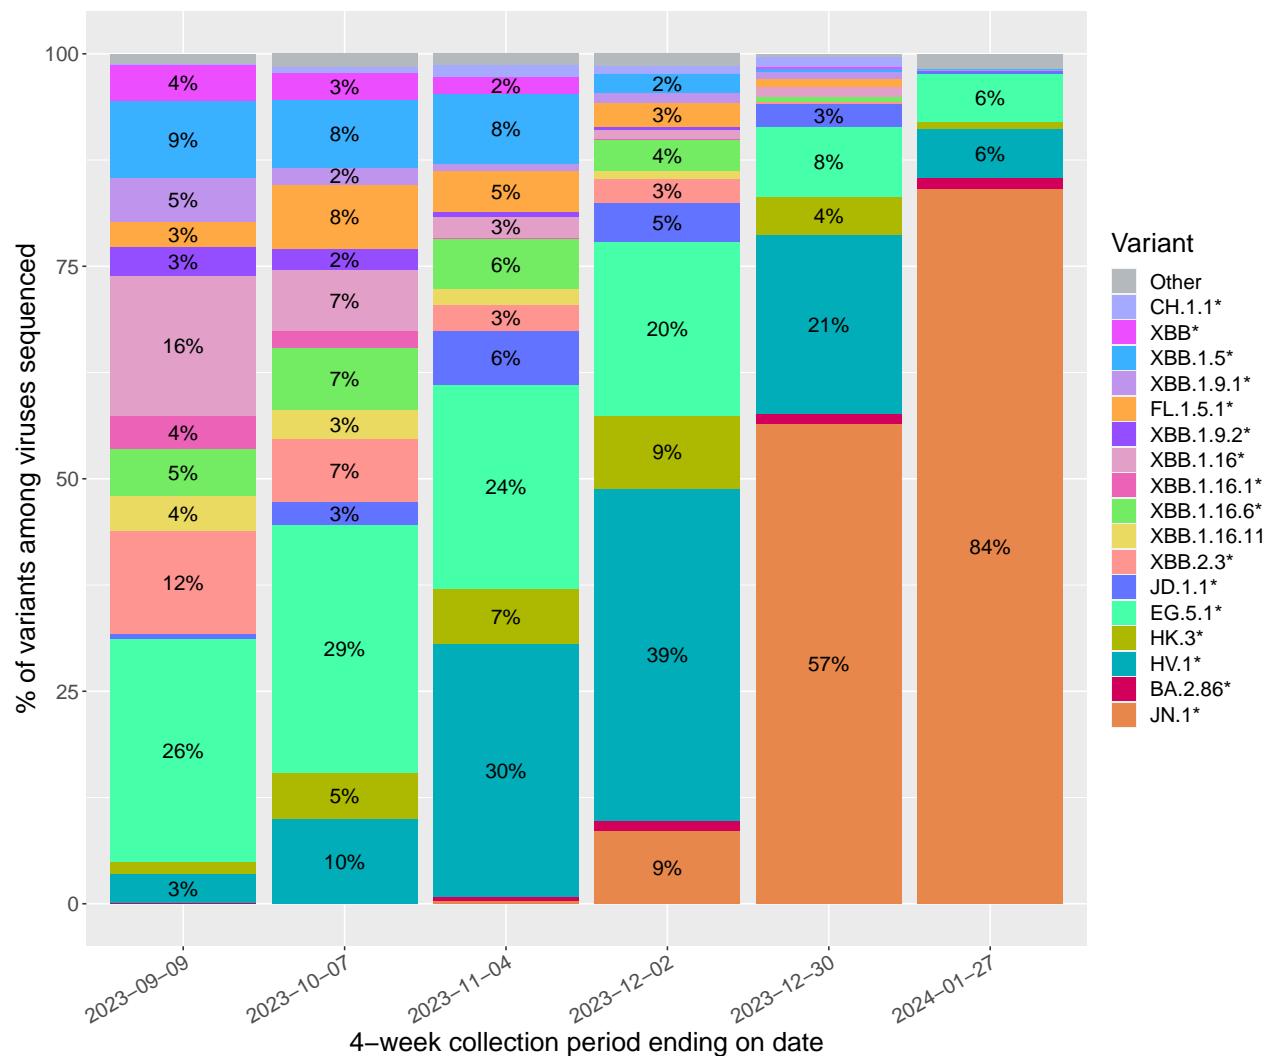

Figure Notes: Graph depicts estimated SARS-CoV-2 variant proportions (percentages rounded to the nearest integer) for the State of Hawaii, grouped in 4-week collection periods (based on the date of specimen collection). Not all positive SARS-CoV-2 specimens are sequenced and sequenced specimens are not a random selection of all COVID-19 cases. Graph only includes specimens selected randomly for surveillance. Percentage estimates based on historical data may change over time as additional sequences are reported. Each variant is defined by the parental lineage shown; an asterisk (*) indicates inclusion of respective sub-lineages. “Other” represents an aggregation of lineages not included in the other variant categories shown.

Omicron Variants Detected in the State of Hawaii

WHO label	Lineage	Earliest specimen collection date	Latest specimen collection date	Cumulative sequences
Omicron	Other	01 Apr 2023	31 Oct 2023	23223
	BA.1.1	27 Nov 2021	19 Jun 2022	7725

Note: Lineage “Other AY.*” represents an aggregation of different AY.* lineages in which each alone accounts for <2% of the cumulative Delta sequences from Honolulu County.

Maui County

Total Variants Identified

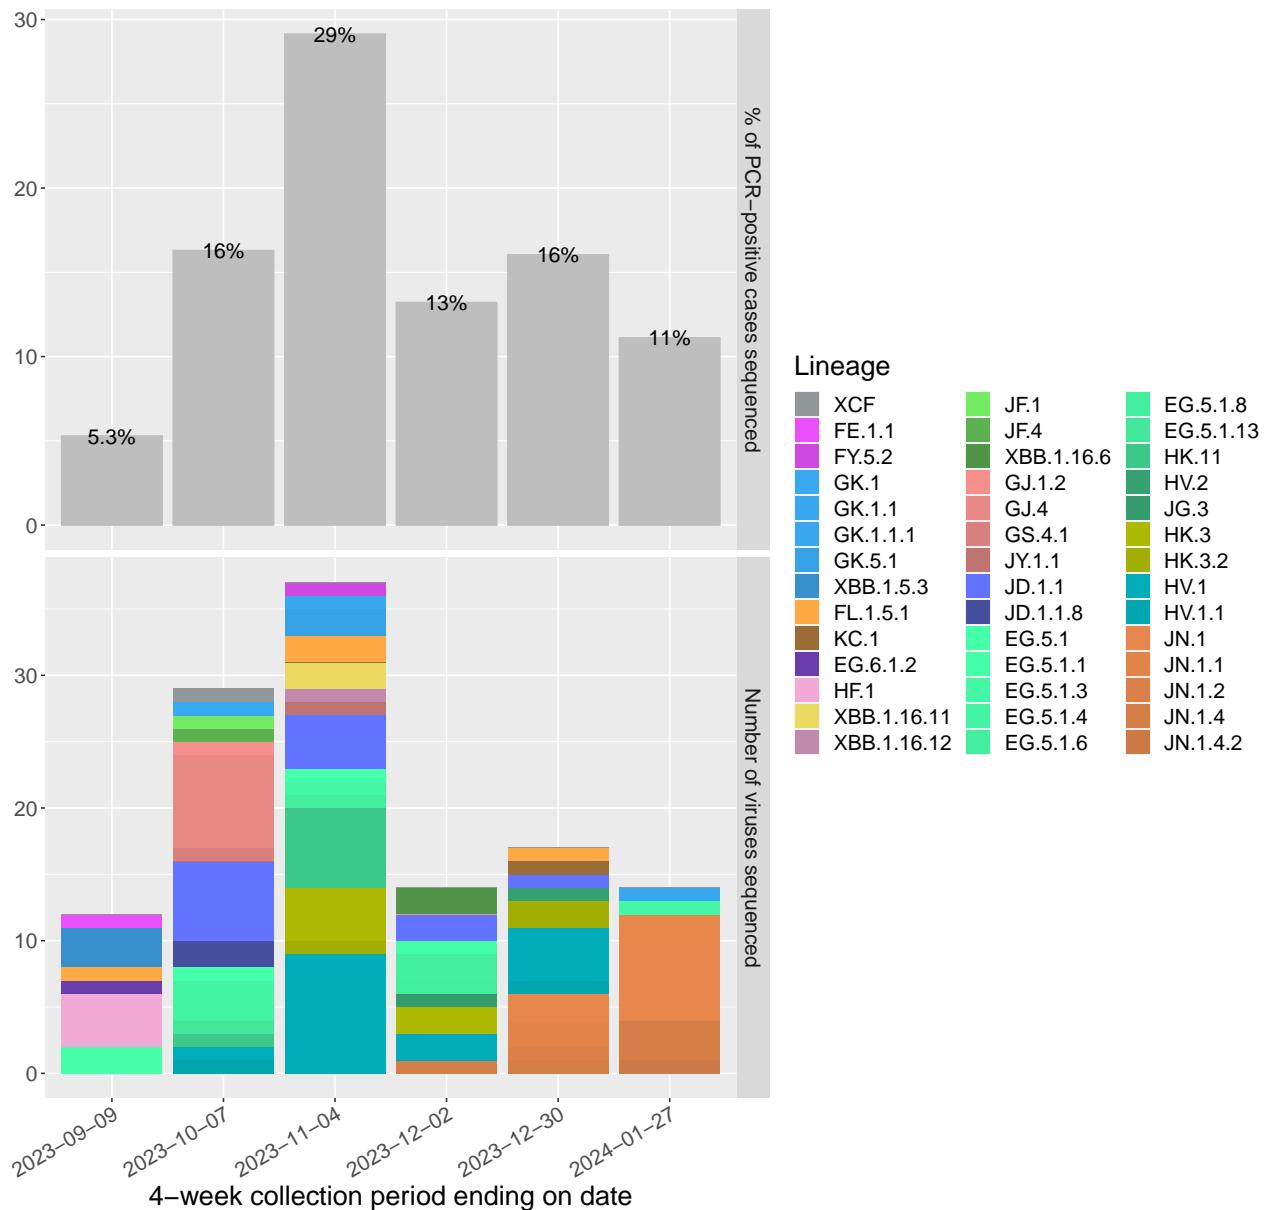

Figure Notes: Graph depicts SARS-CoV-2 variants by lineage identified in Maui County in the 4-week collection periods ending on dates shown (based on when the specimen was collected from a patient). Upper (gray) bars represent the percentage of PCR-positive cases from each period that were sequenced. Lower (color) bars represent the number of sequenced viruses from each period (numbers may change over time as additional sequences are reported; one sequenced virus equates to one PCR-positive case). This graph does not estimate prevalence in the population.

Estimated Variant Proportions for Maui County

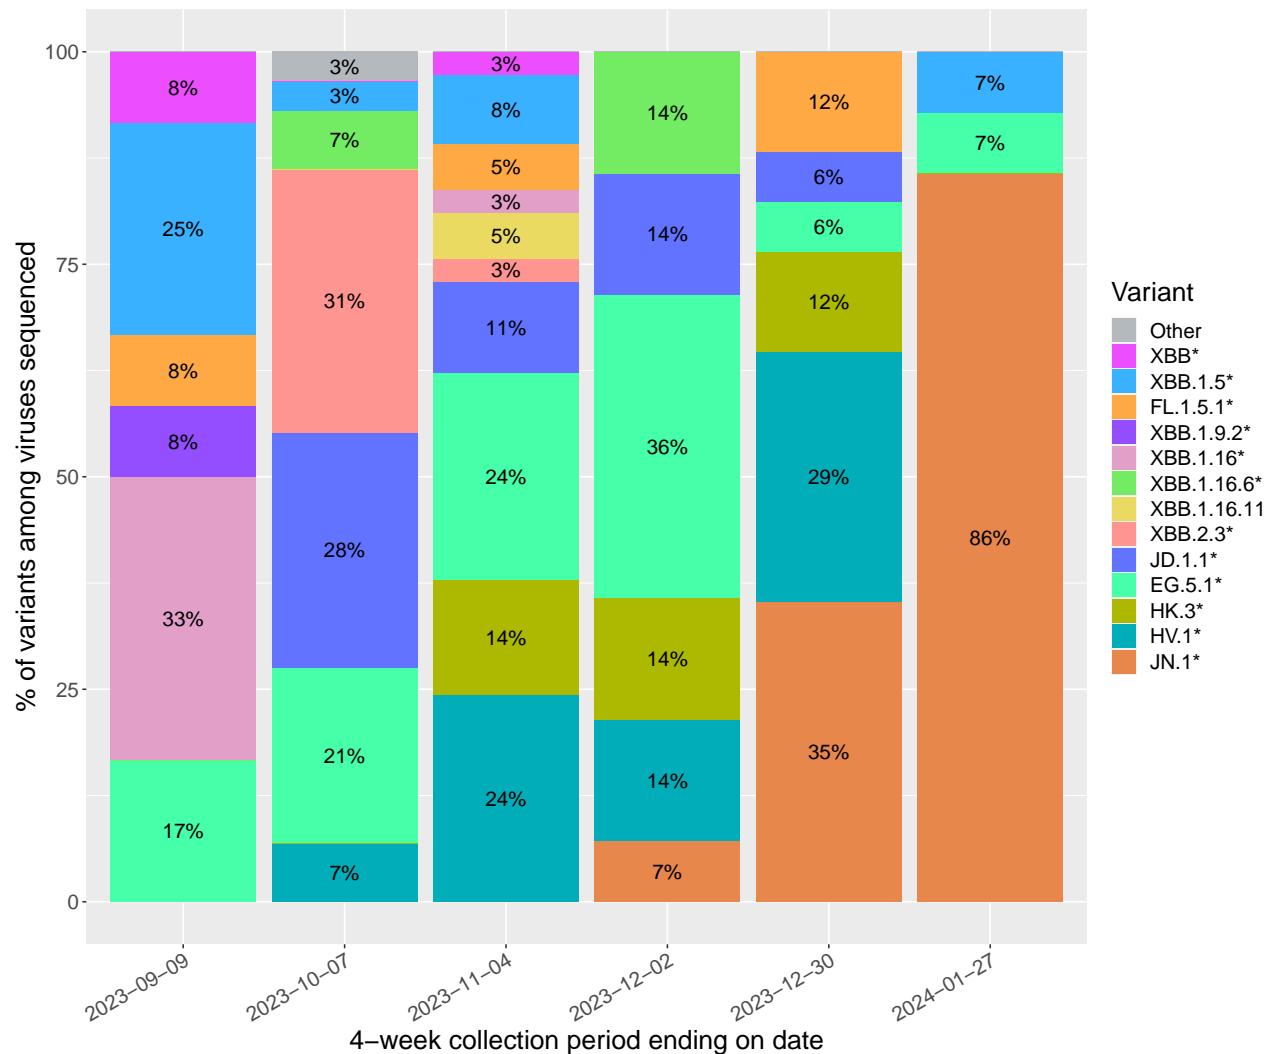

Figure Notes: Graph depicts estimated SARS-CoV-2 variant proportions (percentages rounded to the nearest integer) for Maui County, grouped in 4-week collection periods (based on the date of specimen collection). Not all positive SARS-CoV-2 specimens are sequenced and sequenced specimens are not a random selection of all COVID-19 cases. Graph only includes specimens selected randomly for surveillance. Percentage estimates based on historical data may change over time as additional sequences are reported. Each variant is defined by the parental lineage shown; an asterisk (*) indicates inclusion of respective sub-lineages. “Other” represents an aggregation of lineages not included in the other variant categories shown.
