Thank you for this opportunity to provide testimony. As a community member and public health advocate, I am writing to **strongly support the HAR 11-157 proposed rules update.**

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you for your consideration,
Bryscen Prothero APRN-Rx

Hi

My name is Janelle Jinbo. I am a medical provider in the state of Hawaii and have been for more than 10 years. I am a strong supporter of immunizations. Immunizations are one of the easiest things to do to prevent many diseases that increase rates of morbidity and mortality in Hawaii today. Vaccinations not only help prevent the individual from getting diseases, but also those around them. The state of Hawaii has lagged behind the rest of the nation in its laws to support the use of recommended vaccinations in childhood.

Thus, I thank you for this opportunity to provide testimony. I am writing to strongly support the HAR 11-157 proposed rules update.

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. Testimony HAR

Date:

Monday, October 22, 2018 8:59:15 AM

To Whom it may concern,

My name is Annalisa and I am the Health Aide at Farrington High School, my Hawaii Keiki Nurse had forwarded the testimony to me because vaccinations are a BIG issue in my school.

Heres some of the issues I run into:

* A lot of my students are coming from Philippines and Micronesia so I rely on the HAR often. What I find is the State of Hawaii and the CDC run differently for vaccine timelines. This is an issue because as I'm telling my student's they are non-complaint they go to the clinic and they go off CDC Guidelines.

* I wish the "Catch-up" schedule was written in the HAR. As I'm sure most will assume students in high school should have all vaccines that's NOT the case for this district.

* As of right now I have 40 student's non-complaint and the only thing that truly helps me is entering the student as a Provisional and them having to have an appointment card to enroll in school.

* Often they make an appointment but DO NOT go to appointment. As the health aide at Farrington High I hand deliver a reminder Provisional to the student with a copy of their appointment card, then I call parent to remind them as well and I mail a copy home. If they were to do a no show for there appointment this can cause a delay with other vaccines such as Dtap 2 & 3 and Polio 2 & 3 since both vaccines require 6 months between doses.

* I wish it was written in HAR that all students on EPI 12 A or B at end of school year will be EXCLUSION for the following school year.

* Having students start their school year with a Provisional then they attend and update Health Room they are served Provisional again which causes procrastination on complying in vaccines. I feel only one Provisional should be served and then there time starts. As long as they continue to receive vaccines on time no EXCLUSION should be served.

Thank you for your time,

Annalisa Felt
Health Aide

Aloha,

I am writing to state my SUPPORT of vaccination and examination requirements for the protection of Hawaii keiki. I am in a homeschool group where a parent is working to mobilize others to oppose this bill. I believe the idea of informed consent for vaccinations is not based on credible science and could put other children at risk of spreading preventable diseases by making the choice to not vaccinate their children while participating in a learning community. If I understand correctly, I am happy that the state is working to require that these individuals would vaccinate their children if they intend to have their children participate in the public/private/charter/homeschool community of Hawaii. If they choose to not vaccinate their children, I believe those of us who do take medically and scientifically based precautions to protect our keiki, especially those that are too young for vaccinations and especially vulnerable, that we should also have the choice to not expose our children to potentially life threatening preventable disease that these unvaccinated children could spread because their parents are not basing their decision on the overwhelming scientific advice and opinion of the medical community that vaccinations are safe and effective at preventing the spread of preventable disease.

Thank you!
A concerned parent

Bruce Anderson, PH.D.
Director of Health
Hawaii State Department of Health

SUBJECT: Hawaii Administrative Rules (HAR) Title 11, Chapter 157, "Examination and Immunization"

Dear Dr. Anderson:

Thank you for this opportunity to provide testimony on the proposed rules. I strongly support the HAR 11-157 proposed rule changes.

This update of the Administrative Rules would establish immunization requirements for school, post-secondary school, and child care facility attendance in Hawaii. The State of Hawaii, through the Hawaii State Department of Health, Immunization Branch, monitors the immunization levels of public and private individuals in the state, and is proposing these changes to HAR 11-157.

Why monitor and insist on high student immunization levels in Hawaii?

- More than 3 million persons die from vaccine-preventable diseases every year. A vaccine-preventable disease can be minimized or prevented through immunization.
- Vaccine-preventable diseases are passed through the school community by person-to-person contact.
- Vaccination of students – both for attendance and at registration – is a critical strategy for keeping schools and communities safe for children who **can** get vaccinated and for those who **cannot** because of medical reasons.
- School immunization regulations rely on **herd or community immunity** that occurs when a large percentage of a population has become immune to an infection, thereby providing a measure of protection for individuals who cannot be vaccinated.
- Vaccine-preventable diseases have a costly impact, resulting in doctor's visits, hospitalizations, and premature deaths. Sick children can also cause parents to lose time from work.

The Centers for Disease Control and Prevention (CDC) clearly states:

- State and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases (VPDs).
- Studies have shown that vaccine exemptions tend to cluster geographically, making communities with more vaccine exemptions at greater risk for disease outbreaks.

I respectfully request that the Hawaii Administrative Rule 11-157 be supported and passed for the reasons noted above.

Signed:

Judy Strait-Jones, MPH, MED

From: [REDACTED]
To: [REDACTED]
Subject: Testimony for HAR 11-157
Date: Tuesday, October 23, 2018 10:22:54 AM

Thank you for the opportunity to provide testimony. As a community member, public health advocate, former immunization program educator for this Department and current member of the Hawaii Immunization Coalition, I strongly support the HAR 11-157 proposed rules update.

The proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the ACIP. It is challenging enough to meet the immunization goals set for the public without administrative infrastructure to support the provider community. We need to have our rules as current as the information on a national level indicates.

Hawaii is lagging in desired immunization levels once children enter 7th grade and this lag continues throughout the adult and senior years. This is true both for vaccines which address communicable diseases such as HPV, MCV, and Tdap, and for those which prevent disease in adults with underlying diseases such as diabetes, cancer, heart and lung disease in the case of Pneumococcal vaccine.

Limiting exemptions for those who are able to receive vaccines is the responsible approach for minimizing exposure for those who are medically contraindicated to receive certain vaccines. Health care providers and health program administrators site the lack of strict requirements as a major barrier to carrying out ACIP recommendations and achieving the goals set by the CDC.

Please support the proposed changes to HAR 11-157.

Thank you,

Marian Phillipson

This email is public testimony against HEARING DOCKET NO. R-157-18-07 (Amendment to Hawaii Administrative Rules Title 11, Chapter 157, "Examination and Immunization.")

I am adamantly opposed to adding more vaccines to the vaccine schedule. The research has not been done to assess what the impacts are to children of adding more and more vaccines to the schedule.

Specifically, I am VERY STRONGLY OPPOSED to mandating the annual flu shot and the HPV vaccine. These vaccines are available if someone chooses it in consultation with their physician. I have discussed the HPV vaccine in depth with my doctor and she is not in agreement that the research exists to prove that this vaccine is safe. The vaccine only protects against 4 strains of the virus when there are over 200 strains of HPV, and there have been far too many injuries for it to be worth the risk. Further HPV is curable when treated and annual pelvic exams are effective for diagnosis.

The American College of Pediatricians has issued strong and serious warnings against HPV. They warn against the methods used for testing the vaccine safety and the health risks associated with HPV vaccine includes infertility due to premature ovarian failure among other health affects, including death.

Further, HPV is not a communicable disease that children might 'catch' at school simply by attending school.

Allow me to clarify that my children are vaccinated. However, I have done my research on the HPV vaccine and am convinced that this vaccine was rushed to market and is not safe. Its sole purpose is for pharmaceutical industry profits (\$300 per shot x 3 shots/student = many multi millions of dollars for the industry).

Again, I OPPOSE this Amendment of Chapter 11-157 of Hawaii Administrative Rules.

Mahalo,
Irene Kelly
[REDACTED]

To: [REDACTED]
Subject: TESTIMONY (HAR) Title 11, Chapter 157, "Examination and Immunization"
Date: Thursday, October 25, 2018 12:47:50 PM

To Whom It May Concern (i.e. which is all of us),

Re: Hawaii Administrative Rules (HAR) Title 11, Chapter 157, "Examination and Immunization."

I'm writing in response to the proposed addition of the following vaccines to the vaccine schedule here in Hawaii:

Hepatitis A, PCV, Rotavirus and Flu Vaccines for those attending childcare.
Hepatitis A, HPV, MCV and Tdap booster in 7th grade for K-12 students.
Tdap and Varicella for all college students and MCV (Meningococcal Conjugate Vaccine) for 1st year college students living in dorms.

Why are more vaccines being added to the list when the vaccine schedule as whole has NEVER been tested for safety or efficacy? Not one study.

Vaccines have also never been tested to determine if they cause cancer, even though they contain cancer causing ingredients. And what are the repercussions of injecting female DNA into males, and male DNA into females? Vaccines grown on aborted fetal tissue contain the DNA from what would have been that child. That aborted fetal DNA can insert into our own children's DNA (it's called Insertional Mutagenesis). We don't know what the repercussions are because it's never been tested.

You'll just keep adding more and more vaccines to the schedule without the proper testing having been done. When is it going to be enough? How many more children need to be maimed or killed until we choose the children over Big Pharma profits?

If you haven't figured it out yet, I am completely against adding more vaccines to the current Hawaii schedule. The proposed amendment to add more vaccines should be denied.

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

One could make the argument that schools should not have the HPV vaccine mandatory since it does not have the same transmissibility as other respiratory infections. However, sexual experimentation does occur in the teen years and early HPV vaccination not only is proven to prevent genital warts and other HPV-related cancers but will also confer better protection compared if given later. HPV vaccination has been proven to be safe despite what one may hear about unproven neurological side effects and it does not make a teenager promiscuous.

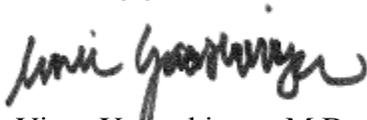

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you for your consideration.

Sincerely yours,

Vince Yamashiroya, M.D.

Re: STRONG OPPOSITION TO HAR-157

Aloha,

HAR-157 needs to be taken off the table immediately. Our ohana lives on the island of [REDACTED] and we strongly oppose this proposed rule change for the following reasons:

1. Where there is risk, there must be a choice. Vaccines carry risk. If you don't believe me, read the vaccine insert itself—not the generic “fact sheet” from the doctor, but the actual, lengthy, detailed insert that comes in the vaccine box. It is wrong to mandate a medical procedure that is known to cause harm and carries risk.

2. You are not protecting more children with these rules, you are intentionally putting more children in the way of the risks of vaccines. Parents shouldn't have to set their own child on fire to keep others warm. Have you read the study that shows the effects of the suggested vaccine schedule as a whole? No? Because there isn't one. How dare you try to mandate a medical procedure when there aren't adequate safety studies in place.

It recently came to light that the safety obligations put in place years ago by congress in the National Childhood Vaccine Injury Act were never upheld. This proves that we cannot trust the government to follow through with their promises when it comes to the health and safety of our children—so parents must. Stop making it harder for us to protect our children.

3. HPV is a sexually transmitted disease. It is disgusting and appalling that you are suggesting the HPV vaccine be a requirement for children to attend school. What kind of gatherings are happening that they need supposed protection from an STD? It is also the most controversial vaccine because of the debilitating side effects that have ruined the lives of many across the world.

4. Requiring the flu vaccine is inappropriate. Did you know that the flu vaccine is contraindicated for people with egg allergies? Egg is a common allergy. Most people don't know this nor is the information shared and the basic question “are you allergic to eggs?” asked when the shot is administered. Plus the efficacy rate of the flu vaccine is so low, it's laughable that you'd add it to the list. It shows that you truly do not have the best interest of children in mind.

5. Stop re-defining what a “group” is – Your wording about what a “school” is concerns me. It now defines “school” as a “congregate setting for educational purposes.” That is too general. Even if you listed “exceptions” in a later paragraph, this definition is too vague and I ask that it be changed to “public school.” If you want to have rules for public school, that's one thing, but many, many, many of us have opted to not send our children to public schools for a wide variety of reasons. Stay out of our options. Stay out of our private schools, stay out of our daycare centers, stay out of our homeschool co-ops, stay out of our playgroups. Stay out. If we wanted our children to be forced into a “one size fits all” mold, we would send them to public school. But we haven't. We have created our own options because there is no “one size fits all” when it comes to anything—including education and medical decisions.

6. Medical Freedom is a basic right. You don't know the medical concerns, religious beliefs, or educational background of every individual that you are trying to regulate. Stop pretending you know better. Stop creating blanket rules based on what you believe everyone should believe. Medical freedom should be protected so that INDIVIDUALS can make educated INDIVIDUAL decisions when it comes to their health. Health is personal and varies from individual to individual. Parents have the right to informed consent and making educated decisions when it comes to vaccines. Stop trying to take that away from parents.

Subject: Please do not mandate vaccines
Date: Saturday, October 27, 2018 4:15:40 PM

Please do not mandate vaccines. They have been implicated in so much injury, disability and death. 3.9 billion paid out to vaccine injured families. Do not mandate or increase your vaccine schedule. I have been a RN for 8 years and I was 1 year away from graduating from Marquette as a Nurse practitioner when my son was vaccine injured at his first set of vaccines. They injected him with 7 vaccines in 3 shots and one oral. He screamed for 18 months. His body was so stiff. He banged his head and did not relax into our arms until 18 months. Do not mandate these vaccines. The rate of death from any of these diseases was already down 90% by the time the first vaccine came to market. Please go to Learntherisk.org, watch Vaccines Revealed, watch Vaxxed, Listen to Dr. Seneff from MIT. You do not want to be part of these permanent injuries, disabilities and deaths.

Thank you for reading this,

Date: Sunday, October 28, 2018 6:27:37 PM

To Whom It May Concern,

Thank you for this opportunity to provide testimony. As a nurse, community member and public health advocate, I am writing to **strongly support the HAR 11-157 proposed rules update**, as these proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

Recent outbreaks of vaccine-preventable diseases in our state and across our country can be attributed to the decrease in vaccination uptake in our community, thus illustrating the importance and value of vaccinations.

The effectiveness of vaccinations in our community depends on those that are blessed in being healthy enough to receive vaccinations, as those whose immune systems are compromised--our most vulnerable (newborns, elderly, and the immunocompromised), are not able to receive vaccinations.

The health of our community is interdependent. In order for vaccinations to work in preventing disease outbreaks, a concept called, herd immunity is necessary. Herd immunity, indirect protection from a contagious disease, occurs only when a high percentage of the population is immune to the disease, often through vaccination.

Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized. Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you for your consideration,
Nagisa Kimura, RN, MPH

Subject: legislation to increase vaccination requirements
Date: Sunday, October 28, 2018 7:27:19 AM

I have recently become aware that the Hawaii Department of Health is considering legislation to greatly increase the vaccination requirements for children to include HPV and Meningococcal vaccine in seventh grade, Hepatitis A for all children, additional doses of MMR, and flu vaccine for young children. All of these proposed changes are in the wrong direction. Already the childhood vaccination schedule includes an excessive burden of aluminum exposure. Aluminum is present in high amounts and in an especially toxic formulation in the HPV vaccine. Aluminum is also used as an adjuvant in Meningococcal and Hepatitis A vaccine. The flu vaccine often contains mercury, possibly the most neurotoxic metal known to biology. While MMR contains neither aluminum nor mercury, my research on MMR and that of others have shown that MMR is statistically linked to autism. I believe the causal link is due in part to the fact that MMR has been found to contain glyphosate as a contaminant. Glyphosate works synergistically with the glutamate present in the vaccine to cause neurotoxicity.

We face an epidemic in autism, ADHD, food allergies and autoimmune diseases among our children today, and I believe that excessive vaccination is playing a critical role in that epidemic. HPV vaccine in particular has had a very checkered history, with many reports showing up on the web of severe adverse effects leading to either death or a permanent severe disability among affected children. Japan has made the very wise decision to stop recommending HPV. Our country should be following their lead.

Given the rising awareness of the toxic effects of over-vaccination, Hawaii should be considering dropping requirements for some of the already existing vaccines on the schedule. Instead, there is a long list of new vaccines being proposed. In the interest of safeguarding our keiki, I urge you not to introduce any new vaccines on the schedule.

Thank you for your consideration.

Stephanie

Subject: HPV and vaccines.
Date: Sunday, October 28, 2018 10:24:07 AM

Agammammunoglobulinaemia. Big word - from the middle of the last century, before almost all vaccines existed. No Polio vax, no measles, mumps, meningitis, rubella (chicken pox) HPV, Hep A, B, or C....etc.

This agammammunoglobulinaemia was the condition found in which many people cannot make antibodies - this is a little tricky and requires logic and retention so some don't make it through this train of thought/logic/facts.

The definition of "vaccine effectiveness" (a legal term with no relationship between health, disease curing or prevention and effectiveness in those matters) is "antigen response" So first: What is an antigen?

An antigen is a substance in your body that your body desperately works to get rid of - it could be an allergen like pollen, dander, or a food substance. It could be a toxin. A pathogen. It could be dead cells carried away from a cut, scrape or wound - and EVERY substance in EVERY vaccine is an antigen - your body DOES NOT WANT IT INSIDE OF YOU!

So the body makes antibodies to remove those substances if possible. Not all antibodies are alike. The antibody to remove one of the 4 or 9 out of over 120 HP viruses will not remove the aluminum the shot just shoved into your muscle tissues. Nor will it remove the carcinogenic and neurotoxic formaldehyde in your vaccine, or the Polysorbate 80 (or 20) that will damage your blood-brain barrier and allow toxins to enter your brain which shouldn't get there. That's why you HAVE a blood/brain barrier.

So you get injected with a group of toxins - some neurotoxic, some plain poisonous, some carcinogenic, some genetics from insect slurry, dog parts, calf pieces, egg goo, monkey chunks, and the ever popular aborted human baby genetic line of cells. In the case of HPV vaccines - they use GENETICALLY MODIFIED (never proven safe*) yeast - i'm sure every woman's friend - and viruses which have NEVER BEEN PROVEN TO CAUSE CERVICAL OR ANY CANCERS - EVER!!!!

These people with agammammunoglobulinaemia developed the same childhood diseases as everyone else - at the same rates. More interesting is that they cured their selves in the same time frame and with the same cure rates as people that can make antibodies.

SO ANTIBODIES ARE NOT WHAT CURES DISEASES AND LIKELY DOESN'T PREVENT THEM either in many cases. Since the vaccine crowd (i call them JABBERS for obvious and ambiguous reasons) believes that antibodies are necessary for the immune function to work - THEY ARE WRONG - flat out wrong.

So basically, the HPV shot is a stupid GUESS. The university in Vancouver used Mercks own statistics and proved protection as claimed was absolutely impossible. They also proved that the children that die from anaphylactic shock and those getting headaches develop swelling in their lower brain stem. If severe enough, that can shut down all your motor functions - no heartbeat, breathing, muscle control - and results in situations like that poor girl who got her HPV shot, LITERALLY TOOK SIX STEPS, AND THEN DIED!!!

The HPV is causing - PROVEN to cause reproductive harm to females. In Australia, one girl took her HPV shots at age 14 and entered menopause at age 16. Proven to be caused by the Gardasil. She is not the only one.

So not only is there no proof that HPV viruses cause cancer and that the obverse is shown in studies, not only is there no proven effectiveness of the HPV vaccines to prevent cancer, or even HPV infections - people taking the HPV vaccines are PROVEN to have more likelihood to develop other HPV infections. Proven.

So the shot is targeted wrong, doesn't work as claimed and has the highest degree of damages to the victims of "immunizations" of any vaccine - ever. And we thought Smallpox was bad...That vaccine may not have killed and damaged (reproductively, but mostly neurologically) as much on a per-capita basis as this HPV [REDACTED] does...

So to mandate this vaccine, and violate human rights to self-determination is an abomination, a crime, a psychopathic power play by your group. When one realizes that THERE IS NO POSSIBLE HERD IMMUNITY FROM VACCINES your stupid and erroneous assertion/argument that it's needed for the "good of the herd" goes down the drain. In China there is 99% vax compliance for measles and 707 outbreaks in one year. Total herd immunity failure. In S Korea (2005) it was decided that they had a "chicken pox problem" and in multiple steps increased vaccine compliance. By 2015 they estimated the general populace had 95% compliance, and the under 18 month age group was at 97% vax compliance for chicken pox. Their chicken pox and chicken pox outbreak rate had not only increased MORE than each increase in vaccination - their end result is NOT herd immunity - as the chicken pox rate is TRIPLE what it had been in 2005. Statistically, when one vaccinates - that disease increases.

So you violate the constitutionally recognized human right (they don't come from govt - so govt has no right to take those rights away. If you conversely argue that you are in fact a corporation as you are in reality - no corporation has any regulatory authority over any human being at all - in both cases your arguments are [REDACTED]) unlawfully - which makes YOU treasonous. You literally turn the state into a literal dictator and them into literal slaves - which is no doubt your intent. You have the state practicing medicine without a license - and using the most ignorant, stupid, dangerous, and insane diagnostic criterion of "one size fits all". Thus you show imbecility, spiritual retardation, ignorance of the highest laws of the land, and psychopathic control issues.

[REDACTED] you - i won't even be vacationing in your damn state again if this passes. Only done so twice, but not again, if.....

Bradley S Roon - non corporation (Notice the name is not in ALL CAPS which always ALWAYS designates corporations when used by fictitious legal entities. Note - fictitious legal entity - corporate HAWAII - literally DOES NOT EXIST. It is simply a mind construct agreed upon by some people.)

Subject: HAR 11-157
Date: Monday, October 29, 2018 5:49:27 PM

Aloha,

My name is Lyndee Sprenger and parent of 4 toddler and elementary age children. All of my children have inherited genetic mutations that make it difficult for them to process chemicals, manufactured and processed foods and other environmental pollutants that many children have no problem detoxing out of their systems. They may look normal and appear healthy, but their genetic makeup allows for them to be more susceptible to even "normal" substances and can cause violent reactions.

Unfortunately we only became aware of this information after severe allergic reactions to vaccination which led to autoimmune issues in both of my older children causing medical as well as other impairment. While we have personally researched long and hard to find the cause of injury, many medical professionals do not recognize the genetic mutations listed yet, and will not support our refusal on medical means to continue to vaccinate our children. This has led to strong beliefs on our part, where we have had to cling to FAITH and the only way we have been able to protect our children is to state we will not vaccinate for their safety based on our religious beliefs. This is true in our case, however it should NOT be the only way we can have our children educated and also choose not to vaccinate. We are making informed decisions about the health and safety of our children based on the science and knowledge we have. Much of this knowledge is learned from personal experience and deep research learned from these sometimes traumatic experiences.

Please allow us the freedom to make choices for our children based on what we believe is safe for them. Medicine is changing and advancing everyday. Things we thought we knew 20 years ago are proving to be wrong today. Please don't let our children be an experiment. Let us as parents decide what is best for our children.

Please do not mandate HAR11-157.

Lyndee Sprenger

Aloha,

I am writing to you to oppose HAR 11-157 which is a violation of our health care privacy, rights and freedom. I am a stern believer in body autonomy. And I am very concerned Hawaii might follow California's lead in taking that right away from its citizens. Forcing children and healthcare workers to inject themselves with something that the government has deemed critical to society's health at large is a scary thought. I find it interesting that the government has not deemed clean drinking water to the residents of Flint, Michigan and other cities around the nation, important to their health? Yet when a new vaccine can be mandated to the vaccine schedule, and billions of dollars are to be made off that introduction, it seems VERY important to our health. lol. Money aside lets consider the vaccines being questioned, the Hep A and HPV vaccine, If you spend any time doing real research you will find that HPV and Hep A are low on the list of medical concerns. And if you research the HPV vaccine and the injuries resulting from that vaccine it far outweighs the lives saved. Japan and Denmark did not pull that vaccine for no reason. And finally as a parent and healthcare worker I know that NO research has ever been done on the effect of the magnitude of vaccines children receive in America today. When I was a child we received a handful before entering school, today the number these small children have received is astronomical and continues to grow. It is irresponsible medicine. And unfortunately pharmaceutical companies have a heavy hand in Healthcare and government today. But as government elected officials I plead with you not to take their handouts and to really do your research. Please help protect Hawaii's keiki. I am not anti-vaccination, I am for choice in vaccination. Please protect our choice. And do your research. Thank you very much, Tara Mattes

Thank you for providing the opportunity for me to provide testimony. I am a community pediatrician in East Hawai'i, and i would like to voice my strong support for the HAR 11-157 proposed rules change. We have a large unvaccinated population and visitors from every corner of the world. I tire of treating serious and vaccine-preventable diseases and of seeing children and young adults with life-threatening conditions that might have been avoided, like cervical cancer. Given the history of infectious diseases in these islands, and how the ravages of diseases now vaccine-preventable helped lead to the collapse of the Hawaiian Kingdom, I cannot strongly enough encourage the Immunization Branch of the Department of Health to adopt this common-sense rules update.

Thank you for your consideration.

Subject: HAR 11-157 proposed rules update
Date: Monday, October 29, 2018 5:48:24 PM

Aloha,

As a practicing pediatrician and public health advocate, I am on the front lines of keeping our keiki healthy and disease-free.

I am writing to **strongly support the HAR 11-157 proposed rules update.**

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

I have seen preventable diseases such as measles, mumps, hepatitis A, hepatitis B, pertussis, and tetanus impact children significantly. The benefit of vaccination is for everyone to remain healthy, while exemptions of any kind put everyone at risk, but significantly increase the risk of the most vulnerable.

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you for your consideration.

Sincerely,
Bryan Mih, MD MPH FAAP

10/29/18

To whom it may concern,

I am a state senator for [REDACTED].

I oppose any increase in mandatory vaccinations for any category of workers, students, or people.

The total vaccination schedule today includes about ten times as many vaccinations as we had 20 years ago, and more come on line every year. Yet the combinations of vaccines given have never been proven safe or effective. The sum total of heavy metals in the adjuvants to all these vaccines amounts to a clear health hazard. It has not been proven safe.

I am not an 'anti-vaxxer,' and I am also not 'anti-science.' I am pro-freedom and pro-individual liberty. Like many others I also believe in natural health which does not come from chemicals, but from one's inherent, God-given powers to grow, heal, and maintain health when free from harmful influences, such as pharmaceuticals. You may not feel the same; That is your right, but you do not have the right to take this health freedom away from others.

In fact I have a degree in biology and respect science greatly. One of the primary principles of science is the precautionary principle; if you are unsure of the consequences of an action, proceed cautiously or not at all. This scientific principle should be applied here, instead of the reckless promotion of untested vaccine protocols.

The adjuvants in vaccines have never been proven safe, either in individual doses or in the large combinations of vaccines given today. The active ingredients have also never been proven safe or effective in the same sense that any modern medicine must be proven. The very fact that vaccine manufacturers have been granted immunity from liability is telling: the only other industry granted such immunity is the nuclear industry. The logic is that the liability is so vast and the public need so great that special immunity is needed. But as with nuclear industry, there is no true need and the protection comes from political power and financial influence, not from public safety concerns.

Some say we must compel vaccines to protect ourselves and our kids. But if vaccines really worked, then one wouldn't care if my child or your teacher is vaccinated or not; one's vaccines would protect one. I am aware of the 'herd-immunity' argument here, and I am also aware of its scientific fallacy.

The pharmaceutical industry is free to promote its products, despite lack of safety studies. And you are free to accept them if you wish. But you have no right to compel any one to submit to such hazards, and to take away anyone's freedom of choice regarding how they care for their own body.

The number of vaccines recommended or required in this country is much greater than in other modern countries, such as the E.U. Is this because the other countries are not as 'scientific' as the U.S.? Or is it possible that what we accept as 'scientifically justified' is influenced by the massive outreach of the pharmaceutical industry in our country? And is it possible that you are being used as a marketing device of this pharmaceutical industry?

If there is any question about this, then further compelling the use of vaccines is irresponsible and immoral. You must stop doing so.

Re: *Notice of Public Hearing Docket No. R-157-18-07*

Aloha Director Anderson,

Kaiser Permanente Hawaii appreciates the opportunity provide the following comments for the proposed amendments to Hawaii Administrative Rules (“HAR”) Title 11, Chapter 157, “Examination and Immunization”. Kaiser Permanente Hawaii supports the proposed amendments given that they update the immunizations required for schools, post-secondary schools, and child-care facilities as well as the manner and frequency of their administration in accordance with current recognized standard medical practices.

Kaiser Permanente Hawaii provides and coordinates complete health care services for over 253,000 members through 21 medical office buildings in the state. We are a total health organization composed of Kaiser Foundation Health Plan Hawaii Region, Inc., Kaiser Foundation Hospitals, which provides hospital services to our patients, and the Hawaii Permanente Medical Group, comprised of approximately 600 physicians who provide or arrange care for patients throughout the region.

The enactment of Act 231, Session Laws of Hawaii 2013, allowed more rapid compliance with federal recommendations for vaccinations. The current state rules process for updating the immunization school entry requirements is very lengthy and can take years. The Centers for Disease Control (CDC) Advisory Committee on Immunization Practices (ACIP) meets three times a year to ensure immunization schedules and vaccine administration guidelines, are providing the best protection against infectious diseases in the population. These proposed amendments by the Department of Health are being done pursuant to Act 231 and adhere to the CDC’s ACIP recommendations as they apply to the specific list of vaccines as required for school entry and attendance in the state.

We note that HAR Title 11, Chapter 157 was last updated in 2001. Therefore, the “*Guide to Hawaii Pediatric Immunization Requirements*” is obsolete and is not in alignment with the CDC’s ACIP schedule. This has led to confusion in terminology, which has in turn led to duplication in vaccine administration. A notable example is inconsistencies in administration of the hepatitis B vaccine. The ACIP recommendation states, “the final dose in the hep B vaccine series should be administered no earlier than 24 weeks,”. In contrast, the “*Guide to Hawaii*

Pediatric Immunization Requirements” states the third (and final) dose should be given, “not before 6 months”. This difference between the ACIP recommendation and the “*Guide to Hawaii Pediatric Immunization Requirement*” has led to infants needing an extra injection, which leads to increased cost and time for the family as well as increased cost and time to the health care system, not to mention added discomfort to the child.

In conclusion, Kaiser Permanente Hawaii strongly supports the proposed amendments to HAR Title 11, Chapter 157 because they conform and align to the CDC’s ACIP recommendations. We believe that the recommended vaccines are a safe, efficient and cost-effective way to protect against vaccine-preventable diseases.

Thank you for your time and consideration. Please do not hesitate to contact Jonathan Ching, Specialist, Government Relations at [REDACTED] or [REDACTED] if you have any questions or require additional information.

Hawaii Department of Health, [REDACTED]

RE: public hearing for the proposed amendment and compilation of Hawaii Administrative Rules (HAR) Title 11, Chapter157, “Examination and Immunization.”

Strongly **Oppose** Administrative Rules (HAR) Title 11, Chapter157, “Examination and Immunization.” Taking on the ACIP guidelines is not in the best interest of our Keiki’s overall health or best practice of health guidelines for the State of Hawaii.

Dear Hawaii Department of Health,

Thank you for taking the time to read my testimony completely and taking into strong considerations of my testimony. My Name is Dawn Poiani and I am a mother of 3 boys and a health advocate residing in the State of Hawaii. I strongly **oppose** the state of Hawaii taking on the ACIP guidelines as their best practice for immunization. I see serious issues with this proposed rule as there are some inherent flaws in the ACIP vaccine recommendations and . If the state of Hawaii follows the ACIP Vaccine schedule guidelines we are adding multiple new vaccines to our already vaccine burdened schedule. These additional vaccine recommendations have never been tested for safety and synergistic affects of against our current schedule. I have watched hours of multiple different hearings of ACIP and witnessed how new vaccines are approved, and I must say, these hearings are disturbing to watching. I witnessed the ACIP gleefully and irresponsibly approve more vaccines to the pediatric schedule using weak vaccine science and underpowered correlation studies. Every vaccine is approved solely on the safety of the vaccine and if the vaccine will affect the serology of the other vaccines. An example is of the ACIP approval process of approving a new adjuvant in the Hep B vaccine. There are no safety studies done on the new adjuvant given with the currently used adjuvants or the safety of adding it to the schedule as well as there were some risk concerns that the ACIP voted to watch after the Hep B was put on the market. Watch this video and you will get the sense of how

vaccine safety is an after-market concern. https://youtu.be/L_JJMpe00mM. Do we really want to make our children the test subject for the safety of every vaccine that the ACIP recommends adding to our children's vaccine schedule? I don't, these are our children our future! The US Government HHS (Health and Human Services) has never conducted a single safety study as part of the fulfillment of the National Childhood Vaccine Injury Act of 1986 which grants legal immunity to vaccine makers. These safety studies were assigned to HHS in an effort to be the checks and balances over pharmaceutical safety studies and recommendations, because they have no liability for vaccine injuries and death. HHS was also to conduct and report these findings every two years to Congress; these studies have never been done! Exposure to viral particles and adjuvant (aluminum) in vaccines, along with routine exposures to other immune disruptors are '**antigen overload**' for the immune system that could shift the induction of chronic health problems (e.g., increased asthma, ocular or skin allergies, ovarian failure, gastrointestinal conditions or neurological and autoimmune diseases). We are seeing a rapid rise in chronic disease and neurological disorders in the State of Hawaii and across the world. There is only one environmental exposure that can be found in most states as well as most other countries, and that is vaccines. So are vaccines the potential cause of the rise of chronic disease and neurological issues? Are we trading the prevention of a handful of diseases for chronic health issues and neurological problems? We don't know because there has never been an effective study done looking at the vaccine schedule. It is claimed that it is unethical to do a study like that, so the solution is to just put the next new vaccine on the schedule, and see what happens. The ACIP continues to add vaccines to the schedule based on information and studies they receive from vaccine makers that can and do tweak data and find new ways to record reactions and data, in their studies, in an effort to make their vaccines look safer and or more effective (ex. <http://probeinternational.org/library/wp-content/uploads/2014/09/chatom-v-merck.pdf>, <https://www.classaction.com/zostavax/lawsuit/>). Additionally, ACIP calls on VAER to report vaccine injuries as their source of safety once the vaccine is on the market, but VAERS is voluntary and dismally under used for reporting (estimated between 1-10%) yet this is the safety science? There are over 200 vaccines currently being developed, how many more will they add to the schedule without any safety studies against our schedule, how many will be approved gleefully

with poor science? There is only one ingredient and one vaccine adequately studied. From these two studies the mantra has been “the science has been settled that vaccines are safe and effective.” **If the dose makes the poison**, at what point do the trace amounts of aluminum, Antibiotics, Egg protein, Formaldehyde, Monosodium Glutamate, Thimerosal and many many antigens become the tipping point and destroy our children’s health and vitality? I cannot understand how any doctor, immunologist, or virologist can emphatically say that adding to our vaccine schedule is safe. The State of Hawaii should set it’s own schedule based on a **Core Group** of vaccines that are specifically targeted to protect our demographics and geographical tendencies. We have no idea how any vaccine will affect our diverse ethnic population or the affect of our keiki’s overall health by more vaccines to the schedule. It is medically unethical and irresponsible. Are we really going to play a Russian roulette game on our Keiki? The future health of Hawaii deserves better than that. These additional vaccine recommendations do not provide the strength of the benefit to risk ratio to recommend adding further vaccines to the schedule.

By adding the HPV vaccine to the schedule requirements for school entry at 7th grade provides absolutely no benefit to the spread of disease in a school environment. The HPV is a cancer preventative vaccine that may or may not protect the student 20-40 years later from cancer. Additionally, there are serious issues with the way the HPV vaccine studies have been conducted. Manufacturers, did not have to prove that vaccine prevented cancer and were allowed to use precancerous lesions as “surrogate endpoints” in the clinical trials. Scientists do not know if the decline in cases of precancerous lesions will translate into fewer cases of cervical cancer in 20-30 years. None of the participants in the original pre-approval clinical trials received a true saline placebo, an aluminum containing adjuvant was used. Manufacturers never tested HPV vaccines on human fertility (acknowledged in the package insert). Manufacturers never tested HPV vaccine to discover if they might cause cancer (package insert say vaccine has never been tested for “carcinogenicity”). <https://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM111263.pdf>. The original Gardasil clinical trials used a new metric, “**New Medical Conditions**,” as a way to claim that serious health problems after vaccination were unrelated to the vaccine or aluminum-containing placebo.

More than 50 percent of all clinical trial participants reported “new medical conditions,” including infections, reproductive disorders, neurological syndromes, and autoimmune conditions. The FDA never questioned this novel metric. Lawsuits have been filed against Merck, GlaxoSmithKline, and government health agencies around the world, including the US, India, Columbia, Japan, Spain and France. The US government earns royalties from Merck and GSK for licensing HPV vaccine technology (this is an egregious conflict of interest!). Why would the state of Hawaii mandate the HPV vaccine, when the vaccine carries these kinds of flaws in the HPV vaccine safety assurance? As of June 2018, the VICP paid out or settled 126 HPV vaccine claims. A total of 49 people received \$5.8 million after the U.S. Court of Federal Claims found Gardasil injured them <https://www.hrsa.gov/sites/default/files/hrsa/vaccine-compensation/data/monthly-stats-june-2018.pdf>. “The HPV Vaccine On Trial: Seeking Justice for a Generation Betrayed” by Mary Holland. Let the HPV be an optional vaccine and not mandated to the required school entry **Core Vaccines**.

According to the manufacture’s package inserts, the rate of “**serious adverse events**” **from meningitis B vaccine are 2.1% for Bexsero (Novartis)**, <https://www.fda.gov/downloads/biologicsbloodvaccines/vaccines/approvedproducts/ucm431447.pdf> and **1.8% for Trumenba, (Pfizer)**, <https://www.fda.gov/downloads/biologicsbloodvaccines/vaccines/approvedproducts/ucm421139.pdf>. Based on this information, if the roughly 58,000 HI college and undergraduate students receive either of these vaccinations, approximately 1,218 students will experience “severe adverse events,” including death. In 2016, there were 2 cases at Rutgers University, treated with antibiotics and fully recovered. The risk of “**SERIOUS ADVERSE EVENTS**” from the vaccine is much higher than the risk of becoming ill with bacterial meningitis. At a cost of \$100-125 a dose, this is a serious cost to the State of Hawaii. Although Bacterial Meningitis can be a serious disease, it is not common and is very difficult to acquire. The best outcomes in cases of bacterial meningitis occur when the infection is detected early and antibiotics are administered. Public Health initiatives to enhance the awareness of the early symptoms of the infection and the importance of securing appropriate treatment would be impactful. There is no public health situation present that warrants infringing on a person’s right

to decide what medical treatment and intervention is appropriate for him/her and allowing doctors and students to make these decisions for health care is essential.

Hep A cannot become chronic disease and most (70%) of infections in children younger than age 6 are not accompanied by symptoms according to the CDC. To avoid “**antigen overload,**” the Hep A Vaccination should only be recommended for individuals in high-risk settings and not for the requirement of school attendance.

Examples would include people that are at increased risk for acquiring hepatitis A virus (HAV) infection?

- Persons with direct contact with persons who have hepatitis A
- Travelers to countries with high or intermediate endemicity of HAV infection
- Men who have sex with men
- Users of injection and non-injection drugs
- Persons with clotting factor disorders
- Persons working with nonhuman primates
- Household members and other close personal contacts of adopted children newly arriving from countries with high or intermediate hepatitis A endemicity
- People who have chronic liver disease.
- Homeless population.

The cases of Hep A we have seen in Hawaii in the past years have not spread from student to student in schools. Most of our Hep A cases were from food contamination. The healthier approach to preventing the spread of Hep A would be addressing the food importation issues into Hawaii. There is very minimal risk of Hep A spreading from student to student in schools.

The influenza vaccine from year to year is from 10% -60% effective according to the CDC. The flu vaccine, due to the innate natural drift nature of the virus and the absolute guess that the flu vaccine makers must make to pin point the prevalent strain the following year, this vaccine is not affective. The flu vaccine is one of the leading reported vaccines for adverse events according to VAERS. This risk/benefit ratio to require this vaccine for school just doesn't add up. Additionally this vaccine continues to have trace amounts of mercury (Thimerosal),

according to the FDA vaccines with trace amounts of thimerosal contain 1 microgram or less of mercury per dose.: the manufacturers best effort to wash the mercury out is not 100% effective. However mercury in conjunction with aluminum creates a heavier neurotoxic load which comes with risk. <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4344667/>
<https://www.cdc.gov/flu/professionals/vaccination/effectiveness-studies.htm>
<http://vaccineimpact.com/wp-content/uploads/sites/5/2017/09/DOJ-Report-9.8.17.pdf>

The requirement of a standardized medical exemption is flawed and it is a direct effort to restrict our medical rights. A standardized medical form may intimidate or discouraging a Physician to use their best precautionary principles and medical judgement for each patient. Physicians need to be allowed to write their medical evaluations and exemptions on their own letter head and freely decide if a vaccine is truly appropriate using the best medical judgement for each patient. It is not in the best interest of the patient or the physician to create additional paperwork, road blocks or exemption restrictions to a physicians best medical practice.

The Hawaii Vaccine Coalition is promoting the idea that restricting or even eliminating Religious Exemptions would improve vaccinations rates, which are already higher than the national average. Article I section 4 of the bill of rights “No law shall be enacted respecting an establishment of religion, or prohibiting the free exercise thereof, or abridging the freedom of speech or of the press or the right of the people peaceably to assemble and to petition the government for a redress of grievances. [Ren and am Const Con 1978 and election Nov 7, 1978]. There are inherent constitutional issues of restricting religious exemptions or challenging a persons spiritual beliefs.

Mandatory school reporting of all students with vaccine exemptions may be a violation of FERPA (Federal Educational Rights and Privacy Act) as well create additional financial burden on schools. <https://www.mbm-law.net/newsletter-articles/“ferpa-trumps-hipaa-in-immunization-disclosure”/1020/>

Oppose Administrative Rules (HAR) Title 11, Chapter157

Thank you for the time you took to read my testimony. **I strongly OPPOSE HAR 11-157 rule changes.** These rule changes are not in the best interest of our Keiki's health or the best interest of promoting a healthy child in the State of Hawaii. My uncle is a Surgeon/doctor and he once said "before I prescribe any medication I always ask myself will this drug cause more harm than the disease it is trying to cure?". These rule changes squash our freedom and the fundamental principles of effective and safe medicine - "First Do No Harm." Please host a public hearing statewide to fairly hear all testimony on all islands.

Sincerely,

Dawn Poiani

Subject: Testimony for HAR 11-157
Date: Monday, October 29, 2018 8:47:49 PM

Thank you for this opportunity to provide testimony. As a community member and public health advocate, I am writing to **strongly support the HAR 11-157 proposed rules update.**

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you for your consideration

Subject: HAR 11-157 proposed rules update
Date: Tuesday, October 30, 2018 12:01:29 PM

To the Hawaii DOH:

I am writing to strongly support the HAR 11-157 rules update. I have practiced community pediatrics on Kauai for over 40 years, long enough that I have been witness to the enormous benefits that have occurred with the introduction of the Varicella, Hemophilus, and Pneumococcal vaccines, to name just a few of the vaccines that have been developed and have become the standard of care over my practicing lifetime. I cannot stress strongly enough how gratifying it is to see the virtual elimination of bacterial meningitis, epiglottitis, and pneumococcal pneumonia, which in the past caused severe morbidity and mortality. In addition, because of an over 90% immunization rate on most of Kauai, we no longer have to witness life-threatening varicella in immunocompromised children, and severe chicken pox in adolescents. We have seen even recently the effects of a Hepatitis A epidemic in the unimmunized population in Hawaii, and until Hepatitis B vaccine was introduced we were helpless to prevent the maternal-newborn transfer of the Hepatitis B virus, which was a cause of chronic Hepatitis B infection, cirrhosis, and liver cancer. I could go on, but these are just a few examples of the inestimable good that has accrued to the health of our keiki from a strong and diligent immunization program. I am happy to see the immunization standards for Hawaii being updated, as we have newer vaccines and recommended practices with the advent of the administration of Meningococcus, DTaP, and HPV vaccines to preteens. I also strongly support the emphatic language regarding school attendance vis-a-vis appropriate physical exams and documented immunizations or immune testing. As health workers, we must continue to support the best health measures for all of Hawaii's children, and we have plenty of data and strong recommendations from the CDC and AAP to support us in this endeavor.

Thank you so much for soliciting opinions from the pediatric community on this very important health issue.

Sincerely,
Linda J. Weiner, MD

Subject: I oppose additional vaccines being added to the childhood schedule.
Date: Tuesday, October 30, 2018 7:58:59 AM

Please consider your actions carefully. There is mounting scientific evidence that our over-bloated vaccine schedule is doing grave damage to a whole generation of our children.

Meningococcal vaccine for all seventh graders:

There is no question that meningococcal meningitis is a serious disease that can cause death and disability, but we need to ensure that the solution is not worse than the problem. There is every reason to believe that mandatory meningococcal B vaccines for all seventh graders could kill more students than the disease they protect against. Before we relinquish our rights, pay millions and sicken students, we should do the math.

http://www.dailycamera.com/guest-opinions/ci_28283397/robert-f-kennedy-jr-doing-math-meningitis-vaccinations

HPV vaccine for all seventh graders:

The HPV Vaccine on Trial: Seeking Justice for a Generation Betrayed paints a devastating picture of corporate and government conflicts of interest, negligence, and malfeasance in approving and promoting human papillomavirus (HPV) vaccines, touted to prevent cervical and other cancers. Coming out on the heels of recent New York Times revelations about astounding financial conflicts of interest at Memorial Sloan-Kettering Cancer Center, this groundbreaking book highlights the lack of transparency, manipulated science, and abuse of state power to market this medical juggernaut, already raking in over \$2.5 billion per year. Authors Holland, Rosenberg, and Iorio conclude:

- HPV vaccines have never been proven to prevent cancer of any kind.
- No participants in the original HPV clinical trials received true saline placebos.
- Japan no longer recommends HPV vaccines following a mass of injuries
- The clinical trials never investigated the vaccine's possible effects on human fertility or potential to cause cancer.
- The clinical trials show that the vaccines contribute to HPV lesions, and potentially cancer, in some women. Despite this, neither the manufacturers nor government agencies recommend prescreening to eliminate those with clear risk factors.
- Although the vaccine is targeted for 11-12-year-old children, and legal for children as young as 9, only a small fraction of clinical trial subjects was in this age range.
- Lawsuits against HPV vaccine manufacturers and government health agencies are progressing around the world, including the US, India, Japan, Colombia, Spain, and France.
- The US government earns millions in royalties from Merck and GSK, the vaccine manufacturers, for its role in the invention of HPV vaccine technology
- Although the US government proclaims HPV vaccines safe and effective, it has paid out millions of dollars to compensate families for death, brain injury, multiple sclerosis, ulcerative colitis, and other severe, debilitating conditions.

Influenza vaccine for all young children:

The influenza vaccine is a joke. It is very ineffective, usually less than 40% effective. And in multi-dose vials it contains mercury which can cause serious brain damage. Why are we risking the lives of our children with this vaccine, when the illness is not a threat to any healthy child. Keep our children healthy with hand washing and nutrition that includes adequate levels of vitamins A, C, and D.

Hepatitis A vaccine for all children:

The best tool for prevention of hepatitis A is to wash your hands with soap and water after using the bathroom, changing a diaper or preparing and eating food.

While I support the availability of hepatitis A vaccine for all who choose to use it, I oppose the mandated use of hepatitis A vaccine for the following reasons:

Hepatitis Does Not Cause Chronic Infection and Rarely Causes Death: Hepatitis A has a mortality rate of less than one percent (0.6) and over 70 percent of deaths occur in adults over the age of 49. Almost everyone who gets hepatitis A recovers from it without any treatment. Plus, it is so rarely fatal that the CDC does not show a record of deaths from it some years.

Hepatitis A Gives Lifelong Immunity But the Vaccine Does Not: Children often show no symptoms if they get hepatitis A and then develop lifelong immunity to the infection, but nobody knows how long vaccine-induced immunity will last. (All vaccines give only temporary immunity).

Child-to-Child Transmission in School is Rare: According to the CDC, "Child-to-child disease transmission [of hepatitis A] within the school setting is uncommon."

Hepatitis A Vaccine Can Cause Reactions: The vaccine can cause unpleasant or even health- or life-threatening conditions, such as Guillian-Barre Syndrome.

Additional dose of MMR for post-secondary school attendance and Meningococcal vaccine for all first-year students living in on-campus housing:

From 2003 to 2017 there were 127 deaths due to the MMR vaccine reported to VAERS, yet only 2 deaths due to natural measles during the same time period. Harvard School of Medicine estimates that only 1 to 10 percent of vaccine injuries are reported to VAERS. So actual VACCINE DEATHS could range from 1,270 to 12,700. Our ability to capture real data on the post-marketing occurrence of vaccine injury is appalling!

Please! for the sake of our children! Do not add any more vaccines to the childhood schedule.

Sincerely,
Susan Jorg

To: Dr. Bruce Anderson
Hawaii Department of Health

Testimony in Support of Amendments to Immunization Policies

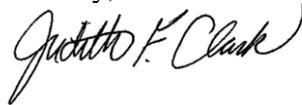

Hawaii Youth Services Network (HYSN) supports the proposed amendments to H.A.R. Title 11, Chapter 157, Examination and Immunization, which seek to codify the United States Department of Health and Human Services' Advisory Committee on Immunization Practices' General Best Practice Guidelines for Immunization.

A fully immunized population is our best protection to prevent the spread of communicable diseases. In particular, HYSN is pleased to see that HPV vaccine will be required for public school students.

HPV is so common that nearly all sexually-active men and women will get at least one type of HPV at some point in their lives. There is no cure for HPV - only treatment for related health problems. Yet, too few adolescents in Hawaii are receiving HPV vaccines.

Thank you for this opportunity to testify.

Sincerely,

Judith F. Clark, MPH
Executive Director

RE:

Public hearing notice: Proposed Changes to Hawaii Administrative Rules (HAR 11-157)

Re: NEW VACCINE REQUIREMENTS and REPORTING

Thursday November 1st 3:00-4:00 pm

Location: Hawaii Department of Health, Kinau Hale Boardroom, 1st Floor 1250 Punchbowl Street, Honolulu, HI 96813

To Whom It May Concern:

I would like to submit written testimony regarding the above.

I strongly OPPOSE HAR 11-157, for the following reasons:

This grave responsibility and power to make potentially life-altering decisions for Hawaii's Keiki, should not reside in the hands of a very few individuals, (if not a single individual: Chief of Disease Outbreak Control Division of the Hawaii DOH). The customary checks and balances of our Legislative Body should be restored, and the 2013 statute that allowed for this excessive control over health policy should be repealed. The Hawaii DOH should not be allowed to use such broad strokes in addressing important children's health policy. Notable important changes (too many) include: 1. The addition of multiple vaccines, some of which are not transmissible in a school setting (HPV). There are almost 300 vaccines currently in development, and ACIP blindly adds more vaccine requirements, when not one safety study has ever evaluated the potentially dangerous, synergistic or long term effects. How many is too many? See video here of an actual ACIP meeting to approve a new Hepatitis B vaccine—while acknowledging that data on a known "signal" of myocardial infarction [heart attack] will be collected from their consumer-guinea pigs, after sales begin 2. The requirement of a standardized Medical Exemption form could interfere with the doctor/patient relationship, restrict and discourage a physicians' best professional judgement regarding the patient-specific, "precautionary principle of medicine". 3. The requirement of a standardized Religious Exemption form may include wording that restricts religious freedoms. 4. Mandatory school reporting of all students with vaccine exemptions may be a violation of FERPA (Federal Educational Rights and Privacy Act). 5. New requirements for HPV (Human Papilloma Virus / trade name "Gardasil") and Influenza vaccines. Because neither have been deemed truly safe or effective, reports of extremely low voluntary uptake exists worldwide.

VAERS has paid out over \$3.7 billion to people for vaccine injuries. Vaccines are not completely safe. We have basic human rights. We should not be forced to vaccinate.

Sincerely,

Katherine M. Gravesen

Dear DOH:

I am a student pharmacist at the [REDACTED]. I support the amendments proposed for Title 11, Chapter 157 "Examination and Immunization" as this would help to increase the health of our students and community. As a student pharmacist, I can help take the burden off of patients who do not have time to go and see their doctors. By having us easily accessible, more people can get vaccinated which means less chances of disease.

Respectfully,

Samantha Okubo

Student Pharmacist

Class of 2022

Aloha, I'm writing in regards for my grandson Zechariah Kamaile- Shim. I adopted him at the age of 6months he's now 11yrs old . I'm grandma but legally mom. Single parent. He has autism, none verbal and extreme aggressive behaviors. At he meet all his milestones but had many ear inspection. So that time he missed having vaccine shot due to air infection and a cold coughing runny nose. So at 18 months old he was given his vaccine shot three days later No eye contact No laughing No sound from his mouth he was there and breathing normal but as if he'd turn into a zombie! All those months before he was he was a happy loving baby saying mama and baby talk. I know in my heart that those 4 shots made him this way and know he has to suffer for the rest of his life. I pray everyday for those people to understand what it feels like to be in those children's shoe and really know what they'd go through. God please bless your children for with your grace! In Jesus name Amen ..Thank you Renee and my grandson Zechy.

Subject: Testimony on vaccinations
Date: Tuesday, October 30, 2018 12:25:21 PM

Aloha,

I am a parent and nanny. I did extensive research on vaccinations when my daughter was a baby, in the 1990s in California. At that time we still had the right to refuse vaccinations. Based on that research, we decided not to vaccinate my daughter. Primarily there were four issues for us: The use of Mercury in some vaccinations, the lack of proactive investigation and data gathering and study on the adverse impact of vaccinations on children, the studying of the influence of vaccinations in spreading disease, and the number of vaccines given to babies at one time. We chose to strengthen her immune system through the use of natural medicines.

Fast forward to 2018. As a nanny, I saw the adverse and potentially fatal effects of vaccination first hand, here on Maui. The 1 year old for whom I cared was vaccinated. The day after his visit to the doctor, he experienced shortness of breath which woke him from his nap. I called 911 and his mom, as he continued to struggle to breathe. Fortunately, I had Rescue Remedy with me, and administered it to him. Within seconds his chest shifted and his breathing became normal.

His father and the paramedics arrived. The head paramedic was questioning the father on health history. Father told him that he had his checkup the day before and he had been vaccinated (4 vaccinations at once). Not knowing this, I said oh, perhaps that's what caused it. The paramedic looked sternly at me and said " that's not possible.". I countered that in fact it was highly probable and that it should be noted. I also told his I gave the child Resue Remedy and it successfully cleared his breathing. He ignored this information.

The boy's mother took him to the doctor later that day and the doctor minimized the effect of the vaccinations. These attitudes by medical professionals are disturbing in that they lack interest in what is actually happening to children who have been vaccinated.

Also, please note that during the California whooping cough outbreak in 2010, 81% of pertussis cases under the age of 18 were fully vaccinated children. In a pertussis outbreak in Texas, the CDC statistics show that 81.5 percent of cases were fully vaccinated.

There are still big questions about vaccinations and their effectiveness, as well as their side effects. If medical professionals are trained to not even collect data and show interest in what is really going on, how can the public trust them. Parents should have the right to choose whether to vaccinate their children. And the state should ensure that the medical industry is researching the effects of vaccination in an unbiased way, and that the truth is being shared with the public.

Sincerely,
Rosemary Robinson

Subject: Re: HAR-11-157
Date: Tuesday, October 30, 2018 3:12:55 PM

To Whom It May Concern,

Regarding HAR 11-157

I am a physician in private practice ([REDACTED]). I am strongly opposed to HAR 11-157. As a physician I have personally witnessed numerous vaccine related injuries, including neurological developmental injury, during routine vaccination as per the CDC recommend childhood vaccination schedule.

The risk of vaccination is not insignificant. To view the risk of vaccine injury, as documented by the Federal Health Resources and Services Administration, please see the following url: <https://www.hrsa.gov/sites/default/files/hrsa/vaccine-compensation/data/monthly-stats-oct-2018.pdf>. Compensated injuries represented here are injuries that are permanent or fatal. The document represents a gross under reporting of vaccine injuries since it documents only those vaccine injuries filed in a federal court and represents only permanent, fatal and near fatal injuries. Vaccine injuries are real and they are much more common than published data suggest.

Any decision regarding a medical procedure that involves risk should be based upon an informed consent between the doctor and patient that involves assessment of the individualized benefits versus risk for any procedure. Mandatory vaccines in any form, as proposed by HAR-11-147 violate the basic right to make informed healthcare choices and place the citizens of Hawaii at increased risk for iatrogenic illness by enforcing a one sized fits all medical procedure. Medical interventions can be put in place to help protect from vaccine injury, but only if patients are properly informed of the risks and have a choice in the matter.

The HPV vaccine is particularly dangerous. The impact of the HPV vaccine seen in my patients includes damage to joints, cartilage and mobility which at this point seem to be permanent. This vaccine is untested in combination with other vaccines and is not necessary for community safety in a primary school setting as HPV is a sexually transmitted disease.

Please protect our children by opposing HAR-11-157.

Subject: Regarding: NOTICE OF PUBLIC HEARING DOCKET NO. R-157-18-07
Date: Tuesday, October 30, 2018 4:40:27 PM

To Whom it May Concern within the Hawaii Department of Health:

It has come to my attention that the Hawaii Department of Health has a Public Hearing coming up on November 1st regarding proposed rule changes to include new vaccination requirements for Hawaii's children in order to attend school or daycare.

One of the vaccines that it appears may be added to the list of vaccines required for children includes the influenza vaccination. Is this committee aware that the National Vaccine Injury Compensation Program has paid out almost 4 billion dollars since the program began to those injured or killed by vaccines, many of whom received the Influenza vaccination? The current up to date payouts can be found here: <https://www.hrsa.gov/sites/default/files/hrsa/vaccine-compensation/data/monthly-stats-oct-2018.pdf>

A recent press release stated that pharmaceutical companies who manufacture vaccines may reach an estimated 61 billion dollar profit by the year 2020. We have seen time and time again, pharmaceutical companies putting profits over the health of Americans. It is absolutely a proven fact that cannot be disputed. Why, then, are they given blanket immunity via the National Childhood Vaccine Injury Act of 1986 signed into law by President Reagan? Because vaccine manufacturers are not held liable for the injuries and or deaths they may cause, there is low incentive to create a safer vaccine.

The Advisory Committee on Immunization Practices is a committee within the CDC who recommends the vaccination schedule to the American people. Has anyone within the Hawaii Department of Health ever sat and watched the ACIP committee have discussions and make vaccine recommendations? Please see the video here for an example of ACIP's abhorrent and negligent decision-making process in action: https://www.youtube.com/watch?v=L_JJMpe00mM&feature=youtu.be

Also see this link here: <https://www.youtube.com/watch?v=vUPWRWTxj4s&feature=youtu.be> where you can watch the ACIP vote on its new vaccine schedule recommendations, unanimously-immediately after hearing the impassioned comments and criticisms by members of the public at their latest meeting.

Recently this past summer, the Informed Consent Action Network (ICAN) and Robert F. Kennedy Jr. sued the United States government and won in an issue regarding vaccine safety. According to a legal document entitled, "Mandate for Safer Childhood Vaccines" Health and Human Services (HHS) has openly admitted to not having filed any vaccine safety reports in over 30 years as they were required to by the National Childhood Vaccine Injury Act of 1986. See link here: <http://icandecide.org/government/ICAN-HHS-Stipulated-Order-July-2018.pdf>

If we cannot even trust our own government to do the studies that will show us whether vaccines are safe or not, how is it acceptable to continue to add more and more vaccines to the requirements in order for children to attend school or daycare?

I vehemently oppose the addition of any vaccination requirements proposed and discussed

during this public hearing. Until vaccine safety is removed from the CDC to an independent scientific board, I will never be in favor of any additional vaccines being added to the schedule. Vaccine safety should not be done by the very people who create the vaccines, and then recommend them to the public to purchase. The conflict of interest is huge, and our children and the American people deserve better. We MUST stop blindly following what the pharmaceutical companies desire. It is simply no longer acceptable.

Sincerely,
Tara Czachor

Dear Dept of Health,

Thank you for this opportunity to provide testimony. As a community member and public health advocate, I am writing to **strongly support the HAR 11-157 proposed rules update.**

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized.

Dear Dept of Health, I am writing to **strongly support the HAR 11-157 proposed rules update.**

Thank you for this opportunity to provide testimony. As a community member and public health advocate, I am writing to **strongly support the HAR 11-157 proposed rules update.**

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

Thank you for your consideration.

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

Honolulu, Hawaii 96813

SUBJECT: Proposed amendment and compilation of Hawaii Administrative Rules (HAR) Title 11, Chapter 157, "Examination and Immunization."

Aloha,

As a parent of three children I OPPOSE the proposed amendments to the Hawaii Administrative Rules (HAR) Title 11, Chapter 157, "Examination and Immunization."

There is no need to impose vaccines for sexually transmitted diseases for all students especially when some students are not sexually active. Please be mindful that ALL vaccines contain toxic ingredients and they ALL carry risks. I would appreciate if each family along with their medical advisor be allowed to weigh the pros and cons of each vaccines for themselves. The HPV vaccine in particular is highly controversial as many thousands of women have claimed injury from this vaccine. If there is a risk, there should be a choice and an opportunity for informed consent.

I would also like to request that a public hearing be held on every island for all families to be informed and participate in the hearing process.

Mahalo,

Mitsuko Hayakawa

[REDACTED]
October 30, 2018

Bruce S. Anderson, PhD., Director of Health
Hawaii Department of Health
1250 Punchbowl Street
Honolulu, HI 96813

Aloha Dr. Anderson,

I am in strong opposition to the proposed amendments to HAR Title 11, Ch 157. As a mom, grandma, registered nurse and health advocate, **a serious question** has arisen in my heart over the many years of attempting to understand the role and purpose of Hawaii's Department of Health: ***What causes a health agency like the Department of Health to develop and continue with perspectives, policies and rules that are questionable or detrimental to the health and welfare of the people of Hawaii?*** Is it pressure? Funding? Biased research? Fear? Power? Conflicts of interest? Misguided controlled information?

As stated on your website: "The mission statement of the Department of Health is to protect and improve the health and environment for all people in Hawaii", with goals to "promote health, well-being, healthy lifestyles in families, communities and workplaces." These are admirable intentions to be promoters of health and wellness for our beautiful islands. Yet, one of the department's guiding principles is to "ensure that federal mandates are satisfied."

Here is the major concern: Even if federal health recommendations or guidelines do NOT work or benefit the people of Hawaii, the DOH continues to follow and implement them. It is very disturbing that the current proposals for the DOH administrative rule continue to adopt the increasing vaccine schedule following the U.S. DHHS, CDC and ACIP guidelines. (Dept of Health & Human Services, Center for Disease Control, Advisory Committee for Immunization Practices).

Firstly, the following are researched and credible reasons (with resourced footnotes) to understand that adopting the recommendations of DHHS, CDC and ACIP is NOT in the best interest for Hawaii:

- The U.S. vaccine recommendations process is hopelessly compromised by conflicts of interests with vaccine manufacturers, the FDA and the CDC. (1)
- The U.S. Vaccination Policy Flow Chart shows how vaccine policies are made with questionable relationships between the vaccine industrial complex, FDA and the CDC's ACIP.
- Congressional records and transcripts indicate scientific and industry fraud including cover-ups of data that clearly show definitive links between vaccines and serious vaccine injuries. Yet, the U.S. Congress passed a law in 1986 shielding vaccine makers and doctors from liability for vaccine injuries and deaths. More CDC employees and other federal health agency whistleblowers are coming forth and exposing the corruption to the public via mass media and publications. (2)
- Recommendations may be given from the WHO, DHHS, CDC, ACIP and other global or federal health programs, but why is Hawaii's Department of Health **requiring** to adopt recommendations from these "experts" who appear NOT to have our best health interests?

Page 1 of 3

Secondly, public confidence in national and international vaccine policies is at an all time low obviously because of the following well-documented facts:

- We are facing the sickest generation and the U.S. Childhood Health statistics straight from the CDC's own website states:
 - 1 in 6 children with developmental disabilities. (3)
 - 1 in 59 children with Autism Spectrum Disorder (4)
 - 3,600 sudden unexpected infant deaths (SIDS) in 2016 (5)
 - Many other statistics from health agencies disclose phenomenal increases in childhood cancers, irritable bowel syndromes, arthritis, diabetes and other chronic conditions.
- The increasing vaccine schedule and lack of safety and efficacy studies ignore scientific evidence and valid testimonies of adverse vaccine reactions (see VAERS) at the expense of public health interests:
 - Increasing doses of 15 different vaccines with several added booster shots are now being given to our children from birth to age 18, with more vaccines being added to the schedule. Pregnant women are being vaccinated as well as the elderly with more toxic vaccines that compromise immune systems. Adverse reactions are sky-rocketing from neurodevelopmental disorders, allergies, seizures, paralysis, autism and others, worsening as the types and total number of vaccines required have expanded. (6)
 - The CDC's excipient list of vaccine ingredients reads like a toxic brew: from neuro-toxic aluminum, mercury, monosodium glutamate, formaldehyde, polysorbate 80 that causes cancer and infertility, human DNA from aborted babies, pig blood, horse blood, rabbit brains, dog kidneys, cow hearts, monkey kidneys, chick embryos, calf serum, sheep blood and more. (7)
 - Promoting mass vaccines is extremely profitable and big business. As the vaccine schedule continues to increase, global profits from the worldwide vaccine business climb to billions of dollars. Close to 300 more vaccines are in development.

Finally, is the adoption of these DOH administrative rules a violation to our health care privacy and freedoms?:

- Is there a violation of FERPA (Federal Educational Rights and Privacy Act – 20 U.S.C. Section 1232g; 34 CFR, Part 99) when requiring schools to report to the DOH the students/children names of those who have met the immunization requirements and those who have medical or religious exemptions (Section 11-157-64, pages 157-17)? This statewide violation would place Hawaii schools at risk of losing dollars in federal education support.
- Is there a violation of HIPAA (Health Insurance Portability and Accountability Act) as it allows health care providers to send copies of vaccine records to DOH (Section 11-157-5, pages 157-11&12)?
- These national FERPA and HIPAA standards are there to protect individual medical records and personal health information to safeguard the privacy of citizen information from being released to third parties such as local and state health departments.

There are rational perspectives and common sense advice for staying healthy as Hawaii's promoter for health and wellness. As Hawaii's Department of Health, you are encouraged to invest time, resources and energy in researching and promoting healthy lifestyles and health care to improve natural immunity, instead of adopting federal health policies that recommend and promote more toxic vaccinations.

Thank you for your consideration in this serious matter. Mahalo –
Tarita Tehotu

From: [REDACTED]
To: [DOH.Immunization](#)
Subject: HAR 11-157 Support
Date: Wednesday, October 31, 2018 9:20:21 PM

Dear Dept of Health,

Thank you for this opportunity to provide testimony. As a community member and public health advocate, I am writing to **strongly support the HAR 11-157 proposed rules update.**

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you for your consideration.

Re: **STRONG OPPOSITION TO PROPOSED RULE CHANGES
TO HAR 11-157**

Dear Disease Outbreak Division of Hawaii Department of Health:

I respectfully request that public hearings on these changes be held statewide prior to any decisions being rendered, since the sequelae of implementation of these rules are potentially health-endangering.

I **strongly oppose** the proposed rule changes to HAR 11-157, in general, pertaining to Hawaii vaccination policy, for several reasons, including, but not limited to the following:

- Bona fide double-blind, randomized, placebo-controlled studies—the “*Gold Standard*” of scientific inquiry—have NOT been done on individual vaccines, much to the surprise of healthcare workers tasked with administering them when apprised of this fact. It is alarming that substances like vaccines, with such demonstrated ability to alter the human body, are not held to the same testing standards as other drugs. Few, if any, vaccines have been tested using only relatively inert placebos, like sterile water or normal saline; instead, they are tested against other vaccines or aluminum-containing shots as the control, presumably to mask the deleterious health effects of vaccines, or why wouldn’t relatively inert placebos be used instead, exclusively?
- Furthermore, there has yet to be conducted a study on the safety and efficacy of the cumulative CDC-recommended vaccine schedule.

Where is the “vaxxed versus unvaxxed” data? It doesn’t yet exist. While we wait for such data, the people of Hawaii continue to be vaccinated.

We ought not be adding new vaccines to the schedule of vaccine requirements when they have not been adequately studied to demonstrate safety, either individually or cumulatively.

- Vaccines are contaminated with substances known to be toxic; People must retain the right to refuse any substance when there is a risk of injury.

Vaccine Excipient & Media Summary Excipients Included in U.S. Vaccines, by Vaccine

In addition to weakened or killed disease antigens (viruses or bacteria), vaccines contain very small amounts of other ingredients – excipients or media.

Some excipients are added to a vaccine for a specific purpose. These include:

Preservatives, to prevent contamination. For example, thimerosal.

Adjuvants, to help stimulate a stronger immune response. For example, aluminum salts.

Stabilizers, to keep the vaccine potent during transportation and storage. For example, sugars or gelatin.

Others are residual trace amounts of materials that were used during the manufacturing process and removed. These include:

Cell culture materials, used to grow the vaccine antigens. For example, egg protein, various culture media.

Inactivating ingredients, used to kill viruses or inactivate toxins. For example, formaldehyde.

Antibiotics, used to prevent contamination by bacteria. For example, neomycin.

The following table lists all components, other than antigens, shown in the manufacturers’ package insert (PI) for each vaccine. Each of these PIs, which can be found on the FDA’s website (see below) contains a description of that vaccine’s manufacturing process, including the amount and purpose of each substance. In most PIs, this information is found in Section 11: “Description.”

All information was extracted from manufacturers’ package inserts.

If in doubt about whether a PI has been updated since this table was prepared, check the FDA’s website at <http://www.fda.gov/BiologicsBloodVaccines/Vaccines/ApprovedProducts/ucm093833.htm>

Vaccine	Contains
Adenovirus	human-diploid fibroblast cell cultures (strain WI-38), Dulbecco’s Modified Eagle’s Medium, fetal bovine serum, sodium bicarbonate, monosodium glutamate, sucrose, D-mannose, D-fructose, dextrose, human serum albumin, potassium phosphate, pladone C, anhydrous lactose, microcrystalline cellulose, polacrillin potassium, magnesium stearate, cellulose acetate phthalate, alcohol, acetone, castor oil, FD&C Yellow #6 aluminum lake dye
Anthrax (Biothrax)	amino acids, vitamins, inorganic salts, sugars, aluminum hydroxide, sodium chloride, benzethonium chloride, formaldehyde
BCG (Tice)	glycerin, asparagine, citric acid, potassium phosphate, magnesium sulfate, iron ammonium citrate, lactose
Cholera (Vaxchora)	casamino acids, yeast extract, mineral salts, anti-foaming agent, ascorbic acid, hydrolyzed casein, sodium chloride, sucrose, dried lactose, sodium bicarbonate, sodium carbonate
DT (Sanofi)	aluminum phosphate, isotonic sodium chloride, formaldehyde, casein, cystine, maltose, uracil, inorganic salts, vitamins, dextrose
DTaP (Daptacel)	aluminum phosphate, formaldehyde, glutaraldehyde, 2-phenoxyethanol, Stainer-Scholte medium, casamino acids, dimethyl-beta-cyclodextrin, Mueller’s growth medium, ammonium sulfate, modified Mueller-Miller casamino acid medium without beef heart infusion
DTaP (Infanrix)	Fenton medium containing a bovine extract, modified Latham medium derived from bovine casein, formaldehyde, modified Stainer-Scholte liquid medium, glutaraldehyde, aluminum hydroxide, sodium chloride, polysorbate 80 (Tween 80)
DTaP-IPV (Kinrix)	Fenton medium containing a bovine extract, modified Latham medium derived from bovine casein, formaldehyde, modified Stainer-Scholte liquid medium, glutaraldehyde, aluminum hydroxide, VERO cells, a continuous line of monkey kidney cells, Calf serum, lactalbumin hydrolysate, sodium chloride, polysorbate 80 (Tween 80), neomycin sulfate, polymyxin B
DTaP-IPV (Quadacel)	modified Mueller’s growth medium, ammonium sulfate, modified Mueller-Miller casamino acid medium without beef heart infusion, formaldehyde, aluminum phosphate, Stainer-Scholte medium, casamino acids, dimethyl-beta-cyclodextrin, MRC-5 cells, normal human diploid cells, CMRL 1969 medium supplemented with calf serum, Medium 199 without calf serum, 2-phenoxyethanol, polysorbate 80, glutaraldehyde, neomycin, polymyxin B sulfate

Vaccine	Contains
DTaP-HepB-IPV (Pediarix)	Fenton medium containing a bovine extract, modified Latham medium derived from bovine casein, formaldehyde, glutaraldehyde, modified Stainer-Scholte liquid medium, VERO cells, a continuous line of monkey kidney cells, calf serum and lactalbumin hydrolysate, aluminum hydroxide, aluminum phosphate, aluminum salts, sodium chloride, polysorbate 80 (Tween 80), neomycin sulfate, polymyxin B, yeast protein.
DTaP-IPV/Hib (Pentacel)	aluminum phosphate, polysorbate 80, sucrose, formaldehyde, glutaraldehyde, bovine serum albumin, 2-phenoxyethanol, neomycin, polymyxin B sulfate, modified Mueller's growth medium, ammonium sulfate, modified Mueller-Miller casamino acid medium without beef heart infusion, Stainer-Scholte medium, casamino acids, dimethyl-beta-cyclodextrin. MRC-5 cells (a line of normal human diploid cells), CMRL 1969 medium supplemented with calf serum, Medium 199 without calf serum, modified Mueller and Miller medium
Hib (ActHIB)	sodium chloride, modified Mueller and Miller medium (the culture medium contains milk-derived raw materials [casein derivatives]), formaldehyde, sucrose
Hib (Hiberix)	saline, synthetic medium, formaldehyde, sodium chloride, lactose
Hib (PedvaxHIB)	complex fermentation media, amorphous aluminum hydroxyphosphate sulfate, sodium chloride
Hep A (Havrix)	MRC-5 human diploid cells, formalin, aluminum hydroxide, amino acid supplement, phosphate-buffered saline solution, polysorbate 20, neomycin sulfate, aminoglycoside antibiotic
Hep A (Vaqta)	MRC-5 diploid fibroblasts, amorphous aluminum hydroxyphosphate sulfate, non-viral protein, DNA, bovine albumin, formaldehyde, neomycin, sodium borate, sodium chloride
Hep B (Engerix-B)	aluminum hydroxide, yeast protein, sodium chloride, disodium phosphate dihydrate, sodium dihydrogen phosphate dihydrate
Hep B (Recombivax)	soy peptone, dextrose, amino acids, mineral salts, phosphate buffer, formaldehyde, potassium aluminum sulfate, amorphous aluminum hydroxyphosphate sulfate, yeast protein
Hep B (Hepelisav-B)	vitamins and mineral salts, yeast protein, yeast DNA, deoxycholate, phosphorothioate linked oligodeoxynucleotide, phosphate buffered saline, sodium phosphate, dibasic dodecahydrate, monobasic dehydrate, polysorbate 80
Hep A/Hep B (Twinrix)	MRC-5 human diploid cells, formalin, aluminum phosphate, aluminum hydroxide, amino acids, sodium chloride, phosphate buffer, polysorbate 20, neomycin sulfate, yeast protein
Human Papillomavirus (HPV) (Gardasil 9)	vitamins, amino acids, mineral salts, carbohydrates, amorphous aluminum hydroxyphosphate sulfate, sodium chloride, L-histidine, polysorbate 80, sodium borate, yeast protein
Influenza (Afluria) Trivalent & Quadrivalent	sodium chloride, monobasic sodium phosphate, dibasic sodium phosphate, monobasic potassium phosphate, potassium chloride, calcium chloride, sodium taurodeoxycholate, ovalbumin, sucrose, neomycin sulfate, polymyxin B, beta-propiolactone, thimerosal (multi-dose vials)
Influenza (Fluad)	squalene, polysorbate 80, sorbitan trioleate, sodium citrate dehydrate, citric acid monohydrate, neomycin, kanamycin, barium, egg proteins, cetyltrimethylammonium bromide (CTAB), formaldehyde
Influenza (Fluarix) Trivalent & Quadrivalent	octoxynol-10 (TRITON X-100), <i>alpha</i> -tocopheryl hydrogen succinate, polysorbate 80 (Tween 80), hydrocortisone, gentamicin sulfate, ovalbumin, formaldehyde, sodium deoxycholate, sodium phosphate-buffered isotonic sodium chloride
Influenza (Flublok) Trivalent & Quadrivalent	sodium chloride, monobasic sodium phosphate, dibasic sodium phosphate, polysorbate 20 (Tween 20), baculovirus and <i>Spodoptera frugiperda</i> cell proteins, baculovirus and cellular DNA, Triton X-100, lipids, vitamins, amino acids, mineral salts
Influenza (Flucelvax) Trivalent & Quadrivalent	Madin Darby Canine Kidney (MDCK) cell protein, protein other than HA, MDCK cell DNA, polysorbate 80, cetyltrimethylammonium bromide, and β -propiolactone
Influenza (Flulaval) Trivalent & Quadrivalent	ovalbumin, formaldehyde, sodium deoxycholate, <i>alpha</i> -tocopheryl hydrogen succinate, polysorbate 80, thimerosal (multi-dose vials)
Influenza (Fluvirin)	ovalbumin, polymyxin, neomycin, betapropiolactone, nonylphenol ethoxylate, thimerosal
Influenza (Fluzone) Quadrivalent	formaldehyde, egg protein, octylphenol ethoxylate (Triton X-100), sodium phosphate-buffered isotonic sodium chloride solution, thimerosal (multi-dose vials), sucrose

Vaccine	Contains
Influenza (Fluzone) High Dose	egg protein, octylphenol ethoxylate (Triton X-100), sodium phosphate-buffered isotonic sodium chloride solution, formaldehyde, sucrose
Influenza (Fluzone) Intradermal	formaldehyde, egg protein, octylphenol ethoxylate (Triton X-100), sodium phosphate-buffered isotonic sodium chloride solution, sucrose
Influenza (FluMist) Quadrivalent	monosodium glutamate, hydrolyzed porcine gelatin, arginine, sucrose, dibasic potassium phosphate, monobasic potassium phosphate, ovalbumin, gentamicin sulfate, ethylenediaminetetraacetic acid (EDTA)
Japanese Encephalitis (Ixiaro)	aluminum hydroxide, protamine sulfate, formaldehyde, bovine serum albumin, host cell DNA, sodium metabisulphite, host cell protein
Meningococcal (MenACWY-Menactra)	Watson Scherp media containing casamino acid, modified culture medium containing hydrolyzed casein, ammonium sulfate, sodium phosphate, formaldehyde, sodium chloride
Meningococcal (MenACWY-Menveo)	formaldehyde, amino acids, yeast extract, Franz complete medium, CY medium
Meningococcal (MenB – Bexsero)	aluminum hydroxide, <i>E. coli</i> , histidine, sucrose, deoxycholate, kanamycin
Meningococcal (MenB – Trumenba)	defined fermentation growth media, polysorbate 80, aluminum phosphate, histidine buffered saline
MMR (MMR-II)	chick embryo cell culture, WI-38 human diploid lung fibroblasts, vitamins, amino acids, fetal bovine serum, sucrose, glutamate, recombinant human albumin, neomycin, sorbitol, hydrolyzed gelatin, sodium phosphate, sodium chloride
MMRV (ProQuad) (Frozen)	chick embryo cell culture, WI-38 human diploid lung fibroblasts, MRC-5 cells, sucrose, hydrolyzed gelatin, sodium chloride, sorbitol, monosodium L-glutamate, sodium phosphate dibasic, human albumin, sodium bicarbonate, potassium phosphate monobasic, potassium chloride; potassium phosphate dibasic, neomycin, bovine calf serum
MMRV (ProQuad) (Refrigerator Stable)	chick embryo cell culture, WI-38 human diploid lung fibroblasts, MRC-5 cells, sucrose, hydrolyzed gelatin, urea, sodium chloride, sorbitol, monosodium L-glutamate, sodium phosphate, recombinant human albumin, sodium bicarbonate, potassium phosphate, potassium chloride, neomycin, bovine serum albumin
Pneumococcal (PCV13 – Prevnar 13)	soy peptone broth, casamino acids and yeast extract-based medium, CRM197 carrier protein, polysorbate 80, succinate buffer, aluminum phosphate
Pneumococcal (PPSV-23 – Pneumovax)	phenol
Polio (IPV – Ipol)	Eagle MEM modified medium, calf bovine serum, M-199 without calf bovine serum, vero cells (a continuous line of monkey kidney cells), phenoxyethanol, formaldehyde, neomycin, streptomycin, polymyxin B
Rabies (Imovax)	human albumin, neomycin sulfate, phenol red indicator, MRC-5 human diploid cells, beta-propiolactone
Rabies (RabAvert)	chicken fibroblasts, β-propiolactone, polygeline (processed bovine gelatin), human serum albumin, bovine serum, potassium glutamate, sodium EDTA, ovalbumin, neomycin, chlortetracycline, amphotericin B
Rotavirus (RotaTeq)	sucrose, sodium citrate, sodium phosphate monobasic monohydrate, sodium hydroxide, polysorbate 80, cell culture media, fetal bovine serum, vero cells [DNA from porcine circoviruses (PCV) 1 and 2 has been detected in RotaTeq. PCV-1 and PCV-2 are not known to cause disease in humans.]
Rotavirus (Rotarix)	Vero cells, dextran, Dulbecco's Modified Eagle Medium (sodium chloride, potassium chloride, magnesium sulfate, ferric (III) nitrate, sodium phosphate, sodium pyruvate, D-glucose, concentrated vitamin solution, L-cystine, L-tyrosine, amino acids solution, L-glutamine, calcium chloride, sodium hydrogenocarbonate, and phenol red), sorbitol, sucrose, calcium carbonate, sterile water, xanthan [Porcine circovirus type 1 (PCV-1) is present in Rotarix. PCV-1 is not known to cause disease in humans.]
Smallpox (Vaccinia) (ACAM2000)	African Green Monkey kidney (Vero) cells, HEPES, 2% human serum albumin, 0.7% sodium chloride USP, 5% Mannitol USP, neomycin, polymyxin B, 50% Glycerin USP, 0.25% phenol USP

Vaccine	Contains
Td (Tenivac)	aluminum phosphate, formaldehyde, modified Mueller-Miller casamino acid medium without beef heart infusion, ammonium sulfate, sodium chloride, water
Td (Mass Biologics)	aluminum phosphate, formaldehyde, thimerosal, modified Mueller's media which contains bovine extracts, ammonium sulfate
Tdap (Adacel)	aluminum phosphate, formaldehyde, 2-phenoxyethanol, Stainer-Scholte medium, casamino acids, dimethyl-beta-cyclodextrin, glutaraldehyde, modified Mueller-Miller casamino acid medium without beef heart infusion, ammonium sulfate, modified Mueller's growth medium
Tdap (Boostrix)	modified Latham medium derived from bovine casein, Fenton medium containing a bovine extract, formaldehyde, modified Stainer-Scholte liquid medium, glutaraldehyde, aluminum hydroxide, sodium chloride, polysorbate 80
Typhoid (Typhim Vi)	hexadecyltrimethylammonium bromide, formaldehyde, phenol, polydimethylsiloxane, disodium phosphate, monosodium phosphate, semi-synthetic medium, sodium chloride
Typhoid (Vivotif Ty21a)	yeast extract, casein, dextrose, galactose, sucrose, ascorbic acid, amino acids, lactose, magnesium stearate, gelatin
Varicella (Varivax) Frozen	MRC-5 human diploid cells, including DNA & protein, sucrose, hydrolyzed gelatin, sodium chloride, monosodium L-glutamate, sodium phosphate dibasic, sodium phosphate monobasic, potassium phosphate monobasic, potassium chloride, EDTA, neomycin, fetal bovine serum
Varicella (Varivax) Refrigerator Stable	MRC-5 human diploid cells, including DNA & protein, sucrose, hydrolyzed gelatin, sodium chloride, monosodium L-glutamate, urea, sodium phosphate dibasic, potassium phosphate monobasic, potassium chloride, neomycin, bovine calf serum
Yellow Fever (YF-Vax)	sorbitol, gelatin, sodium chloride, egg protein
Zoster (Shingles) (Zostavax) Frozen	MRC-5 human diploid cells, including DNA & protein, sucrose, hydrolyzed porcine gelatin, sodium chloride, monosodium L-glutamate, sodium phosphate dibasic, potassium phosphate monobasic, potassium chloride; neomycin, bovine calf serum
Zoster (Shingles) (Zostavax) Refrigerator Stable	MRC-5 human diploid cells, including DNA & protein, sucrose, hydrolyzed porcine gelatin, urea, sodium chloride, monosodium L-glutamate, sodium phosphate dibasic, potassium phosphate monobasic, potassium chloride, neomycin, bovine calf serum
Zoster (Shingles) (Shingrix)	sucrose, sodium chloride, dioleoyl phosphatidylcholine (DOPC), potassium dihydrogen phosphate, cholesterol, sodium dihydrogen phosphate dihydrate, disodium phosphate anhydrous, dipotassium phosphate, polysorbate 80

A table listing vaccine excipients and media by excipient can be found in:

Grabenstein JD. *ImmunoFacts: Vaccines and Immunologic Drugs* – 2013 (38th revision). St Louis, MO: Wolters Kluwer Health, 2012.

The above Vaccine Excipient and Media Summary is posted on the CDC.gov website.

Where are the safety studies on injection of all of these contaminants into humans? Or are *we* the test subjects? The Gardasil vaccine, which is to be added to the requirement schedule for all seventh graders, contains an aluminum compound. Aluminum is recognized as a neurotoxin and is possibly a culprit in autism and other neurological disorders. Here are links to studies by Exley and Shaw.

We must not add any more vaccines to the schedule of school and daycare requirements until these concerns about aluminum and neurological disorders are better understood, so that a more balanced assessment of risks of vaccination versus benefits can be presented to the people of Hawaii.

- Gardasil testing, for example, used both an aluminum-containing placebo group and a saline placebo group, with most of the control subjects in the aluminum group. This vaccine is to become a requirement for all seventh graders, among the other vaccines in Exhibit A. I oppose this on the basis of inadequate safety data, and the many anecdotes of families reporting injury and death of their children not long after receiving HPV vaccine. Premature ovarian failure is another reported complication; [see also here].
- There is a disconnect between our public health officials on the one side, and on the other side people [including physicians] who recognize the increasing body of scientific literature implicating vaccines as culprits in burgeoning neurological and autoimmune disorders which have been rising concurrently with the additions to the vaccine schedule. Public health officials are reluctant or refuse to acknowledge science from sources without the stamp of approval from the Institute of Medicine [IOM] or other industry-connected scientific bodies. Industry-friendly sources mostly tout the “safety

and efficacy” of vaccines—which suits the industry’s bottom-line by downplaying potential hazards, while independent scientists who challenge the unproven mantra of safety and efficacy, and offer possible answers to victims of health deterioration post-vaccination are ignored by public health officials. This is a disservice to people who look to public health institutions as the ultimate arbiter of safe and effective vaccines.

- In a discussion earlier this year with Hawaii State Epidemiologist, Dr. Sarah Park of DOCD, I asked her if the Department of Health had any data on developmental disorders in Hawaii. She responded that she does *not* track such neurological disorders—“that’s not my area, I only deal with the infectious diseases.” This is alarming, considering that you in the Disease Outbreak Control Division are concerned only narrowly with communicable or “vaccine-preventable” diseases, and you are apparently not leading the way to discover more about the possible connections between vaccines and reportedly skyrocketing rates developmental and autoimmune disorders. Instead of pausing to investigate further, the Department of Health/DOCD seeks to add more vaccines to the schedule of requirements.

This is an unacceptable threat to public health in Hawaii. Other countries like Japan are banning Gardasil due to safety concerns, while we pile more on the list, with reportedly *hundreds* of more vaccines in the profitable pipeline. We need to avoid adding any new vaccines to the current schedule, until we have consulted with *unbiased* neurological disorder and autoimmunity experts who can give the “all-clear” that we are not condemning people to such afflictions in the name of winning the fight against “vaccine-preventable” diseases—some of which were far more benign prior to the commencement of the vaccine program than the neurological and autoimmune disorders which are reportedly increasing in incidence, commensurate with the increases to the vaccine schedule’s additions over the years.

- It is *unacceptable* for public health officials to cherry-pick only industry-friendly data which in effect gives plausible deniability that they've done their due diligence to maintain public safety by promoting "safe and effective" vaccines, based only on their chosen sources, while ignoring or disparaging studies critical of vaccine safety and efficacy. In our discussion this year referenced above, Dr. Park quoted a 2004 Institute of Medicine Report as being the authoritative source regarding my questioning of possible linkage of aluminum to developmental delays. Perhaps it's time to revisit this topic within the Department of Health, as there is emerging peer-reviewed science which offers different conclusions than the 2004 IOM Report.
- It is *never acceptable* to sacrifice someone else's health and well-being for another's. What is it that renders would-be victims of a communicable disease *more* worthy of protection than a potential victim of neurological or autoimmune disease? I hope it's not just industrial greed and control over our public health institutions. We must **NOW** cease the apparently never-ending additions of vaccine requirements *until* we have determined if *industry-independent science* supports or not possible vaccine component linkage to neurological and autoimmune disorders.
- We need legislation requiring full financial disclosure of studies serving as the underpinnings of our public health policy, with sworn assurances of the full disclosure, backed by penalties for insufficient disclosure. Perhaps public health officials ought to be required to cite the foundational studies they rely on in vaccine policy for open public viewing and review by independent experts. Informed consent proponents ought to welcome more debate and disclosure.
- We must protect our customary notion of informed consent. Our current medical and religious exemptions must be expanded—not curtailed. Elimination of non-medical exemptions is being promoted lately and frequently in nationwide media and public health talking

points. These proposed rule changes for reporting of exemptions place *unacceptable* limits on our **RIGHT** to informed consent by burdening the individual choosing to decline a vaccine with additional procedures and privacy violations which do not ultimately promote health.

- The people of Hawaii are looking to you to protect them and not cherry-pick only industry-approved “science.” We hope you are with us and champion the safety and well-being of all of us facing further potential vaccine injury, in addition to your focus on us as potential victims of “vaccine-preventable illnesses.”

Thank you for the opportunity to be heard.

**WHEN THERE IS RISK,
THERE MUST BE CHOICE!**

Sincerely,

Laurie West, RN

Regarding Title 11, chapter 157:
I strongly oppose.

Thank you for the opportunity to oppose and submit a testimony.

I am asking you please to not remove or limit the exemptions for immunizations.

As long as the safety as well as the efficacy of vaccinations are not guaranteed, this should not be forced on anyone. No doubt, you are aware of that the manufactures of the vaccines have warnings about the potential serious side effects and even DEATHS. Even if the risk is low, it's still a risk and should never be forced on anyone. People who choose not to have their family or themselves vaccinated, have seriously and carefully studied the pros and cons of vaccinations and weighed the benefits against the risks or are people with strong religious convictions who's beliefs are not in harmony with inoculations. Should these people be stripped of their religious freedom in a free country?

Please do not punish the children, depriving them of their right to go to public school just because they are not willing to submit to medical procedures that are well documented to not always be safe.

Mahalo for taking the time to read my point of view on this topic.

Sincerely,
Maria Zuech

To: Dept of Health

It is with sadness that I learned that you are considering making immunization mandatory, removing medical as well as religious exemptions.

I would be totally pro-vaccination, if it was SAFE for all children. Regrettably, that is not the situation YET. No argument is needed. The manufacturer makes that clear. Serious side effects and deaths occur. I personally know of children that this has happened to.

With any medical procedure, a medical consent form is needed. With immunization, a cocktail of viruses, blood fractions and aborted fetus tissue is injected right into the body.

Is it really fair, that a child who for medical or conscience reasons cannot submit to this has to be deprived of an education?

I don't believe so. I am respectfully asking you to please, reconsider this bill!

Sincerely
Elisabeth Svanberg

Subject: Hawaii Administrative Rules
Date: Wednesday, October 31, 2018 9:06:39 AM

Dear Dept of Health,

Thank you for this opportunity to provide testimony. As a community member and public health advocate, I am writing to **strongly support the HAR 11-157 proposed rules update.**

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you for your consideration.

Ann Inouye

To whom it may concern,

I very strongly oppose the proposed changes to Hawaii's vaccine policy!!! I am a mother of 3 who homeschools my children and I see these proposed changes as cruel punishment!! You are proposing harsh requirements that I am not ok being required and forced to abide by.

DO NOT MAKE THESE CHANGES!!!

Sincerely,
Peniela Rand

CANCER CENTER

October 31, 2018

The University of Hawai'i Cancer Center strongly supports the addition of human papillomavirus (HPV) vaccination to the immunizations required for 7th grade school entry and attendance in the state of Hawai'i. Preventing cancer is a central mission of the UH Cancer Center and HPV vaccination remains a powerful tool in the effort to prevent cancers caused by HPV. HPV vaccines have proven to be highly efficacious and safe. Vaccine use in the US and other countries has been demonstrated to reduce HPV infections and reduce the development of pre-cancerous lesions.

HPV is a very common infection and is linked to multiple cancers including malignancies of the cervix, vagina, vulva, penis, anus, oropharynx and oral cavity. Our research with the National Cancer Institute and the Centers for Disease Control and Prevention has demonstrated that HPV contributes to substantial proportions of these cancers including nearly all cervical and anal cancers. The need for HPV vaccination in Hawai'i is underscored by the significant statewide increase in certain HPV-associated cancers including anal and vulvar tumors.

Although modest increases have been observed in HPV vaccination rates among boys and girls in Hawaii (55% receiving the recommended doses in 2017), vaccine uptake is well below the national goal of 80 percent coverage by year 2020. Our research among Hawai'i primary care providers has identified the lack of mandatory school-based HPV vaccination as a major barrier to immunization.

The University of Hawai'i Cancer Center affirms our support for school-based HPV vaccination in order to prevent HPV-associated cancers in our community.

Sincerely,

Randall F. Holcombe, MD, MBA
Randall F. Holcombe, MD, MBA

Subject: In strong opposition
Date: Wednesday, October 31, 2018 5:49:53 AM

I am writing in strong opposition to the regulations that HAR 11-157 would impose. When there is a risk, there should be a choice and I feel by making vaccinations mandatory, you are taking away our right to choose. Please re-consider these regulations.

Thank you,
Audrey Alvarez

DOCD, DOH immunization@doh.hawaii.gov
[\(808\) 586-8300](tel:8085868300)

Hawaii Department of Health
1250 Punchbowl St.
Honolulu, Hawaii 96813

I **strongly oppose** the proposed amendment and compilation of Hawaii Administrative Rules (HAR) Title 11, Chapter 157, “Examination and Immunization.”

Dear Hawaii Department of Health,

My name is Kim Haine, I am a Mother and StepMother to 5 children, and was a health care professional for 15 years. I oppose these amendments for several reasons, but primarily because it is not prudent health policy to vastly increase the school vaccine requirements without, acknowledgement and exploration of the **epidemic of chronic disease plaguing America’s children today**.

1. **I oppose the changes to the Medical and Religious Exemption requirements.**

Pertaining to **Religious Exemptions** being “in a format specified by the department” is vague and yet unspecified, therefore leaving room for egregious violations of our Constitutional, First Amendment Rights. It is not up to the government, nor certainly our DOH, to define spirituality or one’s relationship with God.

Medical Exemptions must now be “in a form or format specified by the department, that an immunization is medically contraindicated, due to a stated cause, for a specific period of time, in conformance with recognized standard medical practices”. A physician’s best professional judgement utilizing their intimate patient-specific, as well as family history knowledge, should be the sole determining factor in whether a medical exemption is warranted....period. The “Precautionary Principle of Medicine” must be upheld and not be restricted by bureaucratic oversight.

After evaluating ACIP's most recent General Best Practice Guidelines for Immunization; Section 4 "Contraindications and Precautions", Tables 4-1 and 4-2, it is abundantly clear that ACIP, and any Public Health Department that blindly follows such guidelines, care much more about the judicious uptake and militant adherence to the vaccination schedule, than the prevention of serious, life-long adverse reactions. All conditions listed have been absurdly minimized:

Pertussis Containing Vaccines

- DTaP (Dose 3 – Dose 4) minimum intervals (10/23/2017)
 - Prospective – 6 months
 - Retrospective – 4 months
 - 4 day grace period can be applied to 6 month interval prospectively
 - 4 day grace period can be applied to 4 month interval retrospectively
- Four precautions to DTaP removed
 - Fever $\geq 105^{\circ}$ F within 48 hrs following a dose of DTaP (09/20/18)
 - Persistent, inconsolable crying lasting ≥ 3 hrs within 48 hrs following a dose of DTaP (07/18/18)
 - Collapse or shock-like state with 48 hrs following a dose of DTaP (07/18/18)
 - Seizure within 72 hrs following a dose of DTaP (07/18/18)

See for example table to the left which lists known symptoms of "encephalitis" (brain swelling which can lead to autism), as no longer being a precaution to the DTaP vaccine, let alone a contraindication! There are hundreds of severe adverse reactions listed in ALL vaccine manufacture's package inserts, whether noted during clinical trials

OR post-marketing surveillance, that *should* qualify as a medical exemption, but they do not. **Vaccine Package Inserts** are never given out to patients as **true informed consent**, and most physicians have never even read them. *The Hippocratic Oath* that every American Medical Doctor is sworn in to "**FIRST DO NO HARM**" appears to have been forgotten as it relates to childhood vaccines. Please see a video clip of an actual ACIP vaccine approval meeting in progress here: https://www.youtube.com/watch?v=L_JJMpe00mM

2. I oppose mandatory physician and school reporting to the DOH, the names of children/students whom have not met their immunization requirements, or who have medical or religious exemptions.

The Federal and Educational Rights and Privacy Act (FERPA) and Health Insurance Portability and Accountability Act (HIPPA) standards are in place to protect personal health information and medical records; this would be a grave violation to the intentions of these privacy acts. The reporting of numbers of exemptions may be prudent, however names of students are not necessary, and feels more like a rule approaching communist China.

The only "mandatory reporting" that SHOULD be happening is the reporting by Health Care Professionals of vaccine injuries. We have a failed, passive reporting system in VAERS that, according to a Harvard study funded by our own DHHS, captures an estimated, pathetic 1% of actual vaccine injuries.

3. Finally, I stand in extreme opposition to the requirement of multiple new vaccines to attend daycare and all school institutions in Hawaii.

ACIP recommendations and guidelines are meant to be just that, recommendations, NOT mandates. The new proposed vaccine requirements for Hawaii's children would add approximately 17 doses of 7 new vaccines (including 35+ antigens) for those beginning in daycare. There are no urgent matters in our *school* settings warranting the use/addition of *any* of the proposed vaccines { Influenza; Rotavirus; PCV; Hep A; MCV; TDaP; and especially HPV}. There are also CDC statistics and abundant independent research to back up this claim, as well as facts proving that the risks far outweigh any benefits. HPV (Gardasil) vaccine especially, for a STD not highly communicable in a school setting, is one of the most controversial and dangerous vaccines ever recommended by ACIP. With debilitating autoimmune diseases, paralysis, and even death numbering 60,000 and counting, this vaccine should be pulled from market (as in other countries like Japan), not forced upon schoolchildren.

Important facts pertaining to vaccination:

1. Vaccination is a medical intervention, that carries risk of serious injury, death, and failure to prevent infection or transmission. There are genetic, biological and environmental risk factors rendering some more susceptible to vaccine reactions than others, yet doctors still cannot predict conclusively who will be harmed.
2. Section 13.1 on *every* manufacturer's package insert states that it has "not been evaluated for carcinogenic or mutagenic potentials, or impairment of fertility"
3. In 1986 Congress passed *The National Childhood Vaccine Injury Act* to shield vaccine manufacturers from civil product liability lawsuits for all harm caused by vaccines, including permanent disability and death (Public Law 99-660).
4. Since this 1986 ACT sheltered the vaccine manufacturers from liability, the childhood vaccination schedule has exploded to a current 74+ doses of 17 vaccines (given in pregnancy, on the first day of birth, up to 18 and beyond)
5. **What has also grown concurrently with the vaccination schedule is an epidemic of chronic illness in over half (54%) America's children.**

The gateway period that launched this decline was the late 1980's and early 1990's. Many chronic illnesses have doubled since that time:

- The “4-A” disorders— autism, attention deficit hyperactivity disorder, asthma and allergies—have experienced meteoric growth, affecting children's quality of life and contributing to premature mortality . The spike in autism prevalence has been particularly dramatic, with prevalence as high as 3% (one in 36 children) in some regions . Pediatric autoimmune conditions also are on the rise.
- U.S . children are far more likely to die before their first birthday than infants in other wealthy countries and life expectancy is falling, driven largely by rising death rates in adolescents and younger adults. Suicide is the second leading cause of death in teens, half of whom are reported to have at least one mental, emotional or behavioral disorder.
- The proportion of public school children using special education services is skyrocketing, with estimates ranging from 13% to 25% of school populations .
- The social and economic fallout from these health challenges is hitting home hard—with adverse impacts on intelligence, fertility, household and government finances, employment, productivity, military recruitment and more . The disproportionately high level of neurodevelopmental disability in males versus females is also reshaping society .

Mystifyingly, there is almost no outcry in medical, public health or government circles to find answers and solutions

The potentially dangerous, synergistic and long-term effects of the ever-growing childhood vaccination schedule has never been evaluated properly.

1. A 2013 study by the prestigious Institutes of Medicine (IOM) concluded that:

“ the key elements of the entire (childhood vaccine) schedule: the number, frequency, timing, order, and age of administration of vaccination have not been systematically examined in research studies”

2. In May 2017 Robert F Kennedy Jr.(childrenshealthdefense.org) & Del Bigtree (icandecide.org) filed a lawsuit against our U.S. Department of Health and Human Services suspecting it was not fulfilling its critical vaccine safety obligations.

DHHS is required by Congress as per the NCVIA of 1986, to assure “improvements in the licensing, manufacturing, adverse reaction reporting, research, safety and efficacy testing of vaccines in order to reduce the risk of adverse vaccine reactions”. The lawsuit revealed that

DHHS had never, not even once, submitted a single biennial report to Congress detailing the improvements in vaccine safety. <http://icandecide.org/government/ICAN-HHS-Stipulated-Order-July-2018.pdf>

The mission statement of the Hawaii Department of Health as stated is to “protect and improve the health and environment for all people of Hawaii.” Preventing the spread of infectious disease is important, but it appears that we may be trading infectious disease for chronic, life-long illnesses. Cigarettes were once proclaimed safe by the tobacco giants and supposedly did not cause cancer, while antibiotics have been absolute miracle drugs until mutations created resistant super-bugs like MRSA. It appears we may be in need of another great paradigm shift in medicine and public healthcare, or at the very least unbiased, ethical, independent research and regulation. The mantra “Vaccines are Safe & Effective” is losing support quickly in the eyes of astute Americans.

I am an advocate for improved vaccine safety, fully informed consent, and parental choice. These are essential if public confidence is to be restored, not further eroded.

Thank you for your attention to this serious matter,

Dr. Kimberly Haine

Hawaii for Informed Consent (HFIC)

Date: Wednesday, October 31, 2018 7:23:09 AM

Re: Public Testimony in opposition to Title 11, Chapter 157.

I am opposed to the changes submitted in this proposal. With a medical education and experience as a Registered nurse with my Master of Public Health degree, there should be a choice to ones health especially when there is clear risk involved.

In America, we have freedoms and a right to decide , these changes further take that away. There are numerous clinical studies that show that there can and has been danger in vaccines and that there are often no differences between disease rates of unvaccinated and vaccinated.

Drug/vaccine companies are not held accountable for any injury/harm or are not forced to make what we inject to our immune systems safe. Numerous vaccines are made for diseases that are natural and that pose minimal harm when allowed to naturally occur(i.e chickenpox vaccine). Financial compensation is a driver to force vaccines and many people have received untruths and act on them. The risk for ones child should be determined by their parent.

I plead that you do not pass this change for the sake of everyone's child and the health of our children. Not getting vaccines is not the problem and making people get them is not the answer. Please don't make a knee-jerk reaction with my child's life. Mandating such things could negatively impact people that may want to move and raise their children here(they would no longer come).

Subject: Opposition to HAR 11-157
Date: Wednesday, October 31, 2018 10:18:12 AM

October 31, 2018

Aloha,

Thank you for this opportunity to provide testimony. My family and I live on the island of Oahu. I am writing to **strongly oppose the HAR 11-157 proposed rules update**. The changes proposed in this update would have far reaching consequences to the families of Hawaii. We oppose the proposed rule changes for the following reasons:

1. Vaccines are known to cause harm and carry risk. **Where there is risk, there MUST be a choice.** If you don't believe me, read the vaccine insert itself—not the generic “fact sheet” from the doctor, but the actual, lengthy, detailed insert that comes in the vaccine box (<http://www.immunize.org/fda/#var>). Each vaccine administered to children was never evaluated for its ability to cause cancer, genetic mutation, or infertility. Also, there have never been studies regarding the effectiveness and safety for use of vaccines for people with autoimmune issues and/or MFTHR gene. It is wrong to mandate a medical procedure that is known to cause harm and carries risk, without informed consent. The MMR vaccine insert contains 42 paragraphs of warnings and adverse reactions, including seizures, encephalitis, pneumonia, deafness, and death (https://www.merck.com/product/usa/pi_circulars/m/mmr_ii/mmr_ii_pi.pdf pg. 4-9 Warnings, Precautions, Adverse Reactions). DTaP lists SIDS as a side effect (https://www.gsksource.com/pharma/content/dam/GlaxoSmithKline/US/en/Prescribing_Information/Infanrix/pdf/INFANRIX.PDF pg. 12 Section 6.2). The inserts for active/live virus vaccines state that recipients should avoid close contact with susceptible high-risk individuals for up to 6-weeks following vaccination (https://www.merck.com/product/usa/pi_circulars/v/varivax/varivax_pi.pdf, pg. 3 Section 5.4) (https://www.merck.com/product/usa/pi_circulars/p/proquad/proquad_pi_4171.pdf pg. 4, Section 5.8) (https://www.gsksource.com/pharma/content/dam/GlaxoSmithKline/US/en/Prescribing_Information/Rotarix/pdf/ROTARIX-PI-PIL.PDF pg. 5 Section 5.4) (https://www.emergentbiosolutions.com/sites/default/files/inline-files/ACAM2000%20Package%20Insert%20Version%202003_2018.pdf pg 8. Section 12.2.3). Unfortunately, the government does not know which individuals would be included in this group and would be forcing individuals that fall into those categories (immunocompromised, pregnant women, new infants, etc.) who work and attend the schools to exposure to those illnesses. Will the schools be accepting doctor's note for up to 6-week post vaccine absences?

2. The safety obligations from the 1986 National Childhood Vaccine Injury Act (<https://www.ncbi.nlm.nih.gov/books/NBK220067/>) are in place to protect our Keiki. It recently came to light that those safety obligations have never been upheld. We cannot trust the government to follow through with their promises when it comes to the health and safety of our children—so parents must. Stop making it harder for us to protect our children. Why must parents have to harm their children to provide them an education. (It is essential to note that the total number of vaccine doses on the schedule has dramatically increased since the 1980s. This means children are expected to receive 72 doses between birth and age 18) (if the schedule is followed as written), as opposed to the 10 doses from 1980. This should make everyone question the effectiveness of the vaccines. (<https://www.cdc.gov/vaccines/schedules/hcp/imz/child-indications.html>)

There have been no studies showing the effects of the suggested vaccine schedule as a whole (birth to 18), let alone, how they are currently dosed. Attempting to mandate a medical procedure when there are no adequate safety studies in place is a blatant disregard for public safety. There are no check and balances in the vaccine program, as vaccines are classified differently than any other medications and are not subject to the rigorous scrutiny or the liability that comes along with putting new drugs on the market.

3. HPV is a sexually transmitted disease. It is appalling that you are suggesting the HPV vaccine be a requirement for children to attend school. This is by far the most controversial vaccine because of the debilitating side effects that have ruined the lives of many across the world. There have been numerous lawsuits across the world, including Spain, France, Japan, Colombia, India and right here in the US. The families injured by this vaccine has had their lives devastated, all in the name of money. We should be questioning why we are recommending a drug that has never been proven effective at the prevention of cancer. It has been linked to including but not limited to: ovarian failure, autoimmune disease, pancreatitis, infertility, seizures and disseminated encephalomyelitis, and death following vaccination (https://www.merck.com/product/usa/pi_circulars/g/gardasil_9/gardasil_9_pi.pdf pgs. 4-10 Section 6, 6.1 and 6.2) . The median age for HPV-associated cervical cancer diagnosis is age 49 (<https://www.cdc.gov/cancer/hpv/statistics/age.htm>).

4. Requiring the flu vaccine is inappropriate. Did you know that the flu vaccine is contraindicated for people with egg allergies? Egg is a common allergy. Sadly, this information is not shared and the question “are you allergic to eggs?” is not always asked when the shot is administered (<http://labeling.seqirus.com/PI/US/FLUAD/EN/FLUAD-Prescribing-Information.pdf>, pg. 1 Contraindications). Couple this with the extremely low efficacy rate of the flu shot, its mind boggling that it would be add it to the list. This shows that the government and state entities do not have the best interest of children at heart. Earlier this year the CDC approved what they call an active/live virus flu vaccine. This active virus sheds post vaccine and flu shot clinics at the schools expose high-risk children, teachers, and aids to influenza. (<https://www.azpicentral.com/flumistquadrivalent/flumistquadrivalent.pdf#page=1>, pg 4 Section 12.2, 17.2)

5. Vaccine Excipient and Media. According to the CDC's publication “Vaccine Excipient & Media Summary” (https://www.cdc.gov/vaccines/pubs/pinkbook/downloads/appendices/B/excipient-table-2.pdf?fbclid=IwAR2_pFQdquuxZTD3-i3tHko0ATBNq4s_IWK1NOH6Joi7mAvQBi9JmifCYxw), “In addition to weakened or killed disease antigens (viruses or bacteria), vaccines contain very small amounts of other ingredients – excipients or media.” These excipients include thimerosal (a form of mercury), aluminum (as amorphous aluminum hydroxy phosphate sulfate p/k/a aluminum hydroxide), aborted fetal cells, bovine extract, formaldehyde, monkey kidney cells, calf serum, chicken cells and polysorbate80 (breaks down the blood brain barrier).

6. Medical Freedom is our basic right. Health is very personal and varies between all individuals. Parents have the **right to informed consent**, allowing them to make educated decisions when it comes to vaccines. Stop acting as though you know the medical needs and concerns, religious beliefs, or educational background of every individual that you are trying to regulate. Stop pretending you know what is better than we do with regards to our children. Stop creating blanket rules based

on what you believe everyone should follow and believe in. Medical freedom should be protected so that INDIVIDUALS can make **EDUCATED INDIVIDUAL** decisions when it comes to their health. Stop trying to take that away from us.

I also question why our state epidemiologist, Dr. Park, who used to work for the CDC, isn't being investigated for the conflict of interest. She has stated that "giving parents full informed consent would hurt her flu shot program in the schools." How about the harm her program inflicts on the families that have adverse reactions?

For the reasons above, our religious beliefs, and many other reasons not covered in this testimony, I strongly oppose the HAR 11-157 proposed rule update. I strongly urge the committee to strike the proposed HAR 11-157 updates and do not take away our parental rights to make the right decision for our children. Thank you again for the opportunity to provide testimony.

Sincerely,

Amanda LaCasse

Bruce S. Anderson, PhD, Director of Health
Hawaii Department of Health
1250 Punchbowl St.
Honolulu, Hawaii 96813

RE: public hearing for the proposed amendment and compilation of Hawaii Administrative Rules (HAR) Title 11, Chapter157, "Examination and Immunization."

Strongly **Oppose** the proposed amendment and compilation of Hawaii Administrative Rules (HAR) Title 11, Chapter157, "Examination and Immunization." Taking on the ACIP guidelines is not in the best interest of our Keiki's overall health or best practice of health guidelines for the State of Hawaii.

Dear Hawaii Department of Health,

My name is Maly Gella and I am a Registered Nurse of 21 years. I am an aunty and a mother of a 23 year old daughter who was fully vaccinated as a child. I followed the vaccine schedule without question because I blindly trusted that her doctors were fully educated about vaccine safety, risk, and efficacy. I now know differently.

I strongly **oppose** the state of Hawaii taking on the ACIP guidelines as their best practice for immunization. I oppose these changes because I have spent hours watching ACIP (Advisory Committee for Immunization Practices) meetings and have done much research surrounding all aspects of vaccines; their history, ingredients, extensive side effects including death, the National Childhood Vaccine Injury Act of 1986 removing ALL pharmaceutical liability, the ever growing number of vaccines on the childhood vaccine schedule since the passing of this law, the giving of multiple vaccines at one time while assuring parents that it is safe yet having no safety studies to substantiate this, etc.

These safety studies were the responsibility of HHS after the 1986 Act was passed. These studies were to be conducted every 2 years and the findings reported to congress. ***In the last 30 years these studies were never done!*** A lawsuit was filed and won by ICAN (Informed Consent Action Network) and counsel Robert F. Kennedy Jr. Through this lawsuit HHS had to admit that they never submitted a single biennial report to Congress! So much for government oversight. Lawsuit link <https://goo.gl/1pNeaD>

I hope I have made it very clear why I have concerns. So now my questions to you Mr. Anderson, Dr. Sarah Park, and all parties involved in this decision making process; Do each of you regularly watch the ACIP meetings? If not then how can you confidently implement their recommendations on our children? If you have watched the ACIP meetings how can you in good conscience agree to follow their recommendations? I make these statements because I have watched these meetings and *while some on the committee may ask thought provoking questions and bring up safety concerns they still unanimously vote to proceed with the use of these vaccines!* One such example of this is the new hepatitis B vaccine which contains a new adjuvant. This new vaccine was shown to cause Myocardial Infarctions (MI=heart attacks) in 14 people while being tested. While one ACIP member brought it up as a concern he still voted to allow this vaccine to be used! The committee then said they would look to Post Marketing data for this "signal". In other words the public receiving this new vaccine will be their unknowing test subjects. The committee members

are waiting to see if a percentage will suffer heart attacks. I thought this was illegal based on the Nuremberg code.

I have deep concerns about this November 1st hearing process. We were told that we may ask questions but we will not get answers because the decision maker/s will not be present. So this raises questions for me; 1. Is this just a formality for the DOH? 2. Has the decision to implement these changes already been made and are you just checking off a box to remain compliant? If so this is unacceptable, these decisions personally affect our children and we need to have a say in any medical intervention imposed on them. Gone are the days that we blindly follow the medical establishment.

This whole process is disconcerting. It appears that assumptions have been made (or will be made) by the Hawaii DOH regarding ACIP. They are; 1. The DOH has confidence in adopting the ACIP recommendations because they assume ACIP has done their due diligence on each and every vaccine placed on the schedule. 2. The DOH believes that the safety of the vaccines have been established or ACIP would not recommend they be placed on the schedule. 3. ACIP is an independent, unbiased, conflict free entity. With a little bit of time and effort you will find these are all wrong assumptions. That being said we the public who stand in opposition of (HAR) Title 11, Chapter 157 place this responsibility back on you, the DOH. We need to know how you are making these decisions. We need to see the safety studies that you are basing your decisions on. We will no longer allow you to impose medical interventions on our children or our families that could have dire consequences. The government has already paid out \$3.9 billion to compensate for vaccine injury. We know the truth, vaccines have risk. Any denial of this on the part of the DOH is an outright lie.

We have done our homework and we have seen the injuries first hand. It is time that you the "Department of Health" do your homework, do your job, be advocates of health. With 54% of our children being affected by chronic illness and 1 in 6 children having some type of learning disability, it's time we work together and truly focus on improving the health of the children of Hawaii. We sincerely want to be part of the solution.

We insist that No changes be made to our current medical and religious exemptions. Doctor and patient confidentiality and confidence must be maintained. The DOH has no right in interfere with the doctor patient privilege nor do you have a right to infringe on anyones religious beliefs. A persons deep held religious beliefs are protected under the Constitution. Challenge this and you are opening up Pandoras box.

Lastly I am requesting that the Department of Health host public hearings Statewide on (HAR) Title 11, Chapter 157, "Examination and Immunization."

Thank you for taking the time to read my testimony

Maly Gella, RN

Subject: OPPOSE: MANDATORY Immunizations
Date: Wednesday, October 31, 2018 4:52:09 PM

I OPPOSE the mandatory immunizations.

There has been research on the side effects (due to the ingredients) of immunization for various segments of the population.

I would think that DOH could be held responsible for making this mandatory for those who would suffer greater illnesses and death caused by immunization.

Respectfully,

Sylvia Dolena

To: [REDACTED]
Subject: OPPOSITION TO HAR-157
Date: Wednesday, October 31, 2018 10:04:14 PM

Aloha,

HAR-157 needs to be taken off the table immediately. Our ohana lives on the island of Oahu and we strongly oppose this proposed rule change for the following reasons:

1. Where there is risk, there must be a choice. Vaccines carry risk. Please read the vaccine insert itself (not the generic “fact sheet” from the doctor), but the actual, lengthy, detailed insert that comes in the vaccine box. It is wrong to mandate a medical procedure that is known to cause harm and carry risk.

2. This rule changes will put more children at risk. Have you read the study that shows the effects of the suggested vaccine schedule as a whole? There isn't one. There aren't any adequate safety studies in place.

It recently came to light that the safety obligations put in place years ago by congress in the National Childhood Vaccine Injury Act were never upheld.

We could not rely on our government to follow through with their promises when it comes to the health and safety of our children.

This bill makes it harder for parents to protect their children.

3. HPV is a sexually transmitted disease. It is appalling to require the HPV vaccine in order for children to attend school.

HPV is the most controversial vaccine because of its debilitating side effects. It has been known to ruin the lives of many across the world.

4. Requiring the flu vaccine is inappropriate. Did you know that the flu vaccine is contraindicated for people with egg allergies? Egg is a common allergy. Most people don't know this. The information is most often not shared with patients.

The basic question of “Are you allergic to eggs?” is NOT asked before the shot is administered.

Additionally, this vaccine has been known to have very low efficacy rate. It does not appear that the children's best interest are kept in mind.

5. What you are proposing encroaches upon our rights.

Your definition of “school” as a “congregate setting for educational purposes.” is too broad a statement. Even if you listed “exceptions” in a later paragraph, this definition is too vague.

I wish to stop this bill.

However, at the very least, I ask that it be changed to “public school.” Many parents have opted to not send our children to public schools for a wide variety of reasons.

If we wanted our children to be forced into a “one size fits all” mold, we would send them to public school. But we haven't. We have created our own options. “One size fits all” does not work in most aspects of life, including education and medical decisions.

6. Medical Freedom is a basic right. You are attempting to regulate carte blanche without understanding the medical concerns, religious beliefs, or educational background of every individual.

Medical freedom should be protected so that INDIVIDUALS can make educated INDIVIDUAL decisions when it comes to their health. Health is personal and varies from individual to individual. Parents have the right to informed consent and make educated decisions when it comes to vaccines. Please stop trying to take that away from parents.

Sincerely,
Tsu Osato

Subject: Rejecting mandatory immunization
Date: Wednesday, October 31, 2018 10:24:02 PM

Aloha,

I am writing this on behalf of my family of three. We reject the proposal of a mandatory immunization for children and adults. We believe in Body Sovereignty and we choose not to inject ourselves with any poisons that you deem mandatory. There is extensive research available to show that "herd immunity" has been proven incorrect. It's appalling that mandatory vaccinations are being considered in this state. This is poison whether space out or not, and it is our right to refuse any thing to enter into our bodies that we do not consent to, including vaccinations. We consider mandatory vaccination to be a form of assault, as it involves forceful penetration with a needle and injection of poisons carried out against a person without that person's consent. Those that would like to be vaccinated should be free to do so, and those that do not want to be vaccinated should be free to choose. Body Sovereignty for All.

Subject: RE: HAR 11-157
Date: Wednesday, October 31, 2018 10:57:19 PM

To: Hawaii State Department of Health, and whom it may concern.

Aloha, I am writing to express to you my extreme opposition to HAR 11-157. I live with my family on the Big Island of Hawaii and am strongly opposed to this shocking rule change.

To begin, I am most definitely not anti-vaccine. With some exceptions, I believe most vaccines can and do save lives. What I oppose is being FORCED to undergo an invasive medical procedure that carries with it the possibility of long term damage, injury or death. I am also particularly opposed to the flu vaccine and the HPV vaccine.

The flu vaccine is not only downright dangerous, it has a pathetically low success rate. My grandmother died very shortly after receiving this vaccine, both my parents became violently ill after being vaccinated for the flu, both saying never again, they would much rather take their chances with the actual flu bug. I know of several people here on this island who developed Guillain Barre Syndrome as a direct result of the vaccine and another who died within 6 hours of receiving it. Have you read the vaccine insert? The one that is in the box that the doctor NEVER shows you. Probably because it is about 3 ft long with listed side effects!

As for the HPV vaccine....Words fail me that you could even consider mandating such a hazardous and unnecessary vaccine for admittance to school! Recommendation for this vaccine was withdrawn in Japan due to the thousands of women and girls who had their bodies damaged and lives devastated. Some are paralyzed, some are brain-damaged. All have experienced immense physical, psychological and emotional pain. This has happened to countless females (and males) GLOBALLY. Then there are the many who have DIED from HPV vaccine, within hours or days of being injected. This is an atrocity.

There is no one size fits all, some bodies are sensitive or allergic to vaccine ingredients which include human and animal DNA and neurotoxic, carcinogenic chemicals. If an individual has an underlying genetic, metabolic or immune vulnerability, for example the common gene mutation MTHFR (which many people do not even know they have) a 'vaccine' could kill or seriously harm as the immune system reacts to the toxins and live viruses in vaccines and goes haywire.

This authoritarian overreach regarding unwarranted, mandatory vaccinations appears to be about money and control, NOT the well-being of our children. Pharmaceutical companies are making countless millions of dollars and using citizens, particularly the children, as human guinea-pigs. The 'safety' testing is rushed through, no long term safety studies are performed. The truth is covered up and the vaccine manufacturers are not held accountable.

It is a game of Russian roulette. It is **medical rape**. Please, consider our human rights and parental rights. Stop trying to take away medical freedom, religious freedom and informed consent. There should ALWAYS be choice NOT coercion! This is a violation of the Nuremberg Code. How can you expect we the people, to trust the government when you disregard our most basic rights as humans?

To finish, I thank you for the opportunity to submit written testimony, and I ask that you consider holding state-wide public hearings on every island, with enough public notice that EVERYONE gets the opportunity to hear of it and be able to testify should they decide they wish to do so.

Sincerely,

Nicole Yokoyama

Subject: Aloha and Please: NO Mandatory Vaccinations
Date: Wednesday, October 31, 2018 2:29:27 PM

Dear Honorable Department of Health,

First I just want to say that the Food Handling Prep class I took a couple years ago with a retiring Health Department official was a GREAT class and I remember all the things he taught us, especially about time and temperature!

Health and cleanliness mean a lot to me, but that said, I am writing today to ask you to please not move forward with forcing a Mandatory Vaccine Schedule. Like most, I came from the point of view they were good until one day I met a woman who's 7 year old child was strapped to a way too small stroller and completely checked out. She stated that directly after his MMR, his eyes rolled up in his head and he had been a drooling, detached, mentally challenged child. Her boy never returned. This started me on a long research journey, which lead me to find out that Vaccines aren't required to have the rigorous years of testing as by-mouth pharmaceuticals and that is, in part, a reason for the proliferation of them.

I actually have reams of data to counter what I also thought seemed good medicine until I began to educate myself with more vaccine data and the absolute damage done by the ADJUVANTS used in the ingredients of vaccines with side effects sometimes more debilitating that what the vaccine is actually to prevent, but I won't go on in this vein.

Those that are vaccinated are safe from those who are not, so why would the public health require Nazi Regime forcing of ingredients into people who wish to maintain their right to consent. This is the greatest issue facing the Hawaii DOH, are you really willing to remove people's right to Body Sovereignty on an Island where the People have been marginalized and had their Sovereignty stolen in every other way.

Please do not continue pursuing taking away the individual rights of the many by pushing Mandatory vaccines.

Thank you for all you do for our community. Please don't take your sacred duties to the point of removing people from their sovereign right to informed consent and the right to chose for their own bodies. We may have lost our aloha, but must we really lose even our right to self care?

Respectfully submitted,

Susan

The Senate

STATE CAPITOL
HONOLULU, HAWAII 96813

October 31, 2018

To Whom It May Concern,

I am the State Senator for Puna and Ka'u.

I oppose any increase in mandatory vaccinations for any category of workers, students, or people, and I oppose adding additional vaccines to the childhood schedule for school acceptance.

The total vaccination schedule in the U.S. today includes about ten times as many vaccinations as we had 20 years ago, and more come on line every year. Yet the combinations of vaccines given have never been proven safe or effective. The sum total of heavy metals in the adjuvants to all these vaccines amounts to a clear health hazard. It has not been proven safe.

I am not an 'anti-vaxxer,' and I am also not 'anti-science.' I am pro-freedom and pro-individual liberty. Like many others I also believe in natural health which does not come from chemicals, but from one's inherent, God-given powers to grow, heal, and maintain health when free from harmful influences, such as pharmaceuticals. You may not feel the same; That is your right, but you do not have the right to take this health freedom away from others.

I have a degree in biology and respect science greatly. One of the primary principles of science is the precautionary principle; if you are unsure of the consequences of an action, proceed cautiously or not at all. This scientific principle should be applied here, instead of the reckless promotion of untested vaccine protocols.

The adjuvants in vaccines have never been proven safe, either in individual doses or in the large combinations of vaccines given today. The active ingredients have also never been proven safe or effective in the same sense that any modern medicine must be proven. The very fact that vaccine manufacturers have been granted immunity from liability is telling: the only other industry granted such immunity is the nuclear industry. The logic is that the liability is so vast and the public need so great that special immunity is needed. But as with nuclear industry, there is no true need and the protection comes from political power and financial influence, not from public safety concerns.

Some say we must compel vaccines to protect ourselves and our kids. But if vaccines really worked, then one wouldn't care if my child or your teacher is vaccinated or not; one's vaccines would protect one. I am aware of the 'herd-immunity' argument here, and I am also aware of its profound scientific fallacy.

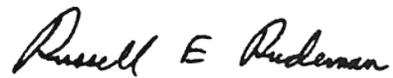

The pharmaceutical industry is free to promote its products, despite lack of safety studies. And you are free to accept them if you wish. But you have no right to compel any one to submit to such hazards, and to take away anyone's freedom of choice regarding how they care for their own body. Some of us don't want foreign biological agents or chemicals injected or otherwise introduced into our healthy bodies. A

The number of vaccines recommended or required in this country is much greater than in other modern countries, such as the E.U. Is this because the other countries are not as 'scientific' as the U.S.? Or is it possible that what we accept as 'scientifically justified' is influenced by the massive outreach of the pharmaceutical industry in our country? And is it possible that you are being used as a marketing device of this pharmaceutical industry?

Please note that these other modern countries, with much fewer vaccinations, have better infant mortality rates, fewer childhood diseases, and longer life expectancy than in the U.S. A scientific approach would take this combination of facts very seriously, and proceed cautiously with addition vaccine recommendations.

If there is any question about this, then further compelling the use of vaccines is irresponsible and immoral. You must stop doing so.

Sincerely,

Russell E. Ruderman, Senator
Hawaii State Senate

Subject: STRONG OPPOSITION TO HAR 11-157
Date: Wednesday, October 31, 2018 11:49:53 PM

Aloha,

Thank you for the opportunity to submit testimony. I oppose HAR 11-157 and urge you to take it off the table.

As a mother of three keiki, I care deeply about our health, and it begins with me. With my husband, we make all the decisions for our family: what we eat, what positive activities will consume our time, and what things we will put into our body when it comes to our health. When I speak with my doctors, I expect informed consent. I do not expect them to have all the answers but I do wish to know ALL the available facts. What I have come to learn is that doctors pass out “fact sheets” (Vaccine Information Sheets) which are far different from the actual vaccine package inserts (see [here](#)). When I dig deeper, I see that there is great risk. It is absolutely wrong to mandate medical procedures that are known to cause harm and carry risk. No vaccine or vaccine schedule is one-size-fits-all. No other medication is – why should vaccines be any different?

Where this is risk, there must be choice. Vaccination is a medical intervention that carries a risk of injury or death. As parents, we have the God-given human and legal right to say no about what goes into the bodies of our keiki. As taxpayers, we have the right to a public education for our keiki. We also have the right to homeschool our keiki as we see fit. That should NOT come at the cost of their health.

When it comes to the changes you are proposing, I have several disagreements. The HPV vaccine should NOT be mandated to attend school. HPV is a sexually transmitted disease. This has absolutely nothing to do with the educational environment. Leave those decisions up to the parents. Also, this particular vaccine has been shown to cause GREAT harm. Please see [all of these studies](#) done on the adverse affects of Gardasil. Did you know that when it was studied, it was only tested in young adults ages 16-26, yet it is recommended as young as 9 years old? There is literally no data on how it will affect our keiki in the short or long term. Our children are being used as guinea pigs.

Requiring the flu shot is also inappropriate. Given the ineffectiveness in recent years, you have a better chance of avoiding the flu by boosting your immune system naturally, washing your hands, and staying home if you are ill. Every year, it is a guessing game. I do not want my children or myself to be subjected to this.

In 2013, the Hawai'i State Legislation empowered the Hawai'i Department of Health with extensive, excessive latitude [to make and alter the health policy in the State](#). Now, only a few if not a single individual has the power to make decisions when it comes to our health. This is inappropriate and is devoid of the proper checks and balances. These individuals do not have

our best interests in mind. Where there is risk, there must be choice. And as parents, we have the right to decide what is best for our keiki.

There are countless victims who have experienced vaccine injury. You can hear their stories [here](#). My family member is one of them and his life was forever altered. Vaccine manufacturers are protected by law; no one is held accountable when injury happens. Taxpayers foot the bill when these (few) cases make it to the “vaccine court” (National Vaccine Injury Compensation Program). As of now in 2018, the U.S. Court of Claims [has awarded nearly \\$4 billion dollars](#) to vaccine victims for their catastrophic vaccine injuries, although two out of three applicants have been denied compensation. Currently, there are 76 vaccines on the childhood schedule. Many more are in the works. When will enough be enough? Who gets to put the cap on the number – the State? The ACIP? No. That decision should belong to the parents.

I respectfully request that the proposed changes to HAR 11-157 be removed for the health of all of our communities. Leave the decisions in the hands of parents who know what is best for their keiki.

Thank you for your consideration,

Aubrey Ae’a

STRONGLY OPPOSE HAR 11-157

Thank you for the opportunity to submit testimony. I'm writing in strong opposition of HAR 11-157. In "all" fairness, public hearings should be hosted by DOH statewide on this rule. Shouldn't "all" the people be informed as this essentially will effect "all" people in one way or another? Vaccinations are approached as a one-size-fits-all and yet there in fact have been adverse consequences as a result of this approach and shouldn't we have learned this already that it doesn't "protect and improve the health for all people," as your mission statement maintains? The emphasis here is on "all," including "all" of those who may suffer adversely from being vaccinated – which goes directly against DOH's mission, and philosophy which also states, "– Health, that optimal state of physical, mental, social and environmental well-being, is a right and responsibility of all of Hawaii's people." How can the "people" exercise their "rights and responsibility" if it's being stripped away from them via forced vaccinations and without their knowledge?

With the multitude of reporting that has taken place and are still taking place, are these given any consideration, like those being documented by the Vaccine Adverse Events Reporting System (VAERS) in writing such a rule? Have all of those who are responsible for composing and proposing to implement HAR 11-157 read every vaccine inserts detailing all the possible adverse effects and at times very controversial ingredients? If side effects so indicated in the inserts exists, how can HAR 11-157 even be considered as not "all" will come away unscathed will they?

In addition, its common knowledge that the Vaccine Injury Compensation Program has paid out approximately \$3.9 Billion thus far, and it's inevitable that, that number will continue to rise, and that's just those who are lucky enough to have their cases heard, not factoring in those that haven't even had that opportunity to be heard, some claiming to still be waiting after an unjust number of years.

Now a days, systems are set up which groups and categorizes applications which just doesn't (at times), in the end produce the best outcomes for "all" that are forced into those "systems." Because medications go down a different road map/system, adverse reactions are known prior and reported and taken into consideration and are commonly discussed with a patient before dispensing/administering. When an adverse event occurs, the patient is listened to, medical interventions follow and so goes the medication road map/system. On the other hand, the vaccine road map/system never allows for disclosure of possible side-effects conveyed in the inserts prior to administration. Neither is one made aware of its controversial ingredients. Why is that? Parents/guardians have encountered a hostile environment in their quest to just have that right to know, or wish to wait, etc., or to be just heard. Why is that? And if a patient appears to have experienced any kind of problems following vaccination, its treated like that couldn't possibly be. Why is that? They are dismissed. They're treated with condescension. That's the current vaccine road map/system. What if it goes against your religious beliefs to have aborted fetal tissue, or other animal products, etc., injected into your person via vaccination, shouldn't you have that "right" to know prior and that "right" to refuse such an abomination? Wouldn't that be violating "people's rights" to reverence their religious beliefs?

My niece ended up in the emergency room, suffering from what she knew was an adverse reaction after receiving the HPV vaccine. When explaining this to the emergency room physician, he belittled her and dismissed anything that she might have been experiencing had anything to do with the HPV vaccination she was given. She was not heard that day. She was not listened to. Why was that? When her and her husband was expecting their first child, they were elated and couldn't wait to hold their baby in their arms. That was short lived when their baby died unexpectedly eight and half months into the pregnancy. She could no longer have children of her own. It's been several years since and she and her husband still honors that little life lost every anniversary. That was the vaccine

road map/system at work at that time. That same road map/system is still intact today given the horrendous vaccine schedule that has grown exponentially over a short period of time. When you follow that path of receiving feedback from patients about adverse, vaccine effects, the end of that path is denial, dismissiveness and condescension. It's that elephant in the room that's never acknowledged, never heard. It doesn't work for "all." It won't work for "all." What a dangerous path for "all" to keep going down on.

This system has created a rift between doctor and patient care that wasn't there before and now it's spilling over and creating unnecessary pressure into the public school environment. How can a system like that ever be to "protect and improve the health for all people," when people are not being listened to and are suffering as a result?" Shouldn't "all" lives matter? Shouldn't that road map/system change first before hastily implementing more forced, hostile mandates? Otherwise the "right" for "all of Hawaii's people" will be stripped by the very agency purporting to respect it. It isn't that hard to see.

Respectfully,
Mrs. L. Nakamura-Higa

Subject: STRONGLY OPPOSE HAR 11-157 rule changes to include new vaccine requirements
Date: Wednesday, October 31, 2018 1:09:09 AM

Aloha Dr. Bruce S. Anderson, Director Dept of Health Hawaii,
It with great concern that I STRONGLY OPPOSE HAR 11-157 rule changes to include new vaccine requirements. An increase in scheduled doses for our keiki without any liability on the part of the pharmaceuticals, the Center for Disease Control, the State of Hawaii or the doctors, in implementing the mandatory program is alarming and irresponsible. Having researched the toxic vaccine contaminants ie. thimerosal aka mercury, aluminum, formaldehyde, animal and/or human dna, one would wonder why the dept of health would consider a schedule increase when research shows incidents of detrimental neurological damage. Over the years it is noted that the vaccine schedule continues to escalate with a spike beginning in 1983 when the pharmaceutical companies were absolved of all liability for vaccine related injuries. When that occurred the burden of responsibility fell on the patient who would incur insurmountable medical bills in efforts to either detox the heavy metals or medicate vaccine injury symptoms. MMR is known to contribute to autism as covered up by the CDC. In 1962 only 5 vaccines were administered. Today in our efforts to "protect" our children, up to 72 + doses from infant to 18 are administered and yet our nations children are sicker than ever ie allergies, asthma, gut issues, ADD, ADHD, cancer, tumors. It is disturbing that this rule change requires all young children to take the influenza vaccine when its' efficacy is only 10%. Another alarming rule change is for all 7th graders be given the HPV aka gardasil when there are known injuries internationally; Japan, France and India have banned HPV gardasil.

All patients must be informed of vaccine contaminants and their side effects and given a CHOICE if there is a RISK and given the KNOWLEDGE that vaccine injuries can induce life-long medical issues.

The right to informed consent to any medical intervention that can kill or injure you or your child is a HUMAN RIGHT.

A healthy Hawaii, which is our goal, is an INFORMED Hawaii. Let's stop the implementation of HAR 11-157 till the pharmaceuticals, CDC, Dept of Health and our local clinics will take ownership of the potential vaccine injuries and take steps to inform EVERY patient of the RISK.

There is no such thing as a safe vaccine.

Sincerely,
Lois Young

Subject: strongly opposing HAR11-157
Date: Wednesday, October 31, 2018 11:09:58 PM

Aloha,

HAR-157 needs to be taken off the table immediately. Our ohana lives on the island of [REDACTED], I work at In the medical field and we strongly oppose this proposed rule change for the following reasons:

1. Where there is risk, there must be a choice. Vaccines carry risk. If you don't believe me, read the vaccine insert itself—not the generic “fact sheet” from the doctor, but the actual, lengthy, detailed insert that comes in the vaccine box. It is wrong to mandate a medical procedure that is known to cause harm and carries risk.

2. You are not protecting more children with these rules, you are intentionally putting more children in the way of the risks of vaccines. Parents shouldn't have to set their own child on fire to keep others warm. Have you read the study that shows the effects of the suggested vaccine schedule as a whole? No? Because there isn't one. How dare you try to mandate a medical procedure when there aren't adequate safety studies in place.

It recently came to light that the safety obligations put in place years ago by congress in the National Childhood Vaccine Injury Act were never upheld. This proves that we cannot trust the government to follow through with their promises when it comes to the health and safety of our children—so parents must. Stop making it harder for us to protect our children.

Vaccines shed, therefore do not protect immuno compromised.

Newborns don't go to school. Also do alot of immuno compromised children go to school & how many % are immuno compromised?

All recent outbreaks has been in fully vaccinated individuals.

94 % of adults are not up to date with vaccines, so the 93% what they suggest have to be vaccinated is not even possible. Even if they were uptodate, vaccines have proven to weaken 2 to 5 years if they even worked at all. So that is completely false. To attack our exemptions is a uncalled for. Why do they keep mentioning elders and new borns. This is mandate for school, right? Also newborns, elderly and immuno compromised DO get vaccinated.

3. HPV is a sexually transmitted disease. It is disgusting and appalling that you are suggesting the HPV vaccine be a requirement for children to attend school. What kind of gatherings are happening that they need supposed protection from an STD? It is also the most controversial vaccine because of the debilitating side effects that have ruined the lives of many across the world. Abstinence needs to be taught in the schools more.

Cervical cancer has increased since the vaccine in the age group it was vaccinated for. Over 50.000 reportes adverse events and 325 deaths reported to VAERS. Fda admits only 1 to 10% even gets

What are the real reasons for these mandates? Hpv and Hep A is not something that would or should transfer in a school environment.

4. Requiring the flu vaccine is inappropriate. Did you know that the flu vaccine is contraindicated for people with egg allergies? Egg is a common allergy. Most people don't know this nor is the information shared and the basic question “are you allergic to eggs?” asked when the shot is administered. Plus the efficacy rate of the flu vaccine is so low, it's laughable that you'd add it to the list. It shows that you truly do not have the best interest of children in mind. Again, I work in the hospitals and I refuse to get this. A few of my kids that have not had all their shots are healthier than my ones that did. I have two vaccine injured children that I know of. Some are too young to know if there are effects or not.

5. Stop re-defining what a “group” is – Your wording about what a “school” is concerns me. It now defines “school” as a “congregate setting for educational purposes.” That is too general. Even if you listed “exceptions” in a later paragraph, this definition is too vague and I ask that it be changed to “public school.” If you want to have rules for public school, that’s one thing, but many, many, many of us have opted to not send our children to public schools for a wide variety of reasons. Stay out of our options. Stay out of our private schools, stay out of our daycare centers, stay out of our homeschool co-ops, stay out of our playgroups. Stay out. If we wanted our children to be forced into a “one size fits all” mold, we would send them to public school. But we haven’t. We have created our own options because there is no “one size fits all” when it comes to anything—including education and medical decisions.

6. Medical Freedom is a basic right. You don’t know the medical concerns, religious beliefs, or educational background of every individual that you are trying to regulate. Stop pretending you know better. Stop creating blanket rules based on what you believe everyone should believe. Medical freedom should be protected so that INDIVIDUALS can make educated INDIVIDUAL decisions when it comes to their health. Health is personal and varies from individual to individual. Parents have the right to informed consent and making educated decisions when it comes to vaccines. Stop trying to take that away from parents.

Use physicians for informed consent statement on that.

Subject: strongly support the HAR 11-157 proposed rules update
Date: Wednesday, October 31, 2018 7:47:30 AM

October 31, 2018

To whom it may concern,

Thank you for this opportunity to provide testimony. As a parent of 3 children, and a pediatrician, I am writing to **strongly support the HAR 11-157 proposed rules update.**

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP)

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life. Some of these diseases are life-threatening. These diseases are preventable!

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you for your consideration.

Cristeta Ancog, M.D.

Certified, American Board of Pediatrics

Dear Hawai'i Department of Health,

I strongly oppose HAR 11-157.

The current vaccination schedule is Adequate as is.

Adding more to the schedule, especially vaccinations like HPV, which have not yet been researched fully and have had countless reports of adverse reactions, is unwise and irresponsible.

These mandates, and the reporting associated with exemptions, infringe upon personal liberties as well as violate the right to privacy concerning ones own health information and record.

Please respect and seriously consider the voices of those who oppose HAR 11-157 and do not move forward with these prescribed changes.

Thank you for listening,

Sandra Oda

Subject: Testimony for HAR 11-157
Date: Wednesday, October 31, 2018 8:17:49 AM

Aloha,

Thank you for allowing me to submit testimony. I oppose HAR 11-157. If there is a risk, there must be a choice. Informed Consent is meaningless without the right to say no. The one-size-fits-all vaccine schedule is not safe for every child. The proven negative side effects and dire consequences of many vaccines are far greater than the risks of the diseases the vaccines are claimed to prevent.

Vaccines never undergo long term, double-blind placebo-controlled tests for safety or efficacy. At best they are tested for 4-6 days and cleared of any harm by the manufacturers who profit off of them. This is a crime against humanity. The truth is that vaccines do harm and the damage typically surfaces after the manufacturer's extremely short safety study. This is not sound science, this is avoiding the elephant in the room. Vaccines do harm. Just look at the number of vaccine adverse reactions and deaths registered with VAERS each year. It is estimated that only 10% of injuries are even reported. The true number of vaccine injuries is staggering, and the injuries are often irreversible. This bill takes away the right of the parent to decide what is best for their children.

I am not anti-vaccine, I am pro-child, pro-family, pro-community. I am pro-science, I am pro-research. I am pro-health, pro-wellbeing, pro-safety. I am pro-government transparency. I am pro-pharmaceutical company accountability.

I am pro-honesty, I am pro-critical thinking. I am pro-freedom.

Please, I urge you to oppose HAR 11-157 for the sake of our child's health and her future. It is OUR decision, not the State's. The children are the future. We must not allow a healthy child to be harmed by unsafe vaccinations that are rushed to market by an industry that is not held legally liable for the harm their products cause. If HAR 11-157 passes, this is a blatant violation of the Nuremberg Code. It also goes against the Declaration of Geneva, where Doctors worldwide swear on oath, "I WILL NOT USE my medical knowledge to violate human rights and civil liberties, even under threat."

We're also asking you to hold public hearings statewide.

Signed,

Eric Day

Subject: Testimony HAR 11-157
Date: Wednesday, October 31, 2018 3:02:57 PM

Thank you for this opportunity to provide testimony. As a community member and public health advocate, I am writing to **strongly support the HAR 11-157 proposed rules update.**

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you for your consideration.

To whom this may concern,

I'm born and raised on [REDACTED]. I have three children 10yrs and under. I am not in support of HAR-157. I strongly oppose this idea becoming a reality. Here are some of my concerns:

1. Where there is risk, there must be a choice. Vaccines carry risk. When I consent to medical treatment, I alone am assuming that risk. You cannot require anyone to receive medical treatment against their will. If I am forced to take the required vaccine and there is a side effect or harm that befalls me, will you assume that risk and liability? Do you become responsible for me now medically?

2. The logical fallacy that all vaccinations are equal and they work the same for all is not only illogical, but is putting the public at risk. Have you read the study that shows the effects of the suggested vaccine schedule as a whole? No? Because there isn't one.

How can you mandate a medical procedure when there aren't adequate safety studies in place.

It recently came to light that the safety obligations put in place years ago by congress in the National Childhood Vaccine Injury Act were never upheld. This proves that we cannot trust the government to follow through with their promises when it comes to the health and safety of our children—so parents must. HAR 11-157 makes it harder to protect our children.

3. HPV is a sexually transmitted disease. It is appalling that you are suggesting the HPV vaccine be a requirement for children to attend school. It is the most controversial vaccine because of the debilitating side effects that have ruined the lives of many across the world. Hepatitis B can only be transmitted by sex and needles, why does my child need to have four doses of this vaccine before they even start school?

4. Requiring the flu vaccine is absurd and so inappropriate! The efficacy rate of the flu vaccine is so low - how could it possibly be added to the list. I have personal testimony of my family members taking the flu shot, immediately getting sick and having long lasting effects like paralysis!!!! When we went back to the doctors, they assumed no fault, because it was the risk that WE took. Needless to say, none of us will ever take the flu shot again! You do not have the best interest of children in mind by requiring people to take the flu shot.

Did you know that the flu vaccine is contraindicated for people with egg allergies? Egg is a common allergy. Most people don't know this nor is the information shared. The basic question "are you allergic to eggs?" Is NOT asked when the shot is administered.

5. Stop re-defining what a “group” is. Your wording about what a “school” is concerns me. It now defines “school” as a “congregate setting for educational purposes.” That is too general. Even if you listed “exceptions” in a later paragraph, this definition is too vague and I ask that it be changed to “public school.” If you want to have rules for public school, that’s one thing, but many, many, many of us have opted to not send our children to public schools for a wide variety of reasons. Stay out of our options. Stay out of our private schools, stay out of our daycare centers, stay out of our homeschool co-ops, stay out of our playgroups. Stay out. If we wanted our children to be forced into a “one size fits all” mold, we would send them to public school. But we haven’t. We have created our own options because there is no “one size fits all” when it comes to anything—including education and medical decisions.

6. Medical Freedom is a basic right. You don’t know the medical concerns, religious beliefs, or educational background of every individual that you are trying to regulate. Stop pretending you know better. Stop creating blanket rules based on what you believe everyone should believe. Medical freedom should be protected so that INDIVIDUALS can make educated INDIVIDUAL decisions when it comes to their health. Health is personal and varies from individual to individual. Parents have the right to informed consent and making educated decisions when it comes to vaccines. Stop trying to take that away from parents.

7. Requiring adults who go to school to get vaccines but no other adults to get the same vaccines is discriminating against adult students.

I can understand the concern that we have about the spreading of communicable diseases! I am NOT against all vaccines all the time. But I strongly disagree with not having the liberty to choose what is best for me and my family, at what time! I DO NOT SUPPORT BILL HAR 11-157!

Thank you for your time.

Sincerely,

Shayna Bing

Aloha kakou,

I write this as a citizen as a mother. I write this letter to advise you that I OPPOSE HAR 11-157. I do not believe HPV and flu shots should be mandatory!!! The flu shot is not effective as it is made out to be. It is a guess in the strain for that year. They have been many adverse reactions to HPV therefore I am not giving it to my kids!! I feel the rules are good the way it is! Please DO NOT pass this resolution!

**By
Hali Robinett, MPH
President-Elect
Hawaii Public Health Association**

Hearing Docket No. R-157-18-07: PROPOSED AMENDMENTS TO HAR TITLE 11, CHAPTER 157

Thank you for the opportunity to provide testimony in support of the proposed amendments to Hawai'i Administrative Rules (HAR) Title 11, Chapter 157 regarding Examination and Immunization. These proposed amendments will bring Hawai'i's rules into compliance with the most current recommendations of the U.S. Centers for Disease Control and Prevention's (CDC) Advisory Committee on Immunization Practices (ACIP), and most importantly, protect our keiki and youth from life threatening diseases now and into the future.

The CDC advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases. The proposed rules update is especially important in this regard for students entering 7th grade (or higher) as the immunization requirements will help to prevent the spread of dangerous infectious diseases, as well as protect our youth from debilitating and life-threatening cancers caused by persistent human papillomavirus (HPV) infections.

Nearly 80 million Americans – one out of every four people – are infected with HPV, and of those millions, more than 31,000 will be diagnosed with an HPV-related cancer this year, namely malignancies of the cervix, vagina, vulva, penis, anus, oropharynx and oral cavity. Despite those staggering figures and the availability of a vaccine to prevent the infections that cause these cancers, HPV vaccination remains low in Hawaii and in the U.S., especially compared to other recommended adolescent vaccines: only 55% of Hawai'i's adolescents (males & females) have received the HPV vaccine compared to 86% who received the vaccine to prevent meningitis, 85% for tetanus booster and 90% for the measles-mumps-rubella booster (NIS-TEEN, 2017). This administrative rule change will greatly increase uptake of the HPV vaccine along with the other required vaccines, thereby protecting vulnerable groups in our community including the very young, the elderly and others with compromised immune systems who cannot be vaccinated.

Immunization is widely recognized as one of the greatest public health achievements of the twentieth century, and the HPV vaccine is considered one of the greatest achievements in cancer prevention in our lifetimes. As such, the Hawaii Public Health Association fully endorses the changes to HAR 11-157, for the health of all communities in Hawaii.

The Hawaii Public Health Association is a group of over 600 community members, public health professionals and organizations statewide dedicated to improving public health. HPHA also serves as a voice for public health professionals and as a repository for information about public health in the Pacific.

Subject: HAR 11-157 STRONGLY SUPPORT
Date: Thursday, November 01, 2018 9:17:40 AM

Dear Madam/Sir,

My name is Nicole Miyahira and I am a community pharmacist on the Big Island. I earned my Bachelor of Science in Biology from Pacific University Oregon and subsequently earned my Doctorate of Pharmacy from the Daniel K Inouye College of Pharmacy in Hilo. I was born and raised by a working class family who did everything in their power to ensure I had the best education and opportunities possible. As a pharmacist, I feel responsible to protect the health of my local community who I serve nearly every day.

I am on the “front lines” so-to-speak in terms of serving our ohana from newborn to kupuna. As a pharmacist I am especially cognizant of the impacts of preventable diseases on our local community. When you witness a baby who was too young to be vaccinated die because a family member was not vaccinated for whooping cough-it changes your life as a medical professional. I feel that people of our generation are “spoiled” as we have not seen what a true preventable disease pandemic looks like and therefore do not understand the weight of importance vaccinations carry.

It is highly discouraging to witness so many individuals strongly oppose LIFE-SAVING vaccinations when they have little to no scientific education, lack any REPUTABLE resources to cite for their deluded views and are so aggressively pushing their message to you.

Ladies and gentlemen, I implore you to ensure that this extremely positive bill becomes law for the children of Hawaii. Mandatory vaccinations help protect the Keiki that are not old enough to receive theirs yet, supports herd immunity of our small communities and protects the kupuna whose immune systems are not as resilient any longer. It also helps to protect Keiki whose parents are misinformed and refuse to do what is in their best interest. It protects our Keiki who medically cannot be vaccinated because of severe medical conditions. There are so many amazing implications of this bill.

I want to show my strong support!

Mahalo for your time,

Nicole K. Miyahira, Pharm. D.

Date: Sunday, November 11, 2018 3:08:10 PM

Aloha, I was reading about this required vaccine for school and I'm totally not comfortable with the HPV & Flu vaccine. I have 3 daughters ages 12, 10 & 3. I would never vaccinate my child with these 2. I'm not an anti-Vaccination parent either. My 2 oldest are fully vaccinated except for the 2 listed above. There just is not enough studies done to put this poison on my child especially the HPV. Adults I know who have been vaccinated with HPV (young adults) have tumors and that can't just be a coincidence. If this is a forced procedure done, my kids will not be going to school. My kids go to public school in Lahaina, Maui and I support vaccination but this makes me really not happy to support these 2 particular. STD vaccine is not an illness that can spread like Chicken pox or Measles, it's ridiculous that it would be treated like so. Please take this into consideration. Mahalo, April Colpas

John A. Burns School of Medicine

Hearing Docket No. R-157-18-07: PROPOSED AMENDMENTS TO HAR TITLE 11,
CHAPTER 157

Thank you for the opportunity to provide testimony in support of the proposed amendments to Hawai'i Administrative Rules (HAR) Title 11, Chapter 157 regarding Examination and Immunization. The proposed amendments modernize and clarify the immunization and examination requirements for school, post-secondary school and child care facility attendance in Hawai'i by updating and expanding definitions, deleting unnecessary definitions and adding new definitions. Additionally, the amendments provide more guidance regarding school and post-secondary school provisional entrance and exclusion procedures.

At the University of Hawai'i John A. Burns, School of Medicine (JABSOM), we strive to teach and train high-quality physicians, biomedical scientists, and allied health workers for Hawai'i and the Pacific by providing an opportunity for a medical education previously unavailable to residents of Hawai'i and other Pacific nations. With Hawai'i's increasing need for medical services combined with growing workforce shortages for physicians and other health care providers, JABSOM plays a vital role in educating future generations of doctors to care for the people of the state.

Appropriate and timely immunizations are critical to the overall health and wellness of individuals as well as our community. Immunization against certain illnesses not only prevents the spread of dangerous contagious diseases, but also provides protection from certain cancers. The adoption of the CDC's recommended adolescent vaccinations for 7th grade entry includes the human papillomavirus (HPV) vaccine, which is the vaccine that has already been demonstrated worldwide to reduce pre-cancers in both females and males. Cervical cancer in Hawai'i disproportionately affects Native Hawaiians, Filipinos and Pacific Islanders. In Hawai'i, only 55% of adolescents receive the HPV vaccine, compared to 86% receiving the vaccine to prevent meningitis

(brain infection), 85% for tetanus booster and 90% receiving the measles-mumps-rubella booster shot. This administrative rule change will greatly facilitate receipt of the HPV vaccine along with the other required vaccines.

Doctors are key to assuring that needed immunizations are administered. Several research studies conducted by JABSOM, as well as the UH Cancer Center, have demonstrated that physician recommendation remains the most important factor in receiving the HPV vaccination. At JABSOM our students receive extensive training in immunization protocols, immunology and vaccinations. The students receive this information as part of illness prevention (public health) instruction and clinical skills development. Our Pediatrics, Family Medicine and Obstetrics-Gynecology residency programs have extensive training in HPV and provide immunizations in their clinics to many of Oahu's minority and underserved patients. Recognizing the importance of making necessary vaccinations available to everyone, JABSOM's staff and students have voluntarily provided immunization services to those who do not have a primary care physician and to the underserved population as part of the HOME Project.

JABSOM supports the proposed amendments to HAR Title 11, Chapter 157. Mahalo for the opportunity to provide testimony on this matter.

Testimony of Jennifer Kurrie
on behalf of
Walgreen Co.

DATE: November 1, 2018

TO: Director Bruce S. Anderson
Department of Health

RE: **Proposed Amendments to HAR Title 11, Chapter 157, Examination and Immunization**

Dear Director Anderson,

I am Jennifer Kurrie, government affairs director for Walgreen Co. (Walgreens). Walgreens operates stores at more than 8,200 locations in all 50 states, the District of Columbia, and Puerto Rico. In Hawaii, Walgreens now has 20 stores on the islands of Oahu, Maui, and Hawaii.

Walgreens **strongly supports** the proposed rules, which would bring Hawaii's school immunization requirements more fully in line with the current federal recommendations. The major amendments include: (1) expanding the definition of "student" to include persons enrolled and physically present on a post-secondary school campus; (2) excluding exclusively online schools from the definition of "school"; (3) incorporating the Federal Advisory Committee on Immunization Practices' (ACIP) 2017 best practices guidance including, by reference, a list of required vaccines; and (4) requiring schools to report to the Department of Health (DOH) the names of the students provisionally admitted, excluded for noncompliance, or exempted from vaccination requirements.

Walgreens commends the Department of Health's efforts to ensure that Hawaii's children receive all recommended vaccines. Walgreens believes that public health is best served by establishing a predictable environment for the uptake of vaccines that are critical to preventing devastating diseases and promoting the overall health of the community. The ACIP-recommended vaccine schedule ensures that vaccines will be administered at the ideal times to maximize their effectiveness in protecting children up through their post-secondary school years.

For these reasons, Walgreens strongly supports moving these proposed rules forward.

Aloha,

I am writing on behalf of my Kupuna, Makua and Ohana to let you know that we strongly oppose the proposal of mandatory vaccinations for all keiki and adults in Hawaii. As a native Hawaiian, born and raised on the islands it pains me to say that I have witnessed first hand family and friends who have taken their children to the doctor for a vaccination and suffered extreme side effects and even death following the injection of vaccinations. When you look at the growing number of autistic children in our community, one cant help but wonder "why all of a sudden?" Someone may challenge and say that "if its the vaccinations then why doesn't everyone who gets vaccinated react to the chemicals and poisons the same"? It is so important to understand that we are all born with different genes and a unique microbiome influenced by epigenetics which affects the way our bodies respond to the infectious diseases and pharmaceutical products like vaccines. What happened to island sustainability? Our Native ancestors built an ahupua'a system where the people could take care of themselves and used native plants to heal ailments and rid the body of sickness. I am asking as a Kanaka that you do NOT take away our rights to practice our indigenous Hawaiian Health healing modalities and do NOT move forward with making it mandatory for us to inject a foreign chemical into our bodies. So much have already been taken from the Native people, please DO NOT take away our right to body sovereignty.

Mahalo

I, Elizabeth Sand, a mother, educator, and national, and domiciles in [REDACTED], testifies to the opposition of mandatory vaccination.

This testimony is for HAR 11-157. My name is Elizabeth Jean Sand and I am a United States citizen. I am a parent, educator and community contributor and I currently reside in [REDACTED].

As a United States citizen I am a protected person as defined by international criminal law in the Tadic judgment of 1999 by the International Criminal Tribunal for the Former Yugoslavia Appeals Chamber, which stated that civilians who are nationals of the occupying State are also protected persons because their allegiance while residing in the occupied State is, in this case, owed to the Hawaiian Kingdom and not the United States. Allegiance to the Hawaiian Kingdom by resident aliens is stated in Section 3, Chapter VI of the Hawaiian Kingdom Penal Code.

I too have come to learn that the Hawaiian Kingdom continues to exist as an independent and sovereign State that has been under an illegal and prolonged occupation by the United States since January 17, 1893. I am also aware that the United Nations Independent Expert Dr. Alfred deZayas sent a memorandum to members of the State of Hawai'i judiciary which stated "international laws (the Hague and Geneva Conventions) require that governance and legal matters within the occupied territory of the Hawaiian Islands must be administered by the application of the laws of the occupied state (in this case, the Hawaiian Kingdom), not the domestic laws of the occupier (the United States)." And according to Amnesty International, war crimes are crimes that violate the laws or customs of war defined by the Hague and Geneva Conventions.

Article 43 of the Hague Regulations and Article 64 of the Fourth Geneva Convention obligates the United States to administer Hawaiian Kingdom law, not United States law. This deliberate failure by the United States to administer Hawaiian Kingdom law has led to grave breaches under Article 147 of the Fourth Geneva Convention and international humanitarian law, which constitutes war crimes committed against me as a protected person. This body illegally enacts United States laws in violation of the Hague and Geneva Conventions and as a victim of war crimes that stem from this unlawful legislation, I demand that this body immediately cease and desist.

My name is Elizabeth Jean Sand and I am a United States citizen. I am a parent, educator, and community contributor and I currently reside in Mountain View. This body illegally enacts

United States laws in violation of the Hague and Geneva Conventions and as a victim of war crimes that stem from this unlawful legislation, I demand that this body immediately cease and desist.

If the Americans in America are learning about the illegal occupation of America in Hawaiian Kingdom, then the Americans in Hawaii should be abiding by international laws of occupation.

RE: public hearing for the proposed amendment and compilation of Hawaii Administrative Rules (HAR) Title 11, Chapter 157, "Examination and Immunization."

I strongly oppose the proposed amendment and compilation of Hawaii Administrative Rules (HAR) Title 11, Chapter 157, "Examination and Immunization."

* I'm requesting that this hearing be held on EVERY island.

My name is Natasha Sky. I am a Hawaii resident, voter, mother, health advocate and member of Hawaii for Informed Consent. I'm writing today with my strong concern on the DOH planned changes on immunization policy.

Currently, 18 states allow philosophical exemptions for those who object to immunizations because of personal, moral or other beliefs. **In Virginia, parents can receive a personal exemption only for the HPV vaccine. If Hawaii mandates HPV for school attendance there should be a philosophical exemption available to opt out of this vaccine for a disease which is non communicable, no long-term safety studies and a higher reported number of incidences of adverse reactions than other vaccines. Please consider in the future to follow policy of these states and support adding a philosophical exemption.

HPV vaccine should not be required for school as it does not have any protection to prevention of an out break or being spread in a social setting.

When it comes to the changes on MEDICAL EXEMPTIONS please follow example of Illinois SB1410-

"A healthcare provider may consider including without limitation the nationally accepted recommendations from federal agencies such as the Advisory Committee on Immunization Practices, the information outlined in the relevant vaccine information statement, and vaccine package inserts, ALONG WITH THE HEALTHCARE PROVIDERS CLINICAL JUDGEMENT, to determine whether any child may be more susceptible to experiencing an adverse vaccine reaction than the general population, and if so, the healthcare provider may exempt the child from an immunization or adopt an individualized immunization schedule." We cannot remove the practitioners ability to use his/her judgement to issue medical exemptions. This infringes on the doctor patient relationship and violates a doctors right to do their job.

Mandating Medical exemptions to be filed with the DOH is a HIPPA violation.

Requiring schools to file exemptions with DOH is a FERPA violation.

The current religious exemption policy is fine as it is, there is no need for a form to be provided by DOH, with extra requirements, infringing on our religious rights. We do NOT need to prove our religious beliefs. It is unconstitutional. IF however, a DOH form is required for religious exemption please include "The religious exception stated need not be directed by the tenets of an established religious organization."

"In May 2017, Del Bigtree & Robert F. Kennedy, Jr. suspected that HHS was not fulfilling its critical vaccine safety obligations as required by Congress in The National Childhood Vaccine Injury Act of 1986 of assuring improvements in the licensing, manufacturing, adverse reaction reporting, research, safety and efficacy testing of vaccines in order to reduce the risk of adverse vaccine reactions. A lawsuit revealed that HHS had never, not even once, submitted a single biennial report to Congress detailing the improvements in vaccine safety."
<http://icandecide.org/government/ICAN-HHS-Stipulated-Order-July-2018.pdf>

↑↑Our state shouldn't follow ACIP due to lack of safety studies. The general issue of following the ACIP schedule is that there are no studies on the synergistic affect of each vaccine that keeps getting added to the schedule.

"Adding to public concern about vaccines is the fact that immunization is mandated by many state and local school entry requirements. Because of this widespread use, safety problems with vaccines can have a potential impact on large numbers of persons." – CDC

Anti-choice mandates violate civil liberties. Mandated medical procedures degrade modern medicine and destroy the foundations of our health care system. When you give up the power to choose what can be done to your body — in this case what can be injected into you or your child's body — you are no longer a free, autonomous, sovereign individual.

Please have public hearings held on every island concerning these proposed rule changes that will immensely affect our state. Residents need to ask questions and be made aware of such rule changes before they are made.

Sincerely,
Natasha Sky

If there is RISK, there must be choice

Subject: Please OPPOSE HAR 11-157
Date: Thursday, November 01, 2018 11:15:43 AM

Aloha Hawaii Department of Health,

I am writing, as a mother and physician, my deep concern and opposition of HAR 11-157. There are many reasons to oppose this bill. First of all I am deeply concerned about the fact that the current CDC vaccine schedule has never been studied in its entirety for children or adults. In the poor studies that have been done, the control included all the toxic adjuvants and ingredients except the active ingredient. Thus there is no comparison to children who are unvaccinated. Also all vaccine companies hold no legal responsibility since the 1986 vaccine law which shields vaccine manufacturers from liability. Our government pays out for vaccine injured individuals and has paid out about 4 billion dollars. We also fail to give true informed consent on these medical procedures. Rarely do I see patients who have had access or have been offered a look at the vaccine insert. We do not require parents to sign consents for vaccines. This is also unethical.

Another cause for concern is the ingredients in these vaccines which are highly toxic, including:

Formaldehyde/Formalin - Highly toxic systematic poison and carcinogen.

Betapropiolactone - Toxic chemical and carcinogen. May cause death/permanent injury after very short exposure to small quantities. Corrosive chemical.

Hexadecyltrimethylammonium bromide - May cause damage to the liver, cardiovascular system, and central nervous system. May cause reproductive effects and birth defects.

Aluminum hydroxide, aluminum phosphate, and aluminum salts - Neurotoxin. Carries risk for long term brain inflammation/swelling, neurological disorders, autoimmune disease, Alzheimer's, dementia, and autism. It penetrates the brain where it persists indefinitely.

Thimerosal (mercury) - Neurotoxin. Induces cellular damage, reduces oxidation-reduction activity, cellular degeneration, and cell death. Linked to neurological disorders, Alzheimer's, dementia, and autism.

Polysorbate 80 & 20 - Trespasses the Blood-Brain Barrier and carries with it aluminum, thimerosal, and viruses; allowing it to enter the brain.

Glutaraldehyde - Toxic chemical used as a disinfectant for heat sensitive medical equipment.

And these are just a few of the known toxic chemicals. The Supreme court has declared vaccines as "unavoidably unsafe" and yet we continue to subject children to them in order to access public school. It is completely unethical to subject children to vaccines, in the number required already. Increasing the requirement is plain wrong. We know it impairs neurological development and increases the incidence of allergies, asthma and eczema. So while it may seem we are saving money from a public health stand point initially, we are giving children chronic disease.

Please see that there is cause for concern. Please do not pass HAR 11-157.

In Health,

Dr Anne Dericks, ND
Naturopathic Doctor
Midwife
Holistic Pelvic Care™ Specialist

Subject: Small world? Or big problem? Against more mandatory vaccines being added to the school schedule.
Date: Thursday, November 01, 2018 11:37:47 AM

I am a native born [REDACTED] girl who recently moved back from [REDACTED].

One strong incentive for my leaving California was the incredibly burdensome and authoritarian rules regarding mandatory vaccinations and school attendance. Many people have fled California because of the mandatory vaccination requirements there.

I am the mother of three children aged 17, 2.5, and 9 months.

My 17 year old was fully vaccinated according to the CDC schedule until aged 12 when he had a severe reaction to the DTAP and Varicella vaccine. Within 4 hours of the shots, he had 2 days of 104 degree fever which was not controllable with fever reducing medications - and vertigo that lasted several days. Luckily for him the reaction did not leave permanent effects/disability, but he will not be receiving another vaccine unless he as an adult decides to do so independently.

My two younger children have not been vaccinated and will only receive a VERY limited number of vaccines if any. This will happen whether or not Hawaii decides to strip my right to choose as a parent.

I have seen FAR too many adverse reactions and read many independent studies that are critical of vaccines and contradictory to the CDC's recommendations to go ahead blindly following their advice to the detriment of my children's health.

Over the last 20 years, I have watched my cousin's husband's health deteriorate after he contracted polio from the vaccine in the early 80's. He received \$1,000,000 from the vaccine court for his injuries - and that does not even begin to cover the quality of life lost due to his disability.

One million dollars seems like a ton of money, but it's nothing compared to the nearly 4 BILLION dollars the vaccine court has already paid out to people who have been permanently maimed or killed by vaccines.

That being said, 4 BILLION dollars in less than the vaccine manufactures make in a year on the schedule currently being administered to our children... and they have ZERO liability. How is this okay? Where is the outrage? Where are the elected officials and public servants acting on the behalf of the people concerned by this?

I know 2 women who have had third trimester losses within 2 weeks of receiving the now recommended DTAP and FLU shot. Two much loved and wanted, viable babies dying before they were born. Coincidence? Maybe. Or maybe it has something to do with these vaccines having ZERO safety studies conducted in regard to pregnant women... except for "passive surveillance". No safety studies, but VAERS reported a 4250% increase in miscarriages within 28 days of receiving the flu shot according to this study: <http://www.cidrap.umn.edu/news-perspective/2017/09/study-signals-association-between-flu-vaccine-miscarriage>

Where is the outrage? Small world, or big problem?

I volunteered as a Sunday school teacher at my church in Los Angeles where more than 50% of all the children had either learning disabilities or SEVERE food allergies... 50%!

This is shocking to me, but apparently it is the new "normal". According to this study, 54% of all insured children suffer from a chronic condition or learning disability:

<https://www.sciencedirect.com/science/article/pii/S1876285910002500>

That seems insane to me, but according to current CDC data 25% of children currently aged 2-8 suffer from a chronic disease:

<https://www.cdc.gov/healthyschools/chronicconditions.htm>

According to this CDC report: 60% of adults in America have a chronic disease, and 40% have two or more:

<https://www.cdc.gov/chronicdisease/resources/infographic/chronic-diseases.htm>

Drug companies have far too much power and too many incentives to continue on with business as usual.

Enough is enough.

The unbiased, un paid for science is there. Vaccines are not safe or effective.

Where there is risk, there must be choice.

Our people are suffering.

Our health situation in this country is in crisis, and it's not due to the threat of Measles, chickenpox, HPV, OR the flu.

Please do the right thing.

Jessica Penner

Subject: STRONG OPPOSITION TO HAR-157
Date: Thursday, November 01, 2018 12:39:48 PM

STRONG OPPOSITION TO HAR-157

Aloha,

I am writing to ask that you cancel HAR-157 for the following reasons:

1. It is not right to mandate something that is known to cause harm. If you read any vaccine insert you will see all the harmful ingredients not highlighted by the doctors that administer these vaccines.
2. You are doing much more harm than good with this mandate. There are no studies that prove the safety of the current mandatory vaccine schedule, so as any parent it is natural for us to be wary of injecting these poisons into our children to supposedly protect us from said diseases. By the way, it was recently exposed that the safety obligations put in place years ago by congress in the National Childhood Vaccine Injury Act were never upheld. How can you continue to pass laws that mandate vaccines when this problem exists?
3. HPV is a sexually transmitted disease. Children should not require a vaccine for an STD to attend school. In school, children are attending class and learning -- they are not having sex and spreading this disease. The HPV vaccine happens to be the most controversial vaccine for good reason -- because of the debilitating side effects that have ruined the lives of many across the world. HPV is a very common disease that most people will contract at some point in their lives -- and for many it clears up on their own or with natural, immune-boosting treatment. It rarely turns into cancer and if it does it takes a long time to do so; meanwhile, it can be monitored and treated before it becomes life-threatening.
4. Requiring the flu vaccine for school attendance is also inappropriate. The flu vaccine is contraindicated for people with egg allergies, which is a common allergy. Most people getting the flu shot are not screened for egg allergies, and this can be very dangerous! Moreover, the efficacy rate of the flu vaccine is so low, not to mention studies show that the flu vaccine puts you more at risk for catching other respiratory illnesses. Again, this is yet another vaccine that does more harm than good. There are safe, alternative methods for boosting the immune system to guard against the flu as well as effective treatments for the flu. I myself have never received a single flu shot in my entire life and I've only caught the flu a few times during my childhood and they were not life-threatening or debilitating because my mother believed in natural medicine and so she kept me healthy and treated me with natural medicine. Most people that I know who often catch the flu are people who subscribe to getting the flu shot regularly. If you do your research, most people that die of the flu have received the flu shot, ironically! This is because vaccines break down the immune system; they do not build it. Vaccines

supposedly "induce immunity" by suppressing the immune response to said disease. Is this really "immunization" or just "suppression of disease expression"? What happens when you repeatedly inject viruses into the body and then suppress the body's immune response to them???

The answer is not a good one! In the natural medicine profession we have observed that the disease will exist in the body for a long time in dormancy (latency) and later on when the body is weak for whatever reason the latent disease will manifest as other illnesses.

Vaccination is NOT immunization!

5. Medical Freedom is a basic right. Parents have the right to informed consent and making educated decisions when it comes to vaccines. Stop trying to take that away from parents. Please help us protect our keiki.

Sincerely,

Mei Li Shikiya

While my family and I have been vaccinated, it has come to my attention that vaccinations are not 100% safe and could be the cause of many illnesses, physical and mental that my family has been through. I do not believe anyone has the right to force anyone to have foreign matter injected or invade a physical body. It should be a choice and leave it at that. Pharmaceutical companies care about every dollar they make from us, NOT about our health and wellness. They are all about profit. Please do not let this pass.

Re: Testimony of Planned Parenthood Votes Northwest and Hawaii in support of
Proposed Amendments to H.A.R. Title 11, Chapter 157, Examination and
Immunization

Dear Director Anderson,

Planned Parenthood Votes Northwest and Hawaii (“PPVNH”) writes in support of proposed amendments to H.A.R. Title 11, Chapter 157, Examination and Immunization, which seek to codify the United States Department of Health and Human Services’ Advisory Committee on Immunization Practices’ General Best Practice Guidelines for Immunization.

PPVNH is dedicated to protecting and promoting the sexual and reproductive health of Hawaii’s people and we support the proposed amendments because they will help to prevent HPV and HPV-related cancers. In our health centers, we see firsthand the devastating effects of HPV on our patients.

According to the Center for Disease Control and Prevention, 79 million people in the United States are currently infected with HPV and 14 million new cases are expected each year. HPV is so common that nearly all sexually-active men and women will get at least one type of HPV at some point in their lives. There is no cure for HPV - only treatment for related health problems. Yet, too few adolescents in Hawaii are receiving HPV vaccines.

Adopting the recommendations of the CDC will help to increase the rates of vaccinated individuals and, in turn, reduce the spread of HPV and HPV-related cancers.

While we can’t protect our youth from everything, we can help to protect them from cancer in the future by adopting these regulations now.

Thank you for the opportunity to testify in support of this important effort.

Sincerely,
Laurie Field
Hawaii State Director

I am writing in regard to the proposal (HAR 11-157) to update school vaccination and examination requirements.

I strongly believe that our right to body sovereignty must be respected as the policy on immunization and medical examinations is discussed. I do NOT support mandatory vaccinations and urge the DOH to uphold our constitutional rights to freedom of choice.

For religious and health reasons many cannot vaccinate and should not be left out of consideration is these policies.

Thank you,

Noelle Purvis

Subject: About mandatory immunization
Date: Thursday, November 01, 2018 5:29:30 PM

This is absolutely absurd and under no circumstance should it be allowed to pass. I can say personally, that no matter what decision you make, we as a family will NOT be participating in these immunizations. If that means we have to take our kids out of school or move, we will. Under no circumstances, whatsoever, will we participate in any mandatory vaccination requirement. It is a violation of our rights as humans and is no better than rape. You are trying to forcibly penetrate us and inject an unwanted substance into our bodies. You do not have our consent, and no means no. If you don't like it, than oh well. We will not be participating, period. All you will successfully be doing is making it more difficult for us to find education, but you will not be succeeding in getting us to agree to any vaccinations.

You may think you are acting in our best interests, and that we just don't know any better. But you are basing your information off of blind trust given to the people who bribe you. They tell you its safe and you believe them. Well we don't, and we should have the right to not have things injected into our bodies.

Testimony Presented Before the Department of Health
State of Hawai'i
Thursday, November, 1, 2018 at 3:00 pm
Testimony of
May Rose I. Dela Cruz, DrPH

Re: Hawai'i Administrative Rules (HAR) Title 11, Chapter 157, "Examination and Immunization"

Dear Dr. Bruce Anderson,

I am writing to offer my testimony in **strong support of HAR 11-157 proposed rules**. This update of the Administrative Rules would establish immunization and requirements for school, post-secondary school, and child care facility attendance in Hawai'i and to provide for the immunization of indigents and other high-risk individuals.

These immunization updates will bring much needed, up-to-date Advisory Committee on Immunization Practices (ACIP) requirements to our current rules. This update is especially important to require students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels, especially for the HPV vaccine. The HPV vaccine prevents certain cancers and is recommended for both males and females at 11 to 12 years old. The proposed Admin Rules would reinforce this recommendation and increase Hawai'i's HPV vaccine rates.

Recently, there was an outbreak of measles, mumps, and Hepatitis A in our state. These outbreaks stem from unvaccinated individuals who contracted these illnesses and spread them to other unvaccinated individuals. Vaccines can prevent outbreaks and save lives. Newborns and persons with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, these vulnerable groups will stay protected. Vaccinated individuals, such as students, protect those who cannot be immunized.

As a public health researcher, I have researched, educated, seen, and experienced the devastation of vaccine preventable diseases. They are costly and carry a heavy burden to individuals and families. Please support the Admin Rules 11-157 to prevent further hardship to others and to protect our *keiki*.

Mahalo for allowing me to submit testimony.

Affiliations are given for identification purposes only. Opinions presented here are personal views and not the official views of the University of Hawai'i or any other organization or entity.

Date: Thursday, November 01, 2018 11:22:19 PM

Aloha,

My name is Candee-Jo Jardine and I am against mandatory vaccinations. That is not to say that I am against any vaccination, but making vaccinations mandatory for any and all is just atrocious. It is a basic human right to govern ones own body. Any other situation where a persons body/self is touched, harmed, or otherwise acted upon without said persons permission is considered a crime. How is this not the same? Yes, some people believe that vaccines are necessary. Others do not. The great thing about America (supposedly) is that we have a choice. That choice should not be taken away. I do not support mandatory vaccinations.

Mahalo,

Candee-Jo Jardine

Written Testimony Presented to the
Department of Health, State of Hawai'i
For Proposed Amendment of HAR Title 11, Chapter 157
"Examination and Immunization"

Public Hearing, Thursday, November 1, 2018
3:00-4:00 PM
Kinau Hale Boardroom
1250 Punchbowl St.
Honolulu, HI 96813

Submitted by:
Mary Boland, DrPH, RN, FAAN
Dean and Professor
School of Nursing and Dental Hygiene
University of Hawai'i at Mānoa

My name is Mary Boland, and I am the Dean for the University of Hawai'i at Mānoa (UHM) School of Nursing and Dental Hygiene. Thank you for the opportunity to submit testimony to the proposed rules related to H.A.R. Title 11, Chapter 157.

UHM Nursing **supports** the intent of the proposed amendments, updates and clarifications of the immunizations and examination requirements for school, post-secondary school and child-care facility attendance in Hawai'i **with the request to revise section §11-157-5 to include amendments pursuant to Act 45, S.L.H. 2014.**

Vaccinations are an important population health effort which ensures the health and safety of individuals and the community at large by preventing the risk of contaminating infectious disease and protecting against some cancers. The UHM Nursing program teaches safe administration, monitoring, care coordination and patient education to nurses and advance practice nursing population, alike. Both nurses, who may administer vaccines, and nurse practitioners, who may prescribe and administer vaccines, are vital to ensuring that the people of Hawai'i receive timely vaccinations that are appropriate for their age, health, and other factors. In addition, UHM Nursing engages in the Hawai'i Keiki: Healthy and Ready to Learn program with the Department of Education. This program establishes certified school nurses in the DOE system and collaborates with key partners, including the Department of Health, to ensure proper infectious disease prevention and reporting. Providing additional guidance and updating the required vaccinations for school aged children to reflect national best practices have the potential to improve the health and wellbeing of school aged children now, with lasting impacts on their health in the future.

UHM Nursing respectfully requests that the proposed amendments include statute change achieved in Act 45, S.L.H 2014 which found that various sections of the Hawai'i Revised Statutes omit advanced practice registered nurses (APRNs) from the definitions or designations of health care entities who may provide health care, prescribe drugs, or sign forms (Standing Committee Report 1624-14). In Act 45, S.L.H. 2014, §325-34 Exemptions and §302A-1156

Exemptions were amended to add APRNs to the list of qualified providers who may certify exemptions for vaccinations.

In both sections listed above, the recognized providers are licensed physicians, physician assistants, or advanced practice registered nurses. This description matches the term “practitioner” in the Hawai’i Administrative Rules Title 11, Chapter 157 Section 2 which reads, (with proposed amendments):

"Practitioner" means a physician, advanced practice registered nurse, or physician assistant licensed to practice in any of the states or territories of the United States. A physician, advanced practice registered nurse, or physician assistant whose license is on inactive status or who is not actively practicing shall not be deemed to be a practitioner for the purposes of this chapter."

Further, APRNs in Hawai’i have grown 104% from 2005 to 2017, with over half of licensed APRNs in this state practicing in a primary care specialty. While the primary care provider shortage remains a pressing reality, APRNs provide critical services in ensuring high quality access to primary care services for people of all ages and in all geographic locations, including the most rural and remote areas in this state (Hawai’i State Center for Nursing, 2017). Further, APRNs are shown to provide care for a higher proportion of vulnerable patients, including publicly insured, uninsured, women, and people residing in rural areas than other care providers (Buerhaus, 2018). Ensuring that the administrative rules reflect current state law enables APRNs to deliver care for the patients and respond to the state’s health needs.

Therefore, the UHM Nursing respectfully requests that section §11-157-5 Exemptions (a) is revised as follows, to recognize the legislative amendments achieved in Act 45, S.L.H. 2014 relative to HRS §§302A-1156 and 325- 34:

§11-157-5 Exemptions. (a) Medical exemptions from the requirements for specific immunizing agents shall be granted upon certification by a **practitioner [physician]** ~~on the physician's professional stationery~~ in a form or format specified by the department, that an immunization is medically contraindicated due to a stated cause, for a specific period of time~~[-],~~ in conformance with recognized standard medical practices. The ~~original certificate~~ form shall be provided to the exempt person or parent or guardian. ~~[A copy]~~ Copies of the ~~certificate~~ form shall be maintained in the student's school health record~~[-],~~ in the post-secondary school student's record, or in the child care facility child's record. Issuing practitioners [physicians] shall forward a copy of the form to the department. Reports of such ~~certificates~~ forms in a format specified by the department shall also be submitted to the department by each school~~[-],~~ postsecondary school, and child care facility.

Thank you for the opportunity to submit testimony for the proposed amendments of HAR Title 11, Chapter 157. Your favorable consideration of the requested revisions is greatly appreciated.

Department of Health, State of Hawaii
For Proposed Amendment of HAR Title 11, Chapter 157
“Examination and Immunization”

Public Hearing, Thursday, Nov 1, 2018
Kinau Hale Boardroom
1250 Punchbowl St.
Honolulu, HI 96813

Written Testimony Submitted by:
Carolyn Ma, Pharm D, BCOP
DEAN
UH Hilo - Daniel K. Inouye College of Pharmacy (DKICP)

My name is Carolyn Ma, and I am the Dean for the UH Hilo Daniel K. Inouye College of Pharmacy (DKICP). The college fully supports the proposed amendments, updates and clarifications of the immunizations and examination requirements for school, post-secondary school and child- care facility attendance in Hawaii.

Relative to these amendments and the offer to assist in immunization advocacy, patient education and administration, the DKICP and all other 144 U.S. nationally accredited (ACPE) schools of pharmacy train pharmacy students to administer CDC recommended vaccinations. Most schools utilize the certified American Pharmacists Association (APHA) course. The DKICP provides training in immunization administration in the first professional year curriculum. Over the next three years of the Doctor of Pharmacy

curriculum, student pharmacists are expected to apply these skills in their experiential rotation courses as well as in numerous community health screening and immunization events. With three years of practice, graduated student pharmacists become very skilled with immunization patient education, administration and monitoring of side effects.

In the last 20 years, pharmacists have become the largest body of health professionals who are able to make a significant impact on vaccination uptake. Pharmacists are highly trained in the areas pertinent for immunizations and the diseases associated with vaccines. Didactic and experiential courses teach information in infectious diseases, community health, self-care, pediatrics and geriatrics. Particular to the Human Papilloma Virus (HPV), coursework includes oncology, women's and men's health, contraception and reproductive pharmacology. Education throughout the four-year professional curriculum focuses therapeutics of medication assessment and therapeutic recommendations via related laboratory tests and subjective/objective findings related to disease and drug therapy. A similar curriculum is included in all U.S. accredited (ACPE) colleges of pharmacy.

The DKICP has also provided training to practicing pharmacists through their training program via the Hawai'i Pharmacists Association. Please note that all immunizing pharmacists and student pharmacists must be certified in Basic Life Support (BLS). BLS certification allows for cardiopulmonary resuscitation (CPR) of adults, children and

infants and for other first responder interventions. In addition, immediate access to epinephrine must be available at any vaccination site.

Per Chapter 461-11.4, HRS, pharmacists may administer a vaccine to persons between 11-17 years of age pursuant to a valid prescription. After vaccination, the pharmacist will immediately provide information to the patient regarding name of vaccine administered, date and location of administration. Within 72 hours, the pharmacists shall provide to the medical home and within five business days, to the DOH immunization registry the same information, as well as the details of the administered vaccine, method and site of administration. Pharmacists who administer vaccines to persons in this particular age range shall complete a training program approved by the ACPE.¹

Adverse reaction reporting of vaccinations should be reported to the Vaccine Adverse Events Reporting System (VAERS). However, the Center for Disease Control (CDC) and the Federal Drug Administration (FDA) state several limitations to the VAERS system in that since the system captures only self-reporting, there may be reporting bias, inconsistent data quality and completeness, and that reports of an adverse event does not necessarily attribute causality to the vaccine. The data-base does not have a non-vaccinated portion for comparison.²

Pertinent to the student population at the University of Hawaii is the concern of the declining rate of the HPV vaccine. The HPV virus is associated with several different cancers (cervical, vaginal, vulvar, anal, esophageal) in both males and females. The HPV vaccine is a cancer preventative intervention. In a recent survey of incoming freshmen performed at the UH Manoa and UH Hilo campuses, only 22% and 5%, respectively, of students have been fully vaccinated.³ Students who had not received at least one of three shot series were 69% (UHM) and 78% (UHH), respectively.³ Although with recent efforts, the vaccination rates have improved, there exists a need for catch-up vaccination efforts as well as coverage for ages beyond the recommended 26 year old group. The FDA recently approved (October 2018) the extension of the vaccine administration to men and women in the 27-45 year old age groups.⁴

In summary, on behalf of the DKICP, I strongly support the amendments to HAR Title 11, Chapter 157 “Examination and Immunization” and believe these changes will improve the health and wellness of our community.

Subject: Fwd: Testimony in Support of HAR 11-157 Proposed Rules
Date: Thursday, November 01, 2018 6:33:28 PM

Aloha,

As a concerned family member with many nieces and nephews as well as a public health professional working in cancer prevention, I am writing to **strongly support the HAR 11-157 proposed rules update.**

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

Furthermore, I believe that vaccine access is closely tied to health equity. Often, the poor health outcomes from people who do not have access to vaccine (e.g. liver and cervical cancer) affect marginalized communities.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you for your consideration.

I strongly oppose HAR 11-157. Vaccines should NOT be forced upon anyone. The United States of America prides itself on being a “free” country.
We should be “free” to make our own decisions about vaccines, and the government should not decide for us.

Thank you all for your consideration into this matter. My name is Yana Dashevsky and I am opposed to HAR 11-157.

I am sure that you have received a lot of personal and written testimony today as to a request for more informed consent and studies to be done in a position to the vaccination schedule for our children. Our kids lives on the line.

After all of the information that you have received today I ask you to consider one item:

EMPATHY.

Empathy to me means putting yourself in the "others" shoes. Take for a moment this time to imagine yourself as a baby as a child who is not able to make a decision for themselves and who's parents responsibility it is to care for their welfare. Now, instead of being sympathetic about the situation consider that this child is yourself. Imagine your own face when you were 2,3,4,5 years old.

Now, imagine your face as you're walking into the doctors office and imagine how you would feel about yourself getting an injection full of positive and negative's at the same time. The research is there, do it. I do not have to continue to prove this point that the effects of antigens in vaccines have not been studied enough. Take this moment to close your eyes and ask yourself what am I fighting for if this [IS ME].

Do I personally want my health and safety to come first and foremost in this equation? Do I personally think that enough research has been done to know the repercussions of vaccinations schedules that include 72 vs 3 vaccines in our modern-day system?

Would I personally want to receive 72 mandated vaccine schedule shots by the time I was nine years old and be forced to except his vaccinations in schools rather than my doctors office?

Personally, I wouldn't argue with anyone of you guys if it was only three vaccines on the table. However when you decide whether it is my choice or not to vaccinate my kids for things like HPV I start questioning you. How would you treat your own self?

Given these mandates if by 2020 HPV is a required vaccines for children in our school system and exemptions are only based on personal out reach from the parents rather than leaving it to the hands of doctors and the parents relationship with their doctors and their children's health, I will know longer live in Hawaii. This is how serious I am about my children and their health. I hope you can just be as serious as I am I imagining if this is happening to you.

Empathy.

I oppose HER space 11Dash 157.

If it was you would you promote it knowing everything you know after today's testimonies?

Thank you again for taking the time to read this letter.

To health and prosperity-

Sincerely,
Yana Dashevsky.

Subject: Testimony - Mandatory Vaccination
Date: Thursday, November 01, 2018 5:58:51 PM

Aloha,

I am writing on behalf of the upcoming hearing in regards to proposing mandatory vaccinations. I have experienced first hand the negative side effects of my daughter receiving the MMR vaccine. She had been receiving her vaccines on the normal schedule and at 12 months when she was due for the MMR, she had a severe reaction that caused her to be hospitalized for awhile and she completely changed from that day on. While in the hospital you could completely see the light in eyes gone, like no one was there. She eventually got better but since has not received a vaccination. I had my son a year later and he has not had not 1 vaccination due to the experience with my daughter, and he is the most healthy child I know. He doesn't get as many colds or flu as she does, he's always been in the top percentile for his age in weight and height. He's hit so many milestones before the expected timeline, he's very bright; even his teachers are amazed at his knowledge and potential. We are born with an immune system for a reason, our bodies are made to fight off illnesses; injecting our children with these diseases is just uncalled for and invasive when it's natural for us as humans to fight off. I am 100 percent against mandatory vaccinations, places where it's become mandatory have not seen a change in the rate of children being diagnosed with illnesses, it's actually the opposite. It is against our rights as Americans and as parents to chose what's best for ourselves and our children. Please hear our concerns and rule wisely.

Mahalo,

Erin Edwards

Place: Hawaii Department of Health, Kinau Hale Boardroom, 1st Fl.
Re: Testimony of Hawaii Children's Action Network in support of
Proposed Amendments to H.A.R. Title 11, Chapter 157, Examination
and Immunization

Dear Director Anderson,

Hawaii Children's Action Network writes in strong support of proposed amendments to H.A.R. Title 11, Chapter 157, Examination and Immunization, which will bring Hawaii's rules into compliance with United States Department of Health and Human Services' Advisory Committee on Immunization Practices' General Best Practice Guidelines for Immunization.

HCAN is a Hawaii based non-profit committed to building a unified voice advocating for Hawaii's children by improving their safety, health, and education. Vaccines play an important role in community health. While some individuals cannot be vaccinated—newborns and those undergoing chemotherapy—if approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Codifying the CDC's recommendations will prevent the spread of preventable diseases and infections, including HPV.

Thank you for the opportunity to testify,

Mandy Fernandes
Policy Director
Hawaii Children's Action Network

Subject: HAR 11-157
Date: Thursday, November 01, 2018 10:11:37 AM

To Whom it may concern,

I would like to write on behalf of the bill HAR 11-157, requiring mandatory vaccines in order for children and adults to attend school.

I believe that every human should have the right to choose what medical procedures are done to us, what medications we take, and what vaccines are injected into our bodies.

I am not against vaccines. I believe in the idea of them, however they have a long way to go before they should ever be considered SAFE FOR ALL. The government should have no say over my body. I am vaccine injured (HPV), and if this vaccine were mandated, I wouldn't have been able to recover, instead I would've had to follow up with 2 additional vaccines in order to attend school. Vaccine manufacturers don't take responsibility for vaccine injuries, will Hawaii's government?

I understand vaccines are a hot topic.

There are usually two very extreme sides to the topic of vaccines. There are people like me, who have first hand seen how vaccines can damage some people. I personally know of over 6 vaccine injured children. Children perfectly fine and developmentally on target, and the next day following their vaccines, are permanently changed, some who suffer severe deficits. I feel until vaccines can be truly proven to be safe for ALL people (which needs to reflect so in the vaccine manufacturers insert to each vaccine) it should in no way be forced upon any persons. You can currently read the dangers of vaccines in the vaccine inserts and on the CDC website.

When a doctor offers you suggestions for medications to take, they inform you a few possible side effects, and then you have the option to read the medication insert for all possible side effects. We then have the choice whether or not we want to take the medication. Imagine if your doctor told you there's a chance of paralysis, infertility, cognitive delays, etc. and then told you that you have no choice in the matter and must take the risk and take the medication or give it to your child. It would be wrong. Just as it's wrong to force vaccinations.

I fully believe in bodily autonomy and don't feel like any government should have a say over what goes into my body.

I hope you'll consider this viewpoint and vote against bill HAR 11-15.

Mahalo for taking the time to read my letter.

Aloha,
Brittany Abella

To whom it may concern-

Is it true that the laws are changing regarding forced vaccinations of children? I hope this isn't so and would like information on this and any public hearings that will be upcoming. I myself was not fully vaccinated until I was a teenager. I never got any illness and am proud that my parents did not subject me to all [the vaccines](#) that were recommended. I am a paramedic and have researched vaccinations recently due to being pregnant. My five nieces and one nephew are not vaccinated and they are in ages 6 mos - 8 years. I have never seen them be ill and we are all proud of providing immunity for our children the most natural way that we can.

Department of Health, State of Hawai'i
For Proposed Amendment of HAR Title 11, Chapter 157

“Examination and Immunization”
Public Hearing, Thursday, Nov 1, 2018
3:00-4:00 PM
Kina'u Hale Boardroom
1250 Punchbowl St.
Honolulu, Hawai'i 96813

Written Testimony Submitted by:
Laura Reichhardt, MS, APRN, NP-C
Director, Hawai'i State Center for Nursing

My name is Laura Reichhardt and I am the Director of the Hawai'i State Center for Nursing (Center). Thank you for the opportunity to submit testimony to the proposed rules related to H.A.R. Title 11, Chapter 157.

The Center recognizes the considerable work to review the existing rules and develop recommendations to improve the clarity of text and recommend additional vaccination requirements for childcare, school, and post-secondary school entry/ attendance. In reviewing the sections receiving an update to requirements for school and post-secondary school attendance, the **Center respectfully requests the Department of Health to consider including revisions achieved related to immunizations pursuant to Act 45, S.L.H. 2014.**

This measure found that various sections of the Hawai'i Revised Statutes omit advanced practice registered nurses (APRNs) from the definitions or designations of health care entities who may provide health care, prescribe drugs, or sign forms (Standing Committee Report 1624-14). In Act 45, S.L.H. 2014, §325-34 Exemptions and §302A-1156 Exemptions were amended to add APRNs to the list of qualified providers who may certify exemptions for vaccinations.

In both sections listed above, the recognized providers are licensed physicians, physician assistants, or advanced practice registered nurses. This description matches the term “practitioner” in the Hawai'i Administrative Rules Title 11, Chapter 157 Section 2 which reads, (with proposed amendments):

““Practitioner” means a physician, advanced practice registered nurse, or physician assistant licensed to practice in any of the states or territories of the United States. A physician, advanced practice registered nurse, or physician assistant whose license is on inactive status or who is not actively practicing shall not be deemed to be a practitioner for the purposes of this chapter.”

In Hawai'i, APRNs have more than doubled, with 104% growth from 2005 to 2017. Over half of licensed APRNs in this state practice in a primary care specialty, providing critical primary care services in the face of our current primary care provider shortage. These APRNs provide critical services in ensuring high quality access to primary care services for people of all ages

and in all geographic locations, including the most rural and remote areas in this state (Hawai'i State Center for Nursing, 2017). Further, APRNs are highly likely to provide care for the population these administrative rules affect. Research shows that APRNs provide care for a higher proportion of vulnerable patients, including publicly insured, uninsured, women, and people residing in rural areas than other care providers (Buerhaus, 2018). Ensuring that the administrative rules reflect current state law enable APRNs to deliver care for the patients and respond to the state's health needs.

With this rationale, the Center respectfully requests that section §11-157-5 Exemptions (a) is revised as follows, to recognize the legislative amendments achieved in Act 45, S.L.H. 2014 relative to HRS §§302A-1156 and 325- 34:

§11-157-5 Exemptions. (a) Medical exemptions from the requirements for specific immunizing agents shall be granted upon certification by a **practitioner [physician]** ~~[on the physician's professional stationery]~~ in a form or format specified by the department, that an immunization is medically contraindicated due to a stated cause, for a specific period of time~~[-]~~, in conformance with recognized standard medical practices. The ~~[original certificate]~~ form shall be provided to the exempt person or parent or guardian. ~~[A copy]~~ Copies of the ~~[certificate]~~ form shall be maintained in the student's school health record~~[-]~~, in the post-secondary school student's record, or in the child care facility child's record. Issuing practitioners [physicians] shall forward a copy of the form to the department. Reports of such ~~[certificates]~~ forms in a format specified by the department shall also be submitted to the department by each school~~[-]~~, postsecondary school, and child care facility.

Thank you for the opportunity to submit testimony for the proposed amendments of HAR Title 11, Chapter 157. Your favorable consideration of the requested revisions is appreciated.

Subject: Written testimony against HAR-157
Date: Thursday, November 01, 2018 11:46:39 AM

STRONG OPPOSITION TO HAR-157

Aloha,

I am writing to ask that you cancel HAR-157 for the following reasons:

1. It is not right to mandate something that is known to cause harm. If you read any vaccine insert you will see all the harmful ingredients not highlighted by the doctors that administer these vaccines.
2. You are doing much more harm than good with this mandate. There are no studies that prove the safety of the current mandatory vaccine schedule, so as any parent it is natural for us to be wary of injecting these poisons into our children to supposedly protect us from said diseases. By the way, it was recently exposed that the safety obligations put in place years ago by congress in the National Childhood Vaccine Injury Act were never upheld. How can you continue to pass laws that mandate vaccines when this problem exists?
3. HPV is a sexually transmitted disease. Children should not require a vaccine for an STD to attend school. In school, children are attending class and learning -- they are not having sex and spreading this disease. The HPV vaccine happens to be the most controversial vaccine for good reason -- because of the debilitating side effects that have ruined the lives of many across the world. HPV is a very common disease that most people will contract at some point in their lives -- and for many it clears up on their own or with natural, immune-boosting treatment. It rarely turns into cancer and if it does it takes a long time to do so; meanwhile, it can be monitored and treated before it becomes life-threatening.
4. Requiring the flu vaccine for school attendance is also inappropriate. The flu vaccine is contraindicated for people with egg allergies, which is a common allergy. Most people getting the flu shot are not screened for egg allergies, and this can be very dangerous! Moreover, the efficacy rate of the flu vaccine is so low, not to mention studies show that the flu vaccine puts you more at risk for catching other respiratory illnesses. Again, this is yet another vaccine that does more harm than good. There are safe, alternative methods for boosting the immune system to guard against the flu as well as effective treatments for the flu. I myself have never received a single flu shot in my entire life and I've only caught the flu a few times during my childhood and they were not life-threatening or debilitating because my mother believed in natural medicine and so she kept me healthy and treated me with natural medicine. Most people that I know who often catch the flu are people who subscribe to getting the flu shot regularly. If you do your research, most people that die of the flu have received the flu shot, ironically! This is because

vaccines break down the immune system; they do not build it. Vaccines supposedly "induce immunity" by suppressing the immune response to said disease. Is this really "immunization" or just "suppression of disease expression"? What happens when you repeatedly inject viruses into the body and then suppress the body's immune response to them???

The answer is not a good one! In the natural medicine profession we have observed that the disease will exist in the body for a long time in dormancy (latency) and later on when the body is weak for whatever reason the latent disease will manifest as other illnesses.

Vaccination is NOT immunization!

5. Medical Freedom is a basic right. Parents have the right to informed consent and making educated decisions when it comes to vaccines. Stop trying to take that away from parents. Please help us protect our keiki.

Sincerely,

Mei Li Shikiya

UNIVERSITY

Donald O. Straney, Ph.D.
Vice President for Academic Planning and Policy

Testimony Presented Before the

State of Hawai'i Department of Health Disease Outbreak Control Division (DOCD)
November 1, 2018 at 2:00 p.m.

By Donald Straney
Vice President for Academic Planning and Policy
University of Hawai'i System

HEARING DOCKET NO. R-157-18-07

Public hearing for the proposed amendment and compilation of Hawaii Administrative Rules (HAR) Title 11, Chapter 157, "Examination and Immunization"

The University of Hawai'i (UH) appreciates the opportunity to comment on the proposed revisions to Hawai'i Administrative Rules (HAR) Title 11, Chapter 157, "Examination and Immunizations." The Department of Health (DOH) is an important partner with the UH on many fronts, and UH acknowledges its contribution to public health for our students, faculty, staff and the community. In the interest of public health and promoting educational and human capital in the state, UH offers revisions to the proposed HAR.

First, §11-157-5 (d) provides an exemption from requirements of this chapter for exclusively online learning. UH supports the intent but requests revision of the exemption to clarify the language to exempt students who participate in online courses or programs exclusively or the programs or courses which are exclusively online. UH offers both in person and online or distance learning classes (1,428 sections in Fall 2018), and UH is preparing to increase its offering of exclusively online programs. Therefore, the exemption should apply to the student, program or course, rather than the institution.

Recommended revisions to new sub-section on exemptions:

§11-157-5 Exemptions (d) After-school programs, family child care homes, parent cooperatives, play groups, respite programs, group child care homes, and drop-in child care centers are excluded from the requirements of this chapter. All schools and ~~post-secondary schools~~ that conduct classes and activities exclusively on-line or electronically via remote learning are excluded from the requirements of this chapter. All post-secondary students who attend classes exclusively on-line or electronically via remote learning are excluded from requirements of this chapter.

Second, the proposed HAR §11-157-6.2 allows a postsecondary student to attend on provisional basis for 45 days upon submitting written evidence that the student is in process of receiving required immunizations. UH recommends that the provisional attendance period be

Telephone: [REDACTED]
Fax: [REDACTED]

extended to the last day of the first academic term of attendance. This period is typically 16 weeks (Fall and Spring terms). The current 45 day provisional attendance period (which is continued in the proposed HAR) is implemented by UH campuses as a prohibition of attendance because students who fail to comply after 45 days would exclude a student in the middle of a term leaving students without financial recourse for tuition and fees that have been paid for the term and unable to complete the term academically due to the immunization-related exclusion.

UH offers that the public health risks are limited as commuting students' exposure to other students is similar to other daily interactions such as on an airplane, in a movie theater, or at employment. In fact, many students take both in person and online classes; this Fall, there are 28,000 student registrations for online classes, which reduces students' contact with one another.

Recommended revisions to proposed sub-section on exemptions:

§11-157-6.2. Provisional Attendance (b) The provisional attendance period shall be no longer than three calendar months after the date of provisional attendance to a school or child care facility and ~~no longer than forty-five calendar days after~~ not to extend beyond the last day of the academic term following the date of provisional attendance to a post-secondary school.

Third, the proposed HAR §11-157-6.2 allows a post-secondary student to attend on provisional basis upon submitting written evidence that the student is in process of receiving required immunizations. UH requests that provisional attendance also be granted to all students of a post-secondary school when the post-secondary school has a plan to offer students immunizations within the provisional attendance period. UH believes that the public health purpose can be served when it can provide attending students with health services rather than exclude prospective students who have not accessed health services.

Recommended revisions to proposed sub-section on exemptions:

§11-157-6.2. Provisional Attendance (a) A student or child who does not have evidence of all of the required immunizations may:

- (1) Attend school, ~~post-secondary school~~ or a child care facility provisionally upon submitting written evidence from a practitioner or the department stating that the student or child is in the process of receiving required immunizations; or
- (2) Attend post-secondary school provisionally upon submitting written evidence from a practitioner or the department stating that the student is in the process of receiving required immunizations or if the post-secondary school has submitted a written plan that will ensure the required immunization of students within the provisional attendance period.

Thank you for your consideration.

Date: Friday, November 02, 2018 8:09:55 AM

Aloha,

I am writing to you to let you know that as a parent of three children who attend public school In Hawai'i, I strongly oppose HAR 11-157. Being forced to vaccinate my children is against my rights and freedom. The HPV vaccine is the worst of them all and I refuse to be forced to give my children this or any of the vaccines.

My 10 year old was vaccinated for mumps and still ended up getting them last summer when the outbreak occurred, and many people I know that got them were also vaccinated. That just goes to show you that they don't always work. The reasons behind this new bill doesn't make sense. Parents deserve the right to choose what is put into our children's bodies not any government or state office.

I am asking you to consider my testimony when making your decision. Please oppose this.

Aloha to whom it may concern,

I want to state that I am very opposed to MANDATORY vaccinations for the residents of the state of Hawaii. We, as Americans, should have the right to choose whether or not we want to vaccinate our children or ourselves. At this time, vaccinations include many toxic ingredients that can be harmful in many ways to human beings. I ask you to take a moment to read the leaflet that comes with the vaccinations and see what all is included in these vaccinations. Should they be cleaned up and these toxic ingredients be removed and also if the law is changed that we can sue the corporations that make and distribute these vaccinations if they damage us or our children, then I think we can then revisit this suggestion. Just in case it is not clear, I **STRONGLY OPPOSE** mandatory vaccinations!!!

Thank you,
Acacia Morrison

I am writing to state how I feel on the situation and I feel the people should have the right to choose if they want to vaccinate their child or not. My children are vaccinated & haven't had any bad reactions but some children do get bad reactions or become disabled or have even died. So I believe people/parents should have a right to choose for themselves and their family.

Mahalo for hearing my Testimony

From: [REDACTED]
To: [REDACTED]
Subject: Testimony of vaccines
Date: Friday, November 02, 2018 12:14:13 PM

To whom it may concern:

My health suffered enormously after having one flu vaccine in 2013. It was the first and only time I consented to have this poison in my body after encouragement from my doctor to do so, since we were going on a trip that included 'third world' countries.

After taking the shot, I felt exhausted and then feverish within 48 hours. After three days, severe nausea and vomiting followed, and I couldn't even keep water down. The vomiting was relentless; I became so dehydrated that my husband called an ambulance since I couldn't even move without gagging and spitting. The team immediately put an IV in to get fluid into me because of my jaundiced face and cracked skin. I went to the Er and was treated with anti-nausea medicine with continued IV for four hours. I never want to repeat this scenario and would not wish that experience on anyone.

By making vaccines mandatory, children and babies will be subjected to this type of possibly fatal reaction. There are over 50 viral strains in each vaccine administered to kids. If even one of them affects the CNS adversely, the child could have damaging seizures, which could result in autism, muscular dystrophy, or other cerebral-related lifelong affliction. Please don't force anyone to put these toxins in their system. It doesn't end well for those around them either, who can experience the virus shedding and become infected upon contact. This puts everyone at risk.

Thank you for reading my testimony and for taking it into consideration when voting. It should be a no-brainer to not poison our kids with live viruses at such a high magnitude.

Aloha Ke Akua,
L. George

To: DOH webmaster [REDACTED]
Subject: OPPOSE HAR 11-157

I am writing because I am concerned about certain populations who have a higher risk for adverse vaccine reactions receiving some of these vaccines, as most influenza vaccines for both children & adults still contain thimerisol (mercury), and the HPV vaccine is a newer vaccine with no long term studies of safety and has a higher reported incidence of adverse reactions than other vaccines. Some medical conditions recognized in research studies as increasing the risk for adverse vaccine reactions do not qualify for CDC medical vaccine exemptions. I am also concerned that the reporting requirements to the Dept of Health may violate individual's rights to privacy of their health information.

Thank you for your consideration.

Hi , my name is Lindsey Bronkhorst and I am writing our senators to let them know that I oppose the new bill HAR 11-157. I don't feel it is right that any vaccines should be considered mandatory for our children to get a good education . My daughter luckily has a medical exemption because she is one of the many that was vaccine injured as a child, she had a seizure and went into anaphylactic shock and quit breathing as a tiny infant after her vaccines. I continued with these vaccines per her Dr. who stated to me that there was no way the vaccines caused this. She continued to have seizures after each vaccine received before I finally found a new Dr. who had me stop then immediately and tested her for the MTFHR genetic mutation. She tested positive for this as did the rest of my family. It is becoming more understood now that having this genetic mutation can highly increase your risk for adverse side effects with vaccinations. I strongly disagree that the public school system should require all students to get vaccines without first being tested for this mutation. It is a violation of our rights as a parent to not be able to choose to make a medical choice for OUR children. My daughter is so smart, always at the top of her class and I just can't imagine her not being able to be able to participate in school because of this vaccine requirement. And I know there are many other families that are in a similar situation as me. Please be the voice we need in government and help stand up for our rights as parents. This is why we voted for you, because we trust you to be on our side. Vaccines should be the parents choice, plain and simple. Thank you for your time.

STRONG OPPOSITION TO HAR 11-157

Aloha,

I am writing to ask that you cancel HAR 11-157 for the following reasons:

1. It is not right to mandate something that is known to cause harm. If you read any vaccine insert you will see all the harmful ingredients not highlighted by the doctors that administer these vaccines.
2. You are doing much more harm than good with this mandate. There are no studies that prove the safety of the current mandatory vaccine schedule, so as any parent it is natural for us to be wary of injecting these poisons into our children to supposedly protect us from said diseases. By the way, it was recently exposed that the safety obligations put in place years ago by congress in the National Childhood Vaccine Injury Act were never upheld. How can you continue to pass laws that mandate vaccines when this problem exists?
3. HPV is a sexually transmitted disease. Children should not require a vaccine for an STD to attend school. In school, children are attending class and learning -- they are not having sex and spreading this disease. The HPV vaccine happens to be the most controversial vaccine for good reason -- because of the debilitating side effects that have ruined the lives of many across the world. HPV is a very common disease that most people will contract at some point in their lives -- and for many it clears up on their own or with natural, immune-boosting treatment. It rarely turns into cancer and if it does it takes a long time to do so; meanwhile, it can be monitored and treated before it becomes life-threatening.
4. Requiring the flu vaccine for school attendance is also inappropriate. The flu vaccine is contraindicated for people with egg allergies, which is a common allergy. Most people getting the flu shot are not screened for egg allergies, and this can be very dangerous! Moreover, the efficacy rate of the flu vaccine is so low, not to mention studies show that the flu vaccine puts you more at risk for catching other respiratory illnesses. Again, this is yet another vaccine that does more harm than good. There are safe, alternative methods for boosting the immune system to guard against the flu as well as effective treatments for the flu. I myself have never received a single flu shot in my entire life and I've only caught the flu a few times during my childhood and they were not life-threatening or debilitating. Most people that I know who often catch the flu are people who subscribe to getting the flu shot regularly. If you do your research, most people that die of the flu have received the flu shot, ironically! This is because

vaccines break down the immune system; they do not build it. Vaccines supposedly "induce immunity" by suppressing the immune response to said disease. Is this really "immunization" or just "suppression of disease expression"? What happens when you repeatedly inject viruses into the body and then suppress the body's immune response to them???

The answer is not a good one! In the natural medicine profession we have observed that the disease will exist in the body for a long time in dormancy (latency) and later on when the body is weak for whatever reason the latent disease will manifest as other illnesses.

Vaccination is NOT immunization!

5. Medical Freedom is a basic right. Parents have the right to informed consent and making educated decisions when it comes to vaccines. Stop trying to take that away from parents. Please help us protect our keiki.

Sincerely,

Leslie Ho'opai

I have a family history of severe vaccine reaction. I chose not to vaccinate my child as an infant due to serious health risk. I am strongly opposed to government mandated vaccines as I should be able to make informed consent as to the need vs risk to the health of my family. It should be a basic human right as individuals to determine our own health choices especially when severe or fatal consequences can result. The Pharmaceutical industry as the largest lobbying group cannot be trusted to disclose health risks therefore the State should not dictate my right to accept or decline immunizations. This proposal is about economics not public health.

Subject: Testimony - Mandatory Vaccination
Date: Thursday, November 01, 2018 5:58:51 PM

Aloha,

I am writing on behalf of the upcoming hearing in regards to proposing mandatory vaccinations. I have experienced first hand the negative side effects of my daughter receiving the MMR vaccine. She had been receiving her vaccines on the normal schedule and at 12 months when she was due for the MMR, she had a severe reaction that caused her to be hospitalized for awhile and she completely changed from that day on. While in the hospital you could completely see the light in eyes gone, like no one was there. She eventually got better but since has not received a vaccination. I had my son a year later and he has not had not 1 vaccination due to the experience with my daughter, and he is the most healthy child I know. He doesn't get as many colds or flu as she does, he's always been in the top percentile for his age in weight and height. He's hit so many milestones before the expected timeline, he's very bright; even his teachers are amazed at his knowledge and potential. We are born with an immune system for a reason, our bodies are made to fight off illnesses; injecting our children with these diseases is just uncalled for and invasive when it's natural for us as humans to fight off. I am 100 percent against mandatory vaccinations, places where it's become mandatory have not seen a change in the rate of children being diagnosed with illnesses, it's actually the opposite. It is against our rights as Americans and as parents to chose what's best for ourselves and our children. Please hear our concerns and rule wisely.

Please uphold our right to choose which vaccines and what time table to use (if any) for our own children. We must be able to keep our Right for Religious/Philosophical objection to vaccines.

My son had a reaction (brain swelling) to the multiple vaccines he received at 1 year old... it is not recommended that my other children receive the same vaccines doses at the same time, as they may also have a reaction and the outcome may be more severe.

I retain the democratic Right to make informed decisions for my children based on what is best for my family... that is why we are Americans and proud to uphold our strong American Rights.

Thank you,
Catherine (Lightfoot) Martin, CPM

Date: Sunday, November 04, 2018 1:16:45 PM

I plead of you to not move forward on this proposed new vaccine schedule. Both of my children have had all their vaccines on schedule. However, no one in our family have ever had the flu shot (even when the H1N1 scare occurred) and none of us have ever had the flu due to strong immunities and frequent hand washing. Totally unnecessary, and this vaccine should remain a choice for those who feel they benefit from it.

The HPV vaccine gave my son months of adverse reactions. Spaciness, extreme fatigue, his vision decreased from 20/20 to 20/80 after vision testing in a 3 month period. He complained of daily bouts of dizziness. No illnesses or other life changes in this time period other than this vaccine. I absolutely attribute his symptoms to the Gardasil vaccine.

Hep A? Perhaps. But HPV and the flu mandatory..no way!

Hawaii has always been a melting pot for people with different belief systems. It is my strong belief that not only are these proposed vaccines unnecessary, in some cases they are downright dangerous. Please listen to the people. This is not North Korea.

Subject: Urgent! Attack on our medical freedom. Forced medicine = No liberty.
Date: Sunday, November 04, 2018 5:21:10 PM

Aloha!

My name is Martina and I am mom of two perfectly healthy unvaccinated children on [REDACTED]. Thank you for this opportunity to provide testimony. As a community member here in Hawaii and a health medical freedom advocate, I am writing to strongly oppose HAR-11-157. I also request hearings on all islands.

I almost died from a vaccine years ago. My children can not receive vaccines because of that family history.

This proposal violates many sections of the United Declaration of human rights. Mandatory laws that threatens a child's education are unjust laws because they disproportionately target those in society without the family, community, or monetary support that would allow for home schooling their children. For what good reason will a perfectly healthy unvaccinated child not have the opportunity to get an education?

By allowing these proposals to go through we will see an outrage from the public. People would rather home school or move out of state then to vaccinate their keiki with a proven extremely dangerous vaccine, as the HPV vaccine.

Our keiki will NOT be your test subjects. It's time to separate pharma and state. The ACIP meeting at the CDC Oct. 24th this year, pharmaceutical lobbyists outnumbered legislators. Our public health agencies and departments all have public-private partnerships with pharmaceutical companies.

Giving under influence to choose who stand in profit in the billions-liability free of adequate safety data. Then sits back to wait for "after-marketing" reporting.

WE, the public are the test subjects in aftermarket reporting. UNACCEPTABLE.

Why did state epidemiologist Dr. Sarah Park testify against a bill this year to provide patients/parents full informed consent prior vaccination. Hence read a real insert and be told ALL adverse events that can follow after injection, such as death, seizures, brain swelling and paralysis.

She testified it could hurt her flu shot school program. Why is that? Conflicts of interests? Should she be investigated?

Also who sponsors Hawaii immunization coalition? You will see many written testimonies from this group. Their arguments to support this rule change is weak and unjust.

They say they want mandates in school for certain vaccines to get high vaccination rates, and in return lower rates of vaccine-preventable diseases.

That statement is a lie. HPV vaccine has NEVER once been proven to prevent cervical cancer. New studies show that cervical cancer has INCREASED in the age group vaccinated for. HPV is NOT a public health threat. Why would we vaccinate ALL Hawaii's keiki with a vaccine that has injured over 59,000 children reported to VAERS and 326 deaths. FDA admits that only 1 to 10% of adverse events even get reported. So what numbers are we really looking at here. There are criminal charges in many countries against the maker Merck(see link), same company that killed 60,000 Americans with viox. Why on earth would parents give their trust to this extremely dangerous product, with their children's lives?

Their argument that vaccines protect the elderly, newborns and immuno-compromised can easily be dismissed. None of those attend school settings. Also they all DO get vaccinated. Including pregnant women. The only immuno-compromised that do not receive vaccines are cancer patients attending chemo. They are therefore also not in a school setting. Also this statement does not make any sense since recently vaccinated individuals can shed live virus. Hence recently vaccinated can not give blood for six weeks after live virus injection, nor are they allowed to visit cancer patients during that time.

Another argument is the theory of herd immunity. Another lie. 94% of the adult population is not up to date with their vaccines. Therefore completely unvaccinated since vaccines IF they even work, wane about 2 to 5 years. Should adults not be able to attend work then if not fully up to date with the adult schedule of 120 doses of vaccines. Anyone can spread disease. There are thousands of infectious diseases but somehow people fear only the 13 we have vaccines for. Why is that? It is called propaganda that is pushed in every direction. I get bribed with a \$5 giftcard at Walmart to go get a free flu shot for the clerk to reach their quota for bonus. That is NOT for health. Please stop this madness.

Also all recent outbreaks have been in fully vaccinated individuals. Syracuse mumps outbreak was in 100% fully vaccinated individuals. Their faulty dangerous products should NOT be forced upon anyone.

When a product injures and kills thousands of people it gets taken off the market. Except when it's a vaccine. It's get mandated.

NCVIA of 1986 is passed by Congress and provides total liability protection to the vaccine maker. Same year the vaccine schedule tripled. Coincidence?

U.S citizens are no longer able to sue a vaccine maker if they are injured compensation are now paid out of taxes, not by the vaccine makers. Only signed into law because they no longer found it profitable if they had to be responsible for all injuries and death.

By passing proposed changes you are opening a door for catastrophic proportions. Parents will refuse to bring their children to school under such oppressing and criminal laws.

Medical freedom is our basic human right. Where there is a risk there must be a choice.

Parents responsibilities are for their children not the false propaganda marketing gimmick "for the herd".

I respectfully request that proposed changes be thrown out due to the fact it is based on profit over our children's health, and that we as parents decide what goes in our children's bodies. If we lose that right. We lose all our freedom and that should upset every single citizen of this country.

I am begging you to look at all the facts and science. Not only the one that protects profit.

Pono, do what is right.

Do not support this unjust, medical tyranny proposal.

We all deserve more freedom, not less.

Oppose HAR-11-157.

Warmly,
Martina, [REDACTED] resident.

"In your previous meeting you advocated for less independent testing, considered 'redundant',

in order to speed up the supply of products.⁷ The recent administration of 250,000 defective vaccines in China⁸, the tragedy of the oral polio campaign in India with over 450,000 cases of paralysis and death⁹, the damage caused by the Dengue vaccine in the Philippines¹⁰, reports from all over the world of chronic pain and paralysis after administration of the HPV vaccine^{11, 12}, show that vaccine safety and efficacy are being tragically disregarded in this drive for fast-tracking approval and easy certification."

Date: Sunday, November 04, 2018 8:58:03 PM

To whom it may concern:

I am a mother of four unvaccinated children and very concerned how Hawaii State mandatory vaccinations would effect our family. We have chosen not to vaccinate for personal and religious reasons and I believe it is our right as parents to make that decision for our children. If it was to become mandatory, we would be forced to pull our children out of public schools and enroll them into an alternative option. I urge the state to really investigate and study the chemicals and additives put into the vaccinations, which can cause more harm than the actual illness itself.

Mahalo for your time,

Andrea Kaleiohi

From: [REDACTED]
To: [REDACTED]
Subject: Reasons to oppose HAR 11-157
Date: Sunday, November 04, 2018 10:14:03 PM

To whom it may concern,

The risk of vaccination is not insignificant. To view the risk of vaccine injury, as documented by the Federal Health Resources and Services Administration, please see the following url:
<https://www.hrsa.gov/sites/default/files/hrsa/vaccine-compensation/data/monthly-stats-oct-2018.pdf>. Compensated injuries represented here are injuries that are permanent or fatal. The document represents a gross under reporting of vaccine injuries since it documents only those vaccine injuries filed in a federal court and represents only permanent, fatal and near fatal injuries. Vaccine injuries are real and they are much more common than published data suggest.

Any decision regarding a medical procedure that involves risk should be based upon an informed consent between the doctor and patient that involves assessment of the individualized benefits verses risk for any procedure. Mandatory vaccines in any form, as proposed by HAR-11-147 violate the basic right to make informed healthcare choices and place the citizens of Hawaii at increased risk for iatrogenic illness by enforcing a one sized fits all medical procedure. Medical interventions can be put in place to help protect from vaccine injury, but only if patients are properly informed of the risks and have a choice in the matter.

Let it be known I oppose HAR-11-157.

Mahalo,

Kim Marzetta

strongly oppose Hawaii Administrative Rules/HAR 11-157

Sunday, November 04, 2018 2:59:15 PM

Dear Hawaii State Department of Health,

I **strongly oppose** Hawaii Administrative Rules/HAR 11-157 to add more mandatory vaccines including HPV and Meningococcal vaccine for all seventh graders, Influenza vaccine for all young children, Hepatitis A vaccine for all children, and an additional dose of MMR for post-secondary school attendance and Meningococcal vaccine for all first-year students living in on-campus housing. Enhanced reporting requirements for health practitioners and schools and enhanced reporting requirements for medical and religious exemptions.

I am a wife, a mother, and a 3rd generation military family. I am pro-vaccine as long as it can be pro-clean green vaccine, and with the way vaccines are made, they do not fit under clean and green because of the toxic chemicals. But what I am not is pro-mandate vaccine. I'm pro medical freedom, for people to have a choice in what they want or do not want in their body.

Disclaimer! Before I start I want to make sure you are aware that I am using the same sources you all do. I always refer to the CDC, FDA, and vaccine manufactures (Merck, GSK, Pfizer, etc.) so that we are all on the same page as far as our knowledge is based off of the information that is provided from these sources that **I hope is consistent, credible, and current.**

You see how I made a disclaimer right in the beginning so we are all on the same page?

Something I know should be done for all parents before administering vaccines, given full disclosure of what is about to happen before it happens, what could happen after it happens, all the good and bad, so they can make the best informed decision.

But, it's a little too late since the bill for informed consent was opposed. That informed consent by giving the parents the package insert to read over during or before the appointment would be an "undue burden", "waste of time", and would be too "time consuming" for both parents and physician (based off of the oppositions submitted for HB 2622) .

But guess what? Anyone who chooses to be a *good* parent knows that when you become a parent, everything we do is time consuming, what we do for our children is never a waste of time, and they are absolutely **not** an undue burden.

We are willing to take the time necessary to have all the information even if it is alarming. Because in the end, the blame will not be on the CDC, FDA, or vaccine manufacturers because as the parent our children are our responsibility. From the day we conceive, that precious small life to us is everything. We grow, nurture, and love them with love we have never experienced. We teach them that lying is bad, and withholding truth is one in the same, so let's all be clear that my focus here is **truth.**

I want to uncover the truth for the sake of time to just focus on one of the vaccines from the list of what is proposed to be added.

The HPV Vaccine also called Gardisal, if this is passed will be required of 7th graders, both boys and girls the age of 12-13. These boys and girls who are capable of reading and understanding, so let's let both parents and the children aware of some of the facts from the Gardisal package insert.

First, let's look at the intended purpose of this HPV vaccine. The indications and usage on FDA.gov states that it is, "...for the prevention of the following diseases caused by Human Papillomavirus (HPV) types included in the vaccine...Cervical, vulvar, vaginal, and anal cancer caused by HPV types 16 and 18...Genital warts (condyloma acuminata) caused by HPV types 6 and 11...And the following

precancerous or dysplastic lesions caused by HPV..."

(<https://www.fda.gov/downloads/biologicsbloodvaccines/vaccines/approvedproducts/ucm111263.pdf>)

Reason #1 Why I don't support mandating more vaccines:

My following question after the purpose of anything is what does it consist of, and in this case, what's in it? Just like I read a menu or packaging for ingredients; I want to know what's in it before I decide to consume it or not.

"What are the ingredients in GARDASIL?"

The ingredients are proteins of HPV Types 6, 11, 16, and 18, amorphous aluminum hydroxyphosphate sulfate, yeast protein, sodium chloride, L-histidine, polysorbate 80, sodium borate, and water for injection."

(https://www.merck.com/product/usa/pi_circulars/g/gardasil/gardasil_ppi.pdf)

I have this rule of thumb that I apply to my life... If I can't pronounce it, and if I don't know what it is, I probably shouldn't be eating it. Keep it simple. I know the contents of an organic apple, the ingredients would say: Apple. I will eat that apple. But, if it was a package of sliced conventionally grown apples grown with pesticides and added chemicals to preserve the apples, I would avoid eating those apples.

This logic applies the same to vaccines. We should know what these ingredients are and what they are capable of before putting it into our children's bodies.

So let's just look at one of the ingredients listed above: amorphous aluminum hydroxyphosphate sulfate

I found this study "*Insight into the cellular fate and toxicity of aluminium adjuvants used in clinically approved human vaccinations*" by [Mold M1](#), [Shardlow E1](#), [Exley C1](#). and in their conclusion they found that "Through *in vitro* cellular modelling, our results further shed light on the capacity of ABA (aluminium based adjuvants) to deposit at sites distant to the injection site as has been suggested in macrophagic myofasciitis (MMF), whereby aluminium is proposed to translocate through draining lymph nodes to distant organs" (<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4981857/>).

Aluminum is one of the most commonly used ingredient in most vaccines. So this ingredient has the ability to move throughout the body to lymph nodes and distant organs. Let's say, it travels to the brain and causes inflammation, which is called **encephalitis**.

Is this possible? **Yes**. How do I know? **It lists it as one of the adverse events on Postmarketing Experience on the Gardisal package insert as encephalomyelitis** which according to the dictionary is "**inflammation of the brain and spinal cord, typically due to acute viral infection.**" You will see more later on my reason #4.

So again to my apple analogy. If I read the ingredients on my apple that stated there was amorphous aluminum hydroxyphosphate sulfate, and I knew it can travel through my lymphnodes and to my organs like my brain and cause inflammation and potential damage. I would DEFINITELY stay away from that poisoned apple like the one from the old witch on Snow White.

I encourage you to learn more about ingesting aluminum vs. injecting aluminum in this well written objective view on it <http://vaccinepapers.org/vaccine-aluminum-travels-to-the-brain/>

Reason #2 Why I don't support mandating more vaccines:

So can we all agree that the goal is to prevent cancer caused by certain types of HPV. But, and this is a big but, the package insert states, "**GARDASIL has not been evaluated for the potential to**

cause carcinogenicity or genotoxicity."

Let me get out my handy dandy dictionary so I can understand this correctly in laywomen terms.

Carcinogen is "a substance capable of causing cancer in living tissue." (dictionary.com)

"A genotoxin is a chemical or agent that can cause DNA or chromosomal damage. Such damage in a germ cell has the potential to cause a heritable altered trait (germline mutation). DNA damage in a somatic cell may result in a somatic mutation, which may lead to malignant transformation (cancer). (<https://www.ncbi.nlm.nih.gov/pubmed/19157059>)

Let's let that sink in for a moment...

You are going to require boys and girls entering 7th grade to get the HPV vaccine that is supposed to prevent certain types of cancer with a substance that hasn't been tested for the potential of causing cancer. So, potentially preventing cancer with something that could potentially cause cancer? Is anyone else confused by this? Do our children not deserve better options?

Preventing cancer doesn't come from a syringe of something that may contain cancer causing ingredients. Maybe instead we should teach our children how to prevent illness and cancer by eating nutrient dense foods, drinking plenty of water, getting enough sunshine and exercise, practicing safe sex and good hygiene. Shouldn't we put more emphasis on these simple yet important aspects of preventing cancer?

Reason #3 Why I don't support mandating more vaccines:

Now let's continue with warning and precautions, just like when you are preparing to ride a roller coaster, they have a short video or explanation of the precautionary measures like wearing the safety harness, keeping all limbs inside the cart, and look forward to avoid injury.

Here is the **Gardasil warning and precaution.**

"Because vaccinees may develop syncope, sometimes resulting in falling with injury, observation for 15 minutes after administration is recommended. Syncope, sometimes associated with tonic-clonic movements and other seizure-like activity, has been reported following vaccination with GARDASIL. When syncope is associated with tonic-clonic movements, the activity is usually transient and typically responds to restoring cerebral perfusion by maintaining a supine or Trendelenburg position" (fda.gov)

I copied that straight from the FDA Gardasil Package Insert website, and no your eyes aren't misleading you, I purposely left the part that vaccines is spelled incorrectly on the insert. If they are careless enough to miss a spelling error, makes me wonder, what else are they careless about...

So again as a laywoman, I wanted to make sure I understood what that warning and precaution was stating so I searched, **"What is tonic-clonic movements?" and this was the result, "A type of seizure that involves a loss of consciousness and violent muscle contractions." (Mayo Clinic)**

So if you were about to ride a roller coaster and they indicated that you will need to be monitored for 15 minutes after the ride to make sure you do not lose consciousness or have violent muscle contractions, I don't know about you, but I would not be lining up for that ride.

Reason #4 Why I don't support mandating more vaccines:

Just in case the potential for cancer, mutations, and seizures weren't enough...

"The following adverse events have been spontaneously reported during post-approval use of GARDASIL."

"Blood and lymphatic system disorders: Autoimmune hemolytic anemia, idiopathic thrombocytopenic purpura, lymphadenopathy.

Respiratory, thoracic and mediastinal disorders: Pulmonary embolus.

Gastrointestinal disorders: Nausea, pancreatitis, vomiting.

General disorders and administration site conditions: Asthenia, chills, death, fatigue, malaise.

Immune system disorders: Autoimmune diseases, hypersensitivity reactions including anaphylactic/anaphylactoid reactions, bronchospasm, and urticaria.

Musculoskeletal and connective tissue disorders: Arthralgia, myalgia.

Nervous system disorders: Acute disseminated encephalomyelitis, dizziness, Guillain-Barré syndrome,

headache, motor neuron disease, paralysis, seizures, syncope (including syncope associated with tonicclonic

movements and other seizure-like activity) sometimes resulting in falling with injury, transverse myelitis.

Infections and infestations: cellulitis.

Vascular disorders: Deep venous thrombosis."

Now, I am definitely not lining up for that ride.

So to bring my point home, and to be very clear, I **strongly oppose** adding more vaccines like this one above, the HPV vaccine to be mandated for our children. Our children who until they are old enough to have personal autonomy, it is our responsibility to speak up for them, stand up when things don't seem right, and protect them from potential dangers.

I support the theory behind vaccines, that's why I said I am pro-vaccine as long as those vaccines are clean and green. We need for vaccines to be better tested for safety of the ingredients whether they are cancer causing, capable of DNA mutations and damage, and impairment of fertility for our children's future. They deserve better, we as parents deserve better information so that we are aware of the risks vs. benefit.

No matter what side you stand on, we all want to do what's right for our children and protect them, that is our main goal, but at what cost? Do we have to risk all of those above mentioned reasons? The toxic substances like aluminum entering their bodies, the unknown about if the vaccine will cause cancer, DNA mutations, impairments to their fertility, seizures, paralysis, or worse case scenario a blood clot that could lead to a parents worst nightmare?

Please, I urge you to do better for our children and their futures. Don't mandate vaccines, give people the opportunity to be educated on this topic. I took my time to read the package inserts, to look up public medical studies, yes it included medical jargon I didn't understand, but nothing a search couldn't clarify for me.

Was it an "undue burden"? NO, because our children are not a burden.

Was it a "waste of time"? NO, because our children deserve our time.

Was it "time consuming"? Yes, but worth every single moment.

Thank you if you made it this far to reading, it really means a lot to me.

Subject: Strongly Opposed to Forced Vaccinations!
Date: Sunday, November 04, 2018 12:04:10 AM

Dear Honorable Department of Health Public Servant,

Please consider what Hawaii County has already passed in 2009 concerning mandatory vaccinations:

“WHEREAS, there is insufficient scientific evidence proving that vaccines are safe or effective, therefore it is not in the best interest of public health to impose mandatory vaccinations without exemptions; and

WHEREAS, swine flu and the flu vaccines both contain Thimerosal, a preservative for vaccines composed of mercury, one microgram of mercury is considered toxic and flu shots contain 25 micrograms. By age two, most United States children have received around 237 micrograms of mercury through vaccines; and

WHEREAS, the fast tracked government vaccines contain a substance called squalene that is suspected of causing serious long-term damage to the body; and

WHEREAS, in the wake of potential harm to the individual and the public from vaccinations, and the vacillating interpretation of “vaccine science,” it is in the public’s best interest to amend the vaccine laws, to include the right of medical, religious, and philosophical exemptions from mandated vaccination programs; now, therefore,

BE IT RESOLVED BY the COUNCIL OF THE COUNTY OF Hawai’i, that it recommends that state and federal elected officials who represent the people of the State of Hawai’i amend vaccine laws to include medical, religious, and philosophical exemptions from mandatory vaccine programs that contain thimerasol or squalene.

BE IT FURTHER RESOLVED, that any vaccine known to contain harmful viruses or any materials known to prompt autoimmune diseases or cancer risks shall provide cause for exemption for any person in the State of Hawai’i who so desires such exemption.”

As a member of the Wai'anae Coast Neighborhood Board, I have heard from many of my

constituents who are opposed to "mandatory" vaccines. It's shameful that "bully tactics" of coercion are being resorted to to promote special financial pharmaceutical interests taking advantage of their fear-mongering among our policy makers and public officials. Auwe!

It is ethically abhorrent for any government official(s) to assume dictatorial caesar-like powers to command their subjects to do mandatory vaccinations. Are we public servants or the masters? Must I remind you of Ke Akua's justice to everyone who is not pono?

Good intentions can no longer be used to commit crimes against the public trust. Respect, educate, and recommend, but DO NOT COERCE NOR FORCE my community to do what you think is best for us...we can decided that perfectly on our own, thank you!

Blessings to you,

W. Ken Koike

To whom it may concern,

I am writing to voice my opposition to any and all legislature that would make vaccinations in any way mandatory for both children and adults alike in any situation. I believe it is a personal and parental right to make decisions regarding vaccination, not the right of our local or federal government to mandate them.

Sincerely,

Briana Ansley
Hawaii, citizen, parent & teacher.

To the Department of Health,

I strongly oppose Amendment HAR 11-157. The State SHOULD not have the right to decide for any parents about vaccinating their own children. WHERE THERE IS A RISK THERE MUST BE A CHOICE !!! And there are many risks involved with proof !

There was only a 1 hr public hearing on Oahu only for testimony to be given. We, as parents, grandparents and citizens demand that there be other public hearings on each Island. This is too important of an issue to be rushed through without the chance for the public to testify !!! I ask that you delay your decision on this important issue.

Sincerely,

Jennifer Edmonds

Aloha,

I am not going to belabor the point of how dangerous vaccines are. We both know, its all over the vaccines safety inserts. You have read at least one, I hope. I have read most of them. In the end it just begs the question who is telling you to poison your own fellow man? How do you sleep at night? How much do they pay you to ruin the lives of innocent children, for their whole life, and the lives of their parents, extended family, friends and acquaintences? Wow, the list gets pretty long pretty quick doesn't it? That means more and more people are coming to terms with what is really happening to us as a society and to mankind in general. It is not "if" but "when" the tipping point is reached which side of the line do you want to be on? Vaccine court will not be able to save you. It is on its way out. Professing ignorance will not save you. You know. History will record this moment as a particularly insidious time when man saw greed as more meaningful than the lives of innocent children being ruined all around him, bringing society to the brink of self destruction. A time that was on a par with the Nazi Holocaust. When the bell tolls many people are going to jail, for the rest of their lives. The whole affair will make the Tobacco Settlements seem like a small blip on the radar. In the time it has taken you to read this note one or two more new kids have been added to the autism list. Time is running short, for everyone. People are waking up. Think carefully before you act, it could be your life on the line before you know it.

With utmost sincerity and humility,

Tom Woolf

Subject: Re: HAR 11-157, I OPPOSE
Date: Monday, November 05, 2018 10:56:26 AM

I, Kimberly Carter, **STRONGLY OPPOSE** the NEW VACCINE REQUIREMENTS FOR HAWAII STUDENTS.

Medical freedom is our basic human right. Where there is a risk there must be a choice! As a community member here in Hawaii and a health medical freedom advocate, I am writing to strongly oppose HAR-11-157.

This proposal violates many sections of the United Declaration of human rights. Mandatory laws that threatens a child's education are unjust laws because they disproportionately target those in society without the family, community, or monetary support that would allow for home schooling their children. By allowing these proposals to go through we will see an outrage from the public. People would rather home school or move out of state then to vaccinate their keiki with a **proven** extremely dangerous vaccine, as the HPV vaccine. HPV vaccine has NEVER once been proven to prevent cervical cancer. New studies show that cervical cancer has INCREASED in the age group vaccinated for. HPV is NOT a public health threat. Why would we vaccinate ALL Hawaii's keiki with a vaccine that has injured over 59.000 children reported to VAERS and 326 deaths. FDA admits that only 1 to 10% of adverse events even get reported. So what numbers are we really looking at here.

There are criminal charges in many countries against the maker Merck. , same company that killed 60.000 Americans with vioxx. Why on earth would parents give their trust to this extremely dangerous product, with their children's lives?

When a product injures and kills thousands of people it gets taken off the market. Except when it's a vaccine. It's get mandated.

NCVIA of 1986 is passed by Congress and provides total liability protection to the vaccine maker. Same year the vaccine schedule trippled. Coincidence?

U.S citizens are no longer able to sue a vaccine maker if they are injured compensation are now paid out of taxes, not by the vaccine makers. Only signed into law because they no longer found it profitable if they had to be responsible for all injuries and death.

I respectfully request that proposed changes to be thrown out due to the fact it is based on profit over our childrens health, and that we as parents decide what goes in our children's bodies. If we loose that right. What true rights do we truly have, that should upset every single citizen of this country.

I am begging you to look at all the facts and science.

Pono, do what is right, Oppose HAR-11-157. Where there is a risk there must be a choice!

Warmly,
Kimberly, [REDACTED].

Aloha again.

I am adding links to my testimony as they didn't show up on my original one I sent yesterday.
Regarding opposing HAR-11-157
Martina Dodson Maui.

As you can see the evidence that this HPV vaccine is extremely dangerous should be enough for you to kindly stop proposed changes. Also why parents are so upset is that **OUR ONLY FREEDOM LEFT IS OUR RELIGIOUS EXEMPTIONS TO AVOID VACCINATIONS.** That will be taken over by a small group of people at the DOH that should not be in charge of our exemptions, since they obviously will follow the criminal ways California took away parents rights to choose. They will also get the ultimate power to just with the strike of a pen to **TAKE THEM COMPLETELY AWAY** with basically **NO** oversight.

Statement from my friend Kathleen Berrett. Her son died this year following the HPV vaccine.

"Colton was a happy healthy very active boy until he became paralyzed from the neck down and ventilator dependent for 4 yrs due to the gardasil vaccine that was administered to him Feb 2014.

He worked hard and strived to get full rehabilitation. He regained function in his legs however He never was able to use his right arm or neck again. His diaphragm remained paralyzed Making him need a ventilator to Breathe and many cares that go along with being trached and paralyzed. He Only regained a portion of his left arm and hand.

He passed away Jan 5 2018 due to subsequent consequences of his vaccine injury. The damages caused by gardasil are horrific and incomprehensible for many to understand when they looked at my sweet son's smiling face. I will never get to see him smile at me anymore. (Sarcasm alert:

I'm so grateful that he didn't get cervical cancer though, nor have the opportunity to spread it to his wife... that he also got cheated from having)

Gardasil kills, it maimes and damages innocent children so wealthy men can make a huge profit.

It's disgusting!

Thanks for sharing his story"

This is a open letter written to the WHO from hundreds of international organisations representing health freedom. Questioning the vaccine safety. Please read.

This book has evidence of the danger of the HPV vaccine. Released last month.

“This book reveals the tragedy of the HPV vaccine scandal.”

—Dr. Luc Montagnier, Nobel Prize Winner for Discovery of HIV

The HPV Vaccine on Trial: Seeking Justice for a Generation Betrayed paints a devastating picture of corporate and government conflicts of interest, negligence, and malfeasance in approving and promoting human papillomavirus (HPV) vaccines, touted to prevent cervical and other cancers. Coming out on the heels of recent New York Times revelations about astounding financial conflicts of interest at Memorial Sloan-Kettering Cancer Center, this groundbreaking book highlights the lack of transparency, manipulated science, and abuse of state power to market this medical juggernaut, already raking in over \$2.5 billion per year.

Authors Holland, Rosenberg, and Iorio uncover:

- HPV vaccines have never been proven to prevent cancer of any kind.
- HPV vaccine inventor Ian Frazer acknowledges that “[C]ervical cancer screening if used and promoted effectively would be almost entirely able to prevent” cervical cancer deaths in countries like the US and Australia, without HPV vaccines.
- No participants in the original HPV clinical trials received true saline placebos.
- The clinical trials never investigated the vaccine’s possible effects on human fertility or potential to cause cancer.
- The clinical trials show that the vaccines can backfire and contribute to HPV lesions, and potentially cancer, in some women. Despite this, neither the manufacturers nor government agencies recommend prescreening to eliminate those with clear risk factors.
- Although the vaccine is targeted for 11-12-year-old children, only a small fraction of clinical trial subjects was in this age range.
- Lawsuits against HPV vaccine manufacturers and government health agencies are progressing around the world, including the US, India, Japan, Colombia, Spain, and France.
- The US government earns millions in royalties from Merck and GSK, the vaccine manufacturers, for its role in the invention of HPV vaccine technology.
- Although the US government proclaims HPV vaccines safe and effective, it has paid out millions of dollars to compensate families for death, brain injury, multiple sclerosis, ulcerative colitis, and other severe, debilitating conditions.

With praise from some of the world’s leading scientists on aluminum, autoimmunity, and vaccines, this book fills a critical void, giving people information they need to make commonsense decisions about this vaccine.

Written in plain language, The HPV Vaccine on Trial ultimately is about how industry, government, and medical authorities may be putting children in harm’s way.

About the Authors

Mary Holland, M.A., J.D., is on the faculty at NYU School of Law, directs its Graduate Lawyering Program, and lives in New York City.

Interview with neurosurgeon Dr. Blaylock
about HPV vaccine.

Merck and its lackeys have made all sorts of wild claims about how Gardasil prevents HPV, as well as cervical cancer, despite the fact that neither of these claims have ever been proven to be true.

"It has never been shown that [Gardasil] prevents cervical cancer," explains Dr. Blaylock to Adams, noting that Merck's widely-aired "One Less" television and internet campaign, which insinuates that Gardasil prevents cervical cancer in young girls, is a complete fraud. "They don't even have scientific evidence of any kind to back up the assertion that this vaccine prevents cervical cancer."

Gardasil has injured, killed far more children than ever would have developed cervical cancer without the vaccine
And yet young girls, young boys, and all young children for that matter, including those that do not even engage in sexual behavior of any kind, are being told that they need Gardasil to protect against a cancer that kills fewer people every year than the vaccine itself. According to the available data, which is under-reported by up to 98 percent, Gardasil has permanently injured and killed far more girls than ever would have developed cervical cancer apart from the vaccine.

Since full side effects are almost never disclosed, Gardasil and many other vaccines are being illegally administered to millions without informed consent

Perhaps most disturbing about Gardasil is the fact that the vaccine was fast-tracked in its development and approval, and is now being administered to millions of people without informed consent. Because the full list of side effects, including the lack of science proving Gardasil's efficacy, is not being disclosed to parents, doctors, pharmacists, and vaccine-administers at grocery store booths are breaking the law by failing to provide informed consent.

Young children and their parents are also not being told that yearly pap smears alone can prevent 80 percent or more of all cervical cancers, or that a young girl's risk of developing cervical cancer apart from the Gardasil vaccine is less than .00002 percent, or less than two-thousandths of a percent, if she gets pap smears.

In essence, parents are being told that Gardasil does all sorts of things that it has never been proven to do, when in reality it has no medical benefits whatsoever, but plenty of serious risk. Meanwhile, the general public is woefully unaware of the fact that vitamin B12, folic acid, vitamin C, curcumin (turmeric), quercetin, and many other nutrients and vitamins naturally prevent HPV and cervical cancer without a vaccine.

Gardasil . . . Here are just a few studies and facts about this vaccine. Like all vaccines one size does not fit all.

You can read the package inserts- there were no true controlled studies. The actual vaccine was tested against amorphous aluminium hydroxyphosphate sulfate, which can't be considered a true placebo as it is not just saline, but an adjuvant used in vaccines. How can

you measure side effects with any accuracy when you're injecting vaccine ingredients in both the control and the test groups?

“The outcome of most interest, prevention of cervical or other anogenital cancers, was not a reasonable endpoint for these trials. Trial size and duration would be unmanageable, since cancer is a rare outcome of persistent oncogenic HPV infection, and it usually takes more than a decade for cancers to develop fr

Award winning documentary on dangers of HPV vaccine.

In March 2018, a three-part documentary called “Sacrificial Virgins” was **honored with two awards** at Brisbane, Australia's Watchdog Film Festival – one for the being the festival's best film and the other in recognition of its investigation “in search of truth and justice.” In short, writer, director and filmmaker Joan Shenton released this documentary in order to shed much-needed light on the growing global concerns around popular HPV vaccines' safety: Gardasil and Cervarix.

Link to study confirming rise in cervical cancer of targeted vaccinated age group.

RE: DECLARATION OF OPPOSITION TO HAWAII ADMINISTRATIVE RULES CHANGES TO TITLE 11, CHAPTER 157, "EXAMINATION AND IMMUNIZATION."

State of Hawaii
Department of Health, Disease Outbreak Control Division (DOCD),
1250 Punchbowl Street, Room 443, Honolulu, Hawaii 96813
Service by e-mail at: immunization@doh.hawaii.gov

Dear DOH Official(s):

I, LEONARD G. HOROWITZ, the Declarant, under pain of perjury of law, do hereby state and declare as follows:

- 1) I am an individual over the age of twenty-one (21) years, a former resident of Hawaii, current residing in the State of Nevada.
- 2) I represent myself here as an expert in public health, emerging diseases, cancer virology, vaccinology, medical history, and health science intelligence research and analysis.
- 3) I verify that the facts set forth in the attached manuscript titled, "New Evidence from Government Records Vets Fraud Tainting Vaccine Mandates, Two Nobel Prizes, and Three Virus "Discoveries," are true and correct to the best of my knowledge, and that the exhibits contained therein are true and correct copies of the originals in my possession.
- 4) I further declare that I am competent to testify as to the truth of the statements contained herein, and in the attached manuscript.
- 5) This sworn Declaration by e-filing serves you with Constructive Notice the neglect of which violates local and federal laws, your official duties, and places you at risk of liability and prosecution for torts and felonies detailed in the attachment, including but not limited to criminally negligent manslaughter.

FURTHER DECLARANT SAYETH NAUGHT

DATED: [REDACTED]

/s/ Leonard G. Horowitz

New Evidence from Government Records Vets Fraud Tainting Vaccine Mandates, Two Nobel Prizes, and Three Virus "Discoveries"

by

Leonard G. Horowitz, DMD, MA, MPH, DNM (hon.), DMM (hon.)

Summary

New laws mandating viral vaccines for school children prompted this review of government records pursuant to the 2008 Nobel Prizes in Medicine given two researchers for their "discoveries" of two "novel" "sexually-transmitted" viruses reported to "cause" AIDS and cervical cancers. Both diseases emerged clinically during the mid-to-late 1970s at the same time herpes was exploding. These viruses, HIV/AIDS and HPV, the cervical cancer microbe, along with the sexually-transmitted hepatitis B virus ("HBV") also exploded simultaneously prompting dramatic changes in society and healthcare leading to current efforts to mandate vaccinations for school children for HPV, polio, hepatitis viruses, and more. New evidence of scientific fraud and fraudulent concealment of risks evidenced by government records, however, challenge these Nobel "discoveries," public health measures, vaccination mandates, and controvert false claims of safety tainting vaccines in general. New compelling, neglected, and concealed evidence from government-recorded lab virus experiments identifies a bio-medical virus-production racket influencing the media and sex industry that raises serious questions regarding the "General Acceptance" of vaccines as trustworthy. This paper critically examines this medical intelligence and serves constructive notice to officials pursuant to facts and evidence required for their dutiful administration of health policies to avoid liabilities and damage to citizens.

Background

In October 2018, this author, who has written extensively about government involvements in the vaccine industry, was asked to testify before the Hawaii Department of Public Health regarding [changes](#) to vaccination laws affecting school children and enrollments that includes a new "List of Required Vaccinations." Added therein for "required" "Kindergarten – 12th Grade Attendance" was the Hepatitis A and B vaccines and HPV vaccine. The later two are widely known to be "sexually transmitted diseases" not risking the lives of young children. A quick review of the package insert for Gardasil, (1) the HPV vaccine made by Merck, showed the mixing-up of two control groups, one receiving saline and the other amorphous aluminum hydroxyphosphate sulfate ("AAHS") adjuvant. The AAHS "can have a profound influence on the magnitude and quality of the immune response to HPV vaccine." (2) Combining the two control groups confounded the true assessment of risk. These two substantial discrepancies prompted this author to conduct the following retrospective study of HPV and its vaccine now on the government's mandatory list for "[vaccine preventable diseases](#)."

According to U.S. Government records published during the 1970s, the National Institutes of Health ("NIH") and National Cancer Institute ("NCI") assembled an international coalition to study cancer viruses for vaccine developments during the 1960s. The unprecedented collaboration was titled the Special Virus Cancer Program ("SVCP"). (3) This comprehensive international research group sought "candidate viruses" that "caused" cancers amendable to "preventative vaccines." This effort predated President Nixon's "War on Cancer" by a decade.

In 2008, the [Nobel Prize in Medicine](#) went to German virologist, Harald zur Hausen, for reportedly "discovering" the "*cause* of cervical cancer" in 1976--the "oncogenic human papilloma virus." (4) That "discovery" was made during the time the SVCP was administered by the NCI. So a review of its science pursuant to the emergence of HPV was reasonable. In 1983, zur Hausen reportedly "isolated" the new "tumorigenic HPV16 and 18 strains." The following year, In 1984, zur Hausen is reported to have "cloned HPV16 and 18 from patients with cervical cancer. These HPV types were found in about 70% of cervical cancer biopsies throughout the world," according to the press release issued by the Karolinska Institute--home to the esteemed Nobel Prize Committee. (4)

Public relations press officers for the KI and Nobel judges claimed zur Hausen's "discovery" and "theory" of cancer causation by a single "tumorigenic agent" flew in the face of "dogma." (4) Previously, the SVCP-NCI coalition held that "co-factors" for "co-carcinogenesis" involved multiple "risk factors." At the time, there was "General Acceptance" in science that this co-factor model was accurate. During the 1960s and 70s, there was General Acceptance that cancers were caused by myriad factors such as stress, risky lifestyles, biological and/or chemical agents, or their cumulative damage to human immunity resulting in cancers. This "immuno-suppression" model was the working premise of the SVCP and NCI's efforts. Chemicals, environmental factors including radiation, and biological agents such as viruses were known to cause genetic damage prompting cancers. Cells mutated forming tumors and malignancies from the overwhelming assaults to DNA/RNA and cell repair.

That was the "dogma" in medicine and science before zur Hausen postulated that there were certain types of *herpes viruses* that "caused" malignancies. (5) These DNA viruses, KI officials reported, "could exist in a non-productive state in the tumours." Zur Hausen's "specific searches for viral DNA" sourced his "discovery" that "led to characterization of the natural history of HPV infection, an understanding of mechanisms of HPV-induced carcinogenesis and the development of prophylactic vaccines against HPV acquisition." (4)

Simultaneously, Françoise Barré-Sinoussi and Luc Montagnier were likewise credited for having "discovered" the single "cause of AIDS--the human immunodeficiency virus ("HIV"). Virus production, the KI press reported, "was identified in lymphocytes from patients with enlarged lymph nodes in early stages of acquired immunodeficiency, and in blood from patients with late stage disease." (4) The KI's press release added, "They characterized this retrovirus as the first known human lentivirus [i.e., slow acting virus] based on its morphological, biochemical and immunological properties. HIV impaired the immune system because of massive virus replication and cell damage to lymphocytes. The discovery was one prerequisite for the current understanding of the biology of the disease and its antiretroviral treatment." (4)

KI's promotions neglected, however, this institute's important role in advancing these "discoveries" more than a decade earlier as a collaborator in the SVCP. It also neglected the reasons the Nobel awards committee [rejected Dr. Robert Gallo's](#) nomination. It had come to public knowledge that Montagnier, collaborating with Gallo in the SVCP, was defrauded by Gallo who had renamed the "French virus" "a couple of times," wrote one of Gallo's colleagues. (5) Apparently, Gallo acted to fraudulently conceal his use of Montagnier's virus to justify Gallo's claim of having discovered the AIDS virus before Montagnier.

Solid evidence has emerged since then from the Supreme Court's ruling on the "Daubert standard" concerning the trustworthiness of so-called "experts," and society's "General Acceptance" of science that is often untrustworthy. "General Acceptance" has evolved as a legal "term of art" that holds special meaning in this review. According to the "Daubert standard" established by the U.S. Supreme Court in *Daubert v. Merrell Dow Pharmaceuticals, Inc.*, 509 U.S. 579 (1993), previously-concealed facts are admissible as evidence against the General Acceptance standard.

SVCP records (3) evidence officials at the esteemed Nobel Prize committee's Karolinska Institute ("KI") in Sweden did fraudulently conceal their own agency's conflicting interests in zur Hausen's award. At the same time, the KI promoted and commercialized their cancer enterprise's investments in "single cause etiology virology," neglecting their own past efforts in early gene cloning, virus mutation experiments, pioneering lab technologies, vaccine research and developments, and subscription to the multi-factorial model of cancer.

In addition, the telling government records from the 1970s shown below detail the KI's involvements with the National Cancer Institute ("NCI") in recombining strains of DNA herpesvirus with strains of RNA tumor viruses isolated from patients worldwide with malignancies. The SVCP collaborators "transformed" benign or "latent" herpes viruses into model cancer triggers. These studies were well-justified in science's search for the causes and cures for cancer. (3)

But it is unreasonable and irresponsible that the General Acceptance in medicine, science, and society, heavily influenced by KI's esteemed Nobel Prize Committee, would be deprived of honest information affecting public health, consumer safety, and informed choice-making under these potentially catastrophic circumstances risking world health. Such silence imposed upon intelligence for concealed commercial interests begs redress. Science is presumed to be honest. The medical-legal community holds dishonesty as actionable and such fraudulent concealment or silence as obstructive to justice. The sequestering of the SVCP Progress Reports (3) is akin to "evidence tampering" in law. Denying due process in medical discovery risking and impacting millions of lives is arguably treasonous and genocidal.

These wrongdoings and "impressions of impropriety" are compounded by superficial dismissals of SVCP's questionable methods, materials, and outcomes.(6) The United States General Accounting Office ("USGAO") did this in an alleged "whitewashing" of this subject in 2002.(6) Rather than thank honorable colleagues, citizens and politicians who bravely encourage transparency, discovery, and open debate over these matters of vaccine safety and the cancer industry, the suspects have discouraged such dialogue. Vaccine industrialists argue in favor of censorship, and produce diversionary propaganda, in light of the risk to public confidence in the vaccine industry and corporate profits. (7)(8) Vaccine advocates argue open dialogue will undermine compliance with increasingly "mandated" vaccinations, and place the general population at risk. General Acceptance of vaccination policies is largely based on these dangerous positions evading critical facts. (7-9)

Equally troubling, to sustain the silence and combat opponents, certain vaccine industrialists have commissioned public relations firms, social media "trolls," and Internet "pseudo skeptics" to issue propaganda to protect the global enterprise. Like protection racketeers, these propagandists smear whistleblowers and authors who raise such debate. (10)(11)

The following facts evidence the seriousness of the science being concealed, following this author's 2001 report in *Medical Hypotheses*.(12) This new evidence from old records begs for scientific scrutiny and public discourse. These findings of facts show powerful conflicting interests have imposed the General Acceptance upon which government officials choose to act in advancing mandatory vaccinations. (13) A multinational corporate conspiracy to defraud the public and fraudulently conceal the laboratory creation of cancer-linked viruses HPV, HBV, and HIV is vetted by the public records examined below. (14) The impact on policy makers and the public gaining this medical-legal intelligence is considerable.

FACTS

1. Shown below are photocopies from the 1971 and 1972 SVCP, Progress Reports 8 and 9. These government records prove the program's initiation in 1962, the year Sarah Stewart and Bernice Eddy discovered the "SE [Stewart Eddy] polyoma virus" that was contaminating the Merck drug company's polio vaccines found associated with cancers.(3) These SVCP documents were published exclusively for internal review by collaborators in this program governed by the U.S. Department of Health, Education, and Welfare, Public Health Service, National Institutes of Health, Division of Cancer Cause and Prevention, National Cancer Institute. (14) These documents were rarely found in medical libraries prior to this author's publication in 1996 of

Emerging Viruses: AIDS & Ebola--Nature, Accident or Intentional? wherein related documents are reprinted and analyzed. (15)

2. Page 410 of the SVCP-NCI Record #9 identifies the KI, below Johns Hopkins University (America's leading hepatitis B research enterprise). Above the KI listing is "Life Sciences, Inc"-- a private company that no longer exists after changing its name to Life Sciences Advanced Technologies, Inc. The "[Life Sciences Industry](#)" is the premier drug and vaccine (i.e., pharmaceutical and biotechnology) enterprise commonly called "Big Pharma." The Life Sciences company began in 1962. As stated above, this date coincides with the year the SVCP-NCI program began, immediately following the discovery of SE polyoma virus, renamed by Merck Drug Company's chief vaccine developer, Dr. Maurice Hilleman, the "SV40" virus.

There is General Acceptance today that SV40 contaminated the early polio vaccines and spread cancers worldwide.(3) From 1962 forward, Life Sciences evolved to become Big Pharma's leading provider of molecular biology products and services as proven by the screenshot below. It is also known that the Life Sciences Building at Los Alamos Laboratory is where Dr. Gerald Myers et. al. published his "Big Bang" theory of HIV/AIDS's emergence in the "early 1970s", based on the use of "genomic sequencing" products and services provided by this company. (15)

3. Shown below is Dr. Gerald Myers's "Big Bang Theory" of HIV/AIDS's emergence in the "early 1970s."(15) "The 'Patient Zero' theory smearing the gay community was determined to be false, largely due to Myers's discoveries. The alleged "hoax" of Randy Shiltz's "Patient Zero" diverted from the laboratory-origin vaccine-transmission theory corroborated by Myers's publications. Picked up by the mainstream press, the Patient Zero falsehood also diverted from Dr. Robert Gallo's NCI SVCP involvements that Gallo deceptively denied in 1996 at the XI International Conference on AIDS in Vancouver, WA. (The interchange between this author and Dr. Gallo is seen on the Internet [HERE](#). It has been viewed by more than 6 million concerned citizens).

Fig. 8.4. The Evolution of AIDS-like Viruses Based on Gene Typing and Molecular Epidemiology Theory as Presented By Dr. Gerald Myers

Chief of the special HIV Sequence Database AIDS Project at the Los Alamos National Laboratory, Myers stated "the preponderance of evidence still argues for an explosive event in the mid-1970s." Regarding the origin of AIDS, he insisted, HIV-1 evolved fairly recently from SIV_{agm}. SV40, the monkey virus Gallo and Bionetics researchers genetically altered in a series of steps and then cultured in human WBCs to alter its outer membrane characteristics, may have been a building block for HIV-2 and HIV-1. Additional evidence suggests that SIV_{agm} may have been man-made as well. Source: See chapter 6, and Myers, G, MacInnes K, and Myers L. "Phenogenetic Moments in the AIDS Epidemic," Chapter 12 in S. S. Morse, ed., *Emerging Viruses* (Oxford, Eng.: Oxford University Press, 1993).

4. The same year that zur Hausen first published his "discovery" of HPV, 1976, the first Gay Related Immunodeficiency Disease ("GRID") patient was "discovered" in New York City. (4) Curiously, those events also coincide with the 2-to-5 year "incubation period" for HIV to express itself in AIDS-related leukemia, lymphoma, and sarcoma lesions following system-wide immunosuppression. Accordingly, the first GRID/AIDS cases would have acquired their infections between 1971 and 1975. This too is consistent with Myers's determinations. (12)

5. Under "Major Findings" of the University of Pennsylvania's Wister group, the SVCP-NCI published in 1972 what was accomplished in 1971: "Rescue attempts have been initiated

employing human sarcomas and leukemias in a variety of combinations designed to activate latent viral genomes." (14)

6. The next SCVP-NCI Report #9 photocopy shown below, contains Johns Hopkins University's contract description. This, like the Hopkins "contact page" reprinted above, appears immediately above KI's contact page, and likewise, their contract description. The Hopkins' description states, "The contractor will compare antigens in cervical carcinoma cells with those induced in Hep[atitis-2 (B-type)] by Herpes simplex virus type I and II." From this it is clear that the Hopkins group triggered hepatitis B infections using Herpes simplex viruses. Then they compared these viral antigens from Herpes type I and II with the antigens found in cervical cancers.

7. The hepatitis B vaccine theory on HIV/AIDS's emergence, precisely as Myers's lab showed exploding in North America and Africa in the "early 1970s," derives from documented studies on gay men in NYC and central African sex workers, conducted between 1972-1974 by the Merck Drug Company--the maker of both the hepatitis B vaccine and the HPV vaccine (i.e., Gardasil) (12)

8. The National Institutes of Health Contract 71-2059 to Merck and Company, Inc. (shown below from Report #8) is titled "Study of Viruses in Human and Animal Neoplasia (i.e., cancer). Directed by Dr. Maurice R. Hilleman, and Robert Gallo's bosses at the NCI, Robert Manaker and Jack Gruber, the Objectives included developing "vaccines or other agents effective for the prophylaxis and therapy of human neoplasia of suspected viral etiology." In that contract, it states: "At the present time, investigations will be focused upon herpes-type (DNA) viruses and "B" and "C" type (RNA) particles. Parallel studies to evolve live attenuated and killed viral vaccines in appropriate animal model systems will be conducted." (14)

Merck and Company, Inc. (NIH-71-2059)

Title: Study of Viruses in Human and Animal Neoplasia.

Contractor's Project Director: Dr. Maurice R. Hilleman

Project Officers (NCI): Dr. Robert A. Manaker
Dr. Jack Gruber

Objectives: To perform investigations designed to develop vaccines or other agents effective for the prophylaxis and therapy of human neoplasia of suspected viral etiology.

Major Findings: This is a new contract.

Significance to Biomedical Research and the Program of the Institute:
Current data support the concept that a virus or viruses are the essential element in most animal tumors studied and that viruses are probably the necessary etiological component in human neoplasia, though expression may be greatly influenced and modified by host and environmental factors. If viruses are the essential element in human cancer, then prophylaxis by vaccines to prevent or minimize infection should provide a rational approach to cancer prevention. This could be accomplished by utilization of live or killed virus vaccines or possibly by vaccines of purified virion subunits.

Vaccines would obviously provide their greatest benefit in preventing infection with oncogenic viruses transmitted horizontally after birth. However, even the possible vertical transmission of hypothetical neoplastic agents does not rule out a potential benefit from vaccines. Nononcogenic viruses may function as essential cofactors in expression of neoplasia, and immunity against such secondary agents might prevent expression of the neoplastic state. Additionally, antibody or cellular immunity may be enhanced by vaccination with homologous virus in virus-dependent cancer. Obviously this research investigation is of fundamental importance to the goals of SVCP and can make unique contributions to the total program.

Proposed Course: The investigators will devote initial efforts to developing methods for propagation, purification, concentration and specific quantitation of candidate viruses suspected or shown to cause cancer in man. At the present time, investigations will be focused upon herpes-type (DNA) viruses and "B" and "C" type (RNA) particles. Parallel studies to evolve live attenuated and killed virus vaccines in appropriate animal model systems will be conducted. Particular attention will be given to developing and applying optimal methods for viral attenuation, viral inactivation, viral quantitation, vaccine safety assessment, and vaccine potency assay.

Date Contract Initiated: March 1, 1971

9. Furthermore, the SVCP contract NIH-71-2025 (from 1971 Report #8) shows Project Officer Dr. Robert Gallo officiating for the NCI. His collaborators explained their Objective of "Evaluation of long-term oncogenic effects of human and animal viral inocula in primates of various species. . . " Progress was reported on "An RNA-dependent DNA polymerase [reverse-transcriptase enzyme that characterizes HIV/AIDS and other "lentiviruses"] similar to that associated with RNA tumor viruses." Gallo's associates detected these enzymes "in human leukemic cells but not in normal cells. . . . The [reverse transcriptase] enzyme was isolated, purified and concentrated 200-fold, making possible its further characterization and study in relation to the leukemic process in man." (14)

Mind you, this was published in 1971, in Project Report #8. Accordingly, this research was done in 1970. And by 1972, vaccines to presumably prevent the AIDS-like viruses were tested in humans. This date corresponds perfectly with the 1972-74 hepatitis b vaccine trials conducted on the gay men in NYC as discussed below. (3) It also corresponds perfectly with Myers's "Big Bang in the early 1970s" implicating vaccine vectors. (12)(15)

BIONETICS RESEARCH LABORATORIES, INC. (NIH-71-2025)

Title: Investigations of Viral Carcinogenesis in Primates

Contractor's Project Directors: Dr. John Landon
Dr. David Valerio
Dr. Robert Ting

Project Officers (NCI): Dr. Roy Kinard
Dr. Jack Gruber
Dr. Robert Gallo

Objectives: (1) Evaluation of long-term oncogenic effects of human and animal viral inocula in primates of various species, especially newborn macaques; (2) maintenance of monkey breeding colonies and laboratories necessary for inoculation, care and monitoring of monkeys; and (3) biochemical studies of transfer RNA under conditions of neoplastic transformation and studies on the significance of RNA-dependent DNA polymerase in human leukemic tissues.

Major Findings: This contractor continues to produce over 300 excellent newborn monkeys per year. This is made possible by diligent attention to reproductive physiological states of female and male breeders. Semen evaluation, artificial insemination, vaginal cytology and ovulatory drugs are used or tried as needed.

Inoculated and control infants are hand-fed and kept in modified germ-free isolators. They are removed from isolators at about 8 weeks of age and placed in filtered air cages for months or years of observation. The holding area now contains approximately 1200 animals up to 5 years old. Approximately 300 are culled every year at a rate of about 25 per month. This is necessary to make room for young animals inoculated with new or improved virus preparations.

During the past year macaques were inoculated at birth or in utero with the Mason-Pfizer monkey mammary virus, Epstein-Barr virus, Herpesvirus saimiri, and Marek's disease virus. EB virus was given with immunostimulation and immunosuppression (ALS, prednisone, imuran). Australia antigen was given to newborn African green monkeys.

The breeding and holding colonies were surveyed for antibody to EBV. All breeders were positive and their offspring contain maternal antibody for several months. Colony-born offspring that have lost maternal antibody and are sero-negative will be surveyed periodically for conversion to the EB positive state.

An RNA-dependent DNA polymerase similar to that associated with RNA tumor viruses was detected in human leukemic cells but not in normal cells stimulated by phytohemagglutinin. The enzyme was isolated, purified and concentrated 200-fold, making possible its further characterization and study in relation to the leukemic process in man.

Significance to Biomedical Research and to the Program of the Institute:
Inasmuch as tests for the biological activity of candidate human viruses will not be tested in the human species, it is imperative that another system be developed for these determinations and, subsequently for the evaluation of vaccines or other measures of control. The close phylogenetic relationship of the lower primates to man justifies utilization of these animals for these purposes. Further study of altered transfer RNA and polymerase enzymes would determine their significance in neoplastic change and provide a basis for selection of therapeutic agents.

Proposed Course: Continuation with increased emphasis on monitoring and intensive care of inoculated animals to determine if active infection occurs, effects of infection, and degree of immunosuppression when used. Further studies of human neoplasms at a molecular level will continue.

10. Complicating matters is the 1969 Department of Defense Appropriations for 1970, Hearings Before a Subcommittee of the Committee on Appropriations House of Representatives, Ninety-First Congress, Part 5, Research, Development, Test and Evaluation, Dept of the Army. Tuesday, July 1, 1969, pg. 79, Washington: U.S. Government Printing Office record that states under the caption "SYNTHETIC BIOLOGICAL AGENTS":

Within the next 5 to 10 years, it would probably be possible to make a new infective microorganism which could differ in certain important aspects from any known disease-causing organism.s. Most important of these is that it might be refractory to the immunological and therapeutic processes upon which we depend to maintain our relative freedom from infectious disease. A research program to explore the feasibility of this could be completed in approximately 5 years at a total cost of \$10 million. (7) [i.e., \$2 million per year over 5 years.] (15)

11. The SVCP was administered by the Litton Bionetics company on behalf of the NCI and Life Sciences industry. (12)(15) This group was overseen by NCI Project Officer Robert Gallo during the early 1970s. During those years, Litton was contracted (under NIH 69-2060) to administer "Support Services for the Special Virus Cancer Program") Under that contract, Litton supplied the experimental viruses, monkeys, chimpanzees and vaccine reagents to SVCP collaborators, including the Merck Drug Company under Merck's contract (NIH 71-2059, titled "Oncogenic Research and Vaccine Development." (Copies of these contracts are downloadable by clicking: [Litton Bionetics and Merck Drug Co SVCP Contracts in 1971](#)). (14)

12. Litton received in the neighborhood of \$2 million per year over "5 years at a total cost of \$10 million" beginning in 1969, the year U.S. Government appropriations for "SYNTHETIC BIOLOGICAL AGENTS" descriptively and functionally identical to HIV/AIDS were authorized by Congress. The screenshot below excerpted from the *Congressional Record*, correlates with the express provisions described in Litton contracts. (See: Project Reports 8 and 9.)

SYNTHETIC BIOLOGICAL AGENTS

There are two things about the biological agent field I would like to mention. One is the possibility of technological surprise. Molecular biology is a field that is advancing very rapidly and eminent biologists believe that within a period of 5 to 10 years it would be possible to produce a synthetic biological agent, an agent that does not naturally exist and for which no natural immunity could have been acquired.

The dramatic progress being made in the field of molecular biology led us to investigate the relevance of this field of science to biological warfare. A small group of experts considered this matter and provided the following observations:

1. All biological agents up to the present time are representatives of naturally occurring disease, and are thus known by scientists throughout the world. They are easily available to qualified scientists for research, either for offensive or defensive purposes.

2. Within the next 5 to 10 years, it would probably be possible to make a new infective microorganism which could differ in certain important aspects from any known disease-causing organisms. Most important of these is that it might be refractory to the immunological and therapeutic processes upon which we depend to maintain our relative freedom from infectious disease.

3. A research program to explore the feasibility of this could be completed in approximately 5 years at a total cost of \$10 million.

4. It would be very difficult to establish such a program. Molecular biology is a relatively new science. There are not many highly competent scientists in the field, almost all are in university laboratories, and they are generally adequately supported from sources other than DOD. However, it was considered possible to initiate an adequate program through the National Academy of Sciences-National Research Council (NAS-NRC).

Hearings Before a Subcommittee of the Committee on Appropriations House of Representatives, Ninety-First Congress, Part 5 Research, Development, Test, and Evaluation, Dept. of the Army. Tuesday, July 1, 1969, page 79. Washington: U.S. Government Printing Office, 1969.

Standards of Review

A. "General Acceptance" of "Vaccine Preventable Disease," Safety & Efficacy Concerns

In the case of *Daubert v. Merrell Dow Pharmaceuticals, Inc.*, 509 US 579 (1993) the Supreme Court ruled that "'General acceptance' is not a necessary precondition to the admissibility of

scientific evidence under the Federal Rules of Evidence," (13) Furthermore, "Pertinent evidence based on scientifically valid principles will satisfy those demands." This decision, directed by the Court that was challenged by the defendant's falsification of evidence, encouraged judges, like members of the public and scientific community, to consider scientific intelligence "not generally-accepted." The Supreme Court made this decision based on determining that "reliable" scientific publications were not "reliable" due to their tainting by commercial interests.

B. Silence and Sequestering Science Presents a Pattern of "Most Persuasive" Evidence

The Supreme Court also ruled in the case of *United States ex rel. Bilokumsky v. Tod*, 263 US 149, 154 - Supreme Court 1923 that "Conduct which forms a basis for inference is evidence. [And s]ilence is often evidence of the most persuasive character." This is applicable to the "silence" of health officials and vaccine administrators regarding the risks, and the media's similar silence and censorship regarding risks of vaccine injuries, including autism and cancers commonly associated with herpes-type cancer virus contaminations in vaccinations, including herpes-B, simian cytomegalo virus, and the Epstein-Barr virus ("EBV") linked to cancers, including leukemias and lymphomas commonly produced by Gallo et. al. at Litton Bionetics during the SVCP between 1969 and 1973 as the above contract proves.

C. Criminally negligent manslaughter and assault with a deadly immunization practice

Under New York law, [PEN § 125.10](#) "A person is guilty of criminally negligent homicide when, with criminal negligence, he causes the death of another person. Criminally negligent homicide is a class E felony." Unlike Hawaii, any "vehicle" in New York, including a syringe, satisfies the element.

With respect to mandating vaccinations knowing harm often results, under [HI Rev Stat § 707-710 \(2013\)](#) (1) A person commits the offense of assault in the first degree if the person intentionally or knowingly causes serious bodily injury to another person. (2) Assault in the first degree is a class B felony. [L 1972, c 9, pt of §1; ree L 1986, c 314, §51; gen ch 1993]

In Hawaii, "negligence" is defined by Hawaii HRS §702-206(4). The actor should be aware of a "substantial and unjustifiable risk" with respect to the actor's conduct, the attendant circumstances, and the result of the actor's conduct. The actor's failure to perceive the risk must constitute a "gross deviation" from the standard of care that a law-abiding person would observe in the same situation. (See §702-206(4).) The offense is a class C felony. Negligence is indicated here, given knowledge that official justifications for administering risky vaccines are flawed and proven false by the aforementioned facts as further discussed below.

D. Fraud and Fraudulent Concealment in Virology and Vaccinology

Under Hawaii case law, the elements of *fraud* include: "(1) false representations were made by defendants, (2) with knowledge of their falsity (or without knowledge of their truth or falsity), (3) in contemplation of plaintiff's reliance upon these false representations, and (4) plaintiff did rely upon them." [Shoppe v. Gucci America, Inc.](#), 14 P. 3d 1049 – Haw: Supreme Court 2000.

And **fraudulent concealment** has been defined as “employment of artifice, planned to prevent inquiry or escape investigation, and misled or hinder acquirement of information disclosing a right of action. The acts relied on must be of an affirmative character and **fraudulent.**” [Lemson v. General Motors Corp., 66 Mich. App. 94, 97, 238 N.W.2d 414, 415 \(1975\)](#) quoting [De Haan v. Winter, 258 Mich. 293, 296, 241 N.W. 923, 924 \(1932\)](#). See also: *Au v. Au*, 626 P. 2d 173 – Haw: Supreme Court 1981.

E. Relevant federal standards

Title 18, U.S.C., § 241-Conspiracy Against Rights. “If two or more persons conspire to injure, oppress, threaten, or intimidate any person in any State, Territory, Commonwealth, Possession, or District in the free exercise or enjoyment of any right or privilege secured to him by the Constitution or laws of the United States, or because of his having so exercised the same they shall be fined under this title or imprisoned not more than ten years, or both.”

Title 18 USC § 1349 - Attempt and conspiracy. “Any person who attempts or conspires to commit any offense under this chapter shall be subject to the same penalties as those prescribed for the offense, the commission of which was the object of the attempt or conspiracy.”

Title 18 USC § 4 - Misprision of felony. “Whoever, having knowledge of the actual commission of a felony cognizable by a court of the United States, conceals and does not as soon as possible make known the same to some judge or other person in civil or military authority under the United States, shall be fined under this title or imprisoned not more than three years, or both.”

Title 18 Part I Chapter 96 § 1961 - “racketeering activity” means "(A) any act or threat involving . . . bribery [and/or] extortion, . . . or dealing in a controlled substance or listed chemical (as defined in section 102 of the Controlled Substances Act), which is chargeable under State law and punishable by imprisonment for more than one year; (B) any act which is indictable under any of the [many] provisions of title 18, United States Code. . . "

Discussion

It has come to the public's attention through respected science journals that the field of medicine has been substantially damaged by fraud committed by special interest groups benefiting "Big Pharma" or the "Life Sciences" industry. "(11)(

"Something has gone fundamentally wrong with one of our greatest human creations, "wrote Richard Horton, the editor of the esteemed *Lancet* wrote in 2015. (16) "The case against science is straightforward: much of the scientific literature, perhaps half, may simply be untrue. Afflicted by studies with small sample sizes, tiny effects, invalid exploratory analyses, and flagrant conflicts of interest, together with an obsession for pursuing fashionable trends of dubious importance, science has taken a turn towards darkness. As one participant put it, “poor methods get results”. The Academy of Medical Sciences, Medical Research Council, and Biotechnology and Biological Sciences Research Council have now put their reputational weight behind an investigation into these questionable research practices. The apparent endemicity of bad research

behaviour is alarming. In their quest for telling a compelling story, scientists too often sculpt data to fit their preferred theory of the world. . . ."

CONTRACTOR : Wistar Institute of Anatomy and Biology (71-2092)
ADDRESS : 36th Street at Spruce, Philadelphia, Pennsylvania 19104
PHONE : AC-215, Phone 222-6700, x-226
CNTRCT TITLE: Extraction and Characterization of Virus-Induced Transplantation
Antigen From Sarcomas and Leukemia
DATES : 2/1/72 - 1/31/73
PRINC INVEST: Dr. Anthony Girardi
PROJ OFFICER: Dr. James T. Duff, Bldg. 37, Room 1B22, x-65967

SEGMENT : Solid Tumor-Virus
SEG CHAIRMAN: Dr. Robert Huebner, Bldg. 37, Room 2D24, x-63301
CNTRCT SPEC : Mr. Thomas Porter, Bldg. 37, Room 1A03, x-65025

Dr. Horton concluded his heroic editorial stating, "The bad news is that nobody is ready to take the first step to clean up the system."

The aforementioned facts corroborate Dr. Horton's indictment of science and the forces undermining its legitimacy.

This author shares the honorable *Lancet* editor's sentiments, but disagrees with his conclusion. As this paper proves, there are many of us in science and medicine who have taken "the first step" only to be smeared and ostracized by the same enterprise mostly responsible for the fraud in science--the Life Sciences industry. (8, 11) I took that "first step" in 1996 with the publication of *Emerging Viruses: AIDS & Ebola--Nature, Accident or Intentional?* (15) Subsequently, I added a peer-reviewed scientific summary in *Medical Hypothesis* bravely financed and administered by the late unjustly smeared editor, David Horroban. (11) It is that "unclean system" that imposes illegitimacy in science along with "General Acceptance" of its falsehoods. (13) Abuse of the media, including "peer reviewed" publications by propagandists, incorporates the most well-studied science of all--behavioral science. This social engineering of General Acceptance imposes deadly consequences. In this instance, "mandatory vaccinations" foreshadows side-effects from the vaccines for HPV, hepatitis, polio, and other GMO-laced injections. This poisons bloodstreams, damaging brains, and induces cancers according to empirical evidence witnessed worldwide. In the United States, for instance, an explosion of need for special educators now burdens the economy attributable to skyrocketing rates of autism among mercury-poisoning victims. All while health officials excuse the association as "unproven" and "debunked" "conspiracy theory." (17)

A. The Facts Controvert Earlier AIDS-Origin Theories: HIV, HPV and HBV are Lab Viruses Engineered for Vaccine Research and Developments According to the NCI and NIH's Neglected SVCP Records

Confusion over Koprowsky's and the Wistar Institute's alleged role in the AIDS outbreak exemplifies the problem with earlier AIDS-origin theories. Koprowsky was falsely accused by *Rolling Stone* magazine for causing the AIDS outbreak. That indictment was later retracted. But

the scandal rocked medicine. It indicted the Salk vaccine's transmission of SV40 cancer virus and polio.

Sabin's OPV was also confirmed to have spread SV40-related cancers. These transmissions occurred during the 1950s during Koprowsky's watch.(3) That evidence, compounded here, corroborates Bernice Eddy's warning that pandemic cancers would certainly come following SV40's widespread transmission through Merck's tainted polio vaccines produced by both Salk and Sabin.

Accordingly, author Edward Hooper was not far off the mark in *The River: A Journey to the Source of HIV and AIDS*. He conjectured that the Wistar Institute's research had contaminated Albert Sabin's oral polio vaccine ("OPV") carrying chimpanzee simian immunodeficiency virus ("SIVcpz") that is the closest relative to HIV in the primate world. But Hooper's critics, many "pseudo-skeptics" paid to protect the status quo by muddling media, promptly "debunked" Hooper's claimed association after confirming that "monkey cells—not chimpanzee cells" were used by Koprowsky.(9) The "smoking gun"--the *chimpanzee* vector--in the origin of HIV/IDS mystery was still missing. It is no longer. It is vetted below.

The facts seriously implicate the Litton/SVCP cohort for the 1976 clinical emergence of GRID/AIDS ("HIV"), the contemporaneous creation of the liver cancer virus hepatitis B ("HBV"), and the cervical cancer virus--human papilloma virus ("HPV"). These strains and types of viruses were commonly mutated and tested by the Litton/SVCP NCI-NIH contractors years before their announced discoveries by men who concealed their knowledge of these most substantive facts.

This widespread neglect of Litton's actions, like this author's publications, (3; 8) evidences a vaccine racket and reckless concealment of medical history. The press today, biased by conflicting interests more than ever, has obscured the General acceptance among cancer virologists that vaccines have been vectors for communicable diseases. But this doesn't sell vaccines, advertising space *WIRED*, or inspire public confidence.

Dr. zur Hausen too, like Koprowsky, worked at the Wistar Institute in Philadelphia. Wistar, along with the Karolinska Institute, is equally suspect as SVCP collaborators, as is Montagnier's 1970s work in collaboration with Dr. Robert Gallo. These historic associations are grounds for reconsidering these researchers' 1980s "discoveries."

Otherwise, It is unreasonable to neglect or excuse Montagnier's and Gallo's aversion to discussing their roles in the SVCP. To date there is only *silence* and *censorship* concerning the high probability that the "French specimen" sourced, like Gallo's HTLVs, from Litton's SVCP-NCI-NIH Contract 71-2025. That contract, shown above, proves these researchers isolated "RNA-dependent DNA polymerase in human leukemic tissues" in the late 1960s or early 1970s. This predates by 13 years Montagnier's "discovery" of this kind of unique, never-before-seen, retrovirus enzyme. (You need the virus to extract its enzyme.) It is unreasonable to believe that no investigator in Litton's lab, allied with Gallo's group at the NCI, would not have isolated similar "lentiviruses"/retroviruses by 1972 as their contract proves they were commissioned to do.

During the past year macaques were inoculated at birth or in utero with the Mason-Pfizer monkey mammary virus, Epstein-Barr virus, Herpesvirus saimiri, and Marek's disease virus. EB virus was given with immunostimulation and immunosuppression (ALS, prednisone, imuran). Australia antigen was given to newborn African green monkeys.

Further evidencing Litton's and Gallo's important roles in the origin of HIV/AIDS from the first hepatitis B vaccine trials is the contracts shown above and below. NIH-71-2025, shown above, states, "Australia antigen was given to newborn African green monkeys. "Australia antigen" ("AuAg") reported in the SVCP publications was the ***first known agent causing hepatitis***. "*AuAg*" was later re-named "*hepatitis B virus*" and "*HBV*." 12)(14)(15) Shown here is Litton's official statement that corroborates Dr. Maurice Hilleman's recorded statement, "We [at Merck] brought in the African greens. We didn't know we were importing AIDS virus at the time." (7)

Litton Bionetics was certainly the supplier of these viruses to Merck and the other SVCP collaborators. Litton exported the test animals, especially monkeys and chimpanzees from their colonies overseas to Merck in New York under contract number NIH-69-2060 --- "Support Services for the Special Virus Cancer Program," as shown below.

This record also proves viral recombination studies using known cancer triggers, including "EBvirus with immunostimulation and immunosuppression" coupled with hepatitis B viral experiments; and in the same lab, the RNA-dependent DNA polymerase (i.e. "reverse-transcriptase AIDS-virus enzyme) was studied with retrovirus recombinations.

BIONETICS RESEARCH LABORATORIES (NIH-69-2160)

Title: Support Services for the Special Virus Cancer Program.

Contractor's Project Director: Dr. Robert C. Y. Ting

Project Officer (NCI): Dr. George Todaro

Objectives: To provide a laboratory that will collect, process and test specimens from human and animal sources suspected of containing virus associated antigens or antibodies, and to provide other virology, immunology or cell culture services as required.

Major Findings: Services and resources provided in close collaboration with NCI investigators during the past year include: (1) biochemical studies of cell growth regulation with Dr. Todaro; (2) attempts to isolate a human cancer virus with Dr. Bassin; (3) tests for EBV antigens for Dr. Levine; (4) immunological tests of leukemia patients, including studies of twins, for Dr. Levine; (5) CF tests for gs antigens for Dr. Hellman; (6) membrane antigen preparation from human tissue for Dr. Herberman; (7) collection of familial cancer sera and histories for Dr. Fraumeni; (8) tissue and serum bank for Dr. Levine et al; (9) American Burkitt registry and follow-up; and (10) data processing with Dr. Waggoner.

When abortively transformed cells containing SV40 genome were re-infected with SV40, they had a lower rate of transformation than cells without the genome; thus, the presence of SV40 did not confer immunity.

Fetal thymus cells of dogs were cocultivated with irradiated human sarcoma cells. The dog cells showed degeneration and transformation (chromosome analysis now being done).

Rhesus cell cultures infected with Mason-Pfizer virus showed evidence of transformation and caused regressing tumors when subsequently inoculated into newborn rhesus monkeys.

Cellular immunity studies of leukemia patients, using lymphocyte cytotoxicity and cytotoxicity inhibition tests, suggest that cells of such patients possess leukemia-associated antigens and that a widespread antigen system may be operative in human and animal tumors.

Significance to Biomedical Research and the Program of the Institute: This contract laboratory provides an opportunity for a systematic, large-scale effort to detect viruses and/or viral antigens in human tumor materials (particularly leukemias and sarcomas), using tissue culture, immunological, biochemical and EM techniques. This is a major objective of the SVCP.

Proposed Course: It is proposed that this contract will continue to supply the necessary supportive services required to meet the needs of the SVCP.

Date Contract Initiated: June 27, 1969

B. Litton Bionetics' Supply Contracts and the Outbreak of HIV, HBV and HPV

Constructive notice is given here to health officials, the scientific community, and corporate-controlled media, regarding the central role of Litton Bionetics's NCI-SVCP supply contracts, especially NIH-69-2160, in the outbreaks of HIV, HPV, and HBV (i.e., hepatitis B virus) and the ongoing risks of inducing cancers through vaccinations presumed "safe."

This author was the first to evidence Litton's *chimpanzees* were used to grow the viruses needed for the first hepatitis B vaccines manufactured by Merck and tested on homosexuals considered at high risk of hepatitis in NYC between 1972 and 1974. (12)(15) Additional groups targeted for this trial were native Americans, kidney dialysis patients, black women (presumably sex workers) in Central West Africa, and Willowbrook State School for the mentally ill on Staten Island in New York. (12)(15) Co-investigators represented the U.S. Army, the New York University Medical Center, and the New York Blood Bank. (12)(15) Financing this commercial enterprise were the real-parties-in-interest in the pharmaceutical and defense industries. Suspects above the rank of "principle investor" included blood-banking officials and leading stockholders in the companies profiting from vaccine manufacturing and blood-banking. Purcell's 1976 grant application shown above makes these facts known.

Most relevant to AIDS and its origin from Litton and SVCP labs, these studies predate by more than a decade the "detection" and "isolation" of the precise cancer complex *pathognomonic* for AIDS. (A *pathognomonic sign* is a particular sign whose presence means that a particular disease is present beyond any doubt.) This sign is also pathognomonic of AIDS's origin from Litton's lab and/or collaborating SVCP labs involved in the suspect hepatitis B vaccine trials. This cause-effect reasonable conclusion is based on the Litton group's contract statement that they isolated and used "viral antigens" from "human tumors" "particularly leukemias and sarcomas" the combination of which is pathognomonic for AIDS. And they did so by 1972, 10-years before Montagnier (and falsely Gallo too) "discovered" the AIDS virus.

Litton Bionetics's early 1970s contracts also show common studies done in cancer vaccineology and molecular biology with Herpes -type viruses. Extracting, cloning, and mutating genetic material from herpes viruses risked transmitting or cross-contaminating subjects involved in Litton and Litton's privies-in-interest's leukemia and sarcoma studies. The SVCP contractors received their supplies of these products from Litton under their contract (NIH-69-2160). Through such collaboration with zur Hausen and his colleagues in Philadelphia, and Montagnier's colleagues in France, it is most likely zur Hausen "discovered" another herpes-type DNA virus that had been mutated during the SVCP that zur Hausen simply named or re-named "HPV".

C. The Common Practice of Renaming Viruses Confusing Who Discovered What

It is public knowledge that SVCP investigators commonly named or renamed viruses for fame and fortune. For example, it is widely known in virology that Dr. Hilleman at Merck renamed the "Stewart-Eddy polyoma virus (SE-polyoma)" to "SV40". The two women discovered SE polyoma in Merck's polio vaccine in 1962. Then there was the Nobel-thirsty Gallo, snubbed by the KI's Nobel Prize committee for doing worse with Montagnier's "discovery."

There is "General Acceptance" that Montagnier supplied Gallo with HIV for Gallo's NCI studies. Serious doubts about this "story" are raised, however, by the aforementioned contractual evidence, including the dates of such viral trafficking. "It was the French virus that Gallo's lab used for their research," the corporate-controlled media alleged.(5) "Gallo's lab notes, obtained by the *Chicago Tribune*, show that the French virus was renamed a couple of times, apparently to hide the fact that it was being used. Gallo later claimed that the French virus didn't grow."(5) Given the general agreement of Gallo's untrustworthiness, it is unreasonable to believe he didn't falsify his lab notes and this entire story "obtained by the *Chicago Tribune*" that is infamous for fabricating stories.(5)

This reasonable objection follows not only the aforementioned contractual evidence, but also the objections raised by Robert Strecker, M.D., Ph.D., published in *Emerging Viruses: AIDS & Ebola--Nature, Accident or Intentional?* Strecker was interviewed by this author in 1996. He was the first American medical scholar who raised the lab virus AIDS-origin theory. Strecker stated that Montagnier, while working with Gallo at the NCI, discovered that "Epstein-Barr-infected T-cells will just churn out AIDS viruses day after day. . . ." Strecker explained this discovery was necessary to overcome Gallo's problem of producing enough HTLV- III viruses (HIVs) "to make enough antibody, " because as the *Chicago Tribute* story stated, "the French virus didn't grow." Regarding this scandal--the French-American AIDS fracas--Strecker opined, "That's all a lot of bull, because they both had the virus, and they both knew what they were doing from day one."

D. Bionetic's Little Known "Classified" History, Fraudulent Concealments, and Red Flags Urging Reconsideration of the SVCP's Origin of Sexually-transmitted Diseases

Major United States Army Biological Weapons Contractors for Fiscal Year 1969

Mr. Mahon. List for the record the major contractors and the sums allocated to them in this program in fiscal year 1969.
(The information follows:)

The following list contains the major contractors and amounts of each contract.

<i>Contractor</i>	<i>Fiscal year 1969</i>
Miami, University, of Coral Gables Fla.....	\$645, 000
Herner and Co., Bethesda, Md.....	518, 000
Missouri, University of, Columbia, Mo.....	250, 000
Chicago, University, of Chicago, Ill.....	216, 000
Aerojet-General Corp., Sacramento, Calif.....	210, 000
Bionetics Research Laboratories, Inc., Falls Church, Va.....	180, 000
West Virginia University, Morgantown, W. Va.....	177, 000
Maryland, University of, College Park, Md.....	170, 000
Dow Chemical Co., Midland, Mich.....	158, 000
Hazelton Laboratories, Inc., Falls Church, Reston, Va.....	145, 000
New York University Medical Center, New York, N.Y.....	142, 000
Midwest Research Institute, Kansas City, Mo.....	134, 000
Stanford University, Palo Alto, Calif.....	125, 000
Stanford Research Institute, Menlo Park, Calif.....	124, 000
Pfizer and Co., Inc., New York, N.Y.....	120, 000
Aldrich Chemical Co., Inc., Milwaukee, Wis.....	117, 000
Computer Usage Development Corp., Washington, D.C.....	110, 000
New England Nuclear Corp., Boston, Mass.....	104, 000

Source: Department of Defense Appropriations For 1970: Hearings Before A Subcommittee of the Committee on Appropriations House of Representatives, Ninety-first Congress, First Session, H.B. 15090, Part 5, Research, Development, Test and Evaluation of Biological Weapons, Dept. of the Army. U.S. Government Printing Office, Washington, D.C., 1969, p. 689.

As shown above, Litton Bionetics was the sixth leading biological weapons contractor in 1969. Robert Gallo served as the NCI's Project Officer overseeing Litton's contract, NIH-71-2025. Gallo also served in the SVCP as the Developmental Research Segment co-director. As mentioned, Litton Bionetics was the main cancer research supplier to the NCI and SVCP contractors. Litton supplied viruses including retroviruses, experimental reagents, and test animals including *chimpanzees*.(12)(15) The SVCP Progress Report #8 makes clear that Gallo's collaborators at Litton Bionetics colonized several species of monkeys, and supplied cancer researchers and vaccine developers worldwide new experimental viruses, and monkey cell lines. Life Science, Inc. supplied enzymes and other supplies needed for vaccine research too.

Litton Bionetics's contract followed closely the Stewart-Eddy 1962 discovery of cancers being spread through Merck's polio vaccines. Nearly a decade later, the NIH and NCI published Progress Report #8 that detailed Gallo's leadership in the 71-2025 contract that began that same year, in 1962. The 1971 contract, titled "Investigations of Viral Carcinogenesis in Primates," was

expanded in 1972 as the first hepatitis B vaccines were injected into the Willowbrook children and gay volunteers in New York. (See also SVCP Progress Report 9, p. 195).(1)

Litton clearly supplied the Merck Drug Company with mutated viruses for vaccine studies in their contract 71-2059. Litton also supplied Merck with the monkeys and chimpanzees used to culture strains of hepatitis B viruses used by Johns Hopkins researchers as well. Through Merck and the SVCP, Litton's investigators were supplying U.S. Army officials too, as well as the New York University Medical Center and Saul Krugman with experimental materials that were used in testing these agents on the mentally-retarded children. Litton's chimps were used to grow the new viruses for this testing, including the new "hep B vaccine" ("AuAg" Australian antigen) viruses as you can read above. The gay men victimized were largely living in Greenwich Village. Merck's advertisements used to attract homosexual volunteers can still be found online.(15)

All the above has been fraudulently concealed and/or recklessly neglected by willfully-blind officials and the complicit "fake news" media.

Genetic engineering at cooperating SVCP-NCI labs of viruses that were functionally identical to HIV and HPV a decade before their alleged discoveries provides adequate evidence for reasonable concern and reconsideration of this entire matter. Add to this evidence of reckless neglect the clinical emergence dates of these two diseases--HIV/AIDS and HPV cervical cancers both in 1976; the common sexually-transmitted disease connotation as with HBV also manufactured and tested at that time; the satisfied incubation period for HIV/AIDS--2-to-5-years between the very first hep B vaccine trials in 1972-74, and zur Hausen's collaboration with the Americans through Wistar and KI in the SVCP, (12)

Now add the red flag of corroborating evidence of Myers's genetic identification of different strains of HIV, Type A and Type E, emerging contemporaneously in Africa and NYC at the precise locations of the HB vaccine experiments. Add further the precise set of cancers studied, including the pathognomic leukemia-lymphoma-sarcoma lab-engineered disease complex synchronously emerging while cervical cancer's from HPV were reported emerging at the height of the herpes fright.

The KI's 1969 contract NIH-69-2005 was titled "Studies of The Significance of Herpes-Type Virus in The Etiology of Some Human Cancers." This SVCP Progress Report #9 covered the "4/9/71 - 4/8/73" period. The Segment Chairman was "Dr. Robert Manaker"--Robert Gallo's supervisor at the NCI. Manaker was key program manager as Chairman of the "Developmental Research Segment" of the SVCP that included several prominent names in developmental virology including Dr. Anthony Girardi and the University of Pennsylvania's Wistar Institute. (See p. 6, of the SVCP, Progress Report #9.) These proven associations tie the relatively small group of suspects together in what appears to be a cancer virology racket. This racketeering enterprise is equally suspect for administering fraudulent concealments for unjust enrichment. The SVCP-KI contract shown below convincingly documents and confirms the statements made by Strecker about the importance of "Montagnier's alleged discovery"--that EBV from Burkitt tumors added to T-lymphocytes will churn out antigens and viruses, such as we see with AIDS.

Proposed Course: The contractor will compare antigens in cervical carcinoma cells with those induced in Hep-2 by Herpes simplex virus type I and II. Work will continue on the characterization of HSV-2 antigens present in exfoliated cancer cells from patients with cervical cancer.

Date Contract Initiated: May 5, 1971

Current Annual Level: \$92,000

KAROLINSKA INSTITUTE (NIH-69-2005)

Title: Studies on the Significance of Herpes-type Virus in the Etiology of Some Human Cancers

Contractor's Project Director: Dr. George Klein

Project Officers (NCI): Dr. Charles W. Boone
Dr. Gary R. Pearson

Objectives: (1) To obtain additional data on EB virus-host interactions. (2) To investigate host immune responses to tumor antigens. (3) To study the regulation of C-type virus expression in defined systems. (4) To investigate cell mediated tumor immune reaction mechanisms in vitro and in vivo.

Major Findings: EBV related research: membrane antigens, early antigens and virus capsid antigens mediated by EBV have been studied in established lymphoblastoid cell lines. Inhibitors such as mitomycin C increase the amount of antigens detected by immunofluorescence. Mouse lymphoblastoid cell hybrids have made it possible to determine whether the presence of EBV DNA is dependent on one or several chromosomes. BUdR labeled cells were super-infected with tritiated thymidine labeled virus and the heavy cell DNA was recovered and examined for associated EBV. No evidence of integrated EBV genome was found. The incubation of tumor cells with serum from patients with lipo-, fibro-, osteo-, and neuro-sarcoma inhibited the stimulation in one autologous lymphocyte-fibrosarcoma combination.

Significance to Biomedical Research and the Program of the Institute: A major effort of the Special Virus Cancer Program has been the study of the viral involvement in the etiology and course of Burkitt's tumor in man. Research on the relationship between EBV infection and the onset of Burkitt tumor, the development of EBV-coded antigens in infected cells, and the analysis of the immune response to Burkitt tumor is therefore highly relevant to total program.

Proposed Course: The contract effort will continue essentially as described above.

Date Contract Initiated: April 9, 1968

Current Annual Level: \$90,000

E. Solid Evidence of a "Conspiracy of Silence" and the "Smoking Gun": Compounding Evidence of a Racketeering Enterprise in Vaccinology

"Conduct which forms a basis for inference is evidence. Silence is often evidence of the most persuasive character," wrote the Honorable Chief Justice Louis Brandies in *United States ex rel. Bilokumsky v. Tod*, 263 US 149, 154 - Supreme Court 1923.

Shall the scientific community neglect the aforementioned red flags, links between the SVCP cooperating labs and zur Hausen's and Montagnier's little-discussed work in the US researching novel virus subtypes profiting private interests in the NCI and Life Science industry? Shall we neglect reconsidering these facts, the cumulative damage from these diseases, and their true causes revealing potential cures? Because if the true causes are being withheld, as Strecker opined, then the true cures may be similarly concealed.

Ethical practice compels reconsidering these matters by a special "independent" investigative committee and/or grand jury.

Diverting from "silence as evidence," the media has offered, muddled, and debunked "conspiracy theories" as defective indictments. This media silence/negligence and counter-intelligence diverts from the facts and evidence published here and previously. (12) This author's proofs have never been "debunked", only ignored, silenced or censored.(12)(15)(18) This author has diagnosed this scheme of mainstream media hashing of facts, including diversions and obfuscations in the corporate-controlled social media. The pattern and practice of such malfeasance serves as a "protection racket" for the multi-trillion-dollar biotechnology and vaccinology industry. Millions of dollars spent to commission "pseudo-skeptics" and "debunkers" to write Op/Ed pieces and online slams is a drop in the bucket for Big Pharma. This allegation is proven by Big Pharma having been caught financing online "trolls" to supplement battalions of propagandists and PR firms issuing "fake news" and false commentaries as documented in the "Best Film-2016" *UN-VAXXED: A Docu-commentary for Robert De Niro*. (19) None of the skeptics address the "smoking gun" or "missing link"--the chimpanzees.

There is "General Acceptance" in the scientific community that *chimpanzees* are the missing link to HIV. Yet, health officials and vaccine proponents have avoided and evaded their duties to examine the scientific evidence presented by this author in 1996 and repeatedly thereafter. The irrefutable evidence proves chimpanzees were used by the New York collaborators to develop the suspect hepatitis B vaccines given to the many victims beginning in 1972. In the follow-up large scale San Francisco study in 1978, according to Dr. Paul O' Malley who headed up the Merck/CDC hepatitis B study, "an inordinate number of GRID victims" received the suspect vaccines. "Of the first twenty-four GRID cases in San Francisco, in fact, eleven were in the hepatitis B cohort." (15)(21)

In 1976, at the time the first GRID cases were emerging in NYC, Robert Purcell, the Head of the Hepatitis Viruses Section of the National Institute for Allergies and Infectious Diseases ("NIAID") published repeatedly on the use of chimpanzees to culture and reproduce the new strains of HBV needed for human testing after the chimpanzees survived the initial injections. Below is a photocopy of Purcell's grant application to extend trials from New York to San Francisco.

The grant application states, "A newly recognized clinical syndrome, type non-A, non-B hepatitis has been further defined and attempts to identify an etiologic agent intensified through transmission studies in chimpanzees." (12)

SUMMARY OF WORK (200 words or less - underline keywords)			
This project consists of continuing studies of the <u>chemistry</u> , <u>structure</u> , <u>epidemiology</u> , <u>immunology</u> and <u>pathology</u> of the <u>human hepatitis viruses</u> . The goal of such studies is the control of human viral hepatitis by application of the most appropriate methods, including <u>active and passive immunization</u> , <u>chemotherapy</u> and interdiction of spread of the viruses. Progress: The biophysical and biochemical characterization of hepatitis A viral antigen has begun, and studies of the immunopathology of hepatitis type A in non-human primates, using defined pools of virus, are in progress. An inactivated subunit <u>vaccine</u> for hepatitis type B has been developed and is undergoing extensive tests of safety and efficacy in chimpanzees and man. A third hepatitis B antigen, <u>e</u> antigen, is being characterized and its relationship to infectivity is being explored. Evidence that populations of hepatitis B viruses may contain defective interfering particles has been obtained, and this finding is being utilized in renewed attempts to isolate the virus. A newly recognized clinical syndrome, type non-A, non-B hepatitis has been further defined and attempts to identify an etiologic agent intensified through transmission studies in chimpanzees.			
Source: USDHEW. <i>Virology: Volume 4—Control of Viral Infections. NIAID Task Force Report.</i> Bethesda, MD: Public Health Service, National Institutes of Health (NIH) 79-1834, 1979, p. 20-65.			

[P]reparations of high density and intermediate density HB virions [viruses] are being purified . . . under conditions of high containment in Dr. Gerin's laboratory. [The same Dr. Gerin who prepared the vaccines for experimentation on New York's homosexual population]. These preparations are being aliquoted and titered [fractioned and standardized] for infectivity in chimpanzees; they will be used for attempts to isolate HBV in a number of tissue culture cell lines.

Cell lines that can be certified as being of ["fetal human or chimpanzee"] liver origin will be inoculated with partially purified HBV that is being titered in chimpanzees. These inoculated cultures will be monitored. . . .

Earlier references to the importance of using chimpanzees to culture and test the hepatitis B viral- vaccine-hybrids are equally compelling. At the International symposium on Viral Hepatitis, Milan, December 1974, Saul Krugman reviewed this subject in "Viral hepatitis type B: Prospects for active immunization. (15) He explained his early research citing the use of chimpanzees in preparing the test antigens of HBV for human trials. Krugman discussed the fact that initial trials were conducted on chimpanzees in the late 1960s, and "serosusceptible unimmunized persons [i.e., humans]" between 1970 and 1974 were injected. This matches precisely the suspect hepatitis B vaccine program in NYC and Willowbrook.

Secret 'Horrorifying' Experiments Conducted For 10 Years

TESTERS INJECT RETARDED CHILDREN WITH HEPATITIS

Doctors Forced Parents' Consent -- Knew Some Would Die!

The media, both scientific and lay, has remained silent on these confirmed links to the "smoking gun"--the association between the use of chimpanzees in the suspect HBV vaccine trials in New York, and subsequent deaths.

F. *Wikipedia* publishes classic example of fraudulent concealment at Willowbrook

This general censorship, fraudulent concealment, and even obvious misrepresentation of dates and facts is best demonstrated by *Wikipedia*. The Willowbrook school was closed in 1976 due to reports of child abuse. *Wikipedia* falsely claims the date of closing was "[i]n 1983, [when] the state of New York announced plans to close Willowbrook, which had been renamed the Staten Island Developmental Center in 1974." That fraudulent misrepresentation diverts from public knowledge of the facility's closing in 1976. Only the "school's" biological testing center remained active to accommodate Saul Krugman, Robert Purcell, et. al. Their teams' continued covert operations followed the clinical course of the immune-suppressive cancers in the hep B vaccine recipients.

The mainstream media neglected what the little known *National Tattler* heralded in 1972 as shown here by its headline: "Testers Inject Retarded Children with Hepatitis." The hepatitis B injections for novel virus cancer studies were completely omitted from Geraldo Rivera's extensive reporting on the "child abuse" at Willowbrook--a scandal that rocked the nation. Similar omissions are standard fare in subsequent news and documentary film productions.

Wikipedia also concealed from its Willowbrook coverage the fact that the blood of these earliest victims were "pooled" prior to screening methods becoming available for HIV. This resulted in contaminated blood and blood products being distributed. These products are widely known to have caused the outbreak of AIDS in the hemophiliac community and general populations that consumed these tainted blood products derived from the gay men in NYC and victims at Willowbrook.

Wikipedia further defrauded the public by concealing the military-industrial interests in the HB vaccine trails. *Geraldo* and *Wikipedia* neglected to report the names of the leading investigators and agencies, and also the evidence strongly indicating the first AIDS cases were appearing in Willowbrook test subjects in 1976 synchronous with the GRID cases emerging among homosexuals a few miles away.

Instead, *Wikipedia* evidenced its complicity and criminal negligence by quoting Paul Offit--the leading propagandist for the vaccine industry. Offit is quoted in the *Wikipedia* Willowbrook coverage justifying the work of Saul Krugman and unnamed parties at Willowbrook. Offit neglected what the science world is concerned about most--the chimpanzee HIV/AIDS link in the hepatitis B vaccine trails.

None of the aforementioned spin sources mentioned this author's published science. In fact, *Wikipedia* censored this author's entire biography immediately preceding the "Ebola Emergency" of 2014. Before that, between 2008 and 2014, *Wikipedia's* biography smeared this author using fraudulent concealments to discredit his earlier works.

Wikipedia's fraudulent concealments, misrepresentations, and protection racket disparaging whistleblowers has aided-and-abetted by willful blindness the Life Science racket, and pan-genocide.

G. Correlations of Significance: Predicates and Evidence of Racketeering

The aforementioned certain correlations challenge public health and safety. These are compiled in this section, listed, and summarized below:

(1) Common Nobel Prize awards in medicine between two researchers in molecular biology in the same year for reportedly "discovering" two "new viruses" claimed to have emerged contemporaneously.

(2) Common affiliation of the Nobel Prize's Karolinska Institute with the NCI and SVCP through third party suspects, including the Wistar Institute and Litton Bionetics engaged in the precise research and development of leukemia, lymphoma, sarcoma retroviruses and DNA-type herpes viruses.

(3) Correlation between these "special viruses" and the never-before-seen AIDS "cancer complex" featuring these precise leukemia, lymphoma, sarcoma recombinants that were isolated and tested to induce such precise never-before-seen cancers during these trials.(3)(8) This evidence is pathognomonic for AIDS and its laboratory origin in the SVCP.

CONTRACTOR : Wistar Institute of Anatomy and Biology (71-2092)
ADDRESS : 36th Street at Spruce, Philadelphia, Pennsylvania 19104
PHONE : AC-215, Phone 222-6700, x-226
CNTRCT TITLE: Extraction and Characterization of Virus-Induced Transplantation
Antigen From Sarcomas and Leukemia
DATES : 2/1/72 - 1/31/73
PRINC INVEST: Dr. Anthony Girardi
PROJ OFFICER: Dr. James T. Duff, Bldg. 37, Room 1B22, x-65967

SEGMENT : Solid Tumor-Virus
SEG CHAIRMAN: Dr. Robert Huebner, Bldg. 37, Room 2D24, x-63301
CNTRCT SPEC : Mr. Thomas Porter, Bldg. 37, Room 1A03, x-65025

Date Contract Initiated: April 22, 1969

Current Contract Level: \$51,600

WISTAR INSTITUTE OF ANATOMY AND BIOLOGY (NIH-NCI-E-71-2092)

Title: Extraction and Characterization of Virus-induced
Transplantation Antigen and Rescue of Virus from
Sarcomas and Leukemias

Contractor's Project Director: Dr. Anthony J. Girardi

Project Officer (NCI): Dr. Charles W. Boone

Objectives: To extract and characterize tumor-specific
transplantation antigens induced by selected DNA and RNA
tumor viruses.

Major Findings: (1) In cooperation with Dr. Berge Hampar
(NCI), the peroxidase staining technique for localization
of murine gs antigen is being evaluated. The technique
is both more sensitive and more specific than the fluorescent
antibody technique. (2) Examination of early fetal hamster
tissue for antigens shared with SV40-induced tumor cells
has confirmed Coggin's findings that such a common antigen(s)
exists, but does not support the concept that it is the
important transplantation type antigen since it protects
only male animals. His findings have been extended to show
the embryos of primiparous females were effective immunogens
against SV40 tumorigenesis while those from multiparous
females were not. (3) Rescue attempts have been initiated
employing human sarcomas and leukemias in a variety of
combinations designed to activate latent viral genomes.
These include co-cultivation and fusion with either BPL
inactivated Sendai virus or lysolecithin.

Significance to Biomedical Research and the Program of the
Institute: The treatment of cancer by immunologic methods
has been an attractive hypothesis for decades, but it is
only recently that new and fundamental discoveries in
immunobiology have made cancer immunotherapy a real
possibility. Many tumors possess individually distinct
transplantation antigens against which the host mounts an
immune response. The transplantation antigens of most
virus-caused tumors in different animal species are the
same for a given virus. The work being conducted by the
contractor is part of a larger effort of the SVCP to isolate
and test virus-induced tumor-specific transplantation
antigens in animal model systems.

Proposed Course: (1) Improve use of the peroxidase reaction
technique as a routine assay method for gs antigens and for
intracellular localization of reverse transcriptase. (2) Study
of the relationship of fetal antigen to tumor antigens.

(4) Correction between the timely emergence of profound immune-suppressed clinical cases called GRID and later AIDS following the precise incubation period expected of "lentivirus" or retrovirus infections from the suspect hepatitis B vaccines administered between 1972 and 1974. (3)(8)

(5) Correlation between the herpes-type viruses subjected to genetic alterations in the SVCP labs and the emergence of the "new" DNA virus by zur Hausen et. al., involving the Wistar Institute, the KI and the NCI, favoring commercial enrichment by enterprise called the "Life Sciences Industry."

(6) Correlation in the practice of renaming viruses for academic and commercial gain between what Robert Gallo did purportedly with Montagnier's virus, and what zur Hausen appears to have done with the herpes-type DNA viruses "emerging" from the SVCP labs; thus creating a whole new commercially profitable "family" of herpes called HPVs.

(7) Correlation between the emergence of the first clinical cases of AIDS simultaneously on two far removed continents, in New York City and Central West Africa, precisely the locations where the suspect hepatitis B vaccines were tested.(3)(8)

(8) Correlation between the emergence of the first clinical cases of AIDS among the precise populations receiving the suspect hepatitis B vaccine, namely gay men in NYC and blacks in the AIDS belt of Africa (with Willobrook cases being censored). (3)(8)

(9) Correlation of similar behavioral methods used to develop the false "General Acceptance" in medicine and society that science is infallible and newly-discovered viruses exclusively "cause" deadly cancers, replacing the previously accepted "dogma" of multi-factorial risks.

10) Correlation of organized public relations attacks, smearing and libeling of individuals voicing opposition to objectionable practices in science for commerce; and most telling

11) The "conspiracy of silence" and negligence obstructing informed consent, human rights, public duties to safeguard society, and scientific evidence analysis, open discourse, and justice under circumstances that are arguably treasonous and genocidal.

These eleven predicate acts evidencing racketeering activity as defined by 18 U.S.C. § 1962 (as defined in § 1961).

H. Racketeering in Health Science Fraud and Criminally Negligent Manslaughter

As stated under the aforementioned Standards of Review, the elements of *fraud* are satisfied by: "(1) the false representation that vaccines are "safe," or "safe enough" for injection or oral consumption; 2) government officials' and healthcare workers' knowledge of the falsity of these representations of safety and efficacy (or without knowledge of their truth or falsity in willfully blind obedience to the false "General Acceptance"), (3) contemplating society's and individual

consumer's reliance upon these false representations, (4) with society's and consumer's reliance upon these falsehoods;" (5) causing damage, side effects, illnesses, including brain damage, cancers, and deaths. [Shoppe v. Gucci America, Inc.](#), 14 P. 3d 1049 – Haw: Supreme Court 2000.

Similarly, the elements of **fraudulent concealment** are satisfied by the “employment of artifice” (e.g., false representations of safety or reasonable risk) “planned to prevent inquiry or escape investigation, and mislead or hinder acquirement of information disclosing a right of action.” Including the right to abstain from the “assault” as defined by law. The officials' acts relied on are “of an affirmative character and fraudulent.” [Lemson v. General Motors Corp.](#), 66 Mich. App. 94, 97, 238 N.W.2d 414, 415 (1975) quoting [De Haan v. Winter](#), 258 Mich. 293, 296, 241 N.W. 923, 924 (1932). This fraudulent concealment also “involves the actions taken” by government and healthcare workers “to conceal a known cause of action” such as negligence, assault, breach of public duty to prevent injury, and/or death. [Au v. Au](#), 626 P. 2d 173 – Haw: Supreme Court 1981.

The facts presented here, proven by government records and public knowledge evidences racketeering activities as defined by 18 U.S.C. §§ 1961 and 1962. The “predicate acts” of the enterprise include: (1) bribery of public officials and media censors as the reference below involving Hawaii State Senator, Roz Baker demonstrates;(24) (2) extortion of persons to get vaccinated or risk dying from terroristically-threatened cancers or infections; (3) dealing falsely in controlled chemicals added to vaccines as ingredients, sterilizers, or adjuvants; (4) mail fraud and wire fraud in correspondence between officials, the media, and the public; (5) obstructing justice by scientific evidence tampering and corrupt influence over witnesses, whistleblowers, and the media; (6) obstruction of criminal investigations as occurred in 2002 when the Honorable Representative James A. Traficant, Jr. petitioned the U.S. General Accounting Office to investigate the origin of AIDS on behalf of Boyd Ed Graves (See reference 6: [USGAO on SVCP Investigation](#)); (7) tampering with witnesses, victims, and informants to preclude discovery and prosecution, as the USGAO did with this author who supplied credible scientific evidence censored by GAO officials during their whitewashing (6); (8) retaliating against witnesses, victims, and informants who sought relief and remedies as the enterprise did against Rep. Traficant, Robert Strecker's brother, Ted Strecker, resulting in the latter's death. This author too has been retaliated against as evidenced by public corruption and Paul J. Sulla, Jr. having [stolen my property in Hawaii](#); (9) relating to peonage and slavery in the abuse of test subject such as the Willowbrook children; (10) economic espionage and theft of trade secrets, as Dr. Gallo was vetted for doing purportedly damaging France; (11) interference with commerce in the natural healing arts and sciences by subverting the multi-factorial causes and cures for cancer and general immunity, while disparaging natural healthcare practices; (12) trafficking in biological weapons and chemical weapons under the guise of “cancer control” and “public health” involving fraud in the sale of drugs, vaccines, and securities financing the pharmaceutical companies; and (13) manufacturing and selling biological and chemical products under false pretenses.

Criminally negligent manslaughter is referred to as *criminally negligent homicide* in the [United States](#). “It occurs where death results from serious negligence, or, in some jurisdictions, serious recklessness. A high degree of negligence is required to warrant criminal liability. This bar has been exceeded by the aforementioned facts. People are dying everywhere from myriad illnesses and drug side effects all prompted by the aforementioned vaccine contaminations. These are not

"vaccine preventable diseases." These are "vaccine induced illnesses" grossly neglected by ignorant or "evil obedient" officials. *Willful blindness* is related to criminal negligence. It occurs when a defendant intentionally puts himself in a position where the defendant will be unaware of facts which would render them liable." (10) This is the overriding and overwhelming negligence witnessed in "public health" and medicine today.

Criminally negligent manslaughter also occurs where there is an omission to act when there is a duty to do so, or a failure to perform a duty owed, which leads to a death. In public health and medicine, officials and doctors are not only obligated by "public duty doctrine" and 42 U.S.C. § 1986 to prevent damage to citizens, but also by the Hippocratic oath to "above all do no harm." Willful blindness to these two duties is widespread. The cause of this "General acceptance" and willful blindness is behaviorally-engineered by the persuasive media fundamental to the racketeering enterprise. The existence of the duty to save lives imposes criminal liability on the willfully blind who aid-and-abet the racket and its damage to society. Criminally negligent manslaughter is most common among professionals "who are grossly negligent in the course of their employment." (22)

Conclusion

False "General Acceptance" has been socially-engineered in favor of the theories that HIV "causes" AIDS and HPV "causes" cervical cancers disregarding the many co-factors and commercial interests involved. This General Acceptance of "vaccine science" must be also rejected in light of the aforementioned evidence of scientific fraud, fraudulent concealment of the risks vs. benefits of vaccination, and the media persuasion and censorship practices abused to generate such General Acceptance. (13) So too must the fraud, omissions and misrepresentations of facts, scientific evidence tampering, censorship, and retaliation against witnesses and whistleblowers stop to secure public health and safety. This institutionalized criminal activity must be rejected by every official and activist in lieu of the aforementioned risks and widespread damage done by the "Life Sciences" industry. Urgent reconsideration must be given to the Special Virus Cancer Program ("SVCP") as the apparent origin of the "sexually transmitted diseases" and their viruses claimed to be killing millions of people worldwide, and risking the lives of billions more.

Solid evidence reprinted above shows a commercial enterprise focusing on inducing cancers and viral mutations during the 1960s and early 1970s continuing to the present. The DNA herpes-type viruses and the RNA tumor-inducing immune suppressive retroviruses and their cross-hybrids were central to the mission and actions of the KI, Wistar Institute, Litton Bionetics, Johns Hopkins, the NCI, NIH, and the SVCP. Their officials and collaborating institutions and corporations are comparatively liable for the damages the enterprise has caused and continues to cause. The use of co-factors to induce cancers, including chemicals, radiation, and genetic recombinations of viruses isolated from cancers worldwide, is clear and compelling evidence of the earlier accepted "dogma." The previous "Generally Accepted" dogma has been replaced by extending the "germ theory" into biotechnology and vaccinology for corporate profit over the public's interest using fraudulent claims that the virus alone is the single etiological agent. (4)

The evidence presented here controverts the main defense raised by [Dr. Robert Gallo as televised](#), that "gene cloning" and crude methods of recombinant biotechnology used during the 1960s and 1970s could not account for the emergence of HIV, HBV and HPV viruses "discovered" years later. This is clearly false. This "crude science" was the most active practice of the relatively small group of "experts" financed to administer the SVCP, NCI, NIH and co-contractors' viral "discoveries." This group hybridized and recombined the human and animal deadly viruses during this age of crude, albeit exploding, biotechnology leading to the commercial enterprise we have today.

Medically-legally, *In re Winship*, 397 U.S. 358 (1970), established the need for "a standard of proof" concerning the "confidence our society thinks [w]e should have in the correctness of factual conclusions." This "standard of proof" and "degree of confidence our society" places in vaccines, medicine, the cancer industry, hospitals, and public health has been irreparably damaged by the fraud and criminal actions evidenced herein. Big Pharma's criminal enterprise suffers from its own shortcomings and wrongdoings. Consequently, the holding in *Daubert v. Merrell Dow Pharmaceuticals, Inc.* is most relevant. "General acceptance" of the "vaccine preventable disease" marketing ploy must be urgently reconsidered given the "pertinent evidence" showing fraud. The cited fraudulent concealments and criminal negligence results in manslaughter. This is hereby proven by the clear and convincing facts and government records in evidence. "[B]ased on [these] scientifically valid [government records and] principles" the devil-doers must be disciplined. And these facts clearly compel reconsideration of the entire vaccine industry as a public duty.

Given the legal standards by which fact-finders must justly rule, reasonable discretion holds that every vaccination imposes risks that have been generally concealed and misrepresented by officials and the media. Under these circumstances corrupted by fraud the push for "mandatory immunizations" for "vaccine preventable diseases" evidences a racketeering enterprise as defined by Title 18 Part I Chapter 96 § 1961. This racket and its scheme violates (among many other laws) Title 18 U.S.C., § 241-Conspiracy Against Rights.

This report is delivered to public health officials and lawmakers in Hawaii, but is applicable everywhere. A sworn certified service of this constructive notice sends the following message: Who-so-ever acts by neglect or willful blindness of the aforementioned facts and evidence in government records, and disregards the elements of fraud and felonies in the vaccine industry, aids-and-abets the criminal racket. Such offenders shall be liable under Title 18 USC § 4 - for Misprision of felony, among other laws; and any damage resulting from such negligence, recklessness, or malfeasance, is actionable under 42 U.S.C. § 1986.

-- END --

Declaration of Conflicting Interests

The author proudly declares two conflicting commercial interests in the presentation of this information: (1) NASA science was supplemented by this author's pioneering development of *OxySilver*--a [528 Solfeggio-frequency](#)-enhanced oligodynamic silver-hydrosol incorporating [water-structuring](#) and micro-clustering technology to enhance energetic memory and cellular absorption for optimal benefits claimed to "make all vaccinations and antibiotics obsolete;" and (2) the industry-wide commercial replacement of the risky, costly, and monopolistic allopathic medical paradigm by the freeing natural healing arts and sciences featuring 528 frequency discoveries in musical mathematics.

(24) Zur Hausen's "discovery" was said to have been made against the prevailing view during the 1970s concerning multi-factorial cancer. He postulated a role for human papilloma virus (HPV) in cervical cancer. He assumed that the tumour cells, if they contained an oncogenic virus, should harbour viral DNA integrated into their genomes. The HPV genes promoting cell proliferation should therefore be detectable by specifically searching tumour cells for such viral DNA. Harald zur Hausen pursued this idea for over 10 years by searching for different HPV types, a search made difficult by the fact that only parts of the viral DNA were integrated into the host genome. He found novel HPV-DNA in cervix cancer biopsies, and thus discovered the new, tumourigenic HPV16 type in 1983. In 1984, he cloned HPV16 and 18 from patients with cervical cancer. The HPV types 16 and 18 were consistently found in about 70% of cervical cancer biopsies throughout the world.

(26) Charges against Hawaii State Senator Roz Baker's on evidence of bribery is presented in an [article](#) published on JudicialCorruptionNews.com by authors Sherri Kane, Leonard G. Horowitz, and anonymous attorneys.

(27) Here is hard evidence of the General acceptance of multi-factorial cancer etiology, directly from page 30 of the SVCP 1977 Report No. 14. Notice this record heralds "Co-Carcinogenesis" involving "biological, chemical, or physical" or environmental factors such as radiation in cancer induction studies. These assaults compounded viral damage from mutating, hybridizing, and recombining especially Herpes DNA viruses (similar to HPV "discovered" by zur Hausen humans and moneys).

4. Projections

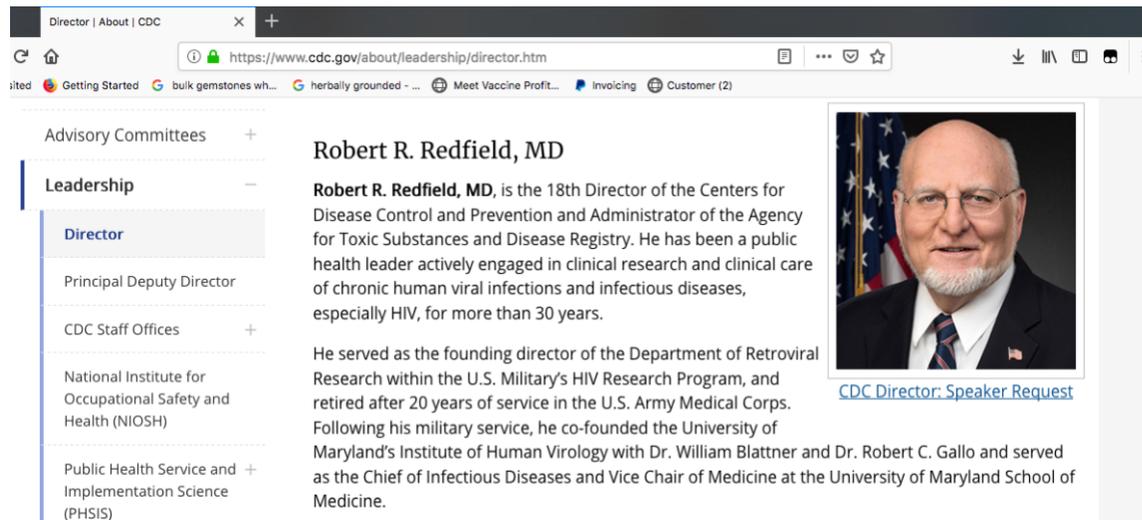

The Viral Oncology Program has set forth a long range research plan to elucidate the role of viruses in human cancers and to exploit any leads that develop for use in the detection, diagnosis, treatment and prevention of cancer. The studies are grouped within the following approaches:

a. Virus Studies

- (1) Basic Studies. Certain basic studies on RNA and DNA viruses in experimental animals and in cell culture will remain an integral part of the Program. The results of these studies have already provided important information about tumor viruses that is applicable to the isolation and identification of human agents.
- (2) Cocarcinogenesis Studies. While it appears that many environmental carcinogens (biological, chemical, or physical) induce cancer, there is evidence that such action is mediated by the activation of latent viruses or viral genes. Cell lines in culture and methods suitable for studying viral-viral, viral-chemical, and viral-physical interactions or cocarcinogenesis are now available and such studies will be considerably expanded:
 - (a) to define the role of endogenous viruses in process of cell transformation;
 - (b) to increase understanding of the relationship of environmental agents as cofactors in carcinogenesis;
 - (c) to extend and develop new methods of inducing tumor virus expression in "normal" cells;
 - (d) to develop reliable, sensitive methods for in vitro carcinogen testing.
- (3) Human Studies. Attempts to isolate RNA or DNA viruses or to detect the presence of viral genetic information and its expression in human tumors will continue. However, considerable emphasis will be placed on developing new probes that can identify viral transforming activity. These efforts will be applied to human cancers:
 - (a) to identify and isolate viruses, virus expression or viral gene products in human leukemias, lymphomas, sarcomas, and carcinomas;
 - (b) to apply specific methods for detecting individuals or groups of individuals at high risk to cancer, i.e., individual susceptibility or predisposition to transformation by viruses.

(27) In the author's opinion, pursuant to the "General acceptance" of vaccines and claims of "safety and efficacy" or "reasonable risk" assurances, the following individuals bear a special burden and should be investigated for conflicting interests, fraud, and treason. This opinion is based on the facts and evidence provided in this article. Such "due process" requires a grand jury to issue indictments, to be advanced by a special "independent" prosecutor free from political and financial interests:

(A) Director of the CDC, Dr. Robert R. Redfield, MD, who co-founded the [University of Maryland's Institute of Human Virology](#) with Dr. William Blattner and Dr. Robert Gallo.

The screenshot shows a web browser window with the URL <https://www.cdc.gov/about/leadership/director.htm>. The page title is "Director | About | CDC". On the left, there is a navigation menu with "Leadership" expanded to show "Director" as the selected item. The main content area features a portrait of Robert R. Redfield, MD, and a text block describing his role as the 18th Director of the CDC. The text states: "Robert R. Redfield, MD, is the 18th Director of the Centers for Disease Control and Prevention and Administrator of the Agency for Toxic Substances and Disease Registry. He has been a public health leader actively engaged in clinical research and clinical care of chronic human viral infections and infectious diseases, especially HIV, for more than 30 years." Below this, it mentions his previous service in the U.S. Army Medical Corps and his role in co-founding the University of Maryland's Institute of Human Virology. A link for "CDC Director: Speaker Request" is visible below the portrait.

B. Director of the HHS, Alex M. Lazar II, was the senior vice president for corporate affairs and communications at Eli Lilly and Co. From 2012 to 2017, he served as president of Eli Lilly USA LLC, the company's largest affiliate. In 2009, Eli Lilly pleaded guilty of defrauding doctors and consumers by promoting Zyprexa for dementia. The \$1.415 billion penalty included an \$800 million civil settlement and a \$515 million criminal fine. The Justice Department said the criminal fine of \$515 million was the largest ever in a healthcare case and the largest criminal fine for an individual corporation ever imposed in a US criminal case.

Alex M. Azar II

Secretary

HHS Office of the Secretary
E-mail Address: Secretary@HHS.gov
Phone Number: 202-690-7000

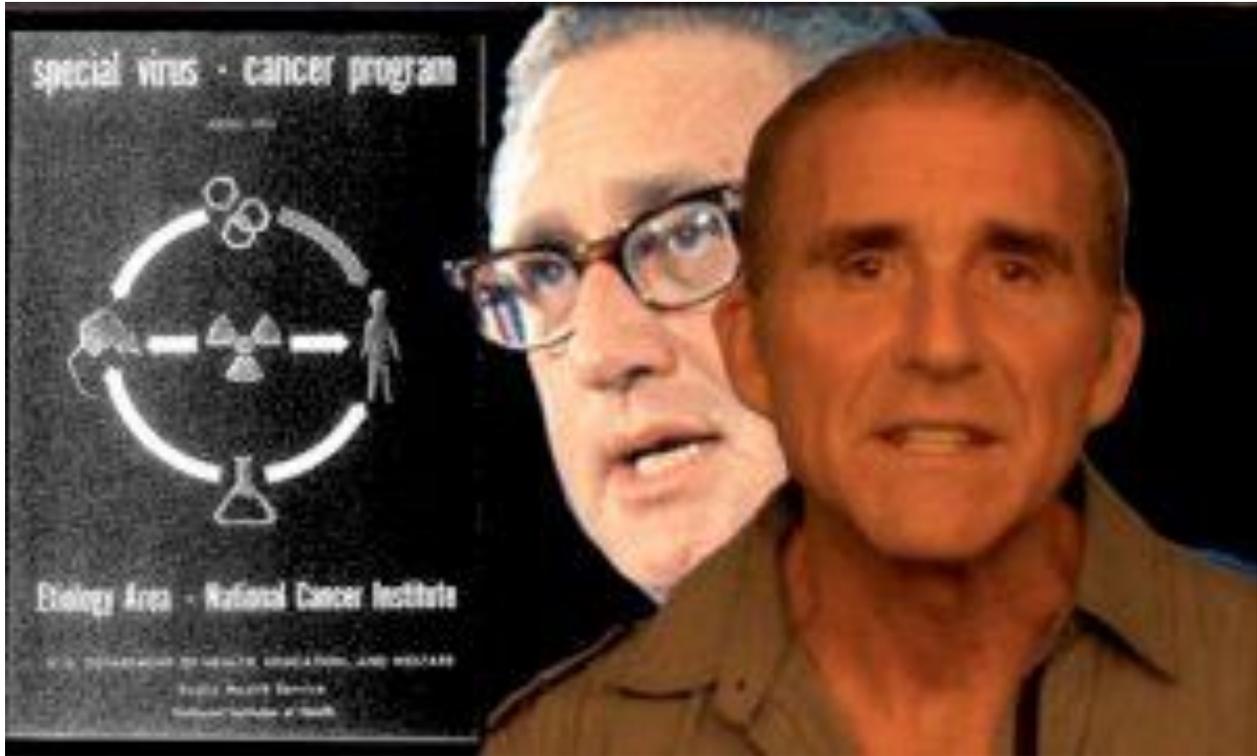

Alex M. Azar II was sworn in as the Secretary of Health and Human Services on Jan. 29, 2018. Azar has spent his career working in both the public and private sectors, as an attorney and in senior leadership roles focused on advancing healthcare reform, research and innovation.

From 2001 to 2007, Azar served at the U.S. Department of Health and Human Services – first as its General Counsel (2001–2005) and then as Deputy Secretary. During his time as Deputy Secretary, Azar was involved in improving the department’s operations; advancing its emergency preparedness and response capabilities as well as its global health affairs activities; and helping oversee the rollout of the Medicare Part D prescription drug program.

In 2007, Azar rejoined the private sector as senior vice president for corporate affairs and communications at Eli Lilly and Co. From 2012 to 2017, he served as president of Lilly USA LLC, the company’s largest affiliate.

It must be known that Eli Lilly produces "Thimerosal"--the mercury preservative used in vaccines linked to autistic spectrum disorder. A provision was fraudulently and untimely inserted into the Homeland Security Act indemnifying vaccine makers against liability at the instruction of [George H.W. Bush who sat on the Board of Directors at Eli Lilly during the 1970's when the SVCP and Litton Bionetics operated.](#) The provision must be repealed in the interest of public health, public safety, and justice.

About the Author

Dr. Leonard G. Horowitz, DMD, MA, MPH, DNM (hon.), DMM (hon.) is considered a "polymath" by his peers. This award-winning medical scholar, author, film-maker, consumer health advocate, drug industry critic, and intelligence industry analyst has published twenty-one books (including three American bestsellers), dozens of peer-reviewed scientific articles, and seven (7) documentary films, including the "Best Film – 2016" at the World International Film Festival in London and Geneva competitions for *UN-VAXXED: A Docu-commentary for Robert De Niro*). Dr. Horowitz's first bestseller, a landmark medical text, *Emerging Viruses: AIDS & Ebola—Nature, Accident or Intention?* is credited by CDC and WHO officials as most influential in establishing vaccination risks opposed by public health activists worldwide. Nonetheless, the United Nations AIDS Secretariat to the UN Theme Group on AIDS [proposed banning the doctor's research](#) in this field.

The doctor's many videos and lectures can be viewed on RevolutionTelevision.net. Dr. Horowitz's second bestseller, *Healing Codes for the Biological Apocalypse*, has prompted a revolution in the music and natural healing arts and sciences. His 2007 decryption of Leonardo da Vinci's most famous drawing revealed the mathematics of *LOVE: The Real da Vinci CODE*; and his follow-up text, the most monumental of his 40-year career, *The Book of 528: Prosperity Key of LOVE*, reveals "God's creative technology," available for revolutionizing every industry, especially music and recording artistry, healthcare and medicine, nutrition, environmental protection, natural resource restoration, along with civilization's transformation as an "enlightened species" choosing peaceful sustainable collaboration versus murderous degenerative competition and lethal consumption.

International acclaim is mounting for the doctor's works revealing Solfeggio frequency physics and metaphysics that has prompted the "[528LOVERevolution](#)" commercialized in the rapidly

growing 528RadioNetwork.com (528Radio.com) that broadcasts “medicinal music” transposed into the “LOVE frequency” of 528Hz the central resonance frequency of chlorophyll, oxygen, and water.

Subject: DOH Chapter 11-157 Testimony- Oahu
Date: Monday, November 05, 2018 2:40:09 PM

Aloha,

Please see my testimony below opposing the proposed amendment to the DOH's Chapter 11-157.

RE: I STRONGLY OPPOSE the proposed amendment of the Department of Health's Title 11, Chapter 157, Examination and Immunization, HAR (Public Hearing on November 1, 2018).

This proposal limits transparency and public participation while mandating vaccinations via a blanket adoption of the best practices guidance of the federal Advisory Committee on Immunization Practices (ACIP). The DOH cannot have broad-reaching authority with minimal oversight from other branches of government while mandating vaccines for Hawaii's children by gradually whittling away parental consent and involvement.

Further, as a taxpayer, I am requesting a formal response to the following OBJECTIONS to the DOH's proposed Chapter 11-157, HAR, Examination and Immunization. Since my child attends school now and will attend a post-secondary school in Hawaii, I believe this new administrative rule will increase my state taxes.

I would like to see a cost analysis conducted to include the costs associated with implementing Chapter 11-157 and explanations related to the following:

- A) Increased vaccine purchasing costs to the taxpayer.
- B) Increased administrative and operational costs for 292 public schools to implement Chapter 11-157.
- C) Increased costs in Special Education due to new DOH vaccine requirements.

Also, please respond to section D) Questions about the Implementation of Chapter 11-157 which are specific to the proposed amendment itself.

A. Increased Vaccine Purchasing Costs to the Taxpayer:

1. How much will it cost the State of Hawaii to purchase the ACIP recommended vaccines per this proposed rule for children attending daycare, public and private school, and post-secondary schools via the VFC program and the Section 317 Grants on a yearly basis? Some of the recommended costs are represented below:

HPV9 on the CDC's VFC list[1] costs \$168.10 per dose- a 2-3 dose series per child would be \$336.20 or \$504.3

Meningococcal Conjugate on the VFC list is \$73.83 or \$91.81 per dose- 2 doses per child would cost \$147.66 to \$183.62

Hepatitis A on the VFC list is \$19.58 per dose – 2 doses per child would cost \$39.16

If the DOH uses vaccine combinations such as MMR-V (Proquad), the VFC list price is \$125.11 per dose - 2 doses per child would cost \$250.22 (compared to \$21.05 for MMR and \$98.24 for varicella per dose – for 2 doses each would cost \$238.58)

2. What kind sources of funds will be needed to pay for any NEW vaccines that the ACIP recommends after 2020? Will this be a taxpayer expense, if so why?

3. What contingency plans are in place if the VFC and Section 317 funds run out? Will this be an increased taxpayer expense?

4. Does the State of Hawaii use any non-federal sources to pay for our vaccine supplies? If so, what is the average costs incurred purchasing non-contract vaccines. Will this be a taxpayer expense for future shortages?

5. How much will the proposed changes increase vaccine reimbursements and vaccine-related reimbursements such as a vaccine administration fee to Hawaii State Medicaid because of the added ACIP vaccine recommendations? Will this be a taxpayer expense?

6. How many children in Hawaii's state Medicaid, Quest and related programs will receive the newly recommended vaccines and what is the estimated financial costs in these programs? Will this be a taxpayer expense?

B. Department of Education:

According to the DOE's official enrollment count for 2018-2019[2], there is a total of 180,837 children enrolled. The DOH proposal would require DOE personnel from each of the 292 schools to do at minimum the following:

1. Collect, review, maintain and enforce rules related to proof of immunization documents.

2. Monitor and enforce provisional school entry requirements continuously.

3. Monitor and enforce all medical and religious exemption requirements continuously.

4. Submit personally identifiable information to the DOH on a regular basis, either electronically or by copying.

5. Require additional administrative and operational costs per school.
6. Purchase additional equipment, supplies, space and hire personnel.

In 2016, former Superintendent Kathryn Matayoshi submitted testimony opposing SB2316 which required 7th graders to receive 1 dose of the HPV vaccine for school entry citing that the “added administrative and operational workload, school personnel will be tremendously challenged.” Although SB2316 involved only a single vaccine dose for 7th graders compared to three vaccines for 7th graders in the proposed amendment, the message was clear. Mandating any vaccine for school entry would create an additional financial and operational burden to the DOE.

How much would the administrative and operational costs be to the 292 schools in the Department of Education to implement the immunization requirements for 180,837 children under the DOH’s proposed Chapter 11-157? Will this be a taxpayer expense?

C. Cost of Special Education:

In addition there is a total of 1580 children in Pre-K special education and 17,591 children in special education for a total of 19,171[3] children who rely on funding from the Hawaii Department of Education and from the Office of Special Education Programs (OSEP), US Department of Education.

1580	Pre-K
8733	K-6
2926	7-8
5932	9-12

The current autism rate is 1 in 36[4] and has steadily increased over the last 14 years. While the claim is the cause is unknown, there is ample evidence pointing to the number of vaccines administered early in life. In 1962, there were 5 doses of vaccines given. By 1983, 24 doses were administered and by 2017 the number of doses was 72. While the belief that correlation is not causation, the steady increase in the rate of autism has increased in tandem with the number of vaccines added to the vaccine schedule as recommended by the ACIP.

Whether or not the DOH believes autism is related to vaccines, the Department of Education will be responsible for educating children with ADD, ADHD, Asperger’s, Autism, PDD-NOS, Autism, Learning Disabilities, Speech Delay, Multiple disabilities, and the medically fragile in the public schools. This will not be on the Department of Health.

In 2015, the California legislature ignored the pleas of hundreds of testifiers who opposed SB277. This bill eliminated personal and religious exemptions for vaccines while also making it extremely difficult for doctors to write and parents to receive medical exemptions for their child. This sounds like a similar scenario in the Hawaii DOH's Chapter 11-157 -5 Exemptions.

In June 2015, SB277 became California law. The removal of exemptions most likely contributed to the exponential rise in California's autism rates in 2016, to 7 percent and specifically 17 percent in kindergartners in public schools while previously the autism rate had risen basically at the same rate since 2001.[5]

While most parents intuitively know what led to their child's autism, the DOH, CDC, ACIP continue to ignore the increased autism rates. The increased incidence of autism in California is most likely attributed to the increased vaccination rates or the accelerated "catch-up" schedule since many California parents were forced to give their children more than the usual number of doses and in a shorter period of time just in time for school. This same scenario will most likely occur in Hawaii.

How does this relate to the Department of Education? Hawaii's weighted-student formula may be useful in determining the number of "dollars" per child but the special education children are weighted the same as a typical child. Thus, funds for special education services as described under a child's Individualized Educational Program (IEP), and under the Individuals with Disabilities Education Act (IDEA) usually comes from another source of funding such state general funds[6] and federal funds.

The DOH's new proposal under Chapter 11-157 of increasing the number of vaccinations will most likely convert some typically developing children into those needing special education. Without additional funding to properly address the needs of these emerging special education children, they will not be able to receive the fair and proper education they are entitled to under the law. At the same time, taxpayers will be left with funding their increased educational needs and taking care of these children for a lifetime.

The DOH in collaboration with the Department of Education must conduct a financial analysis to determine a baseline for special education costs prior to the adoption of Chapter 11-157.

There must also be an analysis to estimate the potential costs of educating new cases of children in the DOE's special education AFTER the new vaccine requirements are implemented in 2020.

How much does the State of Hawaii expect the taxpayers to pay to fund this DOH vaccine mandate?

D. Questions about the Implementation of Chapter 11-157:

1. In Ch 11-157, the DOH created the definition for

“recognized standard medical practice” to mean “in accordance with the US Dept. of Health and Human Services,’ Advisory Committee on Immunization Practices (ACIP), General Best Practice Guidance for Immunization and future amendments that are adopted by the department” which forces physicians to practice medicine the way the DOH wants them to practice, i.e. following the ACIP guidance.

First, how will the DOH know if a provider is following the ACIP Best Practices Guidance? Will physicians be fined or penalized for not following the ACIP’s Best Practices Guidance, even though it is a ONLY a guidance and a recommendation?

2. Second, the phrase “and future amendments that are adopted by the department” is extremely vague and seems to give the Immunization Branch the authority to adopt ANYTHING in the future, and then force providers to comply, possibly against their own medical judgement. Is this the intent of the DOH?

3. Will parents be fined or penalized if their physicians fail to follow the ACIP recommendations and Best Practices Guidance? Can physicians follow the Guidance based on their own medical judgement? If so, in what way?

4. Under 11-157-3(b) Immunizations, it states “Only those sections of Exhibit B that pertain to the requirements of this chapter, including the specific vaccinations listed in Exhibit A, shall apply.” Since the ACIP guidance is about 197 pages long, please identify the specific sections of the guidance that applies to a corresponding section of the proposed amendment.

Further under 11-157-3(c), it states “if an exhibit conflicts with this chapter, this chapter shall prevail.” Can the DOH provide an example of how such a conflict would occur since the proposed rule supposedly includes information taken directly from the ACIP guidance?

Again, the DOH must specify the exact sections of the ACIP Best Practices Guidance that will be considered part of the DOH’s Ch 11-157, HAR. This is too broad of a reach of authority and too little oversight of the potential changes in the administrative law.

5. Will Table 4.1 Contraindications and precautions in the ACIP guidance (p.52) be the only allowable reasons or “stated cause” i.e. “medically contraindicated due to a stated cause” as per 11-157-5 under medical exemptions? Specifically, if a student has a “severe allergic reaction” as described on (p.53) from a flu vaccine, does that mean the medical exemption will be allowed compared to a student who acquired an autoimmune disease such as GBS or Acute Flaccid myelitis which is not listed as a contraindication?

The Conditions listed in Table 4.2 (p.59) of the ACIP guidance are called “conditions incorrectly perceived as contraindications or precautions to vaccinations.” If a physician, using his own medical judgment for a patient, believes that a particular vaccination would be harmful to his patient and lists one of the misperceived conditions from Table 4.2 as a “stated cause” as per Chapter 11-157-5, would this determination invalidate the Medical Exemption for this patient? How and who makes this determination if

invalidated?

6. Why should a time period be specified for a contraindication such as an autoimmune disease or severe allergic reaction? A peanut allergy lasts a lifetime, thus please justify the need for the time requirement.
7. Does the ACIP guidance trump the physician's best medical judgement when he determines the child's need for a medical exemption?
8. Will someone from the DOH evaluate medical exemptions for "validity" or be able to reject a medical exemption submitted by a physician? With what criteria? If so, who will that be? Please list the criteria to be used for evaluating "validity."
9. If the DOH rules that the religious exemption is not "bona fide," what criteria will be used to make this decision? Who in the DOH or DOE will make this decision? Will the parent receive a written explanation if rejected?
10. Provide a list of religions that are unacceptable for the purposes of a religious exemption.
11. If exemptions can be rejected, will there be an appeal process and would that be an administrative process or in a court of law?
12. If the ACIP best practices guidance changes every 3 to 5 years, will the DOH automatically update its HAR or will it remain the same since the proposed amendment is a blanket adoption of practically the entire document? How will the public and community be informed of these changes?
13. How will the public know which parts of the ACIP best practices guidance have been adopted as law and which have not? How will the DOH inform the community of its decisions and will there be a grace period?
14. How much it will cost state taxpayers for the major overhaul of the updated immunization program? Has the additional training required, communication to providers, and other hidden costs been properly determined? Is this a taxpayer expense?
15. In Ch 11-157, a "Grace Period" is defined as the "four day period prior to minimum required ages or intervals during which an immunization may still be considered valid." In the ACIP Best Practices Guidance, p.13, it also states that "doses of any vaccine administered equal to or greater than 5 days earlier than the minimum interval or age should NOT be counted as valid doses and should be repeated as age appropriate."

The ACIP decisions in this section "Spacing of Multiple Doses of the Same Antigen" under "Timing and Spacing of Immunobiologics" appears to be based on "expert opinion and arrived at consensus" rather than actual clinical trials. This recommendation is not rooted in science but opinion. If physicians do not follow this ACIP guidance exactly,

will the DOH have the authority to dictate how a physician practices medicine related to vaccines?

16. How will the DOH minimize confusion among health care providers when there are substantive changes in the ACIP recommendations versus delays in implementation of these recommendations as allowed in proposed section 11-157-3(d)?

17. The definition of a practitioner includes PA, APRN, or physician licensed to practice in HI. The definition of a physician means a person licensed to practice medicine, including naturopathic and osteopathic medicine. However, the medical exemptions states that only a “physician” is allowed to certify a medical exemption, 11-157-5.

Does this mean that a PA and APRN are not allowed to write medical exemptions or that they can write an exemption but it must be certified by a Physician or Naturopathic physician?

18. What does the DOH mean by “certification by a physician,” on a medical exemption?

19. 11-157-5 states that religious exemptions must be certified to state that a “person’s religious beliefs prohibit the practice of immunization.” What does this mean exactly? If I am an atheist, does this fall under a person’s religious beliefs?

20. The proposed amendment states that a parent must certify that the person’s religious beliefs prohibit the practice of immunization. How does a person go about CERTIFYING their religious beliefs and WHO shall certify this belief?

21. Who will have the authority to deny a religious exemption and on what legal standing?

22. By rejecting a person’s religious beliefs on a religious exemption, whatever they may be, isn’t this religious discrimination, if not, how is it not?

23. In what situations could a Religious Exemption not be acceptable? Provide examples.

24. Please provide sample forms of the proposed Religious Exemption and medical exemption and any other forms, written or electronic, that are proposed by Chapter 11-157 and a list of information that will be required on both forms.

25. Will religious and medical exemption information be stored in the Hawaii Immunization Registry? If so, what other information will be stored in the HIR such as religious and medical exemption information?

26. Can parents refuse to allow their child’s immunization record be copied/sent from the school to the DOH? If not, why not? If so, what is the process?

Can parents refuse to allow their child’s immunization record to be

copied/sent from the physician to the DOH? If not, why not? If so, what is the process?

27. Please provide a sample opting out form to either the school or DOH, if hand-written or electronic. If electronic, what information will be required and who will be submitting an electronic form and to whom in the DOH?

28. To whom does section 11-157-7 Penalties and Remedies apply? – The physician, provider, school personnel, parents, or student? How would this case be decided, in a court of law or by an administrative hearing?

29. 11-157 does not define “vaccine preventable diseases.” However, since Hawaii is in a tropical region where there is a possibility of Zika infections, for example, does this mean that if a Zika vaccine is available, the DOH could mandate it even temporarily due to “unforeseen circumstances”(11-157-3(d))? Realistically, vaccine trials are being conducted at this time for Dengue[7], Ebola[8] and Zika[9] diseases. Also diabetes[10] and breast cancer[11] vaccines are also in clinical trials. If the ACIP recommended these vaccines, could the DOH require all these vaccines as well? Will the people have any say in this matter?

30. What are the estimated overall exemption rates for Hawaii from 2001 to 2018?

31. What are the estimated overall vaccination rates for Hawaii from 2001 to 2018?

32. What is the HPV rate among 7th graders in 2017 or 2018, i.e. cervical cancers, anal warts, genital warts for children in Hawaii?

33. How did the DOH determine the need for the HPV vaccine in Hawaii and was that based on Hawaii statistics or just because it is recommended by ACIP?

34. If a student is vaccinated per a mandatory requirement for school entry and becomes vaccine injured, can the school be held accountable and how will the department of health, immunization branch be held accountable?

35. If the ACIP makes more than one recommendation about a school related vaccine, how will that be communicated by the school to the parents?

36. Is the DOH aware that pediatricians have Incentive Programs[12] that will pay pediatricians a bonus for a certain percentage of children who are fully vaccinated in their pediatric practice? When vaccines are being pushed by pediatricians for monetary gain, is mandating vaccines in the best interests of our children?

37. Will physicians be required to use the Hawaii Immunization Registry (HIR) if Ch 11-157 is adopted?

38. What is the process for parents to acquire information

Subject: HAR 11-157 - OPPOSE
Date: Monday, November 05, 2018 3:16:04 PM

To the Department of Health,

I strongly oppose Amendment HAR 11-157. As a parent, I should decide the medical interventions appropriate for my own child, not the State. I do believe vaccines are necessary, however I do not agree with the CDC schedule of vaccinations, or the amount of vaccinations required. I support a delayed vaccine schedule, and as a parent it should be my choice.

I do understand the concern about the anti-vax movement putting everyone at risk, and some of the loudest proponents of "no" vaccinations do make the movement sound *crazy*. However, if you listen to the majority of these parents, they are far from crazy. They are deeply concerned about the risks associated with vaccines - both with the toxicity of ingredients as well as the schedule that doesn't take into account the inherent risks of immunizing babies so young. There needs to be studies showing the risks, more information available to the public on every level, before something like this is mandated. Without that information, all parents are hearing is a loud discord of right versus wrong and are unsure of the path to take. Forcing a vaccine mandate doesn't address the issue of parents being (very rightly) worried about the health risks.

There is a vaccine court that doles out money for vaccine injuries. That's because vaccines *can* harm. This is fact. Not all vaccines harm all children. This is also a fact. But because there are two sides, and one side proven to cause harm, this issue should not be taken lightly. Not when our keiki are the ones at risk.

Even more, once vaccinations are mandated, what's to stop pharmaceutical companies from forcing even more vaccinations on children and adults alike? Is the govt taking control in good faith that a billion dollar industry is going to sit by and not create 10-20 more vaccines for every child to be mandated to have? History has shown this will certainly not be the case...

There was only a 1 hr public hearing on Oahu only for testimony to be given. We, as parents, grandparents and citizens demand that there be other public hearings on each Island. This is too important of an issue to be rushed through without the chance for the public to testify. I ask that you delay your decision on this important issue and please please please listen to the people, parents, and concerned citizens of Hawaii nei.

Sincerely,
Katie Edmonds

Dear Department of Health,

My name is Teresa Gochenouer, longtime resident of Honolulu. I attended the hearing last week on this bill and I strongly request that you say an emphatic NO to it. First of all, the Department of Health should never have been allowed to be in this position of changing the law without legislative oversight. I see that this became law in 2013 and I deeply regret not having been a part of that decision by voicing my opinion in opposition to that, as I was unaware this was going on.

This bill is an affront to the American citizen on many levels. First, as an American citizen as provided in the Declaration of Independence, we as citizens of the United States have the right to life, liberty, and the pursuit of happiness. My body and the bodies of my children are protected by law. You cannot force people to be injected with poison under the guise of health. We are protected by law to live with liberty, as individuals, and shall not be forced to comply with your requirements using scare tactics with language that says our choices are at the expense of the community. Second, there is so much corruption in the CDC and the FDA, with collusion by officials and pharmaceutical companies, many who have worked for both, making this a huge conflict of interest, all the while harming children. Thirdly, these drugs have not been tested or been run through trials; the recipients of these vaccines are the trials, how shameful and reprehensible!! Fourthly, since 1986, these pharmaceutical companies have not been held accountable as they are protected by law from being sued by the individuals and families who have been damaged by these vaccines. What a racket! These companies have made billions of dollars and the rate of vaccine injuries has skyrocketed. To think that the Department of Health has the ability to change the vaccine schedule without oversight is horrendous. With the federal suggestion of increases to the vaccine schedule coming at an alarming rate who says when enough is enough!! We the people, the individuals do.

The hearing last week was attended by about 75% against this bill and about 25% for the bill, from my estimation. Of the individuals who testified, the people for the bill were largely people representing entities in the health profession, while the individuals in opposition to the bill were citizens like myself who stand on the principles of our country. The health professionals, while they see the patients with disease in their offices, are talking about the extremes, not the norm of society. Don't let the exception become the rule.

I am extremely against this bill, HAR11-157, because it goes against our God given rights to life, liberty, and the pursuit of happiness. I strongly oppose and it request that you do not pass this bill.

Sincerely,
Teresa Gochenouer

Date: Tuesday, November 06, 2018 8:59:27 PM

My name is Julie Patry from Lahaina, Hawaii. As a healthcare worker and mother in Hawaii, I am writing to strongly oppose HAR 11-157. I also request that hearings be held on all the outer islands regarding this important decision.

I want to tell you the story of my sister, Laura Meyer. In 1983, my sister Laura was born. I was 8 years old when she was born. My older sister and I were so excited to have a little sister. She was a healthy, beautiful baby. When she was 6 weeks old, my mother took her for her first well baby visit and she received her first immunization, the DPT. Within 12 hours, she had 3 seizures and a period of high-pitched crying. Our family doctor, who gave the immunization, easily diagnosed this as a severe reaction to the DPT shot. From that day on, she had seizures almost daily, and other days she would have many seizures. Our lives were now frequent medical appts and extended hospitalizations. We often had to call an ambulance to begin IV medications while transporting her to the hospital. Many of the important events in all our lives were a balancing act to care for her, often in the hospital, and carry on with life. Because of her reaction to the DPT immunization, Laura had severe brain damage. She never walked....never talked...and, as her doctors noted, was profoundly developmentally disabled. There was no doubt in our minds, or her doctors', that this was a result of the DPT immunization she received at 6 weeks.

Because of the overwhelming evidence in her case, my parents easily found a lawyer confident in our case. However, the National Childhood Vaccine Injury Act of 1986 had recently been passed. My parents chose "Vaccine Court" over a long and protracted court case. My sister was awarded compensation that would fund her care for the rest of her life.

Caring for a profoundly developmentally disabled child was often very difficult for my mother and our family. But Laura also brought our family so much joy and taught us in ways that no one else could have. Laura was a happy, smiling, beautiful child, who didn't know enough to have a care in the world. Despite her disabilities, she was loved by many for her easy-going nature and bright smile. I chose a career as a clinical social worker because of the lessons she taught me.

When Laura was 11 years old, the doctor convinced my parents that her compromised immune system would put her at risk if she did not receive the MMR. The same doctor who gave her the DPT, advised my parents that the risk of those illnesses outweighed the risk of the MMR vaccination. She received the MMR. She fell ill quickly after receiving it and never recovered.

One week later, she had the worst status seizure of her life. We called an ambulance as we had done many times before...within the hour, Laura was pronounced dead from cardiac and respiratory arrest. Her death certificate reads that her death was a result of a status seizure, the DPT reaction, and the MMR vaccine she had received just one week earlier. My sister was gone. This experience tested the strength of our family beyond all measure. It taught us lessons that we will never forget.

My sister would be 35 this year. I wish she was here to share my life with. This story is the legacy of my sister. To tell her story so you know that vaccine reactions do happen. They do exist. Parents are told they must vaccinate their children for the greater good or because the benefits outweigh the risks. For my sister Laura, the risk was the only reality. There was no benefit. For Laura, the benefit was zero and the risk was her life. Where there is this serious of risk, there must be choice.

I have many concerns about the addition of HPV, Hep A, and flu to the schedule of immunizations. I could write pages about my concerns, as you can tell that this is a topic that is near and dear to my heart. However, I will defer to all the other testimony you have received from other well-informed advocates for vaccine choice. My testimony is about my sister, her story. A reminder that vaccine reactions are real and more common than most realize. I now have two beautiful, healthy boys. They have never received a vaccination and it scares me to wonder what might have happened if they did. I could not go through that pain again. We will never know why my sister was so severely damaged by vaccination. I hope that someday our country will care enough to do the real research that is needed to find out, instead of continuing to deny the concerns and allow money and profits to rule the decisions. Until that day, I urge you to remember that vaccination is a medical choice with risks and consequences on both sides. Where there is risk, there must be choice!

Thank you for your time and attention,

Julie Patry

Thank you for this opportunity to provide testimony. As a community member and public health advocate, I am writing to strongly support the HAR 11-157 proposed rules update.

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you for your consideration.

Jennifer

Subject: HAR 11-157 rule changes for Hawaii vaccine policy
Date: Tuesday, November 06, 2018 1:39:27 PM

The state of Virginia has allowed parents to personally exempt their children from HPV vaccine. Why is it that Hawaii does not allow exemptions for personal beliefs? Religious beliefs are a human and a constitutional right so must be allowed. That in itself is self evident. But, it is an invasion of privacy demanding to know someone's religion. How can you ask one to state their religion as a basis for exemption when even the courts are not allowed to rule on religious interpretation. For example, there are dissenters and idiosyncratic believers among the churches. I may differ in opinion from my religious leader. Yet courts are forbidden to interpret religious beliefs or as to whether a belief is internally consistent. Having one state their religion is of itself absurd because you cannot interpret it. If I differ in opinion from my leaders who is to say who is right? Hep A vaccines from aborted fetuses would be against my belief. Yet, many churches who are against abortion will cave in on the vaccine issue and go along with the government probably for fear of losing their 501c3 status. Disclosing personal information such as one's religion can lead to discrimination. (This has already happened to my family from a DOE employee) Why do you need this information and for what purpose and, who will use this

information wrongly? And what about an atheist and where do they go to get an exemption? How can a vegan get a waiver since vaccines can be of animal or human origin?

Also, there are differences in philosophy in medicine. How does this accommodate someone who believes in oriental medicine? I am an approved NCCAOM candidate which means I am trained in acupuncture and oriental medicine. Personal philosophy, belief or, conscience needs to be accepted for exemptions. If we want to use religion as an exemption, why do we need to state the religious belief? It is not verifiable. There is something sinister about keeping secret lists of people of faith. Can you guarantee to safeguard such information? Our legislators failed us. In many states, legislation goes to many ridiculous lengths to try to circumvent our right to informed consent, even trying to allow teenagers to get the vaccination without their parents consent, though they have not succeeded. This is government overreach and suppression of parental rights.

A family member of mine in her 80's got Lupus after a shingles shot. Similarly, two patients in a care home had the same reaction. No one investigated. If the story was changed to 3 persons ate a restaurant and become ill it would have been investigated. Also, when an incident of a chemical spill which Hazmat responded to and was broadcast on the evening news yet. has to my

knowledge never been reported on the HEER reports. But the offending company was allowed to police themselves and take home the faulty equipment and bury the evidence. This is letting the fox into the hen house to count the eggs. I fear the same here. That those making decisions do not have our best interest in mind. Can we trust those that profit from vaccines to be in charge of policy and research?

We have seen so many vaccines that have been pulled from the market. I don't trust the CDC or the ACIP any other organization to make health decisions for us. They have not proven all vaccines to be safe. We do not like being ordered to play Russian roulette or be their guinea pigs with vaccines. The hearing was clear on this last week and I agree with those who spoke against the bill. Please have hearings for the outer island people.

Thank you,
Linda Manning

Re: SUPPORT for HAR 11-157 proposed rules update

Dear Dr. Anderson:

Thank you for the opportunity to provide testimony. we are writing in **strong support** for the HAR 11-157 proposed rules update. These changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The updated rules for HPV, meningococcal, and Tdap immunizations are critical for protecting children against these conditions as they grow into adulthood. HPV is just one example of how these vaccines are vital. According the CDC over 43,000 HPV-related cancers are diagnosed in the USA every year. Immunizing boys and girls against this virus will help to reduce these preventable diseases.

We also support the rule for child care facilities to require documentation of physicals and immunizations. These facilities often care for infants and young children who may have incomplete immunity against vaccine preventable diseases. They are also prime locations for transmission of diseases that could be brought home to vulnerable kupuna and immunocompromised family members.

We support strict regulation of medical exemption to immunization. Recent research from California shows that limiting personal belief exemption results in significant improvements in immunization rates. However this has resulted in marked increases in medical exemption. In some schools reportedly 20% of children are medically exempt. This begs belief as medical exemption is typically reserved for situations such as individuals with severe allergic reactions to the specific vaccine. The Department of Health should regulate these exemptions, and physicians who provide unwarranted exemption should be subject to scrutiny.

The Hawaii Chapter of the American Academy of Pediatrics is comprised of over 320 pediatricians and child health professionals in the state of Hawaii. Our Mission is to attain optimal physical, mental and social health and well-being for infants, children, adolescents and young adults. **We respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.**

Sincerely,

Michael S.L. Ching, MD, MPH, FAAP
Vice President, Hawaii AAP

I was like so say that I have very strong feelings against mandatory vaccinations. Having the right to decide what goes into your own body seems like a minimum freedom that we all should have. Any putting injections into tiny babies is something that parents should have the right to not do or delay. Gardasil is known to have really really bad side affects for some kids. Did you research Colton's story? Please don't let that happen to our kids in Hawaii.

I urge you to ease up on all mandatory vaccines please do not make it more strict. Thank you!!!

Heidi Schemp

A public hearing on the proposed Hawaii Administrative Rules (HAR 11-157) to update the school vaccination and examination requirements has been scheduled. Thursday, November 1st at 3:00-4:00pm

Date:

Tuesday, November 06, 2018 10:21:47 AM

I am submitting testimony as a physician and vaccine expert. (Prior medical director of a veterinary vaccine company with patents in viral inactivation and vaccine production and witness in a vaccine injury case)

The move to change the school immunization vaccine requirements is something that deserves great consideration.

I am requesting that you extend hearings to the neighbor islands and will also be requesting an informational briefing for the legislature regarding this issue.

Please realize that a precipitous rule change will negatively affect the uptake and use of vaccines.

There needs to be studies showing the risks, more information available to the public on every level, before something like this is mandated. Without that information, all parents are hearing is a loud discord of right versus wrong and are unsure of the path to take. Forcing a vaccine mandate doesn't address the issue of parents being (very rightly) worried about the health risks.

There is a vaccine court that doles out money for vaccine injuries. That's because vaccines *can* harm. This is fact. Not all vaccines harm all children. This is also a fact. But because there are two sides, and one side proven to cause harm, this issue should not be taken lightly. Not when our keiki are the ones at risk.

Even more, once vaccinations are mandated, what's to stop pharmaceutical companies from forcing even more vaccinations on children and adults alike? Is the govt taking control in good faith that a billion dollar industry is going to sit by and not create 10-20 more vaccines for every child to be mandated to have? History has shown this will certainly not be the case...

There was only a 1 hr public hearing on Oahu only for testimony to be given. We, as parents, grandparents and citizens demand that there be other public hearings on each Island. This is too important of an issue to be rushed through without the chance for the public to testify. I ask that you delay your decision on this important issue and please please please listen to the people, parents, and concerned citizens of Hawaii nei.

Sincerely,
Megan Kirkpatrick
Kauai born and raised, mother, botanist.

Subject: email testimony to support HAR 11-157 update
Date: Tuesday, November 06, 2018 11:08:17 AM

Thank you for this opportunity to provide testimony. As a Pediatrician and public health advocate, I am writing to **strongly support the HAR 11-157 proposed rules update.**

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities. In addition, I would support removal or “Naturopathic Medicine” providers from the definition of “physicians” as they are NOT physicians despite their wishes to be called such. Finally, I would support including “drop-in” child care centers in this as well. Even a brief exposure to someone with pertussis or measles is enough to make a vulnerable child (infant, immunocompromised) extremely ill.

Thank you for your consideration.

Tonya Kratovil, MD, FAAP
Pediatric Hospitalist

Subject: support for HAR 11-157
Date: Tuesday, November 06, 2018 11:16:40 AM

Thank you for this opportunity to provide testimony.

As a Pediatrician and public health advocate, I am writing to **strongly support the HAR 11-157 proposed rules update.**

My specialty is caring for the hospitalized children of Hawaii. Immunizations and the diseases they prevent are not a theoretical or statistical issue in my practice, they are something that I see and deal with every day. The diseases that were prevented for decades and that people think are no longer are a threat, are a very real danger to the children of our community. I have personally cared for children who have died from diseases such as whooping cough (pertussis), influenza and meningococcus (bacterial meningitis). I have had patients who needed to be hospitalized due to complications from rotavirus, Strep pneumoniae, chickenpox and measles. Within the last week I had a patient with issues due to Hepatitis B. This is not a full list but merely a sample of the vaccine preventable illnesses that I see far too frequently. There are so many infections and illnesses that I cannot protect children from because specific vaccines have not been created for them, but we can and should protect children and the larger community from the diseases that we do have safe vaccines for.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized.

To Whom It May Concern:

I am old enough that I took care of the gravely ill children who, for example, actually had Hemophilus influenza and Streptococcal pneumonia meningitis/epiglottitis/pneumonia in the 1970's and 1980's. Thanks to vaccines against these dreaded diseases, these diseases are now seen only rarely. I do understand why some in the general public cannot understand why these vaccines are so valuable as they have never seen these illnesses in friends and family—but they do not understand it is because of vaccinations that these diseases are not common. However, if we stop vaccinating, they will come back. Americans need to travel out of the country to countries that do not have well established vaccine programs...such as in 3rd world countries—and then they would “get it”.

Thanks so much for all your efforts to continue vaccinating our population in order to protect the general public.

Subject: HAR 11-157 proposed rules update
Date: Wednesday, November 07, 2018 10:32:28 AM

Thank you for this opportunity to provide testimony. As a community member and public health advocate, I am writing to **strongly support the HAR 11-157 proposed rules update.**

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

I was the previous chair of the Council on School Health at the national American Academy of Pediatrics. Schools rely on children to be healthy in order to learn. Without vaccines, many children would have diseases keeping them from school. I remember being out of school from chickenpox (varicella) and coming back with all of my classmates knowing how to write cursive, which I needed to catch up on.

Vaccines are fundamental to children's health. No state in the nation wants children to be unvaccinated, risking the health of whole groups of students. Vaccine-preventable diseases can spread like wildfire, as evident in communities that don't vaccinate their children.

So I strongly support the update of the HAR 11-157 rules. Do not allow our children to be unprotected.

Thank you for the opportunity to weigh in on this.

Jeffrey Okamoto M.D., FAAP

To whom it may concern:

As a practicing pediatrician for 36 years, I strongly support the HAR 11-157 proposed rules update which will make our immunization practices consistent with the recommendations of the ACIP. Vaccines have significantly reduced the frequency and severity of infant, childhood and adolescent infections but are effective only if administered community-wide and at the recommended ages.

Thank you for your consideration.

To Whom It May Concern.

I oppose any mandatory vaccines for any children in the State of Hawaii students to attend public or private schools. I believe a parent, adult, guardian should have the right to decide what gets injected into their bodies or that of their children. There are many risks to getting vaccines,. In 1988 I lost a son to SIDS after a scheduled vaccine. To this day I will never know if it was vaccine related. Had I known what I know now, I would not have allowed it. Growing up here in Hawaii we had very few vaccine requirements and did just fine. One child lost is Thank You for your time And consideration in this matter.

Subject: HAR 11-157 Testimony - One fact that can save thousands of lives
Date: Wednesday, November 07, 2018 11:42:21 AM

Aloha,

Thank you for hearing my testimony. I urge you with all of my heart to oppose HAR 11-157. Here is one fact that will give you the power to save thousands of lives in Hawaii in regard to Gardasil-9 (the HPV Vaccine) -

For every 100,000 people using Gardasil-9 there will be 2,300 serious adverse events. The Cervical Cancer diagnosis rate in the United States is 7.9/100,000. The risk of vaccine damage with Gardasil-9 far outweighs the benefit. This vaccine is not safe, not effective and WILL be pulled off the market eventually. Many Nations have banned it in order to protect the lives of millions of children. What we are about to witness in the State of Hawaii is a crime against humanity if HAR 11-157 passes. How could anyone in their right mind pass this bill? You must oppose it.

PLEASE use your position in office to do what it is right, not what is profitable. HAR 11-157 does not protect our children, it hurts them. Cancer is treatable, death and disability from an unsafe vaccine are not. PLEASE have the courage to stand up to Merck and these ruthless pharmaceutical companies that have zero liability. It is the parents decision whether or not to vaccinate.

There is only one correct answer, and it's to save lives by opposing HAR 11-157.

Mahalo,

Subject: HAR 11-157 rules
Date: Wednesday, November 07, 2018 9:50:40 AM

I am in full support of HAR 11-157 rules!

I used to see Pediatric wards and Pediatric ICUs filled with children and families who were devastated by hemophilus influenza type B infections as well as pneumococcal strep infections. I no longer see these infections to any degree due to the wonderful job these immunizations have done for our community. This is but one example of the incredible success of immunizations.

I have seen a few cases of meningococcal infections in my 30 year career. I never want to see another one of these devastating illnesses. We now have an immunization to help protect against this terrible infection.

I have never seen a child permanently injured by a vaccine in my 30 years of practice where we give 100's of vaccines a week.

Why anyone would not want to provide our keiki with the protection they deserve is beyond my understanding. Immunizations are a corner stone of preventative medicine and care. Thank you for the opportunity to protect the future of Hawaii. Children may only make up a part of our population but they make up all of our future. LET'S PROTECT THEM and our community by having them fully immunized.

Sincerely,

R. Michael Hamilton, MD, MS, FAAP

To Whom It May Concern,

I oppose any mandatory medical procedure. I stand for Body Sovereignty. Regardless of your stance towards immunizations it should be your choice whether you do it or not. I personally and professionally, with my education as a Doctor of Chiropractic, have not seen any research about their safety that stands to scrutiny. Please consider people's rights to choose what they put inside their bodies, especially when there is a great and growing body of research that shows the toxicity and the risk that is involved in immunization programs.

Respectfully,

Luis E. Feliu, DC

Student Immunization Initiative
Registered Independent Organization

November 7th, 2018

Re: Hawaii Administrative Rules (HAR) Title 11, Chapter 157, "Examination and Immunization"

To Whom It May Concern:

The Student Immunization Initiative (SII) is an organization led by graduate students of the University of Hawai'i at Mānoa. SII advocates for the importance of immunization and participates in educational outreach programs with a focus on vaccine-preventable diseases. The majority of SII members participate in biomedical research and have a thorough understanding of the science behind vaccine development and benefits of increased immunization rates in a community. SII was founded in Hawaii in 2016 and has more than one hundred supporters. **SII strongly supports the HAR 11-157 proposed rules.**

The proposed update of the Hawaii Administrative Rules will ensure Hawaii is up-to-date on the most recent recommendations from the Advisory Committee on Immunization Practices (ACIP). The ACIP is comprised of medical and public health experts, including members of the American Academy of Pediatrics and the American Academy of Family Physicians. The ACIP methodically reviews all data regarding a vaccine's safety and efficacy at specific ages to make recommendations for immunization schedules.

The United States Food and Drug Administration's (FDA) approval process ensures vaccines are as safe as possible. FDA clinical trials require three major phases of approval with safety and effectiveness assessed throughout. Due to this stringent safety monitoring, the U.S. has the safest vaccine supply in history. However, the reality is that no vaccine is 100% effective and many individuals, such as newborns and the immunocompromised, cannot be immunized. Therefore, it is imperative to keep vaccination rates high to ensure *community immunity* – protection for those who cannot be vaccinated.

The Centers for Disease Control and Prevention (CDC) makes it abundantly clear that state and local requirements for daycare and school entry, such as the proposed update HAR 11-157, are important tools for maintaining high vaccination rates and thus lowering the rates of vaccine preventable diseases. The proposed update HAR 11-157 will ensure that students entering 7th grade or higher receive the HPV, MCV, and Tdap shots. This requirement is especially important due to low uptake levels and by ensuring protection prior to exposure, especially for the HPV vaccine.

We respectfully request that the Hawaii Administrative Rule 11-157 be supported and passed for the reasons noted above.

Thank you for this opportunity to provide testimony on the proposed rules.

Sincerely,

The Student Immunization Initiative

November 8, 2018

Bruce Anderson, PH.D.

Director of Health
Hawaii Department of Health

SUBJECT: Hawaii Administrative Rules (HAS) Title 11, Chapter 157,
"Examination and Immunization

Thank you for the opportunity to provide testimony on these proposed rules. I strongly support the rule changes that would establish immunization requirements for school and post secondary students and children enrolled in child care facilities. The Department of Health (DOH), Immunization Branch is charged with monitoring this program.

The Centers for Disease Control and Prevention (CDC) suggests that state and local vaccination requirements for school entry and day care are important for keeping vaccination rates high and as a result lowers rates of vaccine-preventable diseases.

One example of a vaccine-preventable disease is flu. As a former administrator of the Department of Education, I worked with the DOH nurses to develop a coordinated program to provide flu immunizations to all students except those with medical exemptions. It was anticipated that families, often with grandparents living in the home, would also benefit by preventing this disease. Flu could involve visits to a doctor, hospitalizations and even premature death. Parents also could lose time from work. As a result, the flu immunization program has been successful and has continued in Hawaii.

Therefore, I request that the administrative rule changes be supported and

passed to benefit Hawaii's students and families.

Subject: HPV Vaccine Testimony
Date: Wednesday, November 07, 2018 4:31:20 PM

Dear Director Anderson,

My name is Caroline Stoner, and I am writing to express my support of proposed amendments to H.A.R. Title 11, Chapter 157, Examination and Immunization. The scope of efficient immunization benefits for individuals and the State include, preventing long term healthcare costs and the potential loss of productivity. Thank you for this opportunity to provide testimony. As a community member and public health advocate, I am writing to **strongly support the HAR 11-157 proposed rules update.**

Specifically, the proposed amendments that address the prevention of HPV and HPV-related cancers. The HPV virus has serious repercussions such as cancer and genital warts, both of which result not only in physical ailments, but also emotional stress.

As a young woman with many dreams and ambitions, I can speak on behalf of the younger generation when I say we deserve to be protected. Proper vaccinations can help ensure I achieve my goals and have the brightest future.

The HPV vaccine is important because it is currently the most common STD virus and has no cure. About one in four—are currently infected in the United States. Every year, individuals in the US are diagnosed with cancer resulting from contracting HPV, and of those diagnosed with cancer, one-third will die from the disease.

If we can protect our youth from the potential of contracting cancer or other harmful symptoms, by adopting these regulations now, we absolutely must.

I urge you to support **HAR 11-157 proposed rules update.** Thank you for the consideration of my testimony.

Mahalo,
Caroline Stoner

I am a student pharmacist at the [REDACTED]. I support the amendments proposed for Title 11, Chapter 157 "Examination and Immunization" as this would help to increase the health of our students and community. With the passing of this amendment, many members of the community who did not fall under the age range for initial vaccination (<26yo) can receive the preventative measures against several of the cancers that the HPV vaccine yields. Thank you for your time and consideration.

Best regards,
Brent Ocker

Subject: Testimony to OPPOSE HAR 11-157
Date: Wednesday, November 07, 2018 11:26:33 AM

Aloha,

My name is Amber David. I was born and raised here on [REDACTED]. I am a mother of 3 children, all born and are being raised here on [REDACTED].

Thank you for this opportunity to provide testimony. I am writing to you as a mother, that is responsible for the health, safety and well being of my 3 children. I am writing as a concerned community member for all the keiki of Hawaii.

I am writing to strongly oppose HAR 11-157. I also request that there be hearings on all islands.

The amount of vaccines on the CDC suggested vaccine schedule has dramatically increased from 10 doses in 1980, to currently 72 doses for children from birth to age 18.

It greatly concerns me, as it should concern you that there have been no long term studies done showing the safety and effects of the CDC's suggested vaccine schedule. Nor have there been studies done on dosages and large combinations of vaccines given at baby well visits.

The list keeps growing. Again, there have been no safety studies done! To propose to add even more to the already overburdened schedule is irresponsible and a disregard for the safety of our children. Our children are made to be test subjects, and this is unacceptable! If a child does become vaccine injured, the vaccine manufacturers are granted immunity from liability.

If there is even any question about the safety and effectiveness of vaccines, they should not be mandated. If there is a risk, there must be a choice. Parents have the right to informed consent so they can make educated decisions when it comes to vaccines and their own children. Medical freedom is a basic right, and medical freedom should be protected. The future of our keiki depend on it.

The advancement of the proposed mandate could be catastrophic and cause irreversible damage. Please, I urge you to do what is right for the future of our keiki.

Thank you for taking the time to read my testimony.

Aloha, Amber David

Subject: Testimony Title 11. Chapter 157 Examination and Immunization
Date: Wednesday, November 07, 2018 11:28:37 AM

Dear DOH,

I am a student pharmacist at the [REDACTED]. I support the amendments proposed for Title 11, Chapter 157 "Examination and Immunization" as this would help to increase the health of our students and community. Mandating immunization requirements for school will help us protect our community and students from acquiring diseases that are preventable and educate and spread the awareness of the importance of it.

Thank you,
Jiyoung Min

Subject: Testimony
Date: Wednesday, November 07, 2018 11:43:54 AM

Thank you for this opportunity to provide testimony. As a community member and pediatrician, I am writing to strongly support the HAR 11-157 proposed rules update.

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you for your consideration.

Kelli-Ann

To: Hawaii State Department of Health
Hearing Date/Time: Wednesday, Nov. 7, 2018, 3:00 p.m.
Place: Hawaii Department of Health, Kinau Hale Boardroom, 1st Fl.
Re: Testimony of Planned Parenthood Votes Northwest and Hawaii in support of
Proposed Amendments to H.A.R. Title 11, Chapter 157, Examination and
Immunization

Dear Director Anderson,

I am a third generation Hawai'i resident, a graduate student at Hawai'i Pacific University, and President of our campus' Generation Action Club. I am writing in support of proposed amendments to H.A.R. Title 11, Chapter 157, Examination and Immunization, which seek to codify the United States Department of Health and Human Services' Advisory Committee on Immunization Practices' General Best Practice Guidelines for Immunization.

The scope of efficient immunization benefits for individuals and the State include, preventing long term healthcare costs and the potential loss of productivity. In the long term, this leads to increased economic productivity and wellbeing for our communities by improving financial security and reducing risk.

Specifically, the proposed amendments that address the prevention of HPV and HPV-related cancers. According to the U.S. Department of Health & Human Services, Hawaii Adolescent Reproductive Health Facts, only 48% of Hawaii's teens reported using condoms during intercourse, compared to national average of 57%. The risk of unprotected sex can lead to contracting STDs including the HPV virus which currently has serious repercussions and currently, no cure.

According to the Center for Disease Control and Prevention, HPV infection can cause, "cancers of the cervix, vagina, and vulva in women; penis in men; anus, back of the throat, including the base of the tongue and tonsils (oropharynx), in both women and men; and can also cause called genital warts." These symptoms cause not only extreme physical ailments, but also cause emotional stress and their treatment can be very uncomfortable.

Sexual and reproductive health of our youth is especially important because the peak time for acquiring infection for both women and men is shortly after becoming sexually active. Ideally females and males will get the vaccine before they become sexually active and exposed to HPV, as outlined in the proposed amendments.

The HPV vaccine is important because it is a very common virus; about one in four—are currently infected in the United States, and about 14 million people, including teens, become infected with HPV each year (CDC). Every year, individuals in the US are diagnosed with cancer resulting from contracting HPV, and of those diagnosed, one-third will die from the disease.

If we can protect our youth from the potential of contracting cancer or other harmful symptoms, by adopting these regulations now, we absolutely must.

Thank you for the opportunity to testify in support of this important effort.

Sincerely,

Maisa Thayer

My stance on this issue as a mother of 4 and grandmother of 6:

My good friends son was born six days before my second child. He went to his doctor for vaccinations and his life was forever changed. That evening he had seizures. They didn't stop. Obviously the poor little guy suffered severe complications due to the vaccines he received. He was normal and just like that his life and his young parents lives were ruined! Needless to say, my son did not show up for his appointment the following week.

Thank god my children and grandchildren are not vaccinated.

I have worked with young children as a teacher and parent all my life and I can honestly say the children raised by alternative, health conscious parents are thriving, strong And healthy.

Government and big pharmaceutical companies do not have the right to discriminate against children who's parents have made the conscious decision to not risk the obvious dangerous consequences of this onslaught of toxic poisons being forced on them in lieu of a public education paid for by their taxes.

Furthermore, the forcing of seventh graders risk their lives by taking the hpv vaccines is ludicrous. This vaccination is obviously dangerous. Please look at the stories of the story suffering endured by these once healthy victims of these vaccines.

Please don't risk our children's safety in exchange for \$ from the evil big pharmaceutical companies.

Don't follow the footsteps of California and other states.

Make Hawaii a trend setter not a weak follower.

Look at the health statistics worldwide.

Respectfully, Nancy Wood. (Rogers)

Date: Wednesday, November 07, 2018 11:37:48 AM

To the Department of Health,

My name is Catherine Posner, I am a mother and Resident on Kaua'I Island and I strongly oppose amendment HAR 11-157.

The State SHOULD NOT have the right to decide for any parents about vaccinating their own children. WHERE THERE IS A RISK THERE MUST BE A CHOICE !!!

There was only a 1 public hearing on Oahu for testimony to be given. We, as parents and citizens demand that there be other public hearings on each Island. This is too important of an issue to be rushed and I ask that you delay your decision on this extremely important issue.

Sincerely,

Catherine Posner

I am submitting my testimony strongly opposing HAR 11-157. The childhood vaccination schedule grows every year and has never been subjected to any testing in its entirety. The vaccine schedule continues to grow and has never been tested for safety. We are not genetic clones and it is well-established in the medical literature that some individuals have genetic make-ups that make them more susceptible to Adverse Events following Vaccination.

Subject: Testimony for Proposed Changes to HAR 11-157
Date: Wednesday, November 07, 2018 11:51:31 AM

Thank you for this opportunity to provide testimony. My name is Keanu Wong, I am 26, and as a community member and an uncle to three young nephews, I am writing to strongly support the HAR 11-157 proposed rules update.

The reason why I support the changes to the HAR 11-157 rules come down to the point that there may be certain children and adolescents that don't have the ability to become immunized, such as neonates and children going through chemotherapy; in which case herd immunity, a term used since 1923 and recognized as a naturally occurring phenomenon in the 1930s, helps protect the aforementioned children/adolescents.

As an uncle to an eight month old, a five-year old, and a prenatal child, it worries me that if the immunization requirements don't become more stringent, then my family may be put at risk due to less requirements. There is scientific research that proves that if more vaccine exemptions are in a community, the more that said community is at risk for vaccine-preventable disease outbreaks such as HPV and Meningococcal disease.

I respectfully request that the proposed changes to HAR 11-157 rules be supported and passed for the health of all of our communities.

Thank you for your consideration.

Thank you for the opportunity to provide testimony as a pediatrician with 30 years of clinical experience. I strongly support of HAR 11-157 proposed rules update. I have had the personal good fortune during the 1980s to witness the rapid decline over a period of 1-2 years of life-threatening and crippling invasive Hemophilus influenzae disease in children following the nationwide implementation of universal hemophilus influenzae vaccination in children.

The science supporting universal immunization of vaccine-preventable diseases is , for all intents and purposes, irrefutable. It is based upon a wealth of research with vigorous methodology, excellent study design, and adequate population size. There is simply no question that universal vaccination is a substantial public health benefit, preventing both loss of life and limb. Therefore, the burden of proof to discontinue or limit universal vaccination lies with the anti-vaccination coalition.

Demand to see the proof behind the claims of these anti-vaccination groups. Don't settle for less than the careful scrutiny of the science, methodology and study design, and objectivity of the claims these groups wave in front of your faces. Because they will, in the end, come up short. Many of the arguments put forward by anti-vaccination forces are not based on science but temporal associations, the same process that would prove that roosters crowing at dawn cause the sun to rise.

Do not be gulled or lulled by empty rhetoric or dramatic hair-rendering. Truth and reason should not be decided simply by he who shouts the loudest. Passion without substance, or substantiation, after all, is nothing more than hot air.

Thank your for your time, thought, and patience.

Immunizations are one of the Top 10 Achievements in Public Health in the 20th Century. Infectious diseases were once very prevalent in the United States and many people died as a result. For example, in 1920 there were 469,924 cases of measles reported in the US and 7,575 died and 147,991 diphtheria cases reported and 13,170 died.

These diseases are NOT gone, they are kept at bay by having a well-vaccinated population. As an example, in April through May of 2017, Minnesota experienced their largest outbreak of measles in 30 years as a result of low vaccination rates among Minnesota's Somali-American community members. Vaccine coverage rates for MMR had dropped from 90% to only 54% at the time of the outbreak as a result of misinformation about the relationship between vaccines and autism. This is the same type of misinformation that opponents to HAR 11-157 are spreading.

Please approve HAR 11-157. Protect our children and our communities.

Thank you,
Michele Nakata

To whom it may concern,

My name is Dr. Aki Oshita. I am a father of one son and Doctor of Chiropractic for last 10 years.

I am writing this email to share the concern about school vaccination and examination. Also, since we are Pediatric and Maternity Chiropractic office, we have been similar concerns from the parents.

Based on clinical studies about immunization, anatomy, and physiology, everybody is aware of risk and side effects just like other medication. I am not listing the detailed information since you have heard them all. (However, if you need the scientific evidences from our professions, please let me know.)

As long as we DO know that there are side effects and ricks, we as the human beings SHOULD have OPTIONS, just like nobody forces us to take medications.

Thank you so much for spending time to read this.

I would like it to be documented that as a resident of Hawaii with children, that I strongly OPPOSE the proposed increased immunizations for school-aged children in the state of Hawai'i. In particular, I oppose the requirements for the flu vaccine and HPV vaccine. I understand and support the science behind vaccinations, have gotten them myself, and have gotten them for my family. However, these two vaccines in particular are very risky for the young to be subjected to. My family has a history of adverse reactions to the flu shot and I plan not to subject my children to be a "lab animal" and have them receive the flu shot and have a potentially fatal reaction simply because it is mandated by law.

Also, I feel compelled to point out that HPV is a sexually transmitted disease and not communicable by any other means. Why would this be required for attendance in a Hawaii school?

We had previously planned to enroll our children in a private school, however we will absolutely resort to homeschooling or moving if these new proposed immunizations become a requirement. I will not risk my family's health and safety so the DOH can pad the pockets of pharmaceutical companies.

Do not pass the new immunization rules.

It is my RIGHT to chose for myself and my family how, when or if we vaccinate.

We do not know the long term effects of the flu vaccine and HPV vaccines.

This is inappropriate and I will fight this with every ounce of my being.

You placed the hearing for this for the public on a weekday, before the holidays in the afternoon. That is inconsiderate and unfair. People who have families to support are going to be at work! They'll be working extra hard right before the holidays to maintain the time off they'll need shortly after. You're doing a dis-service to our community by allotting this time frame as the public's opportunity to voice their opinions and you're stripping us of our rights.

Do not pass this!
We should not be forced to vaccinate!

Aloha, I was reading about this required vaccine for school and I'm totally not comfortable with the HPV & Flu vaccine. I have 3 daughters ages 12,10 & 3. I would never vaccinate my child with these 2. I'm not a anti-Vaccination parent either. My 2 oldest are fully vaccinated except for the 2 listed above. There just is not enough studies done to put this poison on my child especially the HPV. Adults I know who have been vaccinated with HPV (young adults) have tumors and that can't just be a coincidence. If this is a forced procedure done, my kids will not be going to school. My kids go to public school in Lahaina, Maui and I support vaccination but this makes me really not happy to support these 2 particular. STD vaccine is not a illness that can spread like Chicken pox or Measles, it's rediculous that it would be treated like so. Please take this into consideration. Mahalo, April Colpas

Good Morning,

Due to a computer screen problem I had while submitting my testimony, I was just able to reread what I wrote and noticed the second to the last sentence was cut off. Please accept my apologies and accept my testimony with the completed sentence.

Thank You...

To Whom It May Concern.

I oppose any mandatory vaccines for any children in the State of Hawaii students to attend public or private schools. I believe a parent, adult, guardian should have the right to decide what gets injected into their bodies or that of their children. There are many risks to getting vaccines,. In 1988 I lost a son to SIDS after a scheduled vaccine. To this day I will never know if it was vaccine related. Had I known what I know now, I would not have allowed it. Growing up here in Hawaii we had very few vaccine requirements and did just fine. One child lost is one too many.

Thank You for your time And consideration in this matter.

Aloha,
Sheila Gage

Hello,

It is my understanding that there is talks to make HPV and the flu vaccine mandatory for school age children. This concerns me GREATLY! I do NOT believe that this should come to pass for a multitude of reasons - the easiest being that a parent should have the right to choose what is best for their child.

Where is the public hearing on this on the 14th? I would like to be in attendance.

Thank you,
Dani

Subject: Concerned parent Testimony against vaccine changes
Date: Wednesday, November 14, 2018 1:01:11 PM

Aloha,

As a concerned parent, I am vary worried that the State of Hawaii will be ending the vaccine exception choice for children, as well as, adding two more vaccines to the current schedule. I am concerned about this blanket declaration, because not all people respond well to vaccines. This is also true for medications and food. So, If someone has a food allergy, we do not force them to eat that food. Then why would we mandate across the board vaccinations knowing some children will be compromised and get very sick or have life long illnesses because of it.

As an adult, I am completely up to date on my vaccinations. (Which is rare)However, due to vaccines, I have had to deal with some life altering side effects. These side effects have created a hardship in my overall quality of life and I will be dealing with these side effects for the rest of my days. This has been costly, physically damaging and emotionally draining.

As a parent, who has experienced vaccine side effects and as an informed individual, who knows that all vaccines do have side effects, which sometimes includes death, it is very important to realize that a one size fits all model is not ideal for an entire community. Information on vaccine side effects are available to anyone who asks or researches the topic. This information can be found directly in the vaccine inserts that accompany the vaccines or online. Please, before making any decisions on changing or mandating the vaccine schedule look into the known side effects that do effect some people.

Taking away vaccine exceptions, will cause harm to a certain population of children. We as parents know our children and must do everything to keep them safe. I know some people say, well just home school if you don't like it, but living in Hawaii, our family is in the exact same finacial predicament as so many others. Both my husband and I must work to survive.

Furthermore, to require the hpv vaccine that has done so much damage to so many children around the country and world seems extremely cruel. Beyond my own children, I wouldn't want any parents to be forced to give that vaccine to their children, based on all the bad reactions kids have had. This information is easily attainable through a simple research. I would start with looking at Japan and the information they are learning and publicly sharing about the dangers of the vaccine. Also, hpv is a sexually transmitted disease, not all kids are having unprotected sex or sex at all. So, why in the world would we mandate this completely unnecessary vaccine on them. The risk is absolutely not worth it. We need to trust our children to make good decisions and trust parents to be aware and raise our children responsibly.

So in conclusion, please don't treat all children the same and mandate a vaccine schedule for them that may damage them in the long run.

Please do not add additional dangerous vaccines to the schedule.

Please look into current scientific research that gives a much deeper understanding of how vaccines work.

Think about the children and help us protect the kids who can't handle the toxic load of so many vaccinations.

Sincerely,
A concerned parent

Aloha,

I oppose mandatory vaccinating of all or any Beings. There is too much evidence that vaccinating children and even adults causes significant injury.

Please do not support this bill mandating vaccinations.

I am a grand mother with a young child in the public school system, we will take our child out of public school if this bill is passed.

Thank you for not supporting this bill,

Caroline Delano

Subject: In Support of HAR 11-157
Date: Saturday, November 17, 2018 12:56:29 PM

Thank you for this opportunity to provide testimony. As a community member and public health advocate, I am writing to **strongly support the HAR 11-157 proposed rules update.**

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you for your consideration.

Aloha,

My name is Stasia Estep and I am emailing from the island of Kauai in Opposition of HAR 11-157. These proposed changes will make the highly controversial vaccine HPV, as well as Influnza (which every year varies in percentage of effectiveness, and of recent years is anywhere from 10-60% effective - NOT enough to be warrant a mandate) and others, mandatory for public school here in Hawai'i. The first two are under fire in a number of other countries including but not limited to China, Japan and Canada as of recently.

To mandate these, as well as create further restrictions on medical exemptions with no legal liability on the pharmaceutical companies is both irresponsible and inhumane. It is a violation of our human and civil rights to force a medical procedure with stated and reported risks without easily attained refusal options for those unwilling to take the risk. Behind the paid-for rhetoric of "safe and effective" (not to mention conflict of interest regarding CDC recommendations and pharmaceutical studies) history evidences cases of retroviruses, ineffectiveness, brain damage and other extreme medical risks. With risk must come choice. Expanding exemptions, and shrinking mandates should be the measures on the table, NOT the exact opposite which you are proposing: expanding mandates and shrinking qualifications for exemptions.

Also, this is likely in violation of FERPA rules to require schools to report our children's immunization status to a third party, in this case state/local health departments. I encourage you to explain how it doesn't, if that is the case.

Thank you and I strongly OPPOSE HAR 11-157.

Sincerely,
Stasia Estep

Hello,

I am contacting you all to express my concerns in the HAR 11-157. I oppose this bill. I believe the choice to receive these vaccines should be between the parent(s) and the child's doctor. Where there is a risk of injury and death (no matter how small), there must be a choice. Mandatory vaccination violates my rights. HPV and Hep A are not spread by contact. These vaccines shouldn't be mandatory but up to the parent's discretion.

Please do not force a medical procedure on a non consenting individual. This is unethical.

Thank you,
Karine De Lima

Subject: Testimony for HAR 11-157
Date: Tuesday, November 20, 2018 8:20:56 PM

Aloha,

My name is Kelly Davis and I am representing myself. I am strongly opposed to HAR 11-157. Many individuals can have serious even deadly reactions to vaccinations. My brother and I both had bad reactions to the MMR shot and screamed for days after the shots. I had learning disabilities afterwards growing up which I eventually outgrew. (I believe I outgrew this because over time my body eliminated the chemicals that were injected). Unfortunately, my brother regressed severely after his vaccinations and he is now diagnosed with Asperger's. No parent should feel forced to give their child a vaccination, or they are not allowed to receive an education. There are many side effects and once the damage is done there is no return. You will be left with a disabled child and cannot even hold anyone liable. Vaccines are not double-blind placebo tested and I believe they should not be forced upon anyone. Health freedom should be a basic human right and no one should be forced to inject something into their body.

Some of the vaccinations required by the DOH are not risks for children at school such as the HPV vaccination which only prevents a sexually transmitted disease. Since children are not having sex at school, I don't see why the school system would feel it needs to be required to attend.

Thank you for taking the time to read this and please do not let HAR 11-157 pass.

Kelly Davis

This is why vaccines should not be mandatory. This is a published letter. I am in favor of further investigation not only of gardasil but every vaccine.

TO: FDA Commission, Dr. Scott Gottlieb

I fully support this request for investigation. As a co-author of “HPV Vaccine on Trial,” I have spent the past several years investigating Gardasil, Gardasil 9 and Cervarix. What my co-authors and I learned during the research and writing process was deeply unsettling to me. These vaccines have been recommended not only in the US but also in many other nations and now in the US Gardasil 9 is recommended to millions of children and even adults up to age 45. Yet despite recommending these vaccines to millions of children, safety testing was woefully inadequate and should have precluded product approval. Gardasil clinical trials did not include a saline placebo, the gold standard by which to assess new vaccines. Instead, all but a few hundred “control” participants received Gardasil’s aluminum-containing adjuvant AAHS. Aluminum is a known neurotoxin and Merck boasts that AAHS elicits stronger immune responses than older adjuvants. The flip side of this is that it is more reactogenic as well – creating increased risk of injury. Moreover, DNA fragments remaining in the vaccine may be acting as an undisclosed and unapproved adjuvant. The few hundred children who did not receive AAHS as a control received other active and potentially harmful ingredients in a trial protocol that, as our book and the SaneVax letter describe, was fraught with problems. We now know that, from the clinical trials on, people have not been told the truth about this vaccine. In the trials, young women were told the control was saline and that the vaccine already had been shown to be safe. Neither of these things was true. Gardasil 9’s approval hinges on a presumption that Gardasil is safe, a presumption that is inactuate. Thousands and thousands of children and young adults have been injured by these vaccines. Each of their stories merits investigation and attention. Lives have been damaged and children have died far too young. In cases like the Tarsell and Harmon cases, the VICP has recognized that Gardasil vaccination led to death (Tarsell) and devastating and life altering injuries (Harmon). We still don’t know if these vaccines will prevent cancers and, particularly in high resource nations with strong screening programs for cervical cancer, most women are not at risk. According to NCI 0.6% of US women are at risk of cervical cancer in their lifetimes. The incidence of cervical cancer in 15-24 year olds is thankfully very low: 6 in 1,000,000 (Guo et al. 2018). The rate of injuries reported from these vaccines is tragically much higher. Even in the trials, at the time of Gardasil’s approval approximately 50% of participants reported New Medical Condition – many autoimmune. Yet these were largely dismissed as not related to the vaccine with what appears, from publicly available documents and witness accounts, to be little or no investigation, not the rigorous investigation that should have been done. Even if these vaccines are someday proven to prevent some cancers (many of which would have been detected in screening) we must ask, at what cost? The risk side of the risk/benefit analysis has been minimized and “disappeared” through studies poorly designed to detect risk. But in the real world – given the many injuries reported – risk seems to heavily outweigh the as yet unproven benefit. The FDA must immediately investigate to protect the safety of our children and children worldwide as many nations look to the FDA for guidance. Anything less than an immediate, unbiased inquiry is a disservice.

I support the update of the DOH immunization requirements. Vaccines are safe, effective and good not only for the person receiving them, but for our community as a whole! It is so important not to let a small but vocal proportion of our community (anti-vaxxers) create an unhealthy climate for babies, kupuna and those that are immune-compromised. Please support the update of the bill.

To Whom-It-May-Concern,

I am a resident of the island of Kauai and a parent fo a child who has been given immunization shots while growing up.

Anti-vax, sentiment runs deep in the island and is causing harm to our kids. Last year we had an outbreak of mumps on the north shore of Kauai that was easily preventable. The Centers for Disease Control & Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates and in turn lower rates of vaccine-preventable diseases. It also debunks the myth that vaccines cause autism.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Sincerely,

Jeannie Yoshida

Aloha Kakou

As a lifelong citizen of Hawaii nei and a kupuna, I am so fortunate to have been born just before but close enough to the time when the polio vaccination was introduced. I remember that it was done in 2 stages and all Kilauea people old and young lined up for immunization. This disease was FEARED and today I am thankful for being spared through immunization! I no longer had to live in fear! As part of the plantation's health care, we received our early infant inoculations for measles mumps and diphtheria. Then at school we got regular shots for tetanus and typhoid. Today both my wife Bebe and I maintain our annual flu immunization and both have hepatitis A, pneumonia, and shingles vaccinations. We believe in them out of personal experience as well as the empirical evidence that backs the science!

We are grateful for the advancements in medical science whereby we personally benefit as well as all our acquaintances and family who will not catch any of the communicable diseases from us.

The CDC GUIDELINES SHOULD BE ADHERED TO AND ADOPTED BY THE STATE OF HAWAII AS OUR MEDICAL POLICY FOR IMMUNIZATION AS WELL!!!

Those people who oppose these guidelines do so at all our peril!!!! Some out of fear purported by pseudo medical science, ignorance or archaic religious beliefs, yet are largely spared these diseases today as unsupportive beneficiaries of CDC's vigilance as well as all of us who are immunized. Go to the website for mothers who have lost children because they chose not to immunize them!! See their pain and regret for not having done so.

Let's not be swayed by the hysteria. Contrary to what our president espouses **WE ARE A NATION OF SCIENCE!!!**

Do not take my word or the word of the vociferous opponents. Let results of **MEDICAL SCIENCE** guide your decision!!!

Aloha,

The Hawai'i State Department of Health (DoH) is urged to abandon and reject the proposed amendments to the Hawai'i State Administrative Rules (HAR) Title 11 Department of Health Chapter 157 Examination and Immunization. If adopted, Hawai'i would attain the dubious distinction of being the most vaccinated state in America.

In regards to the Human Papillomaviru (HPV) vaccination: "... lawsuits have been launched in Japan, France, Ireland, Spain, and Columbia claiming HPV vaccine harm." In fact, "The Vigibase database of the World Health Organization has compiled more than 86,000 serious adverse event reports for Merck's HPV vaccine. They include nervous system disorders (39,092), respiratory, thoracic and mediastinal disorders (6060), vascular disorders (5766), nervous system disorders (39,092), reproductive system and breast disorders (3267), cardiac disorders (2604), and blood and lymphatic system disorders (2035)... The number of AE's (Adverse Events) reported for HPV vaccines, in each country, are overwhelmingly higher than that for other vaccines." Also, a 2012 Canadian study "...suggests that HPV vaccines containing HPV-16L1 antigens pose an inherent risk for triggering potentially fatal autoimmune vasculopathies." Curiously, the US Center for Disease Control (CDC) website seems to omit the aforementioned AE's the CDC HPV Vaccine website despite numerous AE reports on the Vaccine Adverse Event Reporting System (VAERS) Database.

If the HPV vaccine is so safe then why has the "National Vaccine Injury Compensation Program has awarded more than \$5 million to 49 victims in claims made against the HPV vaccine"? In addition, "there is compelling evidence that vaccine manufacturer Merck conducted shoddy, questionable clinical trials; and that a number of individuals around the world have suffered drastic health consequences post HPV vaccination." Suffice it to say, the administration of the HPV vaccine should be halted until further studies on the safety and efficacy of this drug are conducted. Please remember that individuals with both diagnosed and undiagnosed immunodeficiency conditions are at an increased risk of AE's from vaccinations. Thus, increasing the vaccine schedule would further exacerbate the likelihood of more adverse events; and in so doing, imperil the health and lives of this vulnerable population.

Furthermore, why do our Hawai'i students--primarily comprised of underage adults-- need this vaccine? By promoting the HPV vaccines

seems as though the DoH and Hawai'i State Department of Education (DoE) are not only condoning but actually promoting sexual activity among students. If the DoE is genuinely concerned about sexual relations and reproductive health, wouldn't it be far more effective for the DoE to instead focus on sex education?

Before Hawai'i aspires to be the most vaccinated state in the Union, I urge the DoH to step back and contemplate the health of our youth from a holistic viewpoint. Internet technologies (i.e., social media, gaming, etc.) have permeated every facet of our lives. Our children do not have the stamina to withstand the lethal allure of video games such as Fortnite or social media platforms such as Snap Chat. Addiction to video games and social media have adversely affected the young generation. Child predators, sexting, bullying, and other threats are more pervasive than ever. Another urgent matter that the DoH needs to confront immediately is the omnipresence of e-cigarettes in our public schools. Vaping liquid nicotine is a habit that all too often leads to a lifetime of addiction. The DoH must respond to the adverse impact of these technologies upon the well-being of our youth.

In closing, do not increase the vaccine schedule. Do not infringe upon our civil liberties. Please respect the parent's right to make decisions about their children's health. Please reject the amendments to HAR 11-157.

Mahalo.

Most Sincerely,

Amy Halas

Hawaii Department of Health, [REDACTED]

RE: public hearing for the proposed amendment and compilation of Hawaii Administrative Rules (HAR) Title 11, Chapter157, “Examination and Immunization.”

Strongly **Oppose** Administrative Rules (HAR) Title 11, Chapter157, “Examination and Immunization.” Taking on the ACIP guidelines is not in the best interest of our Keiki’s overall health or best practice of health guidelines for the State of Hawaii.

Dear Hawaii Department of Health,

Thank you for taking the time to read my testimony completely and taking into strong considerations of my testimony. My Name is Dawn Poiani and I am a mother of 3 boys and a health advocate residing in the State of Hawaii. I strongly **oppose** the state of Hawaii taking on the ACIP guidelines as their best practice for immunization. I see serious issues with this proposed rule as there are some inherent flaws in the ACIP vaccine recommendations and . If the state of Hawaii follows the ACIP Vaccine schedule guidelines we are adding multiple new vaccines to our already vaccine burdened schedule. These additional vaccine recommendations have never been tested for safety and synergistic affects of against our current schedule. I have watched hours of multiple different hearings of ACIP and witnessed how new vaccines are approved, and I must say, these hearings are disturbing to watching. I witnessed the ACIP gleefully and irresponsibly approve more vaccines to the pediatric schedule using weak vaccine science and underpowered correlation studies. Every vaccine is approved solely on the safety of the vaccine and if the vaccine will affect the serology of the other vaccines. An example is of the ACIP approval process of approving a new adjuvant in the Hep B vaccine. There are no safety studies done on the new adjuvant given with the currently used adjuvants or the safety of adding it to the schedule as well as there were some risk concerns that the ACIP voted to watch after the Hep B was put on the market. Watch this video and you will get the sense of how

vaccine safety is an after-market concern. https://youtu.be/L_JJMpe00mM. Do we really want to make our children the test subject for the safety of every vaccine that the ACIP recommends adding to our children's vaccine schedule? I don't, these are our children our future! The US Government HHS (Health and Human Services) has never conducted a single safety study as part of the fulfillment of the National Childhood Vaccine Injury Act of 1986 which grants legal immunity to vaccine makers. These safety studies were assigned to HHS in an effort to be the checks and balances over pharmaceutical safety studies and recommendations, because they have no liability for vaccine injuries and death. HHS was also to conduct and report these findings every two years to Congress; these studies have never been done! Exposure to viral particles and adjuvant (aluminum) in vaccines, along with routine exposures to other immune disruptors are '**antigen overload**' for the immune system that could shift the induction of chronic health problems (e.g., increased asthma, ocular or skin allergies, ovarian failure, gastrointestinal conditions or neurological and autoimmune diseases). We are seeing a rapid rise in chronic disease and neurological disorders in the State of Hawaii and across the world. There is only one environmental exposure that can be found in most states as well as most other countries, and that is vaccines. So are vaccines the potential cause of the rise of chronic disease and neurological issues? Are we trading the prevention of a handful of diseases for chronic health issues and neurological problems? We don't know because there has never been an effective study done looking at the vaccine schedule. It is claimed that it is unethical to do a study like that, so the solution is to just put the next new vaccine on the schedule, and see what happens. The ACIP continues to add vaccines to the schedule based on information and studies they receive from vaccine makers that can and do tweak data and find new ways to record reactions and data, in their studies, in an effort to make their vaccines look safer and or more effective (ex. <http://probeinternational.org/library/wp-content/uploads/2014/09/chatom-v-merck.pdf>, <https://www.classaction.com/zostavax/lawsuit/>). Additionally, ACIP calls on VAER to report vaccine injuries as their source of safety once the vaccine is on the market, but VAERS is voluntary and dismally under used for reporting (estimated between 1-10%) yet this is the safety science? There are over 200 vaccines currently being developed, how many more will they add to the schedule without any safety studies against our schedule, how many will be approved gleefully

with poor science? There is only one ingredient and one vaccine adequately studied. From these two studies the mantra has been “the science has been settled that vaccines are safe and effective.” **If the dose makes the poison**, at what point do the trace amounts of aluminum, Antibiotics, Egg protein, Formaldehyde, Monosodium Glutamate, Thimerosal and many many antigens become the tipping point and destroy our children’s health and vitality? I cannot understand how any doctor, immunologist, or virologist can emphatically say that adding to our vaccine schedule is safe. The State of Hawaii should set it’s own schedule based on a **Core Group** of vaccines that are specifically targeted to protect our demographics and geographical tendencies. We have no idea how any vaccine will affect our diverse ethnic population or the affect of our keiki’s overall health by more vaccines to the schedule. It is medically unethical and irresponsible. Are we really going to play a Russian roulette game on our Keiki? The future health of Hawaii deserves better than that. These additional vaccine recommendations do not provide the strength of the benefit to risk ratio to recommend adding further vaccines to the schedule.

By adding the HPV vaccine to the schedule requirements for school entry at 7th grade provides absolutely no benefit to the spread of disease in a school environment. The HPV is a cancer preventative vaccine that may or may not protect the student 20-40 years later from cancer. Additionally, there are serious issues with the way the HPV vaccine studies have been conducted. Manufacturers, did not have to prove that vaccine prevented cancer and were allowed to use precancerous lesions as “surrogate endpoints” in the clinical trials. Scientists do not know if the decline in cases of precancerous lesions will translate into fewer cases of cervical cancer in 20-30 years. None of the participants in the original pre-approval clinical trials received a true saline placebo, an aluminum containing adjuvant was used. Manufacturers never tested HPV vaccines on human fertility (acknowledged in the package insert). Manufacturers never tested HPV vaccine to discover if they might cause cancer (package insert say vaccine has never been tested for “carcinogenicity”). <https://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM111263.pdf>. The original Gardasil clinical trials used a new metric, “**New Medical Conditions**,” as a way to claim that serious health problems after vaccination were unrelated to the vaccine or aluminum-containing placebo.

More than 50 percent of all clinical trial participants reported “new medical conditions,” including infections, reproductive disorders, neurological syndromes, and autoimmune conditions. The FDA never questioned this novel metric. Lawsuits have been filed against Merck, GlaxoSmithKline, and government health agencies around the world, including the US, India, Columbia, Japan, Spain and France. The US government earns royalties from Merck and GSK for licensing HPV vaccine technology (this is an egregious conflict of interest!). Why would the state of Hawaii mandate the HPV vaccine, when the vaccine carries these kinds of flaws in the HPV vaccine safety assurance? As of June 2018, the VICP paid out or settled 126 HPV vaccine claims. A total of 49 people received \$5.8 million after the U.S. Court of Federal Claims found Gardasil injured them <https://www.hrsa.gov/sites/default/files/hrsa/vaccine-compensation/data/monthly-stats-june-2018.pdf>. “The HPV Vaccine On Trial: Seeking Justice for a Generation Betrayed” by Mary Holland. Let the HPV be an optional vaccine and not mandated to the required school entry **Core Vaccines**.

According to the manufacture’s package inserts, the rate of “**serious adverse events**” **from meningitis B vaccine are 2.1% for Bexsero (Novartis)**, <https://www.fda.gov/downloads/biologicsbloodvaccines/vaccines/approvedproducts/ucm431447.pdf> and **1.8% for Trumenba, (Pfizer)**, <https://www.fda.gov/downloads/biologicsbloodvaccines/vaccines/approvedproducts/ucm421139.pdf>. Based on this information, if the roughly 58,000 HI college and undergraduate students receive either of these vaccinations, approximately 1,218 students will experience “severe adverse events,” including death. In 2016, there were 2 cases at Rutgers University, treated with antibiotics and fully recovered. The risk of “**SERIOUS ADVERSE EVENTS**” from the vaccine is much higher than the risk of becoming ill with bacterial meningitis. At a cost of \$100-125 a dose, this is a serious cost to the State of Hawaii. Although Bacterial Meningitis can be a serious disease, it is not common and is very difficult to acquire. The best outcomes in cases of bacterial meningitis occur when the infection is detected early and antibiotics are administered. Public Health initiatives to enhance the awareness of the early symptoms of the infection and the importance of securing appropriate treatment would be impactful. There is no public health situation present that warrants infringing on a person’s right

to decide what medical treatment and intervention is appropriate for him/her and allowing doctors and students to make these decisions for health care is essential.

Hep A cannot become chronic disease and most (70%) of infections in children younger than age 6 are not accompanied by symptoms according to the CDC. To avoid “**antigen overload,**” the Hep A Vaccination should only be recommended for individuals in high-risk settings and not for the requirement of school attendance.

Examples would include people that are at increased risk for acquiring hepatitis A virus (HAV) infection?

- Persons with direct contact with persons who have hepatitis A
- Travelers to countries with high or intermediate endemicity of HAV infection
- Men who have sex with men
- Users of injection and non-injection drugs
- Persons with clotting factor disorders
- Persons working with nonhuman primates
- Household members and other close personal contacts of adopted children newly arriving from countries with high or intermediate hepatitis A endemicity
- People who have chronic liver disease.
- Homeless population.

The cases of Hep A we have seen in Hawaii in the past years have not spread from student to student in schools. Most of our Hep A cases were from food contamination. The healthier approach to preventing the spread of Hep A would be addressing the food importation issues into Hawaii. There is very minimal risk of Hep A spreading from student to student in schools.

The influenza vaccine from year to year is from 10% -60% effective according to the CDC. The flu vaccine, due to the innate natural drift nature of the virus and the absolute guess that the flu vaccine makers must make to pin point the prevalent strain the following year, this vaccine is not affective. The flu vaccine is one of the leading reported vaccines for adverse events according to VAERS. This risk/benefit ratio to require this vaccine for school just doesn't add up. Additionally this vaccine continues to have trace amounts of mercury (Thimerosal),

according to the FDA vaccines with trace amounts of thimerosal contain 1 microgram or less of mercury per dose.: the manufacturers best effort to wash the mercury out is not 100% effective. However mercury in conjunction with aluminum creates a heavier neurotoxic load which comes with risk. <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4344667/>
<https://www.cdc.gov/flu/professionals/vaccination/effectiveness-studies.htm>
<http://vaccineimpact.com/wp-content/uploads/sites/5/2017/09/DOJ-Report-9.8.17.pdf>

The requirement of a standardized medical exemption is flawed and it is a direct effort to restrict our medical rights. A standardized medical form may intimidate or discouraging a Physician to use their best precautionary principles and medical judgement for each patient. Physicians need to be allowed to write their medical evaluations and exemptions on their own letter head and freely decide if a vaccine is truly appropriate using the best medical judgement for each patient. It is not in the best interest of the patient or the physician to create additional paperwork, road blocks or exemption restrictions to a physicians best medical practice.

The Hawaii Vaccine Coalition is promoting the idea that restricting or even eliminating Religious Exemptions would improve vaccinations rates, which are already higher than the national average. Article I section 4 of the bill of rights “No law shall be enacted respecting an establishment of religion, or prohibiting the free exercise thereof, or abridging the freedom of speech or of the press or the right of the people peaceably to assemble and to petition the government for a redress of grievances. [Ren and am Const Con 1978 and election Nov 7, 1978]. There are inherent constitutional issues of restricting religious exemptions or challenging a persons spiritual beliefs.

Mandatory school reporting of all students with vaccine exemptions may be a violation of FERPA (Federal Educational Rights and Privacy Act) as well create additional financial burden on schools. <https://www.mbm-law.net/newsletter-articles/“ferpa-trumps-hipaa-in-immunization-disclosure”/1020/>

Oppose Administrative Rules (HAR) Title 11, Chapter157

Thank you for the time you took to read my testimony. **I strongly OPPOSE HAR 11-157 rule changes.** These rule changes are not in the best interest of our Keiki's health or the best interest of promoting a healthy child in the State of Hawaii. My uncle is a Surgeon/doctor and he once said "before I prescribe any medication I always ask myself will this drug cause more harm than the disease it is trying to cure?". These rule changes squash our freedom and the fundamental principles of effective and safe medicine - "First Do No Harm." Please host a public hearing statewide to fairly hear all testimony on all islands.

Sincerely,

Dawn Poiani

strongly oppose the HAR 11-157 proposed rules update and its exhibits.

Thank you for this opportunity to provide testimony. As a community member and human rights advocate, I am writing to **strongly oppose the HAR 11-157 proposed rules update and its exhibits.**

The rule changes conflict with the parents right of medical freedom and to choose with their doctor what it good for their child. There is no one fits all solution, and that its why the personal patient doctor / nurse relationship is so important, to have a trusted communication. This rule will overrule this, and it shows that you have no trust in your own people.

By now I talked to many people (school, nurses, parents of all walks), especially the once that vaccinate and their feedback after they are understanding what this really means for them is opposition. I notice that many people who will be affected are not even aware. Not because we don't believe in vaccines works, but we want our choice for certain vaccines and they have their reasons to do so, so do I. I will keep inspiring these people to be part of this, and to speak up in detail for themselves.

We have already a good basic requirement like most states have. These proposed changes are overboard in my opinion. This rule change will put us in a position that no other state has, we would have to most regulated immunization for school children in all USA. I don't agree that we want or need to be the first experimental state with 12 mandatory vaccines for public education. We need to work with each other and need to resist to dictate each other what to do. Its my way or the highway situation.

There are parts that I agree, but many that I do not agree. This is not acceptable, so I disagree at this point strongly.

I also advice in the name of democracy and true informed consent to make a link between the DOH and DOE to inform everyone that will be affected, all parents and students in the Hawaii public education system about the opportunity to give consent and be part of this decision. Its not fair or good enough to have us informed after the fact.

I am opposing especially forcing the yearly flu vaccine and HPV on our children, these need to be done by informed free consent of the parents for children, teens.

There are other solutions that can help with the HPV epidemic, like a education and free will, spending money on real sexual education on teens and regular free screenings/pap smears/STD checks for young people. There is so much more to say.

I respectfully request that the proposed changes to HAR 11-157 be denied and not passed for holding up the basic right of medical freedom, human

rights and trust.

Thank you for your consideration.

Astrid Drolson, resident of [REDACTED]

Subject: Strongly Support HAR 11-157 Proposed Rules Update
Date: Monday, November 26, 2018 10:31:34 AM

Aloha Department of Health,

Thank you for this opportunity to provide testimony. As an advanced practice nurse, long-time employee of the Queen's Medical Center and public health advocate, I am writing to **strongly support the HAR 11-157 proposed rules update.**

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Mahalo,

Hob Osterlund, APRN

Subject: Vaccine danger studies added to verbal testimony opppsing HAR 11-157 Martina Kalfors.
Date: Friday, December 21, 2018 7:44:59 PM

Aloha DOH.

After my verbal testimony in [REDACTED]. You stated I could provide more studies. Here you go. Read it all carefully. This will be shared with all legislators to. We the people are NOT ok with this rule change. There was one person in favor of this, she was not a citizen in the U.S. all the other people were affiliated with an organization representing pharmaceutical industry. No individual testimony in favor of HAR-11-157.

But There were over hundred opposing. Why is that? We THE PEOPLE DO NOT WANT THIS. Watch all hearings public on my FB page. Read all the testimonies. Please. Our keiki deserves it.

The added pdf link to the Corvelva study for infrarix hexa contains all contaminates and NO antigens. Came out this week. ALL RISK, NO BENEFIT. This is the trusted science you want us to inject into our keiki. This is absolutely criminal. No question. This should be enough evidence to immediately do a moratorium on vaccines, until all vaccines have been carefully investigated.

Dr. Stephanie Seneff's study pdf. shows traces of Glyphosate in all vaccines. Show us that it is safe to INJECT to our children. Or anyone for that matter.

There are also 60 peer reviewed studies on the danger of hpv vaccine in pdf link.

Thousands of studies on the danger of vaccines on this link. Pick your choice of disease. Many peer reviewed.

LIVE VACCINES SHED and spread Infectious Diseases NOT unvaccinated children!

All live virus vaccines contain LIVE viruses. They may be weakened but they can still replicate and infect both the vaccinated, unvaccinated, immunocompromised and "shed" to people around them for weeks after the vaccine is given.

Which vaccines are LIVE?

Chicken Pox- Varivax Section 5.4 (up to 6 weeks):

<http://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM142812.pdf>
<<http://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM142812.pdf>>

MMR- MMRII page 5 (Up to 28 days):

<http://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM123789.pdf>
<<http://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM123789.pdf>>

Shingles- Zostavax Section 5.2:

<http://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM285015.pdf>
<<http://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM285015.pdf>>

Rotavirus- Rotateq Section 5:5 (Up to 15 days, fecal shedding):

<http://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM142288.pdf>
<<http://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM142288.pdf>>

Small Pox- ACAM2000 Section 5:10 (Only used in the military but highly contagious):

<http://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM142572.pdf>
<<http://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM142572.pdf>>

But does that REALLY happen? Yes. Yes it can and does as these studies illustrate:

Varicella transfer after vaccine to pregnant mom:

<http://www.ncbi.nlm.nih.gov/pubmed/9255208> <<http://www.ncbi.nlm.nih.gov/pubmed/9255208>>

Pub Med article on Rotavirus shedding:

<http://www.ncbi.nlm.nih.gov/pubmed/18922486> <<http://www.ncbi.nlm.nih.gov/pubmed/18922486>>

Mumps Vaccine sheds:

<http://www.ncbi.nlm.nih.gov/pubmed/24772647> <<http://www.ncbi.nlm.nih.gov/pubmed/24772647>>

Mumps vaccine sheds:

<http://www.ncbi.nlm.nih.gov/pubmed/16266774> <<http://www.ncbi.nlm.nih.gov/pubmed/16266774>>

Measles virus sheds for 1-13 days after vaccination:

<http://www.ncbi.nlm.nih.gov/pmc/articles/PMC228449/>
<<http://www.ncbi.nlm.nih.gov/pmc/articles/PMC228449/>>

Mumps outbreak in Netherlands linked to those vaccinated twice with MMR:

http://wwwnc.cdc.gov/eid/article/20/4/13-1681_article <http://wwwnc.cdc.gov/eid/article/20/4/13-1681_article>

Measles vaccinated child responsible for outbreak in British Columbia:

<http://www.eurosurveillance.org/images/dynamic/EE/V18N49/art20649.pdf>
<<http://www.eurosurveillance.org/images/dynamic/EE/V18N49/art20649.pdf>>

New York Measles outbreak linked to vaccinated:

<http://cid.oxfordjournals.org/content/early/2014/02/27/cid.ciu105>
<<http://cid.oxfordjournals.org/content/early/2014/02/27/cid.ciu105>>

Measles outbreak among the vaccinated:

<http://www.ncbi.nlm.nih.gov/pubmed/8053748> <<http://www.ncbi.nlm.nih.gov/pubmed/8053748>>

We don't know for certain how long shedding occurs because we don't test for it long term or regularly but in rare instances, it has gone on for years:

<http://www.westernmorningnews.co.uk/Vaccinated-man-spread-polio-30-years/story-27693988-detail/story.html> <<http://www.westernmorningnews.co.uk/Vaccinated-man-spread-polio-30-years/story-27693988-detail/story.html>>

Additionally, the Dtap/Tdap and Polio vaccines that are NOT live has been shown to cause the vaccinated to become asymptomatic carriers whenever exposed, thus the vaccinated can be spreading the illness without knowing at any time:

Pertussis carrier:

<http://www.fda.gov/NewsEvents/Newsroom/PressAnnouncements/ucm376937.htm>
<<http://www.fda.gov/NewsEvents/Newsroom/PressAnnouncements/ucm376937.htm>>

Diphtheria carrier:

<http://www.cdc.gov/diphtheria/clinicians.html> <<http://www.cdc.gov/diphtheria/clinicians.html>>

The polio vaccine “does not stop transmission of the virus.” & “when a person immunized with IPV is infected with wild poliovirus, the virus can still multiply inside the intestines and be shed in the feces, risking continued circulation.”

<http://polioeradication.org/polio-today/polio-prevention/the-vaccines/ipv/>
<<http://polioeradication.org/polio-today/polio-prevention/the-vaccines/ipv/>>

You can also find that most medical facilities are aware of this. Johns Hopkins and St. Jude hospitals are just a few of many who post precautions for recently vaccinated visitors.

WHY does this matter?

Because society is so deathly afraid of these illnesses that they rush out and load up on vaccines and want to even pass laws forcing others who should never be vaccinated to do the same; but the science shows that it's the vaccinated that are at a higher risk of infections because vaccines heavily suppress the immune system, vaccines are directly linked to spreading illnesses because people are routinely injected with them. Be aware of the infection and carrier risk each vaccine has when making your choice as you will- take cautionary measures being around individuals that are immunocompromised if you have been recently vaccinated or around someone with the illnesses even if you don't show symptoms.

ONE HUNDRED AND FIFTEEN studies on vaccine SHEDDING...

[Www.medscienceresearch.com/shedding/](http://www.medscienceresearch.com/shedding/) <<http://www.medscienceresearch.com/shedding/>>

THE DILEMMA OF VACCINE-INDUCED DISEASE AND UNVACCINATED CHILDREN
VACCINE SHEDDING

It has long been known that vaccines can cause the diseases they were meant to immunise against.

For instance, the live oral polio vaccination can cause polio – a disease named vaccine-associated paralytic polio (VAPP), which is mentioned on the UK dept of health website, immunisation.org.uk
<<http://immunisation.org.uk>>

‘If a baby has had the oral polio vaccine, the live virus can be found in the baby's poop for up to six weeks afterwards.’

It was actually for this reason that the OPV was voted out and injectable polio vaccine re-introduced. The oral vaccine was responsible for the ONLY cases of polio in the developing world. (Committee on Immunization Practices meeting, held 20th June 1996).

According to DRAFT ACIP meeting minutes, February 2001, page 28:

And lastly the myth of herd immunity. A theory that has never been proven to work. Impossible hence booster.

<https://jbhandleyblog.com/home/2018/6/7/herd-immunity-a-dishonest-marketing-gimmick>
<<https://jbhandleyblog.com/home/2018/6/7/herd-immunity-a-dishonest-marketing-gimmick>>

And if you care about the real truth of history. Read Dr. Suzannes book. "Dissolving Illusions".

<https://jbhandleyblog.com/home/2018/5/14/savehumanity>
<<https://jbhandleyblog.com/home/2018/5/14/savehumanity>>

There you go,

Mahalo,
Martina Kalfors.

October 31, 2018

DOCD, DOH immunization@doh.hawaii.gov
[\(808\) 586-8300](tel:8085868300)

Hawaii Department of Health
1250 Punchbowl St.
Honolulu, Hawaii 96813

I **strongly oppose** the proposed amendment and compilation of Hawaii Administrative Rules (HAR) Title 11, Chapter 157, “Examination and Immunization.”

Dear Hawaii Department of Health,

My name is Kim Haine, I am a Mother and StepMother to 5 children, and was a health care professional for 15 years. I oppose these amendments for several reasons, but primarily because it is not prudent health policy to vastly increase the school vaccine requirements without, acknowledgement and exploration of the **epidemic of chronic disease plaguing America’s children today**.

1. **I oppose the changes to the Medical and Religious Exemption requirements.**

Pertaining to **Religious Exemptions** being “in a format specified by the department” is vague and yet unspecified, therefore leaving room for egregious violations of our Constitutional, First Amendment Rights. It is not up to the government, nor certainly our DOH, to define spirituality or one’s relationship with God.

Medical Exemptions must now be “in a form or format specified by the department, that an immunization is medically contraindicated, due to a stated cause, for a specific period of time, in conformance with recognized standard medical practices”. A physician’s best professional judgement utilizing their intimate patient-specific, as well as family history knowledge, should be the sole determining factor in whether a medical exemption is warranted....period. The “Precautionary Principle of Medicine” must be upheld and not be restricted by bureaucratic oversight.

After evaluating ACIP's most recent General Best Practice Guidelines for Immunization; Section 4 "Contraindications and Precautions", Tables 4-1 and 4-2, it is abundantly clear that ACIP, and any Public Health Department that blindly follows such guidelines, care much more about the judicious uptake and militant adherence to the vaccination schedule, than the prevention of serious, life-long adverse reactions. All conditions listed have been absurdly minimized:

Pertussis Containing Vaccines

- DTaP (Dose 3 – Dose 4) minimum intervals (10/23/2017)
 - Prospective – 6 months
 - Retrospective – 4 months
 - 4 day grace period can be applied to 6 month interval prospectively
 - 4 day grace period can be applied to 4 month interval retrospectively
- Four precautions to DTaP removed
 - Fever $\geq 105^{\circ}$ F within 48 hrs following a dose of DTaP (09/20/18)
 - Persistent, inconsolable crying lasting ≥ 3 hrs within 48 hrs following a dose of DTaP (07/18/18)
 - Collapse or shock-like state with 48 hrs following a dose of DTaP (07/18/18)
 - Seizure within 72 hrs following a dose of DTaP (07/18/18)

See for example table to the left which lists known symptoms of "encephalitis" (brain swelling which can lead to autism), as no longer being a precaution to the DTaP vaccine, let alone a contraindication! There are hundreds of severe adverse reactions listed in ALL vaccine manufacture's package inserts, whether noted during clinical trials

OR post-marketing surveillance, that *should* qualify as a medical exemption, but they do not. **Vaccine Package Inserts** are never given out to patients as **true informed consent**, and most physicians have never even read them. *The Hippocratic Oath* that every American Medical Doctor is sworn in to "**FIRST DO NO HARM**" appears to have been forgotten as it relates to childhood vaccines. Please see a video clip of an actual ACIP vaccine approval meeting in progress here: https://www.youtube.com/watch?v=L_JJMpe00mM

2. I oppose mandatory physician and school reporting to the DOH, the names of children/students whom have not met their immunization requirements, or who have medical or religious exemptions.

The Federal and Educational Rights and Privacy Act (FERPA) and Health Insurance Portability and Accountability Act (HIPPA) standards are in place to protect personal health information and medical records; this would be a grave violation to the intentions of these privacy acts. The reporting of numbers of exemptions may be prudent, however names of students are not necessary, and feels more like a rule approaching communist China.

The only "mandatory reporting" that SHOULD be happening is the reporting by Health Care Professionals of vaccine injuries. We have a failed, passive reporting system in VAERS that, according to a Harvard study funded by our own DHHS, captures an estimated, pathetic 1% of actual vaccine injuries.

3. Finally, I stand in extreme opposition to the requirement of multiple new vaccines to attend daycare and all school institutions in Hawaii.

ACIP recommendations and guidelines are meant to be just that, recommendations, NOT mandates. The new proposed vaccine requirements for Hawaii's children would add approximately 17 doses of 7 new vaccines (including 35+ antigens) for those beginning in daycare. There are no urgent matters in our *school* settings warranting the use/addition of *any* of the proposed vaccines { Influenza; Rotavirus; PCV; Hep A; MCV; TDaP; and especially HPV}. There are also CDC statistics and abundant independent research to back up this claim, as well as facts proving that the risks far outweigh any benefits. HPV (Gardasil) vaccine especially, for a STD not highly communicable in a school setting, is one of the most controversial and dangerous vaccines ever recommended by ACIP. With debilitating autoimmune diseases, paralysis, and even death numbering 60,000 and counting, this vaccine should be pulled from market (as in other countries like Japan), not forced upon schoolchildren.

Important facts pertaining to vaccination:

1. Vaccination is a medical intervention, that carries risk of serious injury, death, and failure to prevent infection or transmission. There are genetic, biological and environmental risk factors rendering some more susceptible to vaccine reactions than others, yet doctors still cannot predict conclusively who will be harmed.
2. Section 13.1 on *every* manufacturer's package insert states that it has "not been evaluated for carcinogenic or mutagenic potentials, or impairment of fertility"
3. In 1986 Congress passed *The National Childhood Vaccine Injury Act* to shield vaccine manufacturers from civil product liability lawsuits for all harm caused by vaccines, including permanent disability and death (Public Law 99-660).
4. Since this 1986 ACT sheltered the vaccine manufacturers from liability, the childhood vaccination schedule has exploded to a current 74+ doses of 17 vaccines (given in pregnancy, on the first day of birth, up to 18 and beyond)
5. **What has also grown concurrently with the vaccination schedule is an epidemic of chronic illness in over half (54%) America's children.**

The gateway period that launched this decline was the late 1980's and early 1990's. Many chronic illnesses have doubled since that time:

- The “4-A” disorders— autism, attention deficit hyperactivity disorder, asthma and allergies—have experienced meteoric growth, affecting children's quality of life and contributing to premature mortality . The spike in autism prevalence has been particularly dramatic, with prevalence as high as 3% (one in 36 children) in some regions . Pediatric autoimmune conditions also are on the rise.
- U.S . children are far more likely to die before their first birthday than infants in other wealthy countries and life expectancy is falling, driven largely by rising death rates in adolescents and younger adults. Suicide is the second leading cause of death in teens, half of whom are reported to have at least one mental, emotional or behavioral disorder.
- The proportion of public school children using special education services is skyrocketing, with estimates ranging from 13% to 25% of school populations .
- The social and economic fallout from these health challenges is hitting home hard—with adverse impacts on intelligence, fertility, household and government finances, employment, productivity, military recruitment and more . The disproportionately high level of neurodevelopmental disability in males versus females is also reshaping society .

Mystifyingly, there is almost no outcry in medical, public health or government circles to find answers and solutions

The potentially dangerous, synergistic and long-term effects of the ever-growing childhood vaccination schedule has never been evaluated properly.

1. A 2013 study by the prestigious Institutes of Medicine (IOM) concluded that:

“ the key elements of the entire (childhood vaccine) schedule: the number, frequency, timing, order, and age of administration of vaccination have not been systematically examined in research studies”

2. In May 2017 Robert F Kennedy Jr.(childrenshealthdefense.org) & Del Bigtree (icandecide.org) filed a lawsuit against our U.S. Department of Health and Human Services suspecting it was not fulfilling its critical vaccine safety obligations.

DHHS is required by Congress as per the NCVIA of 1986, to assure “improvements in the licensing, manufacturing, adverse reaction reporting, research, safety and efficacy testing of vaccines in order to reduce the risk of adverse vaccine reactions”. The lawsuit revealed that

DHHS had never, not even once, submitted a single biennial report to Congress detailing the improvements in vaccine safety. <http://icandecide.org/government/ICAN-HHS-Stipulated-Order-July-2018.pdf>

The mission statement of the Hawaii Department of Health as stated is to “protect and improve the health and environment for all people of Hawaii.” Preventing the spread of infectious disease is important, but it appears that we may be trading infectious disease for chronic, life-long illnesses. Cigarettes were once proclaimed safe by the tobacco giants and supposedly did not cause cancer, while antibiotics have been absolute miracle drugs until mutations created resistant super-bugs like MRSA. It appears we may be in need of another great paradigm shift in medicine and public healthcare, or at the very least unbiased, ethical, independent research and regulation. The mantra “Vaccines are Safe & Effective” is losing support quickly in the eyes of astute Americans.

I am an advocate for improved vaccine safety, fully informed consent, and parental choice. These are essential if public confidence is to be restored, not further eroded.

Thank you for your attention to this serious matter,

Dr. Kimberly Haine

Subject: Parents against your proposed rules for mandatory immunization changes
Date: Tuesday, November 27, 2018 9:57:21 AM

To Whom It May Concern:

We are writing this as concerned parents who would love to attend the public hearing here on [REDACTED], but due to our work schedule & location, we are unable to. First and foremost, we do vaccinate our child so our concern does not come from a No Vaccine perspective. Our concern is that we feel that your proposed changes takes away a parents right to choose. Currently some of the vaccines that you want to add are optional which means that as a parent we get to decide if we want that vaccine injected into our child or not. We value that option and have actually declined 2 out of the 3 proposed vaccinations you want to add WITH the approval of our son's pediatrician. In one of the vaccines, it had to be given in early infancy and since he's already past that, we don't even know what will happen since he doesn't have it. We don't think that it's right for you to make these currently optional vaccines as mandatory in order for our son to attend school. As parents you should not force us to do something we have already decided WITH the approval of our pediatrician not to do. That is taking away our choices as a parent. In addition, we had heard that if your proposed changes go through, and our child doesn't have the flu shot and there's a flu shot being given at the school, our child will get it even if we don't give consent because it will be a mandatory vaccine. Excuse my language, but HELL NO, that is not right. You cannot stick a needle and inject our child with something we blatantly said no to. There are already so many vaccines that our child has to get, in fact when we were children there was not nearly as much and hey, we're alive and doing fine. As parents, we do get all the mandatory ones for our child, but it's not necessary to add the current optional ones in. Leave that choice up to the parents, we don't want our choices taken away.

Sincerely,
Kimi & Guy Kusumoto

Date: Tuesday, November 27, 2018 2:23:45 PM

Aloha,

I am writing you out of deep concern for the mandatory vaccine laws being considered in our state of Hawaii; and would like to encourage more emphasis on safety, safer vaccines. 32 years of safety studies weren't done and that is deeply concerning. More scientifically-based research and safety studies are needed. Including by reliable independent research scientists who have no financial ties or pressured influences & outcomes placed upon them by the industry. Vaccines are not safe for every person or child — that is widely known already.

Please see the links below. If any of this is true, I vote NO mandatory vaccines in Hawaii and in the US. There are too many vaccine related reactions and deaths. In the news recently there was a Senator who dies after his flu vaccine. When will our health agencies take this seriously?

“Forced vaccinations now can be legally stopped - no quality control for 32 years.” See link:

<https://cairnsnews.org/2018/11/19/u-s-govt-loses-landmark-vaccine-lawsuit/?fbclid=IwAR12fypmkOSi3qtUlglltBSq8OtokrCdVR0dJpbW1CjsDylaLsiAEZ4fvYs>

1.) “Flu vaccine BOMBSHELL: 630% more “aerosolized flu virus particles” emitted by people who received flu shots... flu vaccines actually SPREAD the flu.” See link below.

2.) Government document confirms vaccine link to microcephaly. See link below.

<https://www.naturalnews.com/2017-01-19-government-document-confirms-vaccine-link-to-microcephaly.html>

3.) Read “how vaccines increase the risk of pediatric cancer and are being made with genetically-modified cells which mimic cancer cell growth.” See link below.

https://www.naturalhealth365.com/pediatric-cancer-vaccines-2760.html?fbclid=IwAR31kYJomO7LMt8pWzQ1gVkEstkh7gipkDGVFL9HOBiVo62EIHw7_23q75I

4.) “Baby monkeys given standard doses of popular vaccines develop symptoms of autism.” See link below.

<https://www.newstarget.com/2016-07-12-baby-monkeys-given-standard-doses-of-popular-vaccines-develop-symptoms-of-autism.html>

5.) Why wasn't this taken seriously? Retroviruses shouldn't be found deadly viruses in vaccines. A genuine scientist who has strong work, truth & honesty ethics shouldn't be punished for her research.

<https://explainlife.com/scientist-jailed-after-discovering-deadly-viruses-are-delivered-through-vaccines-2841/>

6.) MTHFR gene mutation — vaccines not safe. Autism links MD supported.

<http://www.stopmandatoryvaccination.com/parent/vaccine-injury/vaccines-cause-childs-autism-parents-dont-make-connection-but-new-doctor-does-and-recovers-child/>

7.) ***“The research is hard to ignore, vaccines can trigger autoimmunity with a laundry list of diseases to follow. Vaccines turn our immune systems against us.” See link below.***

<http://www.greenmedinfo.com/blog/attacking-ourselves-top-doctors-reveal-vaccines-turn-our-immune-system-against-us>

8.) “Vaccines are unavoidably unsafe, SUPREME COURT rules!” See link below.

<http://www.hutchnews.com/a1f84eca-2bf8-5839-b94b-d0a0d1c6e7f6.html>

9.) Conscience and Religious Freedom Division and our constitutional rights.

<https://explainlife.com/trump-lays-groundwork-to-ban-mandatory-vaccinations-across-u-s-2730/>

10.) Metals that are particularly detrimental to mitochondrial function include aluminum, arsenic, cesium, tin and thallium. Other toxic metals that many have in their bodies include cadmium, mercury and lead

When you have heavy metal toxicity, you tend to attract EMFs to your body. EMFs in turn impact your body's metabolism and ability to effectively eliminate toxins and heavy metals

<https://articles.mercola.com/sites/articles/archive/2018/04/08/heavy-metal-detox.aspx>

11.) Researchers from the U.S. Centers for Disease Control and Prevention (CDC) conducted a meta-analysis study showing that there is very limited evidence that flu vaccinations for hospital workers provide any benefit for **disease prevention**. The results were published in an early online edition of *Clinical Infectious Diseases* and examined the quality of evidence in studies used to back up the push for vaccinating healthcare workers. What would the benefit for students be then?

12.) Spread the flu, are you crazy?! Here's a CDC funded study showing the vaccinated shed 63 times more flu virus by just breathing!!

<https://thewilddoc.com/cdc-funded-study-shows-the-vaccinated-shed-6-3-times-more-flu->

[virus-just-by-breathing/](#)

13.) Too many beautifully gifted & talented people dying!

Please continue to research deep. We can not afford to overlook the many concerns that are known and those still unknown — without more solid scientifically-based research & safety studies complete.

Mahalo,

Laura Reese

P.S.

Some research shows the nagalase enzyme was added to vaccines. Nagalase prevents Vit production in the body, which is the body's main defense to naturally kill cancer cells.

We can not afford not to do more scientifically- based safety studies / research!

From: [REDACTED]
To: [REDACTED]
Subject: support the HAR 11-157 proposed rules update.
Date: Wednesday, November 28, 2018 1:05:55 PM

Thank you for this opportunity to provide testimony. As a **health care provider** and public health advocate, I am writing to **strongly support the HAR 11-157 proposed rules update.**

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you very much!

Emilia C. Suarez M.S. PA-C

Call to Action

Call to Action

PLEASE NOTE:

Island-wide hearings have been added by Hawaii Department of Health! Please appear in person if possible AND submit written testimony by **WEDNESDAY, DECEMBER 26th at 4:00pm HST** to immunization@doh.hawaii.gov including your name, address, whom you represent [yourself or a group], and a statement, such as, "Re: HAR 11-157, I OPPOSE" or "STRONGLY OPPOSE" [followed by a sentence stating what it is about the proposed rule(s) you oppose].

NEW VACCINE REQUIREMENTS FOR HAWAII STUDENTS ARE COMING...

unsplash-logoHyttalo Souza

*...from HI Department of Health-Proposed Rule
Changes, bypassing the State Legislature via 2013
Act deferring authority to HI DOH*

Hearing schedule:

Big Island

Hilo Thursday, Dec. 20th 9-11am, Hilo State Office Bldg, 75 Aupuni St.,
Conference Rooms A, B and C

*

Kona Thursday, Dec. 20th 2:30-4:30pm, 74-5044 Ane Keohokalole
Hwy, West Hawaii Civic Center Meeting Hale, Bldg G

Maui

Wailuku Friday, Dec. 14th 2-4pm, Wailuku State Office Bldg, 54 South High Street, Wailuku Video Conference Center, Third Floor

*

Moloka'i (video conferencing from Maui) Friday, Dec. 14th 2-4pm, Moloka'i Dept of Health, 65 Makaena Place, Kaunakakai Video Conference Room 107

Lana'i

Tuesday, Dec. 18th 1-3pm, **Lana'i Public and School Library**, 555 Fraser Avenue, Lana'i City Small Conference Room

Kaua'i

Lihue Friday, Dec. 21st 2-4pm, Kaua'i District Health Office Conference Room, 3040 Umi Street

Basic Info on the Proposed Rule Changes:

The Hawaii Department of Health has announced island-wide hearings on proposed rule changes to include NEW VACCINE REQUIREMENTS for Hawaii's children. (See links at right for official documentation.)

Some of the proposed changes include:

- HPV and Meningococcal vaccine for all seventh graders
- Influenza vaccine for all young children [see Exhibit A, Table 1 in the link]
- Hepatitis A vaccine for all children
- Additional dose of MMR for post-secondary school attendance and Meningococcal vaccine for all first-year students living in on-campus housing
- Enhanced reporting requirements for health practitioners and schools
- Enhanced reporting requirements for medical and religious exemptions
- Blanket adoption of recommendations from Advisory Committee on Immunization Practices [ACIP] as they are approved [see [this video](#) for a shining example of ACIP's abhorrent and negligent decision-making process in action; see also in this [link](#), watch ACIP vote on its new vaccine schedule recommendations, unanimously—immediately after hearing the impassioned comments and criticisms by members of the public at their latest meeting]

[Amended Hearing Notice with Additional Neighbor Island Hearings in Dec 2018 and Extended Deadline for Written Testimony](#)

[Original Hearing Notice](#)

[Proposed Rule Changes \[Ramseyer Format\]](#)

[Proposed Rule Changes \[Standard Format\]](#)

[Exhibits A and B](#)

CALL TO ACTION

Suggestions for responding to these proposed rule changes to Hawaii Administrative Rules/HAR 11-157:

First, learn about

- your [right to informed consent](#)

- the difference between the inadequate patient information offered on the CDC's "Vaccine Information Statements" [VISs] versus the more complete information provided on the actual vaccine manufacturers' package inserts [not typically viewed by vaccine-administering health care workers and physicians; they can be found published online at the FDA website, [here](#)]
- the **numerous victims of vaccine injury** not acknowledged by the pharmaceutical industry-propagandized medical establishment
- the fact that more and more **physicians and healthcare workers are speaking out** about potentially harmful, one-size-fits-all vaccination policies and the great disparity in claims about "the science" supporting the safety and efficacy of vaccination against communicable diseases
- the fact that there are *hundreds* of new vaccines coming down the manufacturing pipeline—will the mainstream medical community ever recognize any limit to the number of vaccines to be mandated, or are we to be perpetually at the mercy of the pharmaceutical industry to roll up our sleeves to accept their products and contaminants?
- the fact that industry money is interfering in the once-sacred doctor-patient relationship — does your vaccine-pushing healthcare team derive financial gain by vaccinating you and/or your family members? ASK!
- **vaccine contamination** by toxic metals, chemicals and xenobiological agents, like animal- and fetal-derived human DNA—is it *really* so difficult to imagine where the current epidemic of skyrocketing auto-immunity *may* be stemming from?
- the fact that the American Academy of Pediatrics [AAP] has expressed **eagerness to see removed ALL non-medical vaccine exemptions**
- the **nationwide legislative assault on Americans' vaccine exemptions**
- media fear-mongering which quickly blames "unvaccinated" people as the cause for outbreaks of measles, mumps, flu, polio, pertussis, etc. without discussing the phenomena which implicate vaccines themselves in the SPREAD of disease, such as viral shedding from vaccines and strain replacement
- the **2013 Hawaii State legislation** which empowered the Hawaii Department of Health with extensive, excessive latitude to make and alter health policy in the State; decision-making power now resides in very few individuals, if not a single individual, whereas beforehand, there were at least customary checks and balances

Next, prepare written and/or oral testimony and attend the hearing:

- Read the proposed rule changes and consider their potential impact
- Educate friends and family on the issue of these mandates, and urge them to get involved to protect their right to informed consent
- Plan to appear at your nearest hearing, according to the schedule shown above in this post
- Submit written testimony via email to immunization@doh.hawaii.gov, or via post to Disease Outbreak Control Division [DOCD], 1250 Punchbowl Street, Room 443, Honolulu, HI 96813 [officially, must be received no later than Wednesday, December 26, 2018 at 4:00pm, Hawaii Standard Time
- Plan to arrive early to allow for parking
- Oral testimony at the hearing will be limited to *two minutes per person*

Finally,

- **Be alert to future encroachments on medical and religious exemptions, which could be done with the stroke of a pen;** we anticipate impending attempts to curtail our current medical exemption right and to remove our religious exemption. Watch for any future updates to the status of our legal exemptions and any further encroachments on medical freedom and informed consent [[see this PBS Hawaii discussion of religious exemptions](#)]
- Connect with like-minded people in Hawaii and across the US concerned with preserving our right to the traditional definition of informed consent [not to be confused with the World Health Organization's (WHO's) recent attempt to redefine informed consent
- Join our email list for updates on future legislative action, educational events and advocacy
- Remember, this is a marathon—not a sprint; don't get discouraged and apathetic as a result of such encroachments on our medical freedom—get involved!

"The AAP views nonmedical exemptions to school-required immunizations as inappropriate for individual, public health, and ethical reasons and advocates for their elimination."

American Academy of Pediatrics Policy Statement
 Medical Versus Nonmedical Immunization Exemptions for Child Care and School Attendance, Pediatrics September 2016,
 VOLUME 138 / ISSUE 3

When there is risk there must be a choice!

To: [REDACTED]
Subject: Re: Flu shot spreading 630% more aerosolized flu virus particles
Date: Saturday, December 01, 2018 4:29:57 PM

Aloha,

I am writing out of more deep concern after hearing about the “mandatory vaccine” discussions taking place in Hawaii and in the United States. Americans, scientists, researchers, biochemists, molecular biologists — some independent researchers and more have identified too many RED FLAGS. It’s obvious we need more safety research and safer vaccines NOW. There’s been too much injury and even death. We have to care more and follow up with ACTION. 32 yrs of safety studies weren’t complete by the CDC and that is a MAJOR RED FLAG!

For one, HPV is being linked to infertility, health crisis, paralysis, even death. Beautiful thriving athletic teens in their prime shouldn’t have life-altering outcomes. We should deeply care about that. Why are you having discussions and public hearings about mandatory vaccinations in Hawaii — when 32 yrs of safety studies haven’t been done FIRST?!

There are TOO MANY families in the US and abroad, from our vulnerable population —with a family member disabled, injured, in health crisis, poor health outcomes or dead after receiving the flu shot or other vaccinations. How can we advocate for better safety for ALL families today?

Listen to their stories. Too many fathers, mothers, sisters, brothers, grandparents, and friends including our NY state Senator José Peralta who died — or with poor health outcomes, disabilities, paralysis or dead. Please review any scientific research out there linking vaccines to auto-immune diseases which has impacted our family personally — which can lead to an early demise. All our Fathers... Brothers... Sisters. Friends. Grandparents. Loved ones. They are ALL priceless and irreplaceable!! We have to care more about them too.

Have you considered enough our vulnerable population who are being INJURED from vaccine ingredients and vaccine injections. What can we do to HELP PREVENT injury BEFORE they become a “medical exemption” case? We have life-altering brain & mental health injuries, mass internal injuries, heavy metals crossing the blood-brain barrier, compromised health outcomes, even diseases & cancers spreading. Auto-immune conditions with early demise outcomes. How is this helping our families and communities thrive? Nanoparticles, retroviruses, even nagalase found by independent scientific researchers affecting millions. See previous e-mail for links, please do your own research. More research needed immediately!! Death as the worst outcome. We have to CARE MORE about them too.

See link & testimony below. Retroviruses found in vaccines by experienced PhD biochemist & molecular biologist, her research largely done at National Cancer Institute in Frederick, MD.

<https://m.youtube.com/watch?v=MBEI48og9mM>

* Currently physicians in Oahu are unable to test Hawaii residents for retroviruses.

Auto-immune hits home:

My husband LIVES with a severe auto-immune condition called Ankylosing Spondylitis. At the age of 18 or 20 yrs he was tested for HLS-B27 arthritis blood marker which was negative. After receiving the Hep B vaccine age 28 yrs old he started having severe back pain, he couldn't get a good night's rest or sleep comfortably in bed anymore from the pain, up all hours just trying to find a comfortable position. He was then retested for HLS-B27— and the test came back POSITIVE HLS-B27. Can't say enough how much this has impacted his life and our family — all when in the PRIME of his life. Please prevent this from happening to other fathers, mothers, brothers, sisters, friends in our beautiful state of Hawaii, in the US and abroad.

When scientific research and MD's confirm the highly probable link between Hep B vaccination, inflammation, & auto-immune conditions — these are LIFE-ALTERING reactions and very SERIOUS disabilities we've experienced first-hand and should be taken seriously. Are vaccines safe for everyone? My husbands injury could have been PREVENTED if 32 yrs of safety studies were done!! There is a vulnerable population out there and we need to do a better job protecting them as well!

Vaccination & Auto-Immune

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5607155/>

My husband has faced a life of pain and suffering with Ankylosing Spondylitis or AS — and there are no words to describe how painful it is to watch it take over his body. Simple movements like getting in and out of bed, sitting up from the couch are torture. He's being TORTURED every day by the pain , literally tortured— it's so severe he now can't even take a full breath of air because the inflammation hurts too much. Inflammation is in his chest cavity. Any time he coughs or sneezes it feels like he's being stabbed and he cries out in pain. He has to lift & cross his legs with his hands/arms because it hurts his back too much to lift his leg on its own. And the Humera injections prescribed for 10 yrs... one day he lost half the feeling in his hands, feet, and lips. Long-term side effects are unknown but nerve damage is listed as one. He has nerve damage now and limited use of his extremities.

Our story may hit too close to home for someone else you know — whether it's your own family member or friend. What can we do to prevent this from happening to others? I can't believe how many of our friends and acquaintances have been diagnosed with an auto-immune and Ankylosing Spondylitis as well!! It's becoming a crazy large problem!!

Father blind and paralyzed soon after flu shot. How many more?

See link: <https://news3lv.com/news/local/las-vegas-man-blames-flu-shot-for-triggering-rare-disorder>

Vaccines Revealed, injuries. Watch Dr. Brian S. Hooker PhD testimony. See link below: <https://www.vaccinesrevealed.com/?cookieUUID=7a8ba4a8-baec-492a-b234-cf9e8bff9360>

Injected aluminum and an increase in cancers. See link below.

<http://www.greenmedinfo.com/blog/cancer-causing-metal-millions-eat-wear-or-have-injected-their-kids>

“A team of scientists from [Zabludowicz Center for Autoimmune Diseases](#) in Tel-Hashomer, Israel, set out to take a deeper look at Shoenfeld’s hypothesis.

“**Vaccines and autoimmunity are linked fields,**” the reviewers state of their data.

Autoimmunity caused by vaccines, they say, can be severe, and even fatal. [So my husband’s condition could be fatal for him? How deeply sad.].

Current research and case studies were reviewed by the team. The ASIA model ultimately explains that adverse vaccine reactions have been occurring since the practice began — and that the adjuvants used to stoke the immune system into action are a major vector for disease. Indeed, in some individuals, adjuvants can set off a wave of immune system reactions that culminates in the onset of any number of autoimmune diseases.” See link below:

<https://www.naturalnews.com/2018-10-16-adjuvants-found-in-vaccines-increase-autoimmune-disease.html>

It is my hope all our health agencies will promote higher SAFETY standards for all. Thank you. *What are we doing to learn about genetic profiles / vulnerabilities? Do we study / follow people’s health long-term before and after vaccination? What do we know about Mitochondrial function or impairment? How does nagalase impact Vit D absorption? Have we studied & compared the health of the vaccinated / to the unvaccinated? Why or why not? Let’s keep asking questions and find the answers.

Kind Regards,
Laura Reese

Date: Saturday, December 01, 2018 10:03:42 AM

Please take my testimony.

I Jesse Spiller-Reiff of [REDACTED] OPPOSE requirements for mandatory vaccines in children. We all should have a choice in life and until my children grow up, it is my responsibility to make these choices. We have many factors why, but one is that my child had a very severe reaction to her vaccination at 2 1/2 years old. I will never forget bringing in a healthy child to her doctor and in return I got a very sick one.

Jesse Spiller-Reiff

Subject: Testimony for HAR 11-157
Date: Tuesday, November 20, 2018 8:20:56 PM

Aloha,

My name is Kelly Davis and I am representing myself. I am strongly opposed to HAR 11-157. Many individuals can have serious even deadly reactions to vaccinations. My brother and I both had bad reactions to the MMR shot and screamed for days after the shots. I had learning disabilities afterwards growing up which I eventually outgrew. (I believe I outgrew this because over time my body eliminated the chemicals that were injected). Unfortunately, my brother regressed severely after his vaccinations and he is now diagnosed with Asperger's. No parent should feel forced to give their child a vaccination, or they are not allowed to receive an education. There are many side effects and once the damage is done there is no return. You will be left with a disabled child and cannot even hold anyone liable. Vaccines are not double-blind placebo tested and I believe they should not be forced upon anyone. Health freedom should be a basic human right and no one should be forced to inject something into their body.

Some of the vaccinations required by the DOH are not risks for children at school such as the HPV vaccination which only prevents a sexually transmitted disease. Since children are not having sex at school, I don't see why the school system would feel it needs to be required to attend.

Thank you for taking the time to read this and please do not let HAR 11-157 pass.

Kelly Davis

Aloha, My name is Sarah Silva

HAR-157 needs to be taken off the table immediately. Our ohana lives on the island of Kauai and we strongly oppose this proposed rule change for the following reasons:

1. Where there is risk, there must be a choice. Vaccines carry risk. If you don't believe me, read the vaccine insert itself—not the generic “fact sheet” from the doctor, but the actual, lengthy, detailed insert that comes in the vaccine box. It is wrong to mandate a medical procedure that is known to cause harm and carries risk.

2. You are not protecting more children with these rules, you are intentionally putting more children in the way of the risks of vaccines. Parents shouldn't have to set their own child on fire to keep others warm. Have you read the study that shows the effects of the suggested vaccine schedule as a whole? No? Because there isn't one. How dare you try to mandate a medical procedure when there aren't adequate safety studies in place.

It recently came to light that the safety obligations put in place years ago by congress in the National Childhood Vaccine Injury Act were never upheld. This proves that we cannot trust the government to follow through with their promises when it comes to the health and safety of our children—so parents must. Stop making it harder for us to protect our children.

3. HPV is a sexually transmitted disease. It is disgusting and appalling that you are suggesting the HPV vaccine be a requirement for children to attend school. What kind of gatherings are happening that they need supposed protection from an STD? It is also the most controversial vaccine because of the debilitating side effects that have ruined the lives of many across the world.

4. Requiring the flu vaccine is inappropriate. Did you know that the flu vaccine is contraindicated for people with egg allergies? Egg is a common allergy. Most people don't know this nor is the information shared and the basic question “are you allergic to eggs?” asked when the shot is administered. Plus the efficacy rate of the flu vaccine is so low, it's laughable that you'd add it to the list. It shows that you truly do not have the best interest of children in mind.

5. Stop re-defining what a “group” is – Your wording about what a “school” is concerns me. It now defines “school” as a “congregate setting for educational purposes.” That is too general. Even if you listed “exceptions” in a later paragraph, this definition is too vague and I ask that it be changed to “public school.” If you want to have rules for public school, that's one thing, but many, many, many of us have

opted to not send our children to public schools for a wide variety of reasons. Stay out of our options. Stay out of our private schools, stay out of our daycare centers, stay out of our homeschool co-ops, stay out of our playgroups. Stay out. If we wanted our children to be forced into a “one size fits all” mold, we would send them to public school. But we haven’t. We have created our own options because there is no “one size fits all” when it comes to anything—including education and medical decisions.

6. Medical Freedom is a basic right. You don’t know the medical concerns, religious beliefs, or educational background of every individual that you are trying to regulate. Stop pretending you know better. Stop creating blanket rules based on what you believe everyone should believe. Medical freedom should be protected so that INDIVIDUALS can make educated INDIVIDUAL decisions when it comes to their health. Health is personal and varies from individual to individual. Parents have the right to informed consent and making educated decisions when it comes to vaccines. Stop trying to take that away from parents.

Sincerely,

Sarah Silva

Joint Committee on Health and Children

Meeting on Thursday 3rd December 2015

Opening Statement by Ms. Anna Cannon, REGRET

Chairman, Deputies, Senators thank you for hosting us today.

We are representatives of a group of parents who have come together from all over the country to form R.E.G.R.E.T, which stands for Reactions and Effects of Gardasil Resulting in Extreme Trauma. We are a support Group for families with children suffering long term and life changing health issues following the Gardasil HPV vaccination.

Our 130 daughters display a series of debilitating, long term and chronic symptoms, corresponding directly with the Gardasil Patient Information Leaflet (PIL) ¹by the manufacturer. The PIL is the folded leaflet everyone gets included in the medication package when they go into the pharmacy to collect medication.

We are not given this information when signing the consent form for our daughters to get vaccinated with the Gardasil HPV vaccine in first year, secondary school. Instead we are given a marketing leaflet², outlining five mild side effects. Nowhere does it tell us about the risk of long term, chronic life changing side effects.

It doesn't tell us about the daily, severe headaches our girls struggle with for years, the nausea and stomach pains, the debilitating fatigue, the fainting and seizures, and onset of auto immune disorders.

It doesn't tell us that we might regularly end up in the A&E department, watching our teenagers scream in pain, whilst doctors rule out one condition after the other.

It doesn't tell us that our previously healthy, sporty and high achieving girls might never play sports again, never mind socializing with friends, enjoying what should be the most carefree time in their lives.

It doesn't tell us about the impact of these illnesses on our daughters' ability to continue their education, and the resulting psychological impact of having this basic human right taken away.

Parents are not prepared for the emotional strain of watching their child struggle to get out of bed to face another day of pain, fatigue, muscle weakness, dizziness and inability to concentrate. We also worry about how we will manage to raise the funds to meet our daughters many medical needs in years to come.

¹ See Supporting doc: Merck PIL.pdf

http://www.merck.com/product/usa/pi_circulars/g/gardasil/gardasil_ppi.pdf

² See Supporting doc: Parent Information Leaflet HPV Gardasil Vaccination.pdf

<http://www.hse.ie/eng/health/immunisation/pubinfo/schoolprog/hpv/HPVImmProg.html>

Some of our daughters have contracted potentially life-threatening conditions, rare or unheard of in children their age. And yes, some doctors do admit that they think it is connected with the Gardasil HPV vaccination.

But most medical professionals in GP clinics, A&E departments and Hospitals across Ireland will not acknowledge any connection with this vaccine. Maybe if we as parents had been given the PIL, we could have pointed out the list of possible side effects to these doctors. Instead we struggled, sometimes for years, to understand our previously healthy daughters' range of health issues, before making the connection.

We believe there is significant under-reporting of HPV vaccine adverse reactions to the HPRA (Health Products Regulatory Authority). Before contacting R.E.G.R.E.T., most parents had never heard of the HPRA, or the adverse reaction reporting system. It is also their experience that doctors and consultants failed to report suspicions of side effects even when parents had pointed out the connection.

We all wanted the very best for our children. We trusted that the HSE would act responsibly and respect our right as parents, to be fully and honestly informed before making the decision to sign the consent form. This is a significant decision for parents, considering Ireland is one of the very few countries in the developed world that still do not have a vaccine damage compensation scheme.

Two years ago when the Gardasil vaccination programme was discussed by this Committee, Dr. Colette Bonner from the Department of Health, noted the Committee's concern that there is no vaccine damage compensation scheme. *"There is an expert report which we are considering. I will convey the committee's concerns both to the secretary-general and the Minister on this point,"* she said³.

IN THE INSERT

We now know that Gardasil got CDC fast track approval and underwent a mere six months⁴ of human trial research. Subjects were only followed for 5-15 days⁵ in the safety studies, and only 1200 girls under 16 years of age participated (even though this is the target age for the vaccine). During these clinical safety trials paid for by Merck, 95% of the 'Placebo' injections⁶ contained the same toxic aluminium adjuvant⁷ as the vaccine itself, which resulted in Merck being able to claim that adverse reactions were not significantly higher than those of the Placebo group.

³<http://oireachtasdebates.oireachtas.ie/Debates%20Authoring/DebatesWebPack.nsf/committeetakes/HEJ2012122000010?opendocument>

⁴ & ⁵ In initial trials, participants only followed for 5-15 days from the last dose administered 6 months into trial http://www.merck.com/product/usa/pi_circulars/g/gardasil/gardasil_pi.pdf

⁶ See section "Clinical Trials Experience": http://www.merck.com/product/usa/pi_circulars/g/gardasil/gardasil_pi.pdf

⁷ <http://www.ncbi.nlm.nih.gov/pubmed/22235057>

What we also now know is that in a later 4-year clinical trial by Merck, 2.5% (1 in 40)⁸ of trial participants reported a serious adverse event* after taking the Gardasil HPV vaccine. In addition, 3.3% (1 in 30)⁹ also reported a new auto-immune condition.

**According to the FDA a serious adverse event must fit one of the following criteria: death, life-threatening, hospitalization, disability or permanent damage, congenital abnormality/birth defect, or the requirement to intervene to prevent permanent impairment¹⁰.*

Given the current rate of incidence of cervical cancer in Ireland is only 13/100,000¹¹, the benefits of this vaccine hardly appear to outweigh the risks.

The benefit, according to politicians and health authorities, is that 50 to 60 lives a year¹² will be saved by the HPV vaccine in Ireland. However Health Technology Assessment Reports from other countries¹³ show that these statistics can only result from the combined effect of screening plus vaccination. However in Ireland these figures are being presented as the effect of vaccination alone.

The truth is that our girls will still require ongoing and regular pap smear tests, as protection from the HPV vaccine has not been shown to last longer than 8 years¹⁴.

Worldwide concerns mounting for the safety of the Gardasil HPV vaccine:

Gardasil has now been dropped from the childhood immunisation schedule in Denmark¹⁵ and replaced with an alternative vaccine. As of September 1st, approximately 1100 girls¹⁶ were being treated (or waiting to be treated) in five Danish regional medical centres for suspected Gardasil related conditions. Japan no longer recommends the HPV vaccine after conducting its own investigation into serious reactions¹⁷.

⁸ See section "*Serious Adverse Events in Clinical Studies*"

http://www.merck.com/product/usa/pi_circulars/g/gardasil_9/gardasil_9_pi.pdf

(Note that Gardasil was being used as a placebo in this trial with "Gardasil 9" as the comparison vaccine).

¹⁷ http://ajw.asahi.com/article/behind_news/social_affairs/AJ201306150057

This month we have been told that Gardasil's safety has been reaffirmed based on the results of an EMA Review which found no link between Gardasil and two specific medical conditions (CRPS and POTS).

Research Director and Consultant Dr. Jesper Mehlsen from Frederiksberg Hospital has studied many girls with suspected adverse reactions to the HPV vaccine. He has criticised the EMA, for not releasing the evidence of records and data, when submitting their early release conclusion¹⁸. Dr. Mehlsen is now heading an independent investigation into the HPV vaccine, with results due out in April 2016. Speaking in June this year, he said "A realistic estimate is that one in 500 girls experience serious side effects"¹⁹.

Spanish doctor and professor of Public Health, Carlos Alvarez-Dardet from the University of Alicante, has initiated a petition against the HPV vaccine. He is a former President of the European Public Health Association (EUPHA) and was also an advisor at the W.H.O. He is now calling for an immediate stop to the vaccine²⁰.

Last month, researchers announced the results of a Canadian study to show the effect the HPV vaccine had on 170 teenagers who they followed for 4 years. They now question both the safety and benefits of the HPV vaccine, urging Quebec to halt HPV immunization until its alleged dangers have been independently investigated²¹.

French MEP Michele Ravasi has compiled a large petition with hundreds of Physicians signatures calling for a moratorium on the HPV vaccine²².

As parents we feel that the Minister for Health has a duty of care for 130 teenage girls suffering chronic ill health since the Gardasil HPV vaccination. However, he has consistently declined our requests for a meeting to discuss our daughter's situation.

In a Private members Dail question to the Minister for Health in October (PQ: 36264/15), Deputy Maureen o'Sullivan asked for *"the reason parents are not provided a copy of the Patient Information Leaflet (PIL) prior to signing the consent form for the HPV vaccine"*.

The HSE provided a response in the form of a letter from Dr. Kevin Kelleher, Assistant National Director of Public Health, which included this explanation:

¹⁸ <http://nyhederne.tv2.dk/samfund/2015-11-12-hpv-rapport-konklusionen-er-ikke-endelig>

¹⁹ <http://sanevax.org/gardasil-firestorm-in-denmark/>

²⁰ The epidemiologist Carlos Alvarez-Dardet, professor of public health at the University of Alicante and director of the Journal of Epidemiology and Community Health is the author of a manifesto published in the Spanish newspaper El País, giving the reasons why a moratorium on vaccination with Gardasil is imperative http://elpais.com/diario/2007/11/06/salud/1194303609_850215.html

²¹

https://www.academia.edu/16549844/For_a_moratorium_on_the_HPV_vaccine_Pour_un_moratoire_sur_le_vaccin_HPV

<http://www.ledevoir.com/societe/sante/451710/vaccination-contre-les-vph-appel-urgent-a-un-moratoire>

²² <http://sanevax.org/france-are-hpv-vaccines-necessary/>

“All the information provided to parents about vaccination is prepared from the available licensed documentation for each vaccine, the Summary of Products Characteristics (SPC) and Patient Information Leaflet (PIL). The information is presented in clear simple language and approved by the National Adult Literacy Agency so that it can be understood by all adults as the average reading age in Ireland is 12 years of age”.

So the official reason for the HSE withholding the list of known serious, debilitating and long term side effects from the HPV vaccine information literature is because *“the average adult reading age is 12 years old”*, and on that basis the content of these information leaflets is determined. I hope the absurdity of this logic is not lost on the Committee.

As an aside, I note that it was Merck Sharp & Dohme (MSD) who sponsored NALA’s 2007 Irish Health Literacy research project²³.

There are some who would rather dismiss us as ‘Anti-vaccine’ parents, but we all gave our other children their vaccinations, just as we all signed the consent form for this one. We thought we were doing the best for them. Instead we signed away our girls future, and five years later they are still struggling.

Our lives were never the same following the Gardasil HPV vaccination of our daughters, with years taken from them, their parents, siblings and grandparents. We have been given no answers, guidance, or hope.

We live with the guilt of our decision to sign the Gardasil consent form every day, watching our previously healthy young girls struggle to get through their day, with our bags packed 24/7, in case of yet another emergency visit to the hospital.

Read some of our teenage girls stories here; <http://www.regret.ie/victims 2.html>

Subject: Vaccines prevent severe diseases
Date: Wednesday, December 05, 2018 12:59:54 PM

Testimony for the need of vaccines:

I, along with other pediatric physicians, hope for the best of health in our patients. I would like to relay a story of a patient who had severe disability due to a vaccine preventable disease. During my residency in Michigan, I saw a case of meningococcal meningitis in a child. This is a severe, fast-spreading disease that affects the covering around the brain (the meninges) and goes through the blood stream to affect the whole body. It is not a disease where a patient can take oral antibiotics and stay home. It requires immediate hospitalization in the ICU (intensive care unit), not just the pediatric ward. The hospital in East Lansing was a regional children's facility so we rapidly had to treat this patient as he came from an outlying area. I saw him in the ICU bed, lying unconscious with central lines and the tell-tale purple purpura rash that we are taught to look for in meningitis. Prior to his illness, he had been a normal boy playing and running around, but would leave the hospital with a leg amputation as well as amputations of many fingers and toes. Over the course of his hospital stay, many of his toes and fingers turned black and necrotic. Despite all of the medical care that we had provided, amputations were necessary to save his life. Some children are not so lucky and die because of this disease. He had to endure weeks of hospitalization and then had to learn to walk with a prosthesis. This is why vaccines are needed to prevent death and severe disability in our children.

Whitney Herrelson
[REDACTED]

December 7, 2018

Hawaii Department of Health
Disease Outbreak Control Division

To whom it may concern:

As a mother of 2 small children, and a citizen, voter, and taxpayer in the state of Hawai'i, I adamantly oppose the new additions to the recommended vaccine schedule, specifically the influenza and HPV vaccines, as well as any government-mandated vaccines.

Since the introduction of the HPV vaccine, over 25,000 adverse events have been reported to VAERS,, 772 of which were "serious". In addition, 32 recorded deaths have occurred (White, 2014). I strongly believe (from personal experience) that vaccine injuries go largely underreported. *Where there is risk, there must be choice.*

The influenza vaccine is only 40% effective in 2018, but only 10-40% effective for people ages 9-17 (depending on the vaccine type) (CDC, 2018). This vaccine, like all vaccines, does not come without risk.

While I understand that vaccines have and do save lives, I believe it is unethical to force one person to sacrifice his/her health or life via vaccine injury, to protect the masses. The fact is that no vaccine is without risk, and no one can predict who might be negatively affected. Some lives will be lost to vaccines.

Please thoroughly consider the negative impacts from making Hawai'i the most vaccinated state in the US, and well as the ethics surrounding mandated vaccines.

Sincerely,
Whitney Herrelson

From: [REDACTED]
To: [REDACTED]
Subject: Testimony for HAR 11-157
Date: Friday, December 07, 2018 10:54:27 AM

To Whom It May Concern:

Thank you for this opportunity to provide testimony. As a community member and public health advocate, I am writing to strongly support the HAR 11-157 proposed rules update.

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life. The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases. As a pediatric hospitalist at [REDACTED], I help to provide care for some of the sickest children in the state and I feel very strongly about vaccinations to keep our keiki healthy. I have seen some terrible outcomes in children who have not been vaccinated with significant life-threatening and life-changing events. No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized. Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders. I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities. Thank you for your consideration.

Sincerely,

Jennifer Di Rocco

Subject: Testimony in opposition to proposed rule changes
Date: Friday, December 07, 2018 9:50:29 AM

Aloha,

As a mother, public health professional, laau lapa'au, and sovereignty activist, I am appalled by both the proposed rule changes and by the process (the lack of decision-makers at public meetings should immediately invalidate the entire process). Health sovereignty is not a trivial matter for Hawaiian ohana. My dear health research mentor, Dr. Kekuni Blaisdell, proved the link between loss of Ea (manifested through self-determination and body sovereignty) and poor health outcomes for Kanaka Maoli. Interfering with our right of free, informed choice is a direct attack on ea, and it is not okay.

Please halt this entire process immediately. If the State wishes to lower morbidity from contagious diseases, many steps can be taken that will not interfere with health freedoms, nor drive families underground without access to education resources.

Here are some things that can be done:

- mandate SICK LEAVE, including sick child care. Do not allow people who are not well to be forced to continue to work.
- address the housing crisis. Unhealthy, unsanitary conditions are created by both overcrowding and by people feeling they "can't" take off time from work or keep their sick children home. This would have far greater effect on contagious disease containment than mandatory vaccines.
- provide better information on contagious diseases, including containment strategies that can be used in addition to vaccine programs.
- stop pushy, judgmental approaches (like this one) that turn people off to vaccine programs entirely and foster community distrust and polarization.
- for goodness sake, drop the ridiculous idea that if parents choose even one vaccine, they are ineligible for an exemption. That is offensive and dangerous, and by removing the option of partial vaccination, counter to the goal of increasing vaccine rates.

I am available for consultation at any time.

Mahalo nui loa.

Subject: HAR 11-157 Proposed Update
Date: Friday, December 07, 2018 5:56:17 PM
Attachments: [image001.png](#)
Importance: High

Thank you for this opportunity to provide testimony and feedback by email as I will be unable to attend our local meeting on 12/21/2018. As a community member, a father of two children, and a board-certified pediatrician who has been practicing on [REDACTED] for over 6 years, I am writing to **strongly support the HAR 11-157 proposed rules update.**

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP), which have also been approved by our professional organization, the American Academy of Pediatrics (AAP), as well as the American Academy of Family Physicians (AAFP), and the American College of Obstetricians and Gynecologists (ACOG).

While this has been disappointingly categorized in some media as "new vaccines," please understand that the proposed changes are to bring Hawai'i in line with what have been recommended as routine vaccines in pediatric and family medicine. In fact, during the 2016 Hepatitis A outbreak in Hawai'i **none** of the 292 affected people were children, which can largely be attributed to the fact that the Hepatitis A vaccine has been a part of the routine vaccination schedule for all children since 2006.

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

In fact, this October in my office I was performing physical exams on two of my teenage patients, when with tears in her eyes their mother thanked me for giving them the HPV vaccine. She explained further that this past summer the boys had to witness their father receive treatment for oropharyngeal (throat) cancer due directly to HPV, and was so grateful that her sons would be much less likely to go through the struggle that their father was currently enduring.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

I vaccinate my children, but beyond that, I received my MMR booster-- despite showing immunity to mumps in blood testing--as recommended by the Department of Health to protect myself, my other patients, as well as my infant son who is too young to be vaccinated for mumps.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you for your consideration. Please contact me with any further questions or concerns.

Carl L. Yu, MD FAAP

Pediatrician

Dec 10, 2018

Aloha Hawaii Department of Health,

Thank you for this opportunity to provide testimony.

I STRONGLY OPPOSE THE HAR 11-157 PROPOSED RULES UPDATE.

I OPPOSE INCREASING VACCINE REQUIREMENTS. The risks of adverse reactions include autism, infertility, autoimmune disorders, seizures, paralysis, and death. Increasing vaccine requirements puts are children at greater risks for adverse reactions. There have been no long-term studies done on vaccines proving their safety.

I OPPOSE INCREASING REQUIREMENTS FOR MEDICAL AND RELIGIOUS EXEMPTION. Complicating the exemption process would take away a parent's right to informed consent. Parents must be allowed to refuse the injections of toxic metals, harmful chemicals, allergens, and xeno-biological agents such as animal and fetal derived DNA. Ultimately parents are responsible if anything happens to their child. Doctors and pharmaceutical companies are not held liable for injuries.

The National Childhood Vaccine Injury Act of 1986 ruled that pharmaceutical companies and doctors are not liable for any injuries caused by vaccines. Since then HHS has had the sole responsibility to make and assure improvements in the licensing, manufacturing, adverse reaction reporting, safety and efficacy testing of vaccines in order to reduce the risk of adverse vaccine reactions. Congress required as part of the 1986 act that the secretary of HHS submit a bi-annual reports to Congress detailing the improvements in vaccine safety. In an effort to gain access to these safety reports ICAN and Robert F Kennedy Jr. filed a freedom of information act request in August of 2017 to the HHS only to be blocked from receiving information for over 8 months. ICAN and Kennedy were forced to bring a lawsuit against HHS to provide copies of these reports to Congress or to admit that they never actually filed these reports. The result of the lawsuit was that HHS had to admit that it NEVER filed a single report to Congress detailing the improvements of vaccine safety.

I OPPOSE ADOPTING THE ADVISORY COMMITTEE ON IMMUNIZATION PRACTICES (ACIP) RECOMENDATIONS. These recommendations have not been tested and proven safe and pose risks of severe adverse reactions. The FDA admits that only 1-10% of adverse reactions are even reported.

The HAR 11-157 proposed rule changes increase vaccine requirements and complicate the acquiring of vaccine exemptions, which is a complete infringement on our freedom of informed consent. Also none of the vaccines

have ever been tested in a placebo controlled double blind study. The accumulative effects of combined doses have never been studied. If the proposed changes take effect it would allow the CDC to add many more vaccines to the already overwhelming vaccine schedule. According some doctors over 130 more vaccines are in the process of being developed.

In light of this information, parents should be allowed to easily apply for an exemption. Since government agencies are lacking responsibility in holding vaccine manufacturers accountable

By 2018 the US Court of Claims had awarded nearly 4 billion dollars to vaccine victims for their catastrophic vaccine injuries although 2 out of 3 applicants have been denied compensation.

HEALTH FREEDOM AND INFORMED CONSENT ARE BASIC HUMAN RIGHTS!
Everybody must be allowed the right to chose or refuse what to put into their body. Vaccination is a medical intervention that carries a risk of injury or death. The right to informed consent to any medical intervention that can kill or injure you or your child is a human right.

Please consider the health concerns of everyone susceptible to adverse reactions to immunizations.

Thank you again for the opportunity to provide testimony opposing the HAR 11-157 proposed rules update and the adverse consequences it would cause.

Mahalo,

Reka Starr & Zsolt Csillag

Residents

State of Hawaii Honorable & Esteemed Congresspersons & Senators,

We are mothers, grandparents, aunts & uncles. We entreat you to listen. You are charged (Obligated) to represent 'the people of Hawaii'. This includes all of us, as Citizens, as Parents, as the Most Vulnerable amongst us, Infants (even in the Womb) and Children.

There are 3 issues at stake here:

1. All our Freedoms.
2. Safety.
3. Responsibility.

1. We are a Democracy. As a State, HI is 100% Democratic, as is most of CA. Are we to understand that Democrats in the State of HI are those who Remove the Most Basic Freedoms of its People? Will It follow the Socialist method of Dividing Families by Removing Personal Freedoms? You will see this as families are separated, overburdened by Damaged Children and left to be further Bullied by the Legislation of their 'elected officials'. Will the State **Be Bullied by Federal threats or Corporate Profits** to Not Only remove our God-given rights to Raise our own Families as we see Safe (& remember the Story of the Wisest Ruler in History-Solomon! Who Demonstrated the True Advocate for their own Child-the one who will watch their child Suffer, but their Mother?). Will HI Legislature Create a Population (Births –of local workers- are Reduced by Vaccines given before or after Birth)*a but critically here, a **Population whose Constant, Dependency Needs for Added Healthcare, Added Educational Services, Added Housing & Caretakers until Well after that of Adults** and will, we believe, Surely, very Soon, Overwhelm HI's Healthcare, Housing, Educational and Welfare System's Budgets! Should such Unwise Legislation be Followed by this State (against Common Sense followed by much of the World re: Vacc.), the 'Democratic HI' will be known as One that Removes its Peoples' Freedoms. One that Places Huge Additional Caretaker Burdens (and Taxes to Pay for Such) on its Population? What has HI's Legislation done to insure our Children's Safety, Can HI Democrats show that they care about Families, that they can Lead our Country by Following the Lead of More Intelligent 1st, 2nd & even 3rd World Countries. Can we Directly have a small part in solving a Bigger Problem by Demanding we Use the "Precautionary Principle" in our Vaccine Legislation to Protect the Health and Welfare of our Citizens, especially those without Voices,our Most Vulnerable?
2. Are these Vaccines PROVEN SAFE? NO. Can this 1986 Legislation be Negated to Remove Unsafe, NeuroToxic Poisons from Vaccines' Ingredients (such as Aluminum, Thimerosal-Mercury-formaldehyde, etc.-need a magnifying glass to Read the Side Effects!); to even List Side Effects in Readable Print, so that Parents are aware of the very Real Risks? The Statistics & History of Vaccines' connection **to just Autism Spectrum alone***b, which has gone from **1/10,000 in 1980's to 1/ 2500 in the 1990's, 1/1000 in the 2000's to 1/88 in 2012, 1/68 in 2016, 1/ 1/59 in 2014, to now 1/44 children? What has Changed?** Is is just Coincidence that the Number of Vaccinations have

been Multiplied, as discussed by others here, has Increased, nearly Proportionately? This FACT means that **Every Person in this Room's "FAMILY" will be Negatively Affected** (in just this One Disorder!) at Least Once in their lifetime. It is the Family (parent, grandparent, siblings) who will watch their child Suffer, never able to live or share their lives to their God-given Potential. Are our 'Representatives' listening? Is the State Ready to Admit Culpability in this, when far more than apprx.1500 (just Autism Spectrum alone) of our Local Kauai Population alone, in the very near future is Affected by AS alone (in '06 1 in 6 'affected' from everything from speech & language impairments to serious developmental ones such as Cerebral Palsy,*e. not Including: MS, Brain Inflammation, paralysis, Epileptic, Blind,Diabetic,Mentally Retarded or Miscarriage Deaths to our Child Population *b&f.). Does the State Know how Difficult and Costly it is for Kauai Schools just to get and retain **even One Special Ed Teacher?** Until there are **Multiple Scientific, Unbiased** (by Gov't or Industry-Funded studies with Proven Conflicts of Interest)* c, **Long-Term Studies that Show Guaranteed Proof of SAFETY** in Vaccinations for Hawaii's Most Vulnerable, Why Can't We Demand to Demand the Use of the Precautionary Principle in the Protection of our Most Vulnerable? Hawaii's Future Citizens? We Have Demanded 'Safety' in our FOODS, with every piece of fruit or vegetable, we can Know where it's Grown, the Ingredients in Packaging & the Pesticides sprayed on it; we Know the manufacturer of the Miniscule Nuts & Bolts of our Autos for 'Our Safety'. Aren't there issues of Constant 'ReCalls' on everything we put into our bodies that Is Not Safe? Isn't it Reasonable, then, to ask for Removal of NeuroToxins from Vaccines? From those 'Corporations' who produce such, who since 1986 are Given a 'Free Ride' from SAFETY REGULATIONS (1986for our Bodies, that of the Defenseless, our Newborn, those in the Womb & our Children? Korea (higher vacc. Rate than US,UK & Australia96.6%=higher AS rate)*d

3. Responsibility, Accountability. Where is this for State of HI? The 'costs/yr.' for ASD in the US ('11) were "estimated at \$11.5 -\$60 Billion"!*e. This significant Economic Burden represents a variety of Direct & InDirect costs from medical care to special Education to Lost Parental Productivity. *e. In '05 av. Annual Medicaid-enrolled costs were 5-6 times higher than normal children w/o ASD. Behavioral interventions (all this for ASD alone) cost \$40-60,000/yr. Who is Responsible for this Damage?

An Educated Parent would Not allow these Poisons into their child's bodies. They are Not Responsible, especially if there IS No Choice given to them. *Are our Legislator's Ready for that blame? From their loved ones, their nieces, nephews, children, grandchildren, for their responsibility as they blame them for their hardships, loss of quality of life and sorrow? Will future legislation remove their retirement funds as a penalty for allowing such?*

There is no 'need' for mandated vaccinations. The US is near tops for 'sanitary conditions' in most places, this is not Africa or a 3rd world island, where just the addition of 'Clean Water' has drastically Reduced Disease (ie. Fiji gov't., 2016). We have No Urgent need for a Plague in 'measles, chicken pox, mumps, even polio right now. Why have we "Shielded Drug Companies from All Liability for Harm" since Congress was Blackmailed in 1982 by Vaccine Corporations (Merck,Wyeth,Lederle &

Connaught) & 2-22-2011? *f *The Vaccines Creators are Not Accountable in a Court of Law by their Peers (the PUBLIC in HAWAII, too) for ANY Damages, even if these Vaccines could Easily have been Made Less Toxic! They are completely IMMUNE from Damages (lawsuits) to Hawaii's Children, Hawaii's Future. The Vaccine Industry, Big Pharma is out of Control. From 23 doses of 7 vaccines 36 years ago to 70 doses of 16 vaccines in the 90's to 130 doses of Government Recommend vaccines until we are 78 years old! Today, there is NO Responsibility from the Drug Companies for To Make 'Safe Vaccines' for Human Children. There is No Accountability for Damages to Families, to Babies, to our Cherished Keiki, our Kapuna from even a Death Sentence!*

*The day after the Supreme Court blocked lawsuits against drug companies for Unsafe Vaccines, the Democratic-Controlled Congress approved 'seatbelt safety.' *f **Civil liability** put pressure on Federal Health Agencies to replace use of a contaminated, neurotoxic polio vaccine that can paralyze people, with one that cannot. On Our Urging, HI Congress & Senators, we Demand that you Stand up to this Corporate "Bully" as other States have. Please, bring Common Sense to Government. Take on the 'Elephants in the Room' with our support, or we the People will soon suffer immensely, see the Results and Vote appropriately-against you.*

Aloha,

I strongly oppose the proposed rule to mandate vaccinations for all young children.

Where there is risk, there MUST be choice.

I have 2 autistic cousins who were vaccine injured. There is more to the story. It is not a black and white issue.

My children attend public school. Please do not take away our medical freedom.

Thank you,

Natalie Norberg

RE: Amendments to Title 11, Chapter 157 – “Examination and Immunization”

On behalf of Kaiser Permanente, including the more than 600 physicians and providers of Hawaii Permanente Medical Group, this letter supplements our original testimony submitted on October 29, 2018.

We wholeheartedly endorse evidence-based recommendations to enhance immunization requirements in Hawaii. The proposed rule changes will conform with current national recommendations by the Centers for Disease Control and Prevention and the American Academy of Pediatrics.

There are many unfounded or disproven theories and myths about vaccine dangers. **In truth, vaccinations are extremely safe, and complications are exceedingly rare.** Vaccinations help protect our most vulnerable keiki from terrible diseases that can be debilitating and sometimes deadly.

VACCINATIONS PROTECT OUR KEIKI

No child should suffer from a preventable disease when safe, effective protection is available. Delaying or declining immunizations leaves keiki unprotected when they’re potentially most vulnerable.

Children and adults who are not protected can become very sick and spread illness. We’ve seen this happen most recently in the islands with an extended outbreak of mumps. We must remain vigilant in Hawaii, which has a vast international traveler community. With serious and even deadly diseases circulating globally, we need to protect everyone in the community to keep each other safe and healthy.

VACCINES ARE TESTED FOR SAFETY BEFORE RECOMMENDED

Vaccinations have been falsely associated with various developmental difficulties and conditions. The reason this confusion happens is understandable; vaccinations are given to infants and children during the same time in life when developmental challenges become detectable. When this happens, it’s easy for parents to attribute developmental difficulties or diagnoses to vaccinations a child may have received, even when there’s no scientific or other plausible link.

HOW CAN WE PROTECT OUR KEIKI?

Parents/guardians should complete all well-keiki visits and keep up with recommended immunizations. We do not recommend deviating from the standard schedule:

- Spacing out shots leaves your child unprotected against serious diseases when he or she is most vulnerable.
- Combination shots reduce the total number of injections and provide safe, effective protection.
- Multiple shots during one visit mean fewer trips to the doctor's office and less stress for your child.

Keeping up with the standard schedule is safest so that parents/guardians don't have to worry about leaving gaps in protection.

In conclusion, Kaiser Permanente Hawaii strongly supports the proposed amendments to HAR Title 11, Chapter 157 because they conform and align to the CDC's ACIP recommendations. We believe that the recommended vaccines are a safe, efficient and cost-effective way to protect against vaccine-preventable diseases.

Thank you for your time and consideration. Please do not hesitate to contact Daryl Kurozawa, MD, Associate Medical Director, Government Relations at [REDACTED] or [REDACTED] if you have any questions or require additional information. Alternatively, you may contact Jonathan Ching, Specialist, Government Relations at [REDACTED] or [REDACTED].

From: [REDACTED]
To: [REDACTED]
Subject: Opposition to additional recommended vaccines
Date: Thursday, December 13, 2018 5:42:23 PM

Hawaii Department of Health
Disease Outbreak Control Division

To whom it may concern:

As a mother of 3 small children, and a citizen, voter, and taxpayer in the state of Hawai'i, I adamantly oppose the new additions to the recommended vaccine schedule, specifically the influenza and HPV vaccines, as well as any government-mandated vaccines.

Since the introduction of the HPV vaccine, over 25,000 adverse events have been reported to VAERS,, 772 of which were "serious". In addition, 32 recorded deaths have occurred (White, 2014). I strongly believe (from personal experience) that vaccine injuries go largely underreported. *Where there is risk, there must be choice.*

The influenza vaccine is only 40% effective in 2018, but only 10-40% effective for people ages 9-17 (depending on the vaccine type) (CDC, 2018). This vaccine, like all vaccines, does not come without risk.

While I understand that vaccines have and do save lives, I believe it is unethical to force one person to sacrifice his/her health or life via vaccine injury, to protect the masses. The fact is that no vaccine is without risk, and no one can predict who might be negatively affected. Some lives will be lost to vaccines.

Please thoroughly consider the negative impacts from making Hawai'i the most vaccinated state in the US, and well as ethics surrounding mandated vaccines.

Sincerely,
Noelle Manriquez

From: [REDACTED]
To: [REDACTED]
Subject: Support of HAR 11-157
Date: Thursday, December 13, 2018 7:02:58 PM

Thank you for this opportunity to provide testimony. As a pediatrician who cares for the keiki of Maui, I am writing to **strongly support the HAR 11-157 proposed rules update.**

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

As a pediatrician, I feel that a primary part of my job is to prevent health problems so that our keiki can thrive throughout childhood and continue to do so in adulthood. All of the vaccines that have been added protect against infections that cause serious illness and death, and I hope for a day when no one else dies from these vaccine-preventable illnesses. This rules update can help the community come closer to that goal.

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you for your consideration.

Thank you for this opportunity to provide testimony.
As a former school teacher for children with severe disabilities, mom and community member,
I OPPOSE THE PROPOSED RULE CHANGES HAR 11-157.

I am opposed to mandatory vaccines and over regulation for school children. I have met many children whose condition was caused or made worse by vaccinations. I believe that it is a parent's right to choose whether or not they want their children to be vaccinated.

I am also concerned that the requirements to report on children who aren't vaccinated does not comply with privacy laws (The Family Educational Rights and Privacy Act (FERPA), *20 U.S.C. § 1232g, requires written parental consent before personally identifiable information from your child's education records is disclosed to the health department.* & HIPPA) in our schools and I miss the draft for new standardized medical & religious exemption forms are not part of this proposal, even so they very important part of the process and need to be discussed with professionals and public.

At this point, there is not enough evidence to prove that vaccines are safe for all children and especially for this population demographic. There is no one fits all solution. Informed consent, medical freedom are very important for this country and its people.

There is a huge list of potential side effects that may come from vaccinations. In fact, there is even a special court known as vaccine court created to handle issues with side effects and damages to children.

Toxic ingredients are allowed to be added to vaccinations without any responsibility on the part of the vaccine companies. The rules for safety in vaccines are almost non-existent.

For these reasons and many more, I strongly oppose bill 11-157 requiring mandatory vaccinations for school children. Parents need choices on what's best for their kids!

Sincerely,
Kamala Knudsen, Kauai

Hi there,

Choosing to inject/inhale something into your body or child's body should be your choice. No matter what it is.

You may have a strong belief that mandatory vaccination is the right thing to protect people but what if it's not? What if it harms more than helps? Many don't believe it until something happens to their own child or family member.

It's a game of Russian Roulette. The risks outweigh the benefits. Those that do have a bad reaction, that's it for them. It's either permanent and significant damage or death. And we have no idea who will have that reaction until it's too late.

These are our babies. Deciding between a potential illness or a possible bad vaccine reaction are 2 of the worst concepts a parent has to decide on. But at least we have a choice. At least we have some comfort in feeling we are doing what's best for our kids. Without that choice, we all become bad parents because while we strictly measure out our tylenol to be precisely 1 1/2 teaspoons to be sure we don't accidentally "poison" our babies, we just allow vials of confirmed poisons to pump through their veins on a whim.

Please. This is not ok. Please do not vote for mandatory vaccination for public and private schools, and daycares. Ask yourself what you actually know for real? You know you wouldn't want someone injecting heroin or house cleaner into your loved one. That is what it feels like you're asking so many parents to do to their kids. How could moms and dads sleep at night if that's what they feel they're allowing? How can we send our kids to school if that was the only way they could go? What IF mandatory vaccines causes tons of Hawaii residents to move away, pull their kids out of school? What if mandatory vaccination harms or kills tons more of Hawaii kids than you could have projected. What if?

You may be thinking the exact same thought about what if the opposite were true? Well, that's why we need to keep the decision to vaccinate a choice. If you allow mandatory vaccination and something happens to my child, it will be your fault.

This is serious and deserves serious thought about its implications. Do not take this lightly and do not be a follower. Our kids lives and every parents rights to protect their child is in your hands. This means, all Hawaii children are yours. Can you handle that?

To Whom It May Concern,

My family and I strongly oppose the requirement of vaccinations.
Please honor a parent's right to choose what they feel is best for their child,
not what the government or some bureaucratic organization that may not have the child's best interest at heart.

Since this is the issue at hand, I hope you will be openminded and look into this extensive research below.

Mahalo for your consideration,

A Concerned Parent.

**Here are documentaries proving that:

- a) vaccines aren't safe
 - b) vaccines aren't effective
 - c) vaccines have never been proven to reduce disease or improve immunity in real world populations and
 - d) vaccines are only proven to harm all infants, toddlers, children, adults and seniors.....
- on all measurements of health, no exceptions, straight across the board.

December 14th, 2018 - HAR 11-157 TESTIMONY TO STRONGLY OPPOSE BILL

Location: 54 South High Street, Wailuku, HI, 96793

Room: Video Conference Center (third floor)

Testimony Submitted By: Eric Day, Citizen of the USA and Hawaii

Aloha everyone, my name is Eric Day, I live in Kihei. I am not anti-vaccine, I am not pro-vaccine, I'm vaccine aware. The science is crystal clear, vaccines are unsafe. I am pro-child, pro-family, pro-community, I am pro-science, I am pro-health, pro-wellbeing, pro-safety. I am pro-government transparency. I am pro-pharmaceutical company accountability. I am pro-honesty, I am pro-critical thinking. I am pro-freedom. That's why we're here.

- I'm here today speaking as an individual and the father of a healthy toddler and I strongly oppose this bill, HAR 11-157. I'm also here testifying as a member of Hawaii for Informed Consent, and we strongly oppose the bill as well. HFIC is a non-partisan group advocating for your right to choose or refuse any medical treatment or procedure. HFIC is comprised of ordinary people who have come together with one goal in mind. That goal is the preservation of freedom, more specifically medical freedom. We're a group of doctors, lawyers, engineers, medical practitioners and so on.
- Truthfully? I shouldn't even be here, I should be at the park pushing my little girl on the swings and enjoying life with her, but I'm not. Why? In 2013 SB1138 gave the Department of Health way too much power over the citizens of Hawaii. The DOH has this power without the checks and balances of our government and legislative process. The DOH does not represent the people. They represent the CDC and the pharmaceutical interests that fund them. This bill is NOT about public health, it is about profit. Let's get in to it...

THIS BILL CAN NOT BE MADE A LAW

Promoting mandatory vaccination for entire populations with products that essentially rely on manufacturers' data for their general safety and efficacy is a breach of the precautionary principle, and as such becomes a forced medical experiment. Did you know your babies and children are called "Post-marketing safety surveillance" by the vaccine manufacturers, the CDC and the ACIP (Advisory Committee on Immunization Practices) in regard to adverse events? This is UNACCEPTABLE! It's cheaper to see what Adverse Events happen to the public after vaccination than doing long term premarket trials and studies. Did you know that pre-market trials only use healthy people to determine safety? This is not science! Vaccines are not a one size fits all solution. I'm not a Doctor or a Scientist, but I KNOW THIS! The manufactures have zero liability for any vaccine injuries. They're protected by federal law in the 1986 NCVIA. They don't have to do the research. Since the health risk of vaccination is entirely borne by individuals, the Department of Health and the State of Hawaii must ensure that fully informed consent is left in place and observed. Parents must have

medical decision choice for their children and themselves. When there is risk there must be choice. Humans have many genetic variations, mitochondrial disorders, allergies to various foods and ingredients used in vaccines. Did you know that the above listed people are not included in the premarket trials? They say it would be unethical to include them. Hmm. Unethical? You know what's unethical? A crime against humanity! That is exactly what is being done to our children. Our kids are lab rats! Hawaii Department of Health - I ask this question and demand an answer - How is it ethical and legal to mandate these vaccines for the general public when unbiased premarket trials and studies have NEVER BEEN DONE? Adverse events to vaccines are GUARANTEED because of this lack of doing the science. Did you know Merck is in court right now for fraudulent premarket trials of the HPV Vaccine? Did you know there's been over 59,634 severe adverse events to the HPV Vaccine up to September 14, 2018? And it's estimated that only between 1-10% of adverse events have even reported. We can prevent this cancer with early detection and ZERO side effects. DOH, my child is not your experiment! DOH, you say you're all educated? Really? You're going to mandate the HPV vaccine with the knowledge of this information? I'll tell you this, if you do, you are implicit in a crime against humanity.

THIS BILL IS ILLEGAL ACCORDING TO US LAW

Is everyone here aware that The US Supreme Court acknowledged in the case Bruesewitz vs Wyeth that Congress considers that vaccines are "unavoidably unsafe"? I'm here to let or remind any government employees or department of health officials present that using the term "vaccines are safe" is a false claim according to US Law. THIS IS A FACT! US Law regards vaccines as "unavoidably unsafe." This decision comes from the language of the 1986 National Childhood Vaccine Injury Act (42 USC sec 300aa-22, re manufacturer responsibility.) For this reason ALONE, there must not be any vaccines that are mandated. They are ALL "unavoidably unsafe" according to US Law. In fact in a recent lawsuit against the Department of Health and Human Services, Robert F Kennedy Jr and Del Bigtree proved that not a single required biennial report on the safety and efficacy of vaccines has ever been submitted to congress for over 32 years! THIS is a blatant disregard of US Law, and so is this bill.

Hawaii Department of Health, I ask these questions and we the people of Hawaii demand answers in full and with detail:

1. In regard to the Small Business Regulatory Review Board "Pre-public hearing small business impact statement" dated June 27, 2017, What is the actual increased financial burden to small businesses like daycare centers, preschools and kindergartens for collecting all of the vaccine information from children and their parents and reporting it to the DOH or State? The DOH has not done a cost analysis. Where are the numbers? The DOH answer of "we don't anticipate any increase in financial cost to small businesses" does not work. This is not a cost analysis.
2. What will the increased financial burden be on schools as more and more students require special education? Since 2016 the State of California has

seen an increase of 17% in Autism in Kindergartners since SB277 bill went in to effect mandating vaccines. The Hawaii Department of Education will soon feel this financial burden for funding more Special Education programs.

3. How is it legal for a school to send private student medical records to the DOH or State of Hawaii? This is a FERPA violation. FERPA is Family Educational Rights and Privacy Act. HIPAA does not have authority here. FOR THE RECORD: The law states if there is not a declared communicable disease outbreak in the school, Personally Identifiable Information from student health data can not be sent to the DOH or State of Hawaii. IT IS ILLEGAL!
4. Where is the form and format for Medical Exemption in this bill? This bill contains no details. How long does a medical exemption last? Is it for all vaccines? Is it for each vaccine? Does an adverse event have to happen first? Does the medical exemption require approval of the DOH?

DOH - you must answer all of these questions. We the Citizens of Hawaii demand it.

Thank You,

Eric Day

Member of Hawaii for Informed Consent

December 14, 2018

Public Testimony to Oppose HAR 11-157

54 South High Street, Wailuku, HI, 96793 (Maui County)

Video Conference Center (third floor)

Aloha, I am testifying today as an individual and as a member of Hawaii for Informed Consent to oppose HAR 11-157. The DOH submitted an application to the Small Business Regulatory Review Board (SBRRB) entitled, "Pre-Public Hearing Small Business Impact Statement to the Small Business Regulatory Review Board" received on June 27, 2017 by Ms. Dori Palcovich, Administrator. There are many problems with this Impact statement which will be presented here at this public hearing as a matter of record. The concerns are as follows:

1. Through a UIPA request to the SBRRB, Ms. Palcovich's records showed that the SBRRB received the DOH's Pre-Public Hearing Small Business Impact Statement to the Small Business Regulatory Review Board on June 27, 2017. In addition the DOH also submitted at that time, two documents, a version of HAR Chapter 11-157, dated May 26, 2017 and a copy of the ACIP guidance.

On July 19, 2017, the SBRRB voted to send the proposed rules dated May 26, 2017 to a public hearing. However, the version of Chapter 11-157 dated May 26, 2017 is **DIFFERENT** from the version that is currently posted on the DOH website which is dated September 5, 2018. The September 5, 2018 version was also the version that was debated on at the public hearing on Oahu on November 1, 2018 and will be the same version for the remaining hearings on the outer islands.

There are substantive differences in these versions of Ch. 11-157 relating to the tuberculin testing and the process to move these proposed rules to public hearing should have been halted but was not.

QUESTION: Was the DOH legally or ethically required to submit an up-dated Ch. 11-157, at minimum to the SBRRB or at least disclose this information to the SBRRB?

2. Page 2, question 1, basically asks how small businesses may be adversely affected by the proposed rules. The DOH responded "The health care providers should not be adversely affected by the proposed rules. Child care centers, compulsory schools and post-secondary should not be affected by the proposed rules."

QUESTION: What documents, notes, or additional information did the DOH use to support their assertion that these providers "should not be adversely affected?"

QUESTION: What additional written information, testimonies or summaries of information were submitted by health care providers, child care centers, compulsory schools and post-secondary providers that support the DOH's claim that these providers "should not be adversely affected?"

3. Page 2, question 2, asks for dollar amounts of increased direct costs in fees, fines, and indirect costs including reporting, recordkeeping, equipment construction, labor, professional services, revenue loss, or other costs associated with compliance.

The DOH response was "Increased indirect costs associated with enhance screening and recordkeeping maybe be incurred by some schools and post-secondary schools. The Department does not anticipate any increased costs associated with compliance to health care providers." However, no dollar amounts were provided as required.

QUESTION: The DOH admitted that "some schools and post-secondary schools" may incur increased costs. What are these estimated dollar amounts?

QUESTION: What information did the DOH use to assert that health care providers are not anticipated to incur any increased costs?"

4. Page 2, question 3, asks for the probable monetary costs and benefits to the agency or other agencies directly affected.

QUESTION: The DOH stated that it estimates that the additional requirements necessary for implementation have been determined to be \$60,000 for the 1st year and \$5,000 for additional years. Where is the cost analysis showing how the DOH arrived at both of these figures and what is the plan the DOH intends to implement to achieve these goals?

QUESTION: Since the Department of Education is another agency that will be affected by the additional recordkeeping and monitoring as described in the proposed rules, what information did the DOH use to determine the probable monetary costs for the Department of Education to implement these additional requirements?

5. Page 3, question 4, asks for the methods the DOH considered or used to reduce the impact on small business. The DOH's response was that the training provided would assist the providers and affected organizations to understand the changes to the requirements so that they would be able to screen records appropriately.

QUESTION: When small businesses are required to provide the man-power to implement the recommendations proposed by Ch. 11-157, exactly what are the expected duties necessary to properly screen the documents and what are the estimated costs in man-power and supplies needed to satisfy this requirement?

6. On page 3, question 7, the question asks how the DOH involved small business in the development of the proposed rules.

DOH's response was that the 'School and Immunization Requirements Working Group' was made up of representatives from private compulsory and post-secondary institutions, the American Academy of Pediatrics, Hawaii Chapter, the Hawaii Association of Independent Schools, and Kaiser Permanente, Department of Education, the Department of Human Services, and Tuberculosis Control, Public Health Nursing, Disease Investigation, and Immunization Branches of the Department of Health.

However, there are NO small businesses or individuals represented in this working group. Therefore, it is questionable as to whether any small businesses were involved in the development of the proposed Ch.11-157 rules.

7. On Page 3, question 7a, asks if there were any **recommendations** made by small businesses and whether the recommendations were incorporated in the proposed rule. If yes, explain, if no, why not.

Instead of answering "yes" or "no" to this question, the DOH stated that the 'School and Immunization Requirements Working Group' member organizations emphasized the need for delayed effective date to allow training materials and training to take place of the rules' effective date.

QUESTION: Why did the DOH fail to directly answer this question? Is it because they did not appear to have solicited any responses from small businesses such as daycare business owners, individual providers or the like in their working group?

The exclusion of small businesses from the working group implies that small businesses such as daycare centers and individual providers did not provide any recommendations and thus their input were not incorporated into the proposed rule.

Further, the DOH's solution of providing training and training materials was created by LARGE businesses which included Kaiser Permanente, the HAIS for private schools, and post-secondary institutions which include community colleges and universities.

This omission of small businesses from the working group should invalidate this entire application and the DOH should be required to properly solicit input from small businesses such as daycare centers, other child-care facilities, and individual small business owners before the proposed amendment is allowed to move forward.

8. On page 3, question 8, asks whether the proposed rules include provisions that are more stringent than those mandated by a comparable or related federal, state, or county standards, with an explanation of the reason for imposing the more stringent standard.

The DOH's response states that the proposed school examination and immunization regulations are consistent with the United States Centers for Disease Control and Prevention's Advisory

Committee on Immunization Practices (ACIP) recommendations and are comparable to and in some instances less stringent than other states' school and post-secondary school immunization and examination requirements. The proposed rules are not more stringent than any comparable or related federal, state or county standards.

The DOH's statement is false. There are three problems with the DOH response:

- A. The DOH states that their school examination and immunization regulations are consistent with the ACIP recommendations. However, the issue is that the ACIP guidelines are recommendations and are not federal, state, or county standards. The ACIP guidelines are not mandates or laws from the federal or state governments.
- B. The DOH claims that the ACIP recommendations are comparable to and in some instances less stringent than other state immunization requirements. For example, some states have personal exemptions for vaccinations but Hawaii does not. Hawaii's religious exemption is restricted and this proposed rule will also restrict medical exemptions compared to other states with looser restrictions for these exemptions.

In states that only have medical restrictions such as Mississippi,¹ only 9 vaccinations are required for school entry from K to 12th grade and only Tdap is required for 7th grade. West Virginia² only requires 9 vaccines for school entry from K to 12th grade. California³ does not require the Hep A, flu, HPV or meningococcal vaccines compared to the DOH's proposed rules which would require these vaccines.

Further, only 2 states require HPV. Virginia⁴ requires HPV for 6th graders and a total of 11 vaccines for school entry. Rhode Island⁵ requires a total of 14 vaccines for entry in child-care centers which allows for non-restricted religious exemptions. Most states do not require the flu vaccine but it appears that DOH's proposed rules will.

The DOH's proposed rules will increase 9 vaccines to 14 vaccines for children in K-12, and 6 vaccines to 13 vaccines for children in child care centers. These include Tdap, HPV, and MCV for 7th graders, in addition to the Hep A, and flu vaccine.

Therefore, the DOH's Ch. 11-157 appears to be MORE stringent rather than less stringent than any comparable or related federal, state or county standards which contradicts the DOH's written statement.

- C. Most states comply with the Federal Educational Rights to Privacy Act (FERPA) in their state laws and rules which require written parental consent before releasing any educational

¹ http://www.msdh.state.ms.us/msdhsite/_static/resources/2029.pdf

² <https://dhr.wv.gov/oeps/immunization/requirements/Documents/8-31-17%20%20NewSchoolEnterers.pdf>

³ <https://www.shotsforschool.org/k-12/>

⁴ <http://www.vdh.virginia.gov/immunization/requirements/>

⁵ <http://www.health.ri.gov/immunization/for/schools/>

QUESTION: If the DOH will not conduct a cost analysis, can the DOH definitively demonstrate that the DOH's proposed rules are "not more stringent than any comparable or related federal, state or county standards?"

In conclusion, the DOH's "Pre-Public Hearing Small Business Impact Statement to the Small Business Regulatory Review Board" dated June 27, 2017 has many questionable items and the public deserves answers before Ch11-157 hearings are adopted including the following:

- 6 1. The differences in the Ch. 11-157 versions submitted to the SBRRB which was voted on in July 19, 2017 and moved to public hearing.
2. The vague and non-committal responses provided by the DOH when dollar amounts were specifically asked for.
3. The absence of a daycare provider, or child care center representative, or individual small business representatives on the School Examination and Immunization Requirements Working Group and the inappropriate DOH response provided when recommendations from these small businesses were required.
4. The DOH's claim that their proposed rules are not more stringent than any comparable or related federal, state or county standards when there is evidence to the contrary.
5. The need for a cost analysis if the DOH's their proposed rules are indeed MORE stringent than any comparable or related federal, state or county standards.

Before the DOH's Chapter 11-157 can be adopted, these concerns related to small business must be evaluated and reviewed. Mahalo.

about the Human Papillomavirus Vaccine

New Concerns about the Human Papillomavirus Vaccine

American College of Pediatricians – January 2016

The American College of Pediatricians (The College) is committed to the health and well-being of children, including prevention of disease by vaccines. It has recently come to the attention of the College that one of the recommended vaccines could possibly be associated with the very rare but serious condition of premature ovarian failure (POF), also known as premature menopause. There have been two case report series (3 cases each) published since 2013 in which post-menarcheal adolescent girls developed laboratory documented POF within weeks to several years of receiving Gardasil, a four-strain human papillomavirus vaccine (HPV4).^{1,2} Adverse events that occur after vaccines are frequently not caused by the vaccine and there has not been a noticeable rise in POF cases in the last 9 years since HPV4 vaccine has been widely used.

Nevertheless there are legitimate concerns that should be addressed: (1) long-term ovarian function was not assessed in either the original rat safety studies^{3,4} or in the human vaccine trials, (2) most primary care physicians are probably unaware of a possible association between HPV4 and POF and may not consider reporting POF cases or prolonged amenorrhea (missing menstrual periods) to the Vaccine Adverse Event Reporting System (VAERS), (3) potential mechanisms of action have been postulated based on autoimmune associations with the aluminum adjuvant used¹ and previously documented ovarian toxicity in rats from another component, polysorbate 80,² and (4) since licensure of Gardasil® in 2006, there have been about 213 VAERS reports (per the publicly available CDC WONDER VAERS database) involving amenorrhea, POF or premature menopause, 88% of which have been associated with Gardasil®.⁵ The two-strain HPV2, *Cervarix*TM, was licensed late in 2009 and accounts for 4.7 % of VAERS amenorrhea reports since 2006, and 8.5% of those reports from February 2010 through May 2015. This compares to the pre-HPV vaccine period from 1990 to 2006 during which no cases of POF or premature menopause and 32 cases of amenorrhea were reported to VAERS.

Many adolescent females are vaccinated with influenza, meningococcal, and tetanus vaccines without getting Gardasil®, and yet only 5.6% of reports related to ovarian dysfunction since 2006 are associated with such vaccines in the absence of simultaneous Gardasil® administration. The overwhelming majority (76%) of

VAERS reports since 2006 with ovarian failure, premature menopause, and/or amenorrhea are associated solely with Gardasil®. When VAERS reports since 2006 are restricted to cases in which amenorrhea occurred for at least 4 months and is not associated with other known causes like polycystic ovary syndrome or pregnancy, 86/89 cases are associated with Gardasil®, 3/89 with *Cervarix*TM, and 0/89 with other vaccines administered independently of an HPV vaccine.⁵ Using the same criteria, there are only 7 reports of amenorrhea from 1990 through 2005 and no more than 2 of those associated with any one vaccine type.

Few other vaccines besides Gardasil® that are administered in adolescence contain polysorbate 80.⁶ Pre-licensure safety trials for Gardasil® used placebo that contained polysorbate 80 as well as aluminum adjuvant.^{2,7} Therefore, if such ingredients could cause ovarian dysfunction, an increase in amenorrhea probably would not have been detected in the placebo controlled trials. Furthermore, a large number of girls in the original trials were taking hormonal contraceptives which can mask ovarian dysfunction including amenorrhea and ovarian failure.² Thus a causal relationship between human papillomavirus vaccines (if not Gardasil® specifically) and ovarian dysfunction cannot be ruled out at this time.

Numerous Gardasil safety studies, including one released recently,⁸ have looked at demyelinating and autoimmune diseases and have not found any significant problems. Unfortunately, none of them except clinical safety pre-licensure studies totaling 11,778 vaccinees⁹ specifically addressed post-vaccination ovarian dysfunction. While data from those studies do not indicate an increased rate of amenorrhea after vaccination, the essential lack of saline placebos and the majority of participants taking hormonal contraceptives in those studies preclude meaningful data to rule out an effect on ovarian function.

A Vaccine Safety Datalink POF study is planned to address an association between these vaccines and POF, but it may be years before results will be determined. Plus, POF within a few years of vaccination could be the tip of the iceberg since ovarian dysfunction manifested by months of amenorrhea may later progress to POF. Meanwhile, the author of this statement has contacted the maker of Gardasil, the Advisory Committee on Immunization Practices (ACIP), and the Food and Drug Administration (FDA) to make known the above concerns and request that (1) more rat studies be done to look at long-term ovarian function after HPV4 injections, (2) the 89 VAERS reports identified with at least 4 months amenorrhea be reviewed by the CDC for further clarification since the publicly available WONDER VAERS database only contains initial reports, and (3) primary care providers be notified of a possible association between HPV and amenorrhea. A U.S. Government Representative responded that they “will continue to conduct studies and monitor the safety of HPV vaccines. Should the weight of the evidence from VAERS or VSD and other sources indicate a likely causal association between POF and HPV vaccines, appropriate action will be taken in terms of communication and public health response.”

The College is posting this statement so that individuals considering the use of human papillomavirus vaccines could be made aware of these concerns pending further action by the regulatory agencies and manufacturers. While there is no strong evidence of a causal relationship between HPV4 and ovarian dysfunction, this information should be public knowledge for physicians and patients considering these vaccines.

HAR 11-157 Hearing Testimony

I'm Lori Auldridge. I'm a Maui Mom of 3 and I oppose HAR 11-157.

I'm not anti-vax or pro-vax. And I don't believe that being opposed to HAR 11-157 makes a person anti-vaccine. I think there needs to be less emphasis on the "sides" of an issue and emphasis placed on the issue at hand, which are the proposed vaccine requirement changes by the Department of Health.

Here my questions:

1. Is there anyone in this room who has voting power or who will be making decisions on the outcome of HAR 11-157?
2. If not, how will they hear this testimony? If so, how will the other decision makers hear this testimony?
3. What proof will we be provided that deciding persons will hear our concerns?
4. What proof will we have that our concerns and questions are being genuinely considered? Because honestly at this point, from where I sit, it seems like these hearings are all for show and the decision to pass HAR 11-157 has already been made.

Here are my concerns:

* **I'm concerned about the wording** – it's too vague & inconsistent. It paves the way for our individual choice and medical freedoms to be taken away, starting with vaccine mandates in schools.

Plus the exemption forms that the ACIP recommends are too strict and don't truly give parents choices. There is no choice if our options are vaccinate or get a strict exemption that has to be approved by a secondary individual. That isn't the parent deciding what is best for their individual child, that is literally allowing someone else to make medical decisions for your child. How can a doctor who sees a child for 10 mins every 6 months to know what is best for that individual child? And a religious leader doesn't get to be the expert on what an individual believes. Relationships with God are personal.

That's where the role of the parent is essential. HAR 11-157 word choices pave the way for parents' rights and medical freedoms to be taken out of the equation. Strict medical exemptions are not a choice, it's a restriction of choice. Forcing someone to do something that they don't want to do is bullying.

* **I'm concerned that the Department of Health can make such overreaches.** I don't agree with the 2013 vote to allow the DOH to make changes outside the legislative process. Unfortunately, I was unaware of this motion back in 2013 but am opposed to it

now as it affects me. Which brings up this point: just because something doesn't personally affect you now doesn't mean it won't affect you later. I highly encourage parents of young children or parents-to-be to pay attention. Individual freedom is the core belief and foundation of this country.

This may not personally affect you at the moment, but our individual rights are being whittled away.

* **Why make these changes?** There are no medical problems in our schools that warrant these changes. I have a problem with the term "outbreak" being overused and sensationalized by the media and the DOH to create unnecessary fear. Why make changes just to say you made changes while in a position of power?

I believe the DOE has more pressing matters to address—like budgeting, teacher shortages, and quality education.

The sentiment of "no child left behind" when it comes to education appeals to people because it honors the individual. It implies that every child is important. That same individuality should be given to medical decisions...because every child is important.

For DOT. 12/14/18 Maui Hearing

Aloha my name is Martina Dodson, I am a citizen of United States, live on Maui and I also am a health freedom advocate. Me and my family strongly oppose HAR-11-157.

I almost died from a vaccine. Injury and death is not rare as some people might think. CDC claims one in a million doses. Add that up and its many serious events including death, paralysis, seizure, swelling of the brain etc. What kind of real statistic is that?

If these rule changes go through HI will be the most vaccinated state in the U.S. we also will know WHO TO HOLD RESPONSIBLE FOR THE DEATH AND INJURY THAT WILL happen to Hawaii's keiki. We might not be able to hold them accountable by law for the tragic events that will occur.

BUT MY WORDS HERE IN THIS TESTIMONY, WE WILL GO BACK TO AND LET EVERY SINGLE PERSON IN THIS STATE KNOW, WHO THE CORRUPT PEOPLE ARE THAT SET THIS FORTH IN THE PUBLICS EYES, AND WE WILL HOLD THE PERSONS SUCH AS ROZ BAKER, BRUCE ANDERSON AND DR SARAH PARK AND EVERYONE ELSE INVOLVED ACCOUNTABLE FOR THE ENORMOUS CATASTROPHIC DISASTER to mandate and vaccinate all Hawaii's keiki with the proven dangerous HPV vaccine.

The evidence are overwhelming of the danger of this particular vaccine. If it would have been a regular medication on the market it would have been recalled by now. But because it is labeled a vaccine the can mandate this poison. Only 3 states have this mandated for school it is called medical tyranny. Over 400 deaths have been reported and over 59,000 adverse events to VAERS. Keep in mind FDA admits only 1 to 10% even gets reported.

I urge you to look at proposed rule change. It is a sneaky way to take away parents rights and parents choice. Especially when they want to mandate vaccines for diseases that do not spread in school environment.

Where is the medical justification for 74 doses vaccines before the age of 18. 4 billion has been paid out for injury and death from vaccine court. You cant simply call it science when a vaccine maker have full legal immunity from damage claims. 1986 NCVIA was created and the vaccine schedule tripled. Coincidence?

1 in 40 children with autism. I watched my friends perfectly healthy twin boys go in for a multidose vaccine appointment. Directly after both permanently brain injured later diagnosed with autism. The annual cost for autism is \$268 billion and is expected to be \$1 trillion 2025. These growing costs now fall on families and on tax payers through the cost borne by local school districts, states and medicaid.

53 % of American children with auto immune disorders

Cancer is the leading cause of death in children

U.S has the highest infant mortality rate in a developing country. Also the most vaccinated.

IT CAN ALL BE TRACED BACK TO THE INSANE KIDS SCHEDULE THAT HAS NEVER BEEN TESTED FOR SAFETY IN COMBINED DOSES. NEITHER HAS ANY VACCINE EVER BEEN EVALUATED FOR THE ABILITY TO CREATE CANCER, CAUSING GENE MUTATION NOR THE IMPAIRMENT OF FERTILITY. STATES IN 13.1 IN EVERY SINGLE VACCINE INSERT.

Current Immunization Requirements
(last updated 2001)

Proposed Immunization Requirements
(current CDC recommended vaccines)

give back to Kelly Livanov
or
Laura Hassen

Current Pediatric (all children up to two years of age)	Proposed Pediatric (all children up to two years of age)
DTaP or DTP [Diphtheria, Tetanus, Pertussis]	DTaP
Polio (IPV [Inactivated] or OPV [Oral])	Polio (IPV)
MMR [Measles (Rubeola), Mumps, Rubella]	MMR
Hib [<i>Haemophilus influenzae</i> type b]	Hib
Hepatitis B (Hep B)	Hep B
Varicella (chickenpox)	Varicella
	Hepatitis A (Hep A)
	Pneumococcal Conjugate Vaccine (PCV)
	Rotavirus
	Influenza

Current Preschool/Childcare	Proposed Preschool/Childcare
DTaP or DTP	DTaP
Polio (IPV or OPV)	Polio (IPV)
Hib (1 dose after age 12 months)	Hib (age appropriate)
Hep B	Hep B
MMR	MMR
Varicella	Varicella
	Hep A
	PCV

Current K-12	Proposed K-12
DTaP or DTP	DTaP
Polio (IPV or OPV)	Polio (IPV)
MMR	MMR
Hep B	Hep B
Varicella	Varicella
	Hep A
	Human Papillomavirus (HPV)*
	Meningococcal Conjugate Vaccine (MCV)*
	Tdap [Tetanus, Diphtheria, Pertussis]*
	*for students entering/attending school in grade 7 or higher

Current 7th Grade	Proposed 7th Grade
Hepatitis B	HPV
MMR	MCV
Varicella	Tdap

Current Post-Secondary	Proposed Post-Secondary
Two doses of measles-containing vaccine with at least one of the two being MMR	MCV**
	MMR (2 doses)
	Tdap
	Varicella
	**first-year students living in on-campus housing only

Subject: HAR 11-157 I OPPOSE
Date: Friday, December 14, 2018 4:24:23 PM

Aloha Hawaii DOH

Thank you for the opportunity to provide testimony. I STRONGLY OPPOSE THE HAR 11-157 PROPOSED RULES UPDATE!

My why:

1 - Making this mandatory TAKES AWAY our FREEDOM

2 - Plenty of parents will choose TO vaccinate & if a vaccine is supposed to protect a child then there should be no fear of unvaccinated people being around them because the vaccinated people are (supposedly) protected by the vaccine!

3 - Making this mandatory, the DOE will notice a huge numbers loss as families (who have made the EDUCATED decision not to vaccinate) will choose to homeschool their child

4 - Those who vote for HAR 11-157 will be staying they don't care about our freedoms & we will not vote for them in the next election

Summer Dillberg

Vaccine vs. Disease Trade-offs: Cheating Children's Immune Systems

December 13, 2018

By the Children's Health Defense Team

These days, one policy-maker after another seems to be promoting no-exceptions vaccination policies—hawking an incessant and growing barrage of childhood vaccines that begins prenatally and continues throughout childhood. Despite these efforts, the narrative that vaccines are keeping children healthy is rapidly crumbling.

Rates of chronic and autoimmune illness in American children have climbed to obscene levels ([54%](#) at last count), concurrently with rising vaccination rates—while U.S. life expectancy is [falling](#).

None of the individuals who present vaccination as an unquestioned good ever discusses the trade-offs involved in tampering with the exquisitely sophisticated human immune system, especially during a child's earliest developmental stages, nor do they acknowledge that two of vaccination's basic premises are patently false:

1. It has become clear that the short-lived antibody production that vaccines seek to induce is nothing like the comprehensive lifelong immunity that results from a natural infection;
2. An honest look at health statistics shows that vaccines exact a high cost when they re-engineer children's immune systems; rather than entering adulthood in robust health, many children are paying the piper via some form of immune dysfunction at some point down the road.

Creating an imbalanced immune system

Scientists admire the [immune system](#) as “the most complex system that the human body has.” It is also a “model of [versatility](#),” carrying out an impressive range of essential functions. These include differentiating between “harmless self” and harmful invaders (e.g., bacteria, viruses, fungi or toxins); amplifying the immune response; excreting cellular debris (through mechanisms such as fever, sweating, rash and expectorations); engaging in tissue repair; interacting with the gut microbiome; and more.

This “incredibly [precise](#)” system has two coordinated arms. The cell-mediated immune system is characterized by the activity of white blood cells that travel to the area(s) of infection to eliminate the infected cells. The humoral immune system prompts the formation of

antibodies that target invader-specific proteins (antigens) for destruction.

Interfering with such a precise immune response (the result of millions of years of evolutionary fine-tuning) carries with it massive risk of unintended consequence[s]—and those consequences are now manifesting in the form of an autoimmunity crisis.

The hallmark of vaccination is that it bypasses the cell-mediated response in favor of a “[mock infection](#),” while encouraging a disproportionate humoral response. According to an elegant new [book](#) by Dr. Thomas Cowan (*Vaccines, Autoimmunity, and the Changing Nature of Childhood Illness*), this “reckless” suppression of the cell-mediated response is a very bad idea: “Interfering with such a precise immune response” (the result of “millions of years of evolutionary fine-tuning”) carries with it “massive risk of unintended consequence[s]”—and those consequences are now manifesting in the form of an autoimmunity crisis. Cowan states:

“The deliberate provocation of antibodies without prior cell-mediated activity produces an imbalance in our immune system and a state of excessive antibody production. This excessive antibody production actually *defines* autoimmune disease. ... With millions of people suffering from autoimmune disease, at a number unheard of before the introduction of mass vaccination programs, how can this connection be deemed controversial?”
[Emphasis in original]

Forfeiting protections

Immunologic dysregulation—including dysfunction of the type brought about by vaccination—is associated not just with autoimmunity but also with [cancer](#), and childhood cancers are

[skyrocketing](#). In contrast, many of the once-universal childhood illnesses were, in fact, protective against various cancers. Stated another way, acute infections, and especially those that caused fever, were historically “[antagonistic to cancer](#).” For example:

- Naturally acquired [mumps](#) engendered immunity to **ovarian cancer** through antibodies against a cancer-associated antigen.
- Individuals who experienced fever-inducing infectious illnesses in childhood (such as [rubella and chickenpox](#)) had a lower risk of **non-breast cancers**, including [melanoma and ovarian cancer](#).
- Acute childhood infections protected against Hodgkin’s lymphoma, and [measles](#), in particular, protected against **non-Hodgkin’s lymphoma**.

...children who successfully go through measles...have less heart disease, arthritis, allergies, autoimmune diseases, and overall better health than those who never get measles.

Frenzied media stories about “measles outbreaks” notwithstanding, there are multiple reasons to view natural measles infection in childhood as beneficial. As summarized in Cowan’s book, “children who successfully go through measles...have less heart disease, arthritis, allergies, autoimmune diseases, and overall better health than those who never get measles.” Children’s Health Defense has noted previously how the benefits of measles used to be [taken for granted](#)—until, says Cowan, the vaccine came along “and changed the way we think about measles.”

Ironically, viruses’ potential to serve as “possible agents of tumor destruction” attracted interest as long as a century ago, when clinical experiences showed that, “given the right set of conditions, cancers would sometimes regress during [naturally acquired virus infections](#).” In the current era, the use of viruses as an anti-cancer treatment has

morphed into the “[respectable field](#)” of oncolytic virotherapy, even leading to clinical trials—and “[measles virus](#) still represents a highly interesting candidate for such an approach.”

Genetically engineered viral interventions also promise the pharmaceutical industry profits, whereas simply allowing children to get the measles and acquire their cancer protection naturally cannot be monetized.

Unfortunately, enthusiasm for viruses as “serious contenders in cancer treatment” has further entrenched scientists’ reliance on [vaccine strains of measles virus](#) (which are, after all, “[amenable to genetic modification](#) in the laboratory”)—fostering zeal for a “new age of [engineering immunity](#)” and more of the misplaced faith in “rational manipulation of the immune system” that gave rise to vaccines in the first place. (If anyone has concerns about the potential for these genetically engineered viruses to prompt further unintended consequences, they are keeping their concerns to themselves.) Genetically engineered viral interventions also promise the pharmaceutical industry [profits](#), whereas simply allowing children to get the measles and acquire their cancer protection naturally cannot be monetized.

Circling the wagons

Increasingly, vaccine bullies are employing strategies that would have been unthinkable even five years ago. For example, a children’s hospital in Florida that is [under investigation](#) for medical errors and an unexpectedly high mortality rate in its young heart surgery patients recently announced that it will [deny services](#) to unvaccinated or partially vaccinated children; the hospital is also taking a “[hard line](#)” on flu shots, requiring not just employees but also “non-employee physicians, medical students in training, drug and medical

device representatives and volunteers” to get a shot or (in the case of employees) run the risk of being fired. The reason cited for these unnuanced policies is “patient safety.”

...vaccines are disrupting normal immune system function and leaving both children and adults vulnerable to far more serious chronic diseases.

As these hard-line tactics multiply, it is vital to keep the failure of the U.S. vaccine program in the public eye. The far-from-uncommon phenomenon of [vaccine failure](#) in vaccinated individuals has made it abundantly clear that a vaccine-induced antibody response—the typical indicator of vaccine “protection”—is essentially worthless as a guarantor of real immunity. Even worse, vaccines are disrupting normal immune system function and leaving both children and adults vulnerable to far more serious chronic diseases. The vaccine establishment may not be willing to admit that the vaccination paradigm is fatally flawed, but it is sadly apparent that, in Dr. Cowan’s words, “our communities, hospitals, and schools are filled to the brim with sick and injured children—often suffering from illnesses that barely existed a hundred years ago.”

[Sign up](#) for free news and updates from Robert F. Kennedy, Jr. and the Children’s Health Defense. CHD is planning many strategies, including legal, in an effort to defend the health of our children and obtain justice for those already injured. Your [support](#) is essential to CHD’s successful mission.

Honolulu, Hawaii 96813

My name is Cynthia Henry Keener, my son Makana Keener was born on April 07, 2009. A perfectly healthy infant w/ no complications at birth nor I during pregnancy.

Makana was growing & thriving like my other two children at the same age. He was hitting all his milestones w/ ease. On April 15, 2010 I took Makana in for his routine 12 mos vaccines. He had been ill w/ an alleged respiratory infection and had been on antibiotics one two weeks prior and still had a runny nose. So, I being his mother and having had worked in a Neonatal, Peds, & Newborn Nursery for a total of twelve years questioned his compromised immune system after being on antibiotics. Stating that I didn't feel it was good to give him the MMR, Varicella & Hep A vaccine all at once it'd be too much for him.

Kauai Medical clinic's Dr. Ross exclaimed he'd be fine, I still questioned vaccinating, and he went into drawing a diagram on paper covering lying on patient table. Explaining the statistics & logistics of not vaccinating. My now twenty-six yr old daughter was there and witnessed him talking me into doing something I didn't really want to. He talked me into it and we gave all five vaccines.

Two days later my little boy had a seizure. I took him into the Kauai Medical Clinic after this seizure episode and Dr. Weiner asked me if I was sure he wasn't having a tantrum! I was insulted by her to say the least. I knew what a seizure looked like. Makana began to regress in his walking and talking.

My son continued for two mos to have seizures that Dr. Ross said were not related to the vaccines and it was just a coincidence. They referred us to Ped. Neuro on Oahu @ Kapiolani, Dr. Abe. Who of course put Makana on AEDs. This anti-seizure med made Makana have more seizures as they didn't properly diagnose him. Took him back various times after he was continually having more seizures to our Ped. Dr. Ross at Kauai Med. Clinic & he said to trust Dr. Abe he graduated from Stanford.

For almost one year I fought against the treatment of Makana as he was lethargic, not talking, & barely walking. I began to call hospitals in the mainland, UCLA Epilepsy research Ctr. in Los Angeles. They were able to properly diagnose Makana's seizures that they were unable to in the state of Hawaii. They did 24 hr EEG. Low and behold his seizures were stemming from another part of the brain that required a different med. Could not do a 2 EEG in the whole state of Hawaii, nor did they do the proper genetic testing.

Makana has been on 4 different medications, had three dif pediatric neurologist here in Hawaii. Three different pediatricians, & two Epileptologists care for him in California. The last nationally renowned physician at UCSF Benioff Children's Hospital in San Francisco where we discovered that Hawaii didn't do the extremely important genetic testing to figure out if he is epileptic or not. I was told they had at UCLA where they exclaimed, he had IS Infantile Spasm syndrome. By this time, I had done plenty research & I let them know I didn't agree.

After extensive genetic testing for an anomalies Makana came back with nothing. NO genetic markers for epilepsy, anomalies, retardation nothing! UCSF doctor stated that he seemed to be vaccine damaged & had brain damage from AEDS.

The whole time I was telling all doctors involved with my son that this was from his vaccines all but one denied this. She wouldn't even put it into writing, her hospital had state of the art everything that I am positive was funded partially by pharmaceutical co's of course.

Per the CDC a severe reaction to the MMR is jerking seizures. Well to this date my son still has these jerking seizures which are categorized under Nocturnal seizure disorder, upon waking. Nocturnal seizure disorder stems from brain injury or infection.

My son has developmental delays, ADHD which brain damage goes hand in hand with. Per MRI / CT Scan no obvious brain damage is seen. My son has many cognitive delays & behavioral issues, he is on the Autism Spectrum and struggles w/ daily living.

The Dr. Ross the pediatrician that coerced me into vaccinating my child up until very recently wouldn't even look me in the eye. Nor did he report to VAERS the seizure activity that commenced two days after vaccinating my son. Another physician did who quit working at Kauai Med Clinic as a pediatrician for reasons he wouldn't disclose, he reported it!

How many unreported adverse reactions have gone unidentified at Kauai Medical Clinic? Statistically reactions from low grade fever which is now what docs deem normal all the way to deaths go unreported. CDC does not have true statistics across the nation that is fact.

Dr. Ross of Kauai Med. Clinic years ago was interning w/another pediatrician there who **did report** an adverse reaction to a vaccine. That very pediatrician was let go a month later and that was 25 years ago. I know the MO of these doctors on this small island.

I OPPOSE ANY ADDING OR MANDATING OF MORE VACCINES ON AN ALREADY OVERLOADED & DANGEROUS CHILDHOOD VACCINE SCHEDULE!

I OPPOSE ON THE BASIS THAT WE ARE PERFECTLY MADE IN GOD'S IMAGE TO NOT PUT CONTAMINATES INTO OUR BODIES.

I OPPOSE ON THE BASIS OF HUMAN RIGHTS, DO NOT USE THE DOE SYSTEM TO BULLY PARENTS INTO NOT HAVING CHOICE ABOUT VACCINATION.

I AM PROCHOICE!

I OPPOSE on the basis that there is a full awareness by federal government & the medical industry that there IS a Vaccine Injury Court set in place for those who are injured and die due to vaccines that aren't properly safety tested.

The American Association of Pediatrics recommends that a newborn infant receive the Hep B right after birth because it's an opportune time (PBS) but the FDA states that a two month old infant should only have 25 micrograms of aluminum and no more than that BUT AT BIRTH A NEWBORN GETS IN THE HEP B VACCINE 250 micrograms.

How is this logical?

WHERE THERE IS RISK THERE MUST BE CHOICE!

I grew up with a belief against immunizations, I know it helps the world but some of the Ingredients & outcomes are something I wouldn't do to me or my children. There is a HUGE community of people who haven't been immunized or didn't immunize their own children. It should be a choice & right WE PEOPLE have to do to our own body & still deserve to be treated like human beings & attend normal schools! please don't take away our basic human rights.

Mahalo & Aloha

Date: Monday, December 17, 2018 7:45:00 PM

I am sending my anti-mandatory vaccination testimony. I believe that it is a basic human right to choose. Our country alone is based off of our freedom. They are taking that away when they take away our choice. I think that it is OK to choose if you want to vaccinate or if you don't but it is wrong to tell someone they must. The vaccinations are pumped full of preservatives, poisons, and also the sickness itself, There's so many risks there must be a choice. Thank you.

FOR IMMEDIATE RELEASE

Monday, July 2, 2012

GlaxoSmithKline to Plead Guilty and Pay \$3 Billion to Resolve Fraud Allegations and Failure to Report Safety Data

Largest Health Care Fraud Settlement in U.S. History

Global health care giant GlaxoSmithKline LLC (GSK) agreed to plead guilty and to pay \$3 billion to resolve its criminal and civil liability arising from the company's unlawful promotion of certain prescription drugs, its failure to report certain safety data, and its civil liability for alleged false price reporting practices, the Justice Department announced today. The resolution is the largest health care fraud settlement in U.S. history and the largest payment ever by a drug company.

GSK agreed to plead guilty to a three-count criminal information, including two counts of introducing misbranded drugs, Paxil and Wellbutrin, into interstate commerce and one count of failing to report safety data about the drug Avandia to the Food and Drug Administration (FDA). Under the terms of the plea agreement, GSK will pay a total of \$1 billion, including a criminal fine of \$956,814,400 and forfeiture in the amount of \$43,185,600. The criminal plea agreement also includes certain non-monetary compliance commitments and certifications by GSK's U.S. president and board of directors. GSK's guilty plea and sentence is not final until accepted by the U.S. District Court.

GSK will also pay \$2 billion to resolve its civil liabilities with the federal government under the False Claims Act, as well as the states. The civil settlement resolves claims relating to Paxil, Wellbutrin and Avandia, as well as additional drugs, and also resolves pricing fraud allegations.

"Today's multi-billion dollar settlement is unprecedented in both size and scope. It underscores the Administration's firm commitment to protecting the American people and holding accountable those who commit health care fraud," said James M. Cole, Deputy Attorney General. "At every level, we are determined to stop practices that jeopardize patients' health, harm taxpayers, and violate the public trust – and this historic action is a clear warning to any company that chooses to break the law."

"Today's historic settlement is a major milestone in our efforts to stamp out health care fraud," said Bill Corr, Deputy Secretary of the Department of Health and Human Services (HHS). "For a long time, our health care system had been a target for cheaters who thought they could make an easy profit at the expense of public safety, taxpayers, and the millions of Americans who depend on programs like Medicare and Medicaid. But thanks to strong enforcement actions like those we have announced today, that equation is rapidly changing."

This resolution marks the culmination of an extensive investigation by special agents from HHS-OIG, FDA and FBI, along with law enforcement partners across the federal government. Moving forward, GSK will be subject to stringent requirements under its corporate integrity agreement with HHS-OIG; this agreement is designed to increase accountability and transparency and prevent future fraud and abuse. Effective law enforcement partnerships and fraud prevention are hallmarks of the Health Care Fraud Prevention and Enforcement Action Team (HEAT) initiative, which fosters government collaboration to fight fraud.

Criminal Plea Agreement

Under the provisions of the Food, Drug and Cosmetic Act, a company in its application to the FDA must specify each intended use of a drug. After the FDA approves the product as safe and effective for a specified use, a company's promotional activities must be limited to the intended uses that FDA approved. In fact, promotion by the manufacturer for other uses – known as "off-label uses" – renders the product "misbranded."

Paxil: In the criminal information, the government alleges that, from April 1998 to August 2003, GSK unlawfully promoted Paxil for treating depression in patients under age 18, even though the FDA has never approved it for pediatric use. The United States alleges that, among other things, GSK participated in preparing, publishing and distributing a misleading medical journal article that misrepresented that a clinical trial of Paxil demonstrated efficacy in the treatment of depression in patients under age 18, when the study failed to demonstrate efficacy. At the same time, the United States alleges, GSK did not make available data from two other studies in which Paxil also failed to demonstrate efficacy in treating depression in patients under 18. The United States further alleges that GSK sponsored dinner programs, lunch programs, spa programs and similar activities to promote the use of Paxil in children and adolescents. GSK paid a speaker to talk to an audience of doctors and paid for the meal or spa treatment for the doctors who attended. Since 2004, Paxil, like other antidepressants, included on its label a "black box warning" stating that antidepressants may increase the risk of suicidal thinking and behavior in short-term studies in patients under age 18. GSK agreed to plead guilty to misbranding Paxil in that its labeling was false and misleading regarding the use of Paxil for patients under 18.

Wellbutrin: The United States also alleges that, from January 1999 to December 2003, GSK promoted Wellbutrin, approved at that time only for Major Depressive Disorder, for weight loss, the treatment of sexual dysfunction, substance addictions and Attention Deficit Hyperactivity Disorder, among other off-label uses. The United States contends that GSK paid millions of dollars to doctors to speak at and attend meetings, sometimes at lavish resorts, at which the off-label uses of

Wellbutrin were routinely promoted and also used sales representatives, sham advisory boards, and supposedly independent Continuing Medical Education (CME) programs to promote Wellbutrin for these unapproved uses. GSK has agreed to plead guilty to misbranding Wellbutrin in that its labeling did not bear adequate directions for these off-label uses. For the Paxil and Wellbutrin misbranding offenses, GSK has agreed to pay a criminal fine and forfeiture of \$757,387,200.

Avandia: The United States alleges that, between 2001 and 2007, GSK failed to include certain safety data about Avandia, a diabetes drug, in reports to the FDA that are meant to allow the FDA to determine if a drug continues to be safe for its approved indications and to spot drug safety trends. The missing information included data regarding certain post-marketing studies, as well as data regarding two studies undertaken in response to European regulators' concerns about the cardiovascular safety of Avandia. Since 2007, the FDA has added two black box warnings to the Avandia label to alert physicians about the potential increased risk of (1) congestive heart failure, and (2) myocardial infarction (heart attack). GSK has agreed to plead guilty to failing to report data to the FDA and has agreed to pay a criminal fine in the amount of \$242,612,800 for its unlawful conduct concerning Avandia.

"This case demonstrates our continuing commitment to ensuring that the messages provided by drug manufacturers to physicians and patients are true and accurate and that decisions as to what drugs are prescribed to sick patients are based on best medical judgments, not false and misleading claims or improper financial inducements," said Carmen Ortiz, U.S. Attorney for the District of Massachusetts.

"Patients rely on their physicians to prescribe the drugs they need," said John Walsh, U.S. Attorney for Colorado. "The pharmaceutical industries' drive for profits can distort the information provided to physicians concerning drugs. This case will help to ensure that your physician will make prescribing decisions based on good science and not on misinformation, money or favors provided by the pharmaceutical industry."

Civil Settlement Agreement

As part of this global resolution, GSK has agreed to resolve its civil liability for the following alleged conduct: (1) promoting the drugs Paxil, Wellbutrin, Advair, Lamictal and Zofran for off-label, non-covered uses and paying kickbacks to physicians to prescribe those drugs as well as the drugs Imitrex, Lotronex, Flovent and Valtrex; (2) making false and misleading statements concerning the safety of Avandia; and (3) reporting false best prices and underpaying rebates owed under the Medicaid Drug Rebate Program.

Off-Label Promotion and Kickbacks: The civil settlement resolves claims set forth in a complaint filed by the United States alleging that, in addition to promoting the drugs Paxil and Wellbutrin for unapproved, non-covered uses, GSK also promoted its asthma drug, Advair, for first-line therapy for mild asthma patients even though it was not approved or medically appropriate under these circumstances. GSK also promoted Advair for chronic obstructive pulmonary disease with misleading claims as to the relevant treatment guidelines. The civil settlement also resolves allegations that GSK promoted Lamictal, an anti-epileptic medication, for off-label, non-covered psychiatric uses, neuropathic pain and pain management. It further resolves allegations that GSK promoted certain forms of Zofran, approved only for post-operative nausea, for the treatment of morning sickness in pregnant women. It also includes allegations that GSK paid kickbacks to health care professionals to induce them to promote and prescribe these drugs as well as the drugs Imitrex, Lotronex, Flovent and Valtrex. The United States alleges that this conduct caused false claims to be submitted to federal health care programs.

GSK has agreed to pay \$1.043 billion relating to false claims arising from this alleged conduct. The federal share of this settlement is \$832 million and the state share is \$210 million.

This off-label civil settlement resolves four lawsuits pending in federal court in the District of Massachusetts under the *qui tam*, or whistleblower, provisions of the False Claims Act, which allow private citizens to bring civil actions on behalf of the United States and share in any recovery.

Avandia: In its civil settlement agreement, the United States alleges that GSK promoted Avandia to physicians and other health care providers with false and misleading representations about Avandia's safety profile, causing false claims to be submitted to federal health care programs. Specifically, the United States alleges that GSK stated that Avandia had a positive cholesterol profile despite having no well-controlled studies to support that message. The United States also alleges that the company sponsored programs suggesting cardiovascular benefits from Avandia therapy despite warnings on the FDA-approved label regarding cardiovascular risks. GSK has agreed to pay \$657 million relating to false claims arising from misrepresentations about Avandia. The federal share of this settlement is \$508 million and the state share is \$149 million.

Price Reporting: GSK is also resolving allegations that, between 1994 and 2003, GSK and its corporate predecessors reported false drug prices, which resulted in GSK's underpaying rebates owed under the Medicaid Drug Rebate Program. By law, GSK was required to report the lowest, or "best" price that it charged its customers and to pay quarterly rebates to the states based on those reported prices. When drugs are sold to purchasers in contingent arrangements known as "bundles," the discounts offered for the bundled drugs must be reallocated across all products in the bundle proportionate to the dollar value of the units sold. The United States alleges that GSK had bundled sales arrangements that included steep discounts known as "nominal" pricing and yet failed to take such contingent arrangements into account when calculating and reporting its best prices to the Department of Health and Human Services. Had it done so, the effective prices on certain drugs would have been different, and, in some instances, triggered a new, lower best price than what GSK reported. As a result, GSK underpaid rebates due to Medicaid and overcharged certain Public Health Service entities for its drugs, the United States contends. GSK has agreed to pay \$300 million to resolve these allegations, including \$160,972,069 to the federal government, \$118,792,931 to the states, and \$20,235,000 to certain Public Health Service entities who paid inflated prices for the drugs at issue.

Except to the extent that GSK has agreed to plead guilty to the three-count criminal information, the claims settled by these agreements are allegations only, and there has been no determination of liability.

"This landmark settlement demonstrates the Department's commitment to protecting the American public against illegal conduct and fraud by pharmaceutical companies," said Stuart F. Delery, Acting Assistant Attorney General for the Justice Department's Civil Division. "Doctors need truthful, fair, balanced information when deciding whether the benefits of a drug outweigh its safety risks. By the same token, the FDA needs all necessary safety-related information to identify safety trends and to determine whether a drug is safe and effective. Unlawful promotion of drugs for unapproved uses and failing to report adverse drug experiences to the FDA can tip the balance of those important decisions, and the Justice Department will not tolerate attempts by those who seek to corrupt our health care system in this way."

Non-monetary Provisions and Corporate Integrity Agreement

In addition to the criminal and civil resolutions, GSK has executed a five-year Corporate Integrity Agreement (CIA) with the Department of Health and Human Services, Office of Inspector General (HHS-OIG). The plea agreement and CIA include novel provisions that require that GSK implement and/or maintain major changes to the way it does business, including changing the way its sales force is compensated to remove compensation based on sales goals for territories, one of the driving forces behind much of the conduct at issue in this matter. Under the CIA, GSK is required to change its executive compensation program to permit the company to recoup annual bonuses and long-term incentives from covered executives if they, or their subordinates, engage in significant misconduct. GSK may recoup monies from executives who are current employees and those who have left the company. Among other things, the CIA also requires GSK to implement and maintain transparency in its research practices and publication policies and to follow specified policies in its contracts with various health care payors.

"Our five-year integrity agreement with GlaxoSmithKline requires individual accountability of its board and executives," said Daniel R. Levinson, Inspector General of the U.S. Department of Health and Human Services. "For example, company executives may have to forfeit annual bonuses if they or their subordinates engage in significant misconduct, and sales agents are now being paid based on quality of service rather than sales targets."

"The FDA Office of Criminal Investigations will aggressively pursue pharmaceutical companies that choose to put profits before the public's health," said Deborah M. Autor, Esq., Deputy Commissioner for Global Regulatory Operations and Policy, U.S. Food and Drug Administration. "We will continue to work with the Justice Department and our law enforcement counterparts to target companies that disregard the protections of the drug approval process by promoting drugs for uses when they have not been proven to be safe and effective for those uses, and that fail to report required drug safety information to the FDA."

"The record settlement obtained by the multi-agency investigative team shows not only the importance of working with our partners, but also the importance of the public providing their knowledge of suspect schemes to the government," said Kevin Perkins, Acting Executive Assistant Director of the FBI's Criminal, Cyber, Response and Services Branch. "Together, we will continue to bring to justice those engaged in illegal schemes that threaten the safety of prescription drugs and other critical elements of our nation's healthcare system."

"Federal employees deserve health care providers and suppliers, including drug manufacturers, that meet the highest standards of ethical and professional behavior," said Patrick E. McFarland, Inspector General of the U.S. Office of Personnel Management. "Today's settlement reminds the pharmaceutical industry that they must observe those standards and reflects the commitment of Federal law enforcement organizations to pursue improper and illegal conduct that places health care consumers at risk."

"Today's announcement illustrates the efforts of VA OIG and its law enforcement partners in ensuring the integrity of the medical care provided our nation's veterans by the Department of Veterans Affairs," said George J. Opfer, Inspector General of the Department of Veterans Affairs. "The monetary recoveries realized by VA in this settlement will directly benefit VA healthcare programs that provide for veterans' continued care."

"This settlement sends a clear message that taking advantage of federal health care programs has substantial consequences for those who try," said Rafael A. Medina, Special Agent in Charge of the Northeast Area Office of Inspector General for the U.S. Postal Service. "The U.S. Postal Service pays more than one billion dollars a year in workers' compensation benefits and our office is committed to pursuing those individuals or entities whose fraudulent acts continue to unfairly add to that cost."

A Multilateral Effort

The criminal case is being prosecuted by the U.S. Attorney's Office for the District of Massachusetts and the Civil Division's Consumer Protection Branch. The civil settlement was reached by the U.S. Attorney's Office for the District of Massachusetts, the U.S. Attorney's Office for the District of Colorado and the Civil Division's Commercial Litigation Branch. Assistance was provided by the HHS Office of Counsel to the Inspector General, Office of the General Counsel-CMS Division and FDA's Office of Chief Counsel as well as the National Association of Medicaid Fraud Control Units.

This matter was investigated by agents from the HHS-OIG; the FDA's Office of Criminal Investigations; the Defense Criminal Investigative Service of the Department of Defense; the Office of the Inspector General for the Office of Personnel Management; the Department of Veterans Affairs; the Department of Labor; TRICARE Program Integrity; the Office of Inspector General for the U.S. Postal Service and the FBI.

This resolution is part of the government's emphasis on combating health care fraud and another step for the Health Care Fraud Prevention and Enforcement Action Team (HEAT) initiative, which was announced in May 2009 by Attorney General Eric Holder and Kathleen Sebelius, Secretary of HHS. The partnership between the two departments has focused efforts to reduce and prevent Medicare and Medicaid financial fraud through enhanced cooperation. Over the last three years, the department has recovered a total of more than \$10.2 billion in settlements, judgments, fines, restitution, and forfeiture in health care fraud matters pursued under the False Claims Act and the Food, Drug and Cosmetic Act.

Court documents related to today's settlement can be viewed online at www.justice.gov/opa/gsk-docs.html.

Subject: Written Testimony Opposing HAR 11-157
Date: Tuesday, December 18, 2018 7:20:26 PM

Richelle Paoli
Written Testimony Opposing HAR 11-157
To Be Presented at Hearing in [REDACTED] on
12.20.2018

To Whom It May Concern at the Department of Health:

Thank you for providing the opportunity to provide written and oral testimony. I hope that this testimony reaches the proper parties and that you will thoughtfully consider the public opinion and the voices of the parents as you make decisions on this crucial issue which affects our children and our future so greatly. I am a mother of four and a Registered Nurse. I currently hold active license in two states. We have lived in [REDACTED] for three years. I was employed at the Kona Community Hospital Emergency Room until leaving to have my son last year.

First, I think it is imperative to always keep in mind that we all share the same goals here, and that is to make the safest, healthiest choices for our youth. That being the case, it is only natural that this topic would become an extremely sensitive and heated one as we hold conflicting opinions of how to reach these goals. The desire to protect our children is innate and we will do so at all costs. This also makes us liable to make irresponsible choices in the face of blatant and pervasive misinformation(1). My personal and professional experience and deep research to find the truth has led me to the sad realization that the people are being systematically lied to.

This is happening in ways that are not only morally wrong, but also definitively illegal. This is evidenced by our healthcare providers' failure to provide true informed consent (as required by the HI revised Statutes 671-3)(2). Patients are receiving false information as well as important information being omitted when it comes to vaccines. We are assured that vaccines are 'safe and effective,' that we need them, that the diseases they protect against are dangerous and deadly, and that if we don't vaccinate we will compromise 'herd immunity' and endanger others. I have found these all to be lies. In fact, a patient who should be able to trust their doctor to guide them in such choices is not really given any express choice in the matter at all, these procedures are performed as a matter of course, and anyone who has educated themselves and objects will be subjected to intense ridicule, discrimination, and guilt and shame tactics in attempt to pressure the patient into compliance. The negative term "anti-vaxxers" and their demonization by faulting them for any disease outbreak by the media is evidence of this. So is the decision of many doctors to exclude patients from their practice who refuse vaccinations (which can be attributable to financial incentives for practices with high vaccination compliance rates).

Of course, if vaccines are really the answer to protecting public health, then aren't these actions justified? I am sure that medical professionals and individuals alike are convinced that this is so, and are only doing what they think is best and right. But we can NEVER neglect to examine the facts and the interests that are controlling the public thought. As you will remember, there have been many claims made by the medical community which were later found to be false and dangerous (tobacco was claimed to be safe, and Thalidomide, Fenfluramine, Baycol, and DES were just a few drugs recalled due to devastating side effects). If vaccines are indeed the great advancement that many believe, wouldn't we all be lining up? Why is force necessary? Why are the people objecting? Many would love to chock this up to frenzy created by fraudulent scientists, Russian trolls spreading discord, and misinformed parents. But when the pharmaceutical companies are the second most profitable industry in the world, with vaccines being their most profitable sector, it would be NEGLIGENT TO OVERLOOK how this affects public information and therefore decision making. Corporate interest owns 90% or more of the news media, and has crept into

our university systems, which train our medical professionals, and publish most of our research(3). Medical doctors receive an average of 2 hours TOTAL education on diet THROUGHOUT their education, yet diet is the foundation of health. The medical community credits vaccines with eliminating Polio and smallpox. I urge you all to do your own research into the history of vaccines, so that you can see that most vaccine programs were in fact initiated AFTER the diseases which they take all credit for eradicating were on the decline due to other interventions(4).

When a health professional tells you that vaccines are "proven safe and effective," and that "the science is settled," while he or she may indeed believe this to be the case, the fact is, it is not. Anyone who understands science understands that science is theory which should always be open to further questioning and testing, and which can be "proven" and disproven again and again. To place all faith in specific "science" and to simply stop questioning is to take on a more religious stance, which is dangerous and negligent in matters involving human rights and the public health. In order to provide TRULY informed consent, the medical professional should review with the patient the informational insert that comes with the vaccine. The fact is, most medical professionals have never seen this insert, parents certainly never see them, and are instead given a biased handout with very limited information(5). The fact is, no vaccine is or can be proven completely safe, and their components have not been tested for safety. ZERO studies on long term health effects have been conducted, and very few studies involving completely unvaccinated controls have been performed, due to ethical reservations. Many researchers can testify to the difficulty in getting their work published when it does not agree with the mainstream model, and many have been discredited, slandered, and lost their practice when they simply QUESTIONED the safety and efficacy of vaccines. This should concern us all to the core.

The severity and frequency of vaccine injury is simply not disclosed to parents. Much of the reason for this is that the statistics are completely unknown. This is due to the fact that (according to the FDA) only 1% of adverse events associated with vaccines end up reported to VAERS (the Vaccine Adverse Event Reporting System). The reason for this is that most doctors are not even aware of the system's existence, while others refuse to use it due to their training. So it follows that most parents have no way of knowing about VAERS. (It is important to note here that VAERS and the Vaccine Court were developed as a result of the 1986 National Childhood Vaccine Injury Act (NCVIA), which was passed after vaccine companies threatened to remove DTP from the market after being inundated with lawsuits involving death and serious injury due to the vaccine. This act then removed liability from the vaccine companies, with the government assuming responsibility instead. Meaning the companies that produce the vaccines have ZERO liability when their products hurt people, a concept unheard of in the pharmaceutical industry. Out of the cases that are reported to VAERS, very few of those meet the criteria to be heard in vaccine court, which according to parents that have been through the entire process, is a biased and cruel system, not one built to support the bereaving family. However, 3.9 billion dollars has been paid out to vaccine injured families since the court's establishment.) This is all information NOT disclosed to parents. Wouldn't you want to know this pertinent information before making an INFORMED decision?

Parents are instead routinely told that vaccines are 'safe and effective'. This open letter to the WHO(6) adequately sums up many of the safety concerns of the global community, which the medical community has thus far failed to address. As a nurse and a concerned citizen, I have personally spoken with many parents who have witnessed firsthand some of the devastating effects of vaccines. None of the many parents I have spoken with in the community had doctors who even believed their stories, let alone being reported to VAERS because they were unaware of its existence. Just start asking around, and you will see for yourself. Why aren't these parents' voices being heard? Why aren't their children being counted? Why would the DOH blanket adopt recommendations from the Advisory Committee on Immunization Practices (ACIP), an organization which we have all seen has no regard for the completely rational and justified public outcry against mandatory vaccination practice? To do so is to ignore and dismiss the call for justice by the people.

In response to safety concerns, many are responding with the idea that although it carries some risk, the benefit of mass compulsory vaccination outweighs the risk, both for the individual and the community. This is based on the assumption that vaccines are effective, and the ignorance of the benefits of natural wild type immunity. Thankfully, some independent researchers are continuing to put out non-biased information, which can still (for now) be found, although it requires significant effort and the general

population will not find it. We now know that some vaccines are never effective from the beginning in low-responders (Obukhanych, 2012(7)), which there is currently no way to determine if you or your child will be. Most other vaccines have efficacy that wanes over time, with few lasting beyond ten years, which is one reason more and more keep being added to the schedule. At what point will we say, enough is enough? We are requiring our children to get vaccines which we don't have. And claiming that if they don't, they endanger the herd. What about us?

On the concept of herd immunity (a term coined by Hedrich in the 1930s pertaining to natural immunity in measles which has since been redefined by the medical community to apply to vaccines based on the assumption that they provide immunity akin to the wild-type), the medical community and media continues to blame "anti-vaxxers" whenever there is an outbreak of a vaccine preventable disease, hyper-focusing on these 16 vaccine preventable diseases because they feed into the sensationalism. They paint previously common and rarely complicated childhood diseases as life-threatening and terrifying (measles, mumps, rubella, varicella). The medical community continues to up the percent of vaccinated people we must attain in order to achieve this version of vaccine acquired "herd immunity". The problem is, this is an illusion. Even in countries with 95-99% vaccination compliance (Quebec, Canada and China) measles outbreaks still occur because even vaccinated people can contract and carry measles(7), as we have seen. This is because even in high responders, vaccine induced antibodies wane over time. Whereas natural exposure created the lifelong immunity which up until 1989 (when second dose MMR was added to the schedule) doctors were taught that one dose of MMR would provide. We can vaccinate everyone, and there will still be measles. Other facts of concern on measles/MMR:

-55% of Americans are out of compliance with today's schedule, with most born before 1985 having only 1 dose of MMR. Yet our kids will be required to have 3? What about all the adults?

-Efficacy wanes quickly. By age 20, only 13% have measles antibodies after 2 doses and the second dose gives only a 6 month titer bump(7)

-Mass vaccination efforts have pushed measles into more vulnerable populations (young infants and older adults) where it does more damage. Pre-vaccine, it was a common childhood illness with rare complications (see old cartoons and media), most commonly affecting children aged 1-15 years who handle the disease much better and then acquire lifelong immunity which mothers would pass to their breastfed infants (protecting them in this vulnerable stage). Mass vaccination has eliminated this maternal immunity, resulting in the the vulnerability of young infants to the disease(7)

-Mumps was also a routine childhood disease with rare complications seen. Mumps vaccine induced immunity is also quickly waning, as evidenced by outbreaks in fully vaccinated 15 year olds

-Rubella, a disease so often mild that half of people did not realize they were infected, was reportedly eliminated from the US in 2004. The WHO reports that Rubella vaccine induced protection does not last past 15 years

-Many parents have witnessed their children regress into autism (and other neurological and behavioral disorders) before their very eyes after receiving their MMR. Their experiences and concerns are currently being defiantly ignored by the mainstream medical community, whose stance continues to be, definitively, "vaccines do not cause autism." Despite the fact that many studies have indeed pointed to a link(8,9).

Another vaccine which is being proposed as mandatory by the HAR 11-157 legislation is Gardasil, or the HPV vaccine. The concerns surrounding this vaccine are abundant and extremely serious. First of all, this is another vaccine most adults do not have and are not required to receive. It protects against SOME specific strains of HPV indicated in cervical cancer (a disease which takes 10-20 years to develop and is fully preventable by others means such as routine pap smears). The vaccine contains both aluminum and polysorbate 80, neither of which have been adequately tested for human safety, and which the medical community will insist are safe because the levels are minuscule compared to safely INGESTED levels, a route of ingestion which allows the body to respond in a completely different way. The vaccine's convoluted safety trials, fast-tracking despite zero threat of dangerous outbreak, and intentionally excluded side effects (including causing ovarian failure and infertility in young teen girls, seizures,

depression, and death) have left 300 girls around the world dead, and caused 46,000 very serious reactions in others(10). All that in the name of possibly protecting a much smaller number of girls from cervical cancers that could have been prevented by other safer means. According to Peter Gotzsche, MD and head of the Cochrane Institute in Copenhagen, Denmark, "the general public is not receiving honest information (about Gardasil)."10

-Cervical cancer one of the rarest and most preventable cancers

-Studies DO NOT support the claim that the vaccine has lowered cancer rates

-The Japanese government now refuses to recommend or pay for Gardasil due to its devastating side effects

-Yet despite all this, you want to mandate it for our young children?

When it comes to Flu vaccine, a recently published study (Yan, 2018(11)) funded by the CDC showed that contagious mist was 6.3 times more prevalent in individuals vaccinated for the flu in both the current and previous years than in unvaccinated individuals. Meaning that these vaccinated persons were actually MORE contagious and more likely to spread flu virus to others. Vaccinated individuals get sick with the flu and die, like 6 year old Emma Splan from Connecticut just this month. Reports of injury from flu vaccine are commonplace. There are zero laws in place which prevent kids or adults with active infectious diseases from attending school. Yet we want to legally mandate our kids get shots that their teachers don't even have to get?

These are just a few of the reservations and concerns which NEED to be addressed. It is wholly unreasonable to mandate that our children receive these vaccines WITHOUT even providing complete, true and accurate disclosure to us as parents. Where there is risk, there must be a choice, as with any other medical procedure. Isn't that reasonable? Many parents are not even aware that they have a choice, they don't know about exemptions, they cannot homeschool their kids, and they are simply not being told the truth in order to make an INFORMED decision. We the parents are the ones who must make the decisions we feel are best for our babies, and we and our kids are the ones who have to live with the consequences of those choices. Not government, not DOH, not CDC and not ACIP. Our keiki are not healthy. That much is CLEAR. Chronic childhood illness has skyrocketed and continues to rise. It is obvious that what we ARE doing is NOT working. Time to take a new approach, one that removes corporate dollars from the equation, because that is the ONLY way we can remove conflict of interest and TRULY put the health of our people FIRST. It is UNETHICAL to force children and families to undergo a procedure when there are so many unanswered questions, so much financial interest swaying the truth, and SO MUCH AT STAKE.

Thank You,

Richelle Paoli, RN

Martina Dodson

Lanai 117K-11-157
Hearing.

12/18/18

Aloha my name is Martina Dodson, I am a citizen of United States, live on Maui and I also am a health freedom advocate. Me and my family strongly oppose HAR-11-157.

I almost died from a vaccine. Injury and death is not rare as some people might think. CDC claims one in a million doses. Add that up and its many serious events including death, paralysis, seizure, swelling of the brain etc. What kind of real statistic is that?

If these rule changes goes through HI will be the most vaccinated state in the U.S. we also will know WHO TO HOLD RESPONSIBLE FOR THE DEATH AND INJURY THAT WILL happen to Hawaii's keiki. We might not be able to hold them accountable by law for the tragic events that will occur.

BUT MY WORDS HERE IN THIS TESTIMONY, WE WILL GO BACK TO AND LET EVERY SINGLE PERSON IN THIS STATE KNOW, WHO THE CORRUPT PEOPLE ARE THAT SET THIS FORTH IN THE PUBLICS EYES, AND WE WILL HOLD THE PERSONS SUCH AS ROZ BAKER, BRUCE ANDERSON AND DR SARAH PARK AND EVERYONE ELSE INVLOVED ACCOUNTABLE FORT HE ENOURMOUS CATHASTROPICH DISASTER to mandate and vaccinate all Hawaii's keiki with the proven dangerous HPV vaccine.

The evidence are overwhelming of the danger of this particular vaccine. If it would have been a regular medication on the market it would have been recalled by now. But because it is labeled a vaccine the can madate this poison. Only 3 states have this mandated for school it is called medical tyranny. Over 400 deaths have been reported and over 59,000 adverse events to VAERS. Keep in mind FDA admits only 1 to 10% even gets reported.

I urge you to look at proposed rule change. It is a sneaky way to take away parents rights and parents choice. Especially when they want to mandate vaccines for diseases that do not spread in school enviroment.

Where is the medical justification for 74 doses vaccines before the age of 18. 4 billion has been paid out for injury and death from vaccine court. You cant simply call it science when a vaccine maker have full legal immunity from damage claims. 1986 NCVIA was created and the vaccine schedule tripled. Coincidence?

1 in 40 children with autism. I watched my friends perfectly healthy twin boys go infora multidose vaccine appointment. Directly after both permanently braininjured laater diagnosed with autism. The annual cost for autism is \$268 billion and is expected to be \$1 trillion 2025. These growing costs now fall on families and on tax payers through the cost borne by local school districts, states and medicaid.

53 % of American children with auto immune disorders

Cancer is the leading cause of death in children

U.S has the highest infant mortality rate in a developing country. Also the most vaccinated.

IT CAN ALL BE TRACED BACK TO THE INSANE KIDS SCHEDULE THAT HAS NEVER BEEN TESTED FOR SAFETY IN COMBINED DOSES. NEITHER HAS ANY VACCINE EVER BEEN EVALUATED FOR THE ABILITY TO CREATE CANCER, CAUSING GENE MUTATION NOR THE IMAIRMENT OF FERTILITY. STATES IN 13.1 IN EVERY SINGLE VACCINE INSERT.

Children's Health Defense

From the desk of Robert F. Kennedy, Jr., Chairman
Children's Health Defense

The Honorable Richard Pan
State Capitol
Room 5114
1303 Tenth Street
Sacramento, CA 95814-4900

October 12, 2018

Dear Senator Pan:

I encourage you to read the enclosed book, *How to End the Autism Epidemic*. It provides a complete and accurate account of how vaccine manufacturers and the Centers for Disease Control have worked together to hide an epidemic of autism caused by giving too many vaccines to American children without any regard for the vulnerable subset of children who are at grave risk from vaccine reactions.

I want you to know that just a few weeks ago, I petitioned the Inspector General of the Department of Justice and both Congressional Judiciary Committees to investigate two key Justice Department lawyers' actions during the 2009 "Vaccine Court" Omnibus Autism Proceedings (OAP). Systematic acts of fraud by these two officials caused the OAP to deny compensation to over 5000 families whose children developed autism as the result of vaccination. I provided the Inspector General and Congress with evidence that HHS and two DOJ officials lied to the court, the victim's families and the public to conceal the fact that the government's lead expert had informed them that vaccines could, in fact, cause autism in some children. In order to hide his opinion, the DOJ hurriedly dismissed their expert from providing oral testimony in the OAP. But that was just the start of the cover up. This is a complex story involving intentionally malicious acts, and Chapter 6 of the enclosed book does an excellent job of laying out the entire series of events.

Since this miscarriage of justice, roughly one million children have been diagnosed with autism. According to parents, a significant number of these cases resulted from vaccine injuries. As of 2015, the projected annual cost for autism was \$268 billion and is expected to reach \$1 trillion by 2025. These growing costs now fall on families and on taxpayers through the costs borne by local school districts, states and Medicaid.

Vaccine manufacturers and the CDC have worked hand-in-hand to create a bloated vaccine schedule never properly tested for real side-effects. Every state is now facing skyrocketing special education costs and dramatic increases in chronic health problems amongst its children. I hope you will share this information at once with your State's Attorney General to investigate this matter more fully. We can and must protect our children's health. Please do not hesitate to contact me for more information:

.. @childrenshealthdefense.org

*In 1986, pharmaceutical companies producing vaccines were given full federal protection from lawsuits resulting from vaccine injury or death via the Childhood Vaccine Injury Act passed by Congress. If vaccines are so safe, why did they need a law to protect from liability?

After this law, vaccines became HIGHLY profitable. There are almost 300 vaccines in development, and mandatory vaccine laws for children — and ADULTS — being pushed in most states.

The US gives 2-3x more vaccines to children than most developed countries, yet we have skyrocketing rates of childhood issues that are NOT seen in other countries. Things like asthma, childhood diabetes, food allergies, childhood leukemia, developmental delays, tics, ADHD, autism, lupus, arthritis, eczema, epilepsy, Alzheimers, brain damage, etc... It's NOT a coincidence.

Vaccines contain toxic chemicals that do NOT belong in our bodies, such as aluminum (known to cause brain and developmental damage even in small doses), polysorbate 80, MSG and formaldehyde (known to cause cancer in humans).

Know the Facts

Mercury in Flu Vaccines

- The Food and Drug Administration (FDA) warns pregnant women and young children not to eat fish containing high levels of methylmercury. Yet the Centers for Disease Control and Prevention (CDC) recommends pregnant women and infants get influenza vaccines, many of which contain mercury from the preservative thimerosal.
- According to Environmental Protection Agency (EPA) guidelines one would have to weigh 550 lbs to safely process the 25mcg of mercury in a flu vaccine. Mercury is known to be highly toxic to brain tissue and can impact critical stages of brain development in a fetus in utero, an infant or a child.
- In 2004, the Environmental Protection Agency (EPA) estimated that one in every six women has mercury blood levels that could pose a risk to an unborn child. Two studies in 2012 showed that a mother's mercury exposure is linked to attention problems in her children.
- Scientific studies have documented that mercury rapidly crosses the placenta and accumulates in the fetus at higher levels than in the mother. Ethyl mercury used in vaccines resulted in more than double the amount of mercury deposited into primate infant brains than equal amounts of ingested methylmercury.
- In 2001, the prestigious Institute of Medicine recommended that pregnant women, infants and children NOT receive vaccines preserved with mercury but the CDC Advisory Committee that makes vaccine recommendations chose not to follow their advice.
- It is inconsistent and dangerous to recommend vaccines containing ethylmercury when also counseling pregnant women to avoid seafood high in methylmercury due to the known harmful effects mercury can have on the developing fetus.
- Thimerosal-containing flu vaccines contain 250 times the mercury level the EPA uses to classify hazardous waste. Unused thimerosal-containing flu vaccine should be returned to the manufacturer for appropriate disposal.

FLU VACCINES what you need to know

You want to do *everything* right for your health, you would never knowingly allow someone to inject something into you or your children that wasn't completely safe. Before getting a flu vaccine, you need to know this:

The Supreme Court ruled that vaccines are

unavoidably
UNSAFE

146741nc 00006n

Know the Facts: Flu Vaccines During Pregnancy

According to influenza vaccine package inserts, "Available data on influenza vaccines administered to pregnant women are insufficient to inform vaccine-associated risks in pregnant women."

A 2017 CDC study links miscarriage to flu vaccines, particularly in the first trimester. Pregnant women vaccinated in the 2010/2011 and 2011/2012 flu seasons had two times greater odds of having a miscarriage within 28 days of receiving the vaccine. In women who had received the H1N1 vaccine in the previous flu season, the odds of having a miscarriage within 28 days were 7.7 times greater than in women who did not receive a flu shot during their pregnancy.

A study published in 2016 that looked at the safety of flu vaccines found a moderately elevated risk for major birth defects in infants born to women who had received a flu vaccine during the first trimester of pregnancy. A study published in 2017 found an elevated risk of autism spectrum disorders in children whose mothers had a first trimester flu shot. Flu vaccine administration is documented to cause an inflammatory response in pregnant women. Recent research found inflammation during pregnancy is associated with the development of autism spectrum disorders.

A large study in approximately 50,000 pregnant women over five flu seasons found no difference in the risk for developing influenza or similar illnesses between those who received the influenza vaccine during pregnancy and those who did not.

An independent 2014 review found no randomized controlled trials assessing vaccination in pregnant women. It states, "The only evidence available comes from observational studies with modest methodological quality. On this basis, vaccination shows very limited effects."

Know the Facts: Flu Vaccines for Infants and Children

A review in the medical journal The Lancet found a lack of health benefits from influenza vaccine in children under two along with significantly increased rates of vaccine-related adverse events.

A study that compared children who received flu vaccine to those who did not found no significant difference in the rate of influenza between the active and placebo groups. It also found that the group of children who received the flu vaccine had a 4.4 times relative risk of non-influenza respiratory tract infections.

An Australian study found one in every 110 children under the age of five had convulsions following vaccination with the FLUVAX H1N1 vaccine in 2009. Additional research found a spike in cases of narcolepsy in children associated with the H1N1 vaccine.

2018 - 2019 Flu Vaccines

Influenza vaccines — United States, 2018–19 influenza season*

Trade name Manufacturer	Presentation	Age Indication	Mercury (from thimerosal, µg/0.5 mL)
Inactivated Influenza Vaccines (IIVs) and Recombinant Influenza Vaccine (RIV4)†			
Afluria Seqirus	0.5 mL, prefilled syringe	≥5 yrs	NR
	5.0 mL, multi-dose vial	≥5 yrs (needle/syringe) 18 through 64 yrs (jet injector)	24.5
Fluzix Quadrivalent GlaxoSmithKline	0.5 mL, prefilled syringe	≥6 months	NR
FluLaval Quadrivalent ID Biomedical Corp. of Quebec	0.5 mL, prefilled syringe	≥6 months	NR
	5.0 mL, multi-dose vial	≥6 months	<25
Flucelvax Quadrivalent Seqirus (ccIV4)	0.5 mL, prefilled syringe	≥4 yrs	NR
	5.0 mL, multi-dose vial	≥4 yrs	<25
Fluzone Quadrivalent Sanofi Pasteur	0.25 mL, prefilled syringe	6 through 35 months	NR
	0.5 mL, prefilled syringe	≥3 years	NR
	0.5 mL, single-dose vial	≥3 years	NR
	5.0 mL, multi-dose vial	≥6 months	25
Trivalent IIV (IIV3s)			
Afluria Seqirus	0.5 mL, prefilled syringe	≥5 years	NR
	5.0 mL, multi-dose vial	≥5 yrs (needle/syringe) 18 through 64 yrs (jet injector)	24.5
Fluad Seqirus (aIV3)	0.5 mL, prefilled syringe	≥65 yrs	NR
Fluzone High-Dose Sanofi Pasteur (HD-IIV3)	0.5 mL, prefilled syringe	≥65 yrs	NR
Quadrivalent RIV (RIV4)			
FluBlok Quadrivalent Sanofi Pasteur	0.5 mL, prefilled syringe	≥18 years	NR
Live Attenuated Influenza Vaccine (LAIV4)			
FluMist Quadrivalent Astrazenca	0.2 prefilled intranasal sprayer	2 through 49 yrs	NR

Abbreviations: IIV=inactivated influenza vaccine; RIV=recombinant influenza vaccine; HA=hemagglutinin; LAIV=live attenuated influenza vaccine; mos=months; yrs=years.

More Vaccine Facts to Know

Every year, the Centers for Disease Control and Prevention (CDC) and pharmaceutical companies mount an aggressive campaign in the mainstream media to persuade Americans to get their flu shots. Flu shots are big business: industry analysts estimate that within the next five years, the U.S. flu vaccine market will be worth almost \$3 billion annually.

The CDC has advised the industry to hike demand through the use of a "recipe" of messaging to get your flu shot now through advertisements that include "...statements of alarm by public health authorities...prediction of dire outcomes from influenza...continued reports that influenza is causing severe illness affecting lots of people...repeated urging of influenza vaccination..." that bombard consumers.

From 2014 to 2015, the NVICP flu shot settlements increased from \$4.9 million to \$61 million—an 1100% increase. As the Vaccine Adverse Event Reporting System (VAERS), a voluntary surveillance system, is acknowledged by the government to capture as little as one percent of actual adverse events, the flu vaccine injuries and deaths are substantially underreported.

According to the CDC, over the past 14 seasons, the effectiveness of the influenza vaccine has varied from 10% to 60%.

When offered a flu vaccine

Vaccine decisions should not be made without doing your research first and deciding if the influenza virus is a significant concern for you and your family.

Be sure to find out the manufacturer and avoid vaccines from multi-dose vials that contain the preservative thimerosal.

Review the evidence regarding the effectiveness of the flu vaccine in actually preventing influenza. For information visit www.summaries.cochrane.org

Do not let yourself be pressured into receiving a vaccine that you don't want; should you choose to vaccinate, insist that your doctor or pharmacist find you a mercury-free vaccine.

Tips for Preventing the Flu

Simple techniques such as avoiding those with flu-like illnesses, eating a healthy diet and good hand washing can prevent many cases of flu. If you do contract influenza, optimizing vitamin D levels, fluid intake and rest can boost immune function.

Aloha,

I'm writing on behalf of the immunization shots bill regarding student to be vaccinated to attend schools in Hawaii. I hope you take consideration on the procedures of your actions and actually look into what you are considering. I am an Hawaiian woman and a mother of 3, who all aren't vaccinated whom also rarely ever get sick they're very active and strong smart kids whom I am trying to raise correctly. Besides the fact that all the "shoots" vaccines diseases what ever form of name of your preference is synthetic lines of diseases more than 1 in each shoot which proves that the old diseases are no longer in existence their for we are spreading synthetic lines of diseases that man created by taking the dead bodies of abortions/babies and making more filthy diseases because you need filth very dirty conditions to even catch a virus and that's how people got sick back hundreds of years ago we are way advanced with access to clean water to drink, bathe etc electric. Which already advances us to a more sustainable living. If it's hard to be clean that's proof of how lazy you want to be sorry to say. However a human is born with an immune body system that has the capacity of 100% of function to keep you healthy. Your body is strong whenever you get sick without being vaccinated your body uses the equivalent of 3-17 percent to fight off any viruses diseases cold what ever it may be. However after being vaccinated your body immune system goes weak their for needing to use more out of its 100% so instead of using the 3-17 percent per symptom it raises to 30-70 percent leaving you vulnerable to getting more sick. Ex: say you have a cold stomach ache say that was 45% out of the 30-70 however shortly after you got a sore throat so you use 50% you already are using 95% with only 5 left now your vomiting but you only have 5 percent you have nothing left leaving you sick for a longer duration of time, now you need medicines to help cause your body is to weak to fight for you. Besides all the cases on trial right now in California for this exact reasonings also all the cases that proved vaccines causes autism. Besides the fact that it's a risk of death cause it states effects if dying get to the hospital immediately why is that even an option?! Some people are okay with playing with children's lives I refuse to this is not a game and you should look at the facts before mandating such life impactful decisions on our children's future. I could go on and state more also other ingredients like inbombing fluid and other harmful chemicals however if what I said didn't scare you already than it doesn't bother

you. However at least let parents who do care to have a choice because as a parent I can't see myself volunteering my children's health because a man or woman said so the guilt would kill me knowing I would have to harm them because of someone's greed. We already were stolen given sickness now more sickness and harm when will it be enough what else will be taken from us all of us. Please take my words into consideration on your actions thank you and mahalo

Subject: HAR 11-157
Date: Wednesday, December 19, 2018 1:42:34 PM

Aloha,

As a concerned parent, I am writing you to let you know that I oppose HAR 11-157. Some of the vaccines listed are dangerous. The risk does not outweigh the "protection" given by said vaccines.

Gardasil, for one has been linked to the deaths of over 400 girls. 400! That is heartbreaking.

To make this a mandatory vaccine is not a smart move.

I could go on and on and provide you with much research, but I will keep this short and sweet.

Thank you for hearing me out.

Sincerely,

Laura Roberts

Subject: Aloha/Please NO Mandatory Vaccines
Date: Wednesday, December 19, 2018 3:37:18 PM

Aloha Honorable Hawaii Department of Health,

I am writing to please request that you not continue forward with mandatory vaccinations. This would be an egregious action for you to press forward as a tool for big pHARMA by requiring this from the people and children of Hawaii. We, the people you are entrusted to serve, have resoundingly stated we do not want this, so it is styming that faced with so much data against vaccines, which you have been sent and are hearing, plus the fact that there is not really data of any long term substance to support such an action and blind support of forcing people to submit like prisoners to your will and desire because you have this power.

It is full-hearted at best or corrupt at worst to push forward with an agenda striping the Freedom of Choice and Body Sovereignty, as well as the rights of Informed Consent and it will not bode well in the long run for your Department, so I highly recommend you hear the will of the people and STOP this agenda now. You have been presented with not just impassioned pleas, but outright facts and figures proving that vaccines and their effectiveness are still not really well tested nor proven safe, especially in regards to multiple doses given at one time or in one injection.

The FDA requires far less testing of vaccines than by-mouth pharmaceuticals; hence, the proliferation of them. The timeline from concept to profit is faster, but not safer. Do you realize that in the few clinical trials even done, if a required test is five days, but the baby dies on the six day, it's not noted?

Please do not push forward with this agenda. Stay the honorable and do the right thing here, by NOT pushing forward with this Orwellian Agenda.

Thank you for considering my request.

Mahalo,

Susan Bambara

Anti vaccine

Wednesday, December 19, 2018 11:19:03 PM

Aloha, sending my Anti mandatory vaccine thoughts. My family and I have a strong belief in natural healing and medicine, BUT we do reach out for a doctors help when needed OR wanted with personal preference. I think it should be the same with immunizations. It should be a want/need that the family as a unit gets to CHOOSE as a whole. - Not one that should be forced on family. We ourselves and our family's know us better than any doctor that might see us 1-4 times a year, so to think that you want to FORCE us to vaccinate when you know close to nothing about our health/living or dietary habits seems like insanity to me, also a form of abuse of authority to take away not only a basic human right to have a choice but also taking away the choice that America is supposed to give us, "freedom" right? I oppose the need for mandatory vaccinations, we should choose if that's something we want. Mahalo.

Subject: Comment about the HPV vaccine
Date: Wednesday, December 19, 2018 11:29:49 AM

Dear Sir or Madam,

I am appalled that the Hawaii Department of Health is considering mandatory vaccinations for children for the human papilloma virus. How can anyone who oversees the health of Hawaii's children seek to force a vaccination which may potential have serious side effects. Is the department so in bed with the pharmaceutical industry that it is ignoring safety issues?

While U.S. citizens are prohibited from suing vaccine manufacturers, lawsuits have been launched in Japan, France, Ireland, Spain, and Columbia claiming HPV vaccine harm.

It is beyond question that some children are permanently disabled or die from their vaccine exposures. A broad spectrum of suspected and confirmed adverse vaccine events has grown in the decades from the beginning of mass vaccination. (U.S. Dep't of Health Res. & Human Servs. Admin., National Vaccine Injury Compensation Program Monthly Statistics Report (2017)).

In the U.S. the NVICP has paid affected families approximately \$3.7 billion since it began taking claims in 1989.
<http://law.emory.edu/elj/content/volume-67/issue-3/articles/liability-vaccine-injury-united-european-world.html>.

The Vigibase database of the World Health Organization has compiled more than 86,000 serious adverse event reports for Merck's HPV vaccine. They include nervous system disorders (39,092), respiratory, thoracic and mediastinal disorders (6060), vascular disorders (5766), nervous system disorders (39,092), reproductive system and breast disorders (3267), cardiac disorders (2604), and blood and lymphatic system disorders (2035). <http://www.vigiaccess.org/>

Among 12 - 17 year olds, 45,000 adverse events have been reported.

The number of AE's reported for HPV vaccines, in each country, are overwhelmingly higher than that for other vaccines. But national health authorities and medical professionals continue to deny any causal relationship between HPV vaccines and AE's.

Under the Freedom of Information Act, in 2013 Judicial Watch received documents from the Department of Health and Human Services (HHS) revealing that its National Vaccine Injury Compensation Program has awarded more than \$5 million to 49 victims in claims made against the HPV vaccine. <https://www.judicialwatch.org/press-room/press-releases/hpv-vaccine-injuries-and-deaths-is-the-government-compensating/>

Judicial Watch also received documents, under the Freedom of Information Act, from the U.S. Food and Drug Administration (FDA) detailing reports of adverse reactions to Gardasil. The adverse reaction reports detail 26 deaths reported between September 1, 2010

and September 15, 2011 as well as incidents of seizures, paralysis, blindness, pancreatitis, speech problems, short term memory loss and Guillain-Barré Syndrome.

The conservative watchdog points out, “Merck has waged an aggressive lobbying campaign with state governments to mandate this HPV vaccine for young girls.”

It’s fascinating that Dr. Julie Gerberding, who approved Gardasil when she was director of the C.D.C., was subsequently hired by Merck in 2010 as president of Merck Vaccines. In 2015 she made more than \$2 million selling Merck shares.

https://en.wikipedia.org/wiki/Julie_Gerberding

While the CDC and international government bodies promote the vaccine’s safety, there is compelling evidence that Merck conducted shoddy, questionable clinical trials; and that a number of individuals around the world have suffered drastic health consequences post vaccination.

According to a 2015 Atlantic magazine article, Merck’s top selling vaccine is Gardasil, which brings in \$1.7 billion in sales. With such massive sales is it any wonder any attempts to raise safety issues are routinely dismissed, contrary to evidence.

<https://www.theatlantic.com/business/archive/2015/02/vaccines-are-profitable-so-what/385214/>

There is widespread concern about adverse effects caused by the Gardasil vaccination. They include paralysis, narcolepsy, respiratory dysfunction, cognitive impairment, involuntary movements, blood clots, and a rapid heartbeat.

A 2016 Canadian study looked at over 195,000 girls who had received HPV vaccines. Within forty-two days of HPV vaccination, the girls experienced over 20,000 emergency room visits or hospitalizations. But only 198 adverse events were reported. Liu XC, Bell CA, Simmonds KA, Svenson LW, Russell ML. Adverse events following HPV vaccination, Alberta 2006–2014. *Vaccine* 2016;34(15):1800-1805.

In 2012 Canadian researchers looked at whether or not some serious autoimmune and neurological ADRs followed HPV vaccinations are causal or merely coincidental. They analyzed post-mortem brain tissue specimens from two young women who suffered from cerebral vasculitistype symptoms following vaccination with Gardasil. They conceded “our study suggests that HPV vaccines containing HPV-16L1 antigens pose an inherent risk for triggering potentially fatal autoimmune vasculopathies.”

“The fact that many of the symptoms reported to vaccine safety surveillance databases following HPV vaccination are indicative of cerebral vasculitis, but are unrecognized as such (i.e., intense persistent migraines, syncope, seizures, tremors and tingling, myalgia, locomotor abnormalities, psychotic symptoms and cognitive deficits), is a serious concern.”

“It thus appears that in some cases vaccination may be the triggering factor of fatal autoimmune/neurological events.”

<https://www.omicsonline.org/open-access/death-after-quadrivalent-human-papillomavirus-hpv-vaccination-causal->

or-coincidental-2167-7689.S12-001.php?aid=9036

The basis for HPV vaccination is its ability to prevent precancerous lesions related to HPV type 16 and 18 infections and the idea that preventing those lesions would prevent cervical cancer. According to University of Louisville researcher Dr. Diane Harper who led clinical trials of HPV vaccination, HPV infection can take years to result in cervical cancer. That leaves plenty of time for screening, treatment and prevention. Furthermore, 90% of HPV infections are removed from the body by its own immune system and related processes without medical or other consequences within three years. Only a tiny minority leads to cancer.

The FDA licensed Merck's vaccine as a result of trials that were just three years long.

Dr. Kelly Brogan notes: "In the marketing and licensure of the HPV vaccine, changes to cervical cells have been equated with death. This is called using a "surrogate marker" and in vaccine research, this is considered acceptable because we can't otherwise prove a non-event is attributable to an intervention. There are leaps in logic and in science inherent in this practice that render conclusions nothing more than false marketing." <https://kellybroganmd.com/new-gardasil/>

Former neurosurgeon Dr. Russell Blaylock claimed in 2013: "It has never been proven that the HPV vaccine prevents cervical cancer."

A study by researchers at the University of Texas looked at HPV vaccination data from 2007–2012. The results showed that young women 20 to 26 years of age who received the four-strain Gardasil vaccine were actually more likely than non-HPV-vaccinated women to be infected with high-risk nonvaccine strains of HPV ten years later. Guo F, Hirth JM, Berenson AB. Comparison of HPV prevalence between HPV-vaccinated and non-vaccinated young adult women (20-26 years). *Hum Vaccin Immunother* 2015;11(10):2337-2344.

A review published in 2014 in *Autoimmunity Reviews*, "On the relationship between human papilloma virus vaccine and autoimmune disease," pointed out: "Along with the introduction of the HPV vaccines, several cases of onset or exacerbations of autoimmune diseases following the vaccine shot have been reported in the literature and pharmacovigilance databases, triggering concerns about its safety."

The authors caution that, "the decision to vaccinate with HPV vaccine is a personal decision, not one that must be made for public health. HPV is not a lethal disease in 95% of the infections; and the other 5% are detectable and treatable in the precancerous stage."

<http://www.ncbi.nlm.nih.gov/pubmed/24468416>

In a July 2016 lawsuit against Gardasil's manufacture Merck, in the Superior Court of the State of California, Los Angeles County, evidence was presented questioning the safety of adjuvants in vaccines that can produce autoimmune disorders, such as the addition of aluminum salts.

<http://www.greenmedinfo.com/blog/merck-accused-fraud-deceit-and-negligence-us-gardasil-case>

“It is medically and scientifically accepted that aluminum salts are toxic to and damage the human cells at the injection site. In addition, the aluminum salts cause inflammation at the site. These aluminum salts may bind with the free DNA released from the damaged and dying cells at the injection site. The combination of the Aluminum salt bound by the human DNA is effective in activating Toll Like Receptors (“TLR”), whose function in the immune system is highly complex.”

Lawsuits internationally include one against the French manufacturer of Gardasil in 2013, where the court found 50% of the blame for a teenager’s subsequent multiple sclerosis on Gardasil. Two weeks after the first injection, she experienced sensory and motor problems in the upper limbs. Three months after the second injection she was hospitalized. <https://www.reuters.com/article/us-sanofi-lawsuit/sanofi-sued-in-france-over-gardasil-vaccine-idUSBRE9AN0FX20131124>

In Japan, an injury lawsuit in 2017 against the state and the HPV vaccine drug makers prompted the Japanese health ministry to withdraw their official recommendation for the HPV vaccination.

Twenty eight girls and women suffering what they say are side effects from cervical cancer vaccines that were recommended by the government, demanded compensation from the state and drug makers at the Tokyo District Court. <https://www.japantimes.co.jp/news/2017/02/13/national/crime-legal/suit-opens-tokyo-court-cervical-cancer-vaccine-side-effects/#.XBg7OCx7ILM>

The plaintiffs, ranging in age from 15 to 22, said they have experienced a wide range of health problems, including pain all over their bodies and impaired mobility, after receiving HPV vaccines between 2010 and 2013.

Erina Sonoda, a 20-year-old college student, reported she started to suffer strong menstrual pain after receiving the second of three recommended shots of the Cervarix vaccine, and the pain spread to other parts of her body after the third vaccination. Due to agonizing pain, Sonoda said she has difficulty walking without a cane and often must use a wheelchair.

According to the health ministry, 2,945 people out of the 3.39 million women who had received the shots by the end of April 2017 reported side effects.

In Columbia anthropological researcher Mario Lamo-Jiménez, has raised concerns about the side effects of Gardasil, and is assisting attorneys prosecuting the collective action lawsuit filed by 700 women in that country demanding some \$160 million in compensation from Merck. <https://hetq.am/en/article/84400>

She reported Columbian girls suffering from ASIA syndrome after vaccination, as well as onset of early menopause, where there is a premature ovarian failure and they become sterile, as well as Guillain Barré Syndrome.

In Ireland around 650 girls reported requiring medical intervention or treatment after receiving the HPV vaccine, according to data collected

by the State's medicines watchdog. Ireland accounts for one in five of all reports of suspected adverse reactions against Gardasil in Europe. At this time there are eight cases filed in Ireland's High Court that relate to the HPV vaccine.

At least 6 Danish women have report they developed chronic health problems during an HPV clinical trial. At Aalborg University Hospital, one of the trial sites in Denmark, Miam Donslund began to experience persistent flu-like symptoms as well as two infections, one of which required hospitalization, shortly after immunization. Stine Sørensen began to experience general discomfort, headaches, and a profound fatigue that often made her miss school after she got her first shot of Gardasil. All the women have one or more agonistic autoantibodies in their bodies.

German scientist Gerd Wallukat noted about the autoantibodies, they reveal "the classical pattern I've seen in patients after vaccination."

In Spain in 2017, the High Court of Justice of Asturias condemned the Asturian Health System for the death of Andrea, a young Spanish girl who died in September 2012 after getting the second shot of the HPV vaccine. The Court admonished the hospitals of Jove and Cabueñes, since they did not diagnose the patient's pathology before the second shot of the vaccine was supplied which caused the death of the young woman. <https://healthimpactnews.com/2017/spain-high-court-rules-hpv-vaccine-caused-death-of-young-woman/>

When she got the first shot of the HPV vaccine on July 23, 2012, the woman had a headache and breathing difficulty. Although, she suffered from severe asthmatic exacerbation, she got the second shot on August 23, 2012, and worsened. As a result she suffered severe dyspnea and seizures only 12 hours after receiving the vaccine, and died.

This year India's Ministry of Health and Family Welfare indicated that it was unlikely to include HPV vaccines in the national immunization program.

Last year an empirical study confirmed that the inability to sue vaccine manufacturers in U.S. civil courts since 1986 is associated with a decrease in vaccine safety in FDA-approved vaccines after 1986. Gayle DeLong, Is "Delitigation" Associated with a Change in Product Safety? The Case of Vaccines, Rev. Ind. Org. (June 14, 2017), <https://link.springer.com/article/10.1007/s11151-017-9579-7>.

DeLong found that vaccines licensed after 1986 are associated with approximately 5.2 more reported adverse events per 100,000 vaccine doses than the vaccines that were licensed before the passage of Vaccine Act.

A 2017 investigation by Slate revealed problems with the clinical trials for Gardasil, which was supposed to establish the vaccine's efficacy and safety before it was approved. The article raises questions about why regulators knowingly accepted the company's flawed data. <https://slate.com/health-and-science/2017/12/flaws-in-the-clinical-trials-for-gardasil-made-it-harder-to-properly-assess-safety.html>

"Interviews with five clinical trial study participants and more than

2,300 pages of documents obtained through freedom-of-information requests from hospitals and health authorities suggest inadequacies built into Merck's major clinical tests of Gardasil."

"European health regulators worried about Merck's methods during a review of the company's marketing application for Gardasil 9, the latest version of the vaccine, but have not made their concerns public. In an internal 2014 EMA report about Gardasil 9 obtained through a freedom-of-information request, senior experts called the company's approach "unconventional and suboptimal" and said it left some "uncertainty" about the safety results.

"If I were a research subject, I would feel betrayed," said Trudo Lemmens, a bioethicist and professor of health law and policy at the University of Toronto.

It's worth remembering that former Merck virologists Stephen A. Krahling and Joan A. Wlochowski, filed a lawsuit against Merck in 2010. The scientists alleged that the efficacy tests for the measles, mumps, rubella vaccine (MMR) were faked. They claimed that over the years the effectiveness of the mumps vaccine declined. In 2014 a federal judge rejected Merck's motion to dismiss. The lawsuit is still active with the court ruling class certification is due by 2/15/2019.
<http://ahrp.org/former-merck-scientists-sue-merck-alleging-mmr-vaccine-efficacy-fraud/>

Slate reported when Dr. Rebecca Chandler, at Läkemedelsverket, the Swedish Medical Products Agency began analyzing Merck's safety data for Gardasil 9, three girls vaccinated with Gardasil 9 had been diagnosed with POTS (postural orthostatic tachycardia syndrome), and one with CRPS (Complex regional pain syndrome). There were also several cases of neurological disorders. But none of them had been reported by the company as adverse events.

The suspicion that postural orthostatic tachycardia syndrome is related to the HPV vaccine comes from a 2015 study by Danish researchers who provided some observational evidence about POTS occurrence after HPV vaccines. The authors stated that they "found a close chronologic association to the vaccination. The study found that the average number of days between vaccination and diagnosing POTS was around 11 days.

POTS normally occurs in approximately 1% of adolescents.

The Norwegian press has reported on the case of a 12 years old Norwegian girl, Maria Lysaker Wenersberg, who received the HPV vaccine at school. In April 2015 she was diagnosed with Postural Orthostatic Tachycardia Syndrome which is suspected to be a serious side effect from the vaccine. Most of the time she is now bedridden. Sometimes she faints daily. She has not been able to attend school for the past four and a half years. She has to be pushed in a wheelchair from her bed into the living room.
<http://www.vg.no/nyheter/innenriks/maria-18-har-vaert-alvorlig-syk-i-fem-aar/a/23517356/>

In May 2016, Professor Peter C. Gøtzsche and Cochran Nordic Deputy Director Karsten Juhl Jørgensen, along with others, filed an official complaint about how the European Medicines Agency (EMA) handled the HPV safety issue.

In Australia in 2014 two doctors published in the Journal of Investigative Medicine a case study of a series of teens who had entered premature menopause after vaccination - a phenomenon Dr. Little and Dr. Ward described as ordinarily “so rare as to be also unknown.”

They noted – “Long-term follow-up data after HPV vaccination has not surveyed ovarian function, recorded, measured, or analyzed symptoms or signs of dysfunction. Principles of informed consent, population health, and vaccine confidence require careful, rigorous and independent research to establish ovarian safety following HPV vaccination.”

In a public forum Dr. Little spoke about the poor quality of research being performed on HPV vaccines. She noted a September 2018 article published in Paediatrics which found that women in the USA who received Gardasil were no more likely than those who did not receive Gardasil to have premature ovarian insufficiency meaning that their ovaries were no longer functioning. Little suggest the effect of HPV vaccines on the female ovary needs further study.

The American College of Pediatricians in 2016 released a health warning about the HPV vaccine – “It has recently come to the attention of the College that one of the recommended vaccines could possibly be associated with the very rare but serious condition of premature ovarian failure (POF), also known as premature menopause.”

In January 2016, pathologist Dr. Sin Hang Lee, MD, Director of Milford Medical Laboratory, sent an open letter of complaint to the Director-General of the World Health Organization (WHO), Dr. Margaret Chan, in which he challenged the integrity of the GACVS (Global Advisory Committee on Vaccine Safety) Statement on the Continued Safety of HPV Vaccination.

He wrote: “A series of emails recently uncovered via a Freedom of Information request submitted in New Zealand revealed evidence that Dr. Robert Pless, the chairperson of the Global Advisory Committee on Vaccine Safety (GACVS), Dr. Nabae Koji of the Ministry of Health of Japan, Dr. Melinda Wharton of the CDC, Dr. Helen Petousis-Harris of Auckland University, New Zealand, and others may have been actively involved in a scheme to deliberately mislead the Japanese Expert Inquiry on human papillomavirus (HPV) vaccine safety.”
<https://sanevax.org/wp-content/uploads/2016/01/Allegations-of-Scientific-Misconduct-by-GACVS.pdf>

Dr. Lee found that every one of the 13 Gardasil samples that he examined contained HPV L1 gene DNA fragments. He also found that the HPV DNA fragments were not only bound to Merck’s proprietary aluminum adjuvant but also adopted a non-B conformation, thereby creating a new chemical compound of unknown toxicity.

This non-B conformation, Dr. Lee believes, is responsible for the array of autoimmune illnesses experienced by children and young women following vaccination with Gardasil.

In 2012, he testified at a coroner’s inquest of the death of a New Zealand teenager, 6 months after receiving 3 Gardasil vaccine injections.

During the inquest neuroscientist Professor Christopher Shaw of the University of Columbia in Vancouver told the New Zealand inquest that he was sent the teenager's brain tissue to test. He said there was aluminum in all the samples he tested and there were some abnormalities in the samples. The human papillomavirus (HPV16) was found in her brain, which could have only got there through the vaccine, Prof Shaw said. He said there was a "biological plausibility" that vaccine likely caused her death. He could not say conclusively that was the cause of her death.

Finally, a new study, published in the Journal of Toxicology and Environmental Health, suggests a link between the HPV vaccine and declining fertility. It examined the childbearing capacity of women who received the HPV vaccine – compared to those who didn't, and discovered an alarming correlation. Approximately 60% of women who did not receive the HPV vaccine had been pregnant at least once compared to 35% of women who had had an HPV shot had ever conceived. For married women, 75% who did not receive the shot were found to have conceived, while only 50% who received the vaccine had ever been pregnant.

Considering all this relevant information I would hope that that the Department of Health in all good conscience would not try to force the HPV vaccine on Hawaii's children, when it is known that harm might occur in those more susceptible to injury.

Any decision to vaccinate or not to vaccinate against the sexually transmitted HPV virus is a private medical matter, and definitely not the responsibility of the state.

Re: Comments on increasing vaccination schedule and reducing opportunities to opt out

These are additional comments from me, not a repeat of my previous comments. After learning that the neighbor island public meetings would lack the decision makers, I write once again with my concerns. Thank you for reading.

You may be surprised to learn that I don't wear a tinfoil hat, or believe the earth is flat. I have a degree in science and view the world scientifically. What you are doing here is not only not 'science,' it is the opposite of true science. Allow me to explain.

A few years ago, against my better judgement, my wife and I got 'flu' shots at the doctor's office. I rarely get them and my wife never had done so. Over the next 2 days, my wife became sick with the first 'flu' of her life! We reported the reaction to our doctor, who did two things:

He pronounced it a coincidence;

He did not record the reaction or report it in any way.

Many others have had similar experiences, so this is not unique or unusual.

Now I ask you as scientists, 'how can you evaluate the rates of adverse reactions if the medical community has a policy of dismissing such, and chooses not to report or track them?' Seriously, how do you justify your conclusions of safety when as a matter of policy the medical community does not track reactions and is discouraged from doing so?

I repeat, this is the opposite of science. Rather it is a coordinated campaign to minimize the awareness of adverse reactions; that is, to hide the truth.

One more personal experience informs my views. I requested a delayed schedule of vaccines for my infant baby in 2016. For the next two weeks, I received at my unlisted home number, a series of over ten phone calls claiming to be from CDC requesting a survey of my opinions on vaccinations. These were live voices, not a robocall. They continued despite my choosing not to return the calls. The tenth such call was at 10:00 PM on a Saturday at my home, calling from a Washington DC number; it would be 4 AM in DC if this is legitimate.

Is this a reasonable thing to expect based on my conversation with my doctor? Or is this an outrageous intrusion into my life, a form of intimidation by our government, and an obscene device by the pharmaceutical industry, in obvious collusion with the CDC.

Did my pediatrician call the CDC to report my 'concerns' because they are compelled to do so? It is a violation of my privacy rights and a red flag for those concerned about vaccines.

By proposing more compulsory vaccines, you are an extension of this outrage. Your obligation is not to this over-reaching industry, it is to the people of Hawaii.

I don't use the word 'outrage' lightly. It is an outrage to me that you propose to compel further injections. Thousands of people feel as I do; most cannot attend your public meetings, or have lost faith that their input matters. If your vaccines are scientifically supported, then educational campaigns and doctors can convince people to take them. We must not lose any more freedoms to this travesty.

Among modern (sometimes called 'industrialized') countries, the U.S. has by far the largest number of 'suggested' vaccines for babies and children. We also have the highest cost of health care among such countries.

Yet, the U.S. is virtually the only such country whose life expectancy is declining, rather than growing.

The U.S. has the worst infant mortality among such countries.

Our health care delivery system has been judged the worst among these countries, while the profits derived from it are the largest.

Can you explain this scientifically? It certainly appears we have something to learn, and that our model, so influenced by large corporations, may be less than scientific after all.

Do the other modern countries use less vaccines because they are less 'scientific?' Or is the multi-billion dollar profit-driven pharmaceutical industry, which is strongest in the U.S., the big difference here?

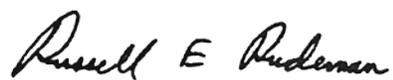

Proposing to increase required vaccines to the highest number in our most-vaccinated nation is irresponsible. I hold you, the decision makers at Department of Health, personally responsible for this outrage. No one is making you do this, yet you proceed in the face of public opposition and lack of safety studies.

Do you have safety studies that analyze the adjuvants as well as the active ingredients? Do you have safety studies that use a true placebo, like in any legitimate scientific study? Do you have studies showing the unprecedented combinations of vaccines, and their adjuvants, are safe in combination and in total?

You do not have any such studies proving the safety of what you propose to compel.

Most medical decisions are, and should be, between a person and his/her medical provider. Yet you propose to interfere with that relationship by compelling more vaccines every year, something virtually no other country does.

The ungodly reach of the pharma industry is using you as a marketing tool. You must find the integrity and strength to oppose this. Forced injections of any kind call to mind the 'experiments' of the Nazi government in the past. No, this is not hyperbole; this is what you are doing to innocent, healthy people. Forced injections that include known toxins, such as the heavy metals in the euphemistically named 'adjuvants' in most vaccines, are even more offensive to those of us who value the American ideal of freedom.

Russell E. Ruderman, Senator
Hawaii State Senate

"When there is risk there must be choice."

Whose facts: vaccines.

We were neither created nor have we evolved to require forced injections for survival. It is a complete human construct for profits and control.

When and if you decide to get a vaccination ask the physician, practitioner, facility owner, vaccine maker or anyone involved to give to you THE unequivocal acceptance of liability for the harm it MAY do to you or your loved one. Additionally, be sure to get your official GUARANTEE of effectiveness.

I assure you that these documents do not and will never exist. While I have empathy for the parents of the child/children who is/are too ill for a vaccination I want to know which of them will assure me or anyone that I/we are not vulnerable to harm from the vaccination serum! There is no such assurance to cause no harm.

Furthermore, if you have such a strong belief in the vaccination then you are protected and in that world of thinking I am the one at risk so why aren't you feeling secure?

Then, humans are born defective and each of us has an (unknown) expiration date. While you may temporarily be saved you can know it is only temporary because infinite is for the gods, legends and hope.

Finally, humans are devolving due to the progressive effects of malnutrition, dehydration and pollution. Survival of the fittest does not mean progressively stronger, just the strongest of the weak. Wake up and see the signs all around you.

It also might make sense from a scientific perspective to have a certain percentage of the population (if it is voluntary) that do not receive the mass ordered injections. In this way if an error was made in the vaccine and it caused harmful side effects with long term health, it makes scientific sense to have a percentage of the population that is not at risk of this....so that problems...those who "opted out" could help care for those who were permanently injured by the vaccine.

People do get injured by Vaccines....The documented risks are clearly stated in the insert, the fact that the companies are not liable for damages, and that there is a secret vaccine injury claim court is also very disturbing and concerning.

Finally, even though I personally am not opposed to all Vaccines, I think it is very important to respect other people's beliefs....especially if statistically they tend to be more educated and wealthy. I could understand if the demographics of people opposed to something were a large mass of uneducated people that had been persuaded by some type of fanatical leader ... then I think the experts in power should try to stop them. However, if the people opposed to something are a small minority of concerned citizens, who tend to be highly educated and more financially successful.... it does make basic sense that their point of view should be heard.

That is the case with the anti vaxing debate... my wife has an IQ of over 150 and she is opposed to it.... many other people much smarter than I am who have researched it are opposed to mandatory vaccines as well.

Personally, I am opposed to mandatory vaccines..., unless it is a species wide health emergency, where the entire human race could be at risk....and even then....quarantine areas should be set up for people who choose to "opt out"and all the facts should be clearly presented.

Thank you

David Marshall

Subject: Oppose mandatory vaccinations
Date: Thursday, December 20, 2018 12:02:10 AM

As a medical provider I am obligated to always look out for the best interests of my patients and I have sworn to do no harm. While medical school stressed the importance of maintaining CDC guidelines I have since come to realize that this may not be the best option for the safety of our children (or our adults). I have seen too many instances of symptoms occurring directly after vaccinations to be able to write them off as all coincidences. Also, simply by comparing the standard patient handouts with the insert of vaccines it is blatantly apparent how sugar-coated the business of vaccines is- and that is exactly what it is... business. While doing my own research as both a doctor and a mother I continue to be amazed not only at the continued increase in the amount of vaccines recommended but also the fact that there is the thought that a company or a practitioner can be objective when there is financial gain involved. While I am not anti-vaccine I am anti-unsafe vaccine practices, of which I feel there are many in this country. I am also very opposed to having people forced to have ANYTHING done to their body without their permission or desire to have it done. When corporations and doctors stand to make large amounts of money off any practice there needs to be far more third party intervention. Furthermore, making vaccines mandatory will simply make many concerned parents find alternatives, such as the number of families that have moved here to escape this same situation in California or those who would feel forced to homeschool their children at the detriment of their professional career. Our medical system continues to have increasing profits while our quality of healthcare continues to decline. This should tell us something. This decision should be between an individual and their physician and both the pros and cons of each vaccination should be discussed as a separate issue, since the risk and benefit ratio is going to be different for each one depending on the person and their particular situation. I have seen parents who chose to vaccinate and regretted it. I have seen parents who chose not to vaccinate and regretted it. There is no right choice but it should be the parent's choice to make- they will always put their child above all else. We should be focusing on things like making sure individuals have adequate vitamin D levels, which have been shown to significantly decrease the risk of contracting viral infections, including the flu. Perhaps if health is truly our goal we should worry less about forced procedures and more about the lack of fresh food in the diets of most children.

I strongly urge you to oppose mandatory vaccinations.

Aloha,

Dr Sarah Strong, ND

One more point I wanted to add....It would seem wise from a scientific perspective to have a certain percentage of the population (if they volunteered for this)that if a mandatory injection was ordereda certain percentage could "opt out" and not receive the injection In this way if an error was made in the vaccine and it caused harmful side effects and injury (which has happened).. it makes scientific sense to have a percentage of the population that is not at risk of this....so those who "opted out" could help care for those who were permanently injured by the vaccine.

People do get injured by Vaccines....The documented risks are clearly stated in the insert, the fact that the companies are not liable for damages, and that there is a secret vaccine injury claim court is also very disturbing and concerning.

Finally, even though I personally am not opposed to all Vaccines, I think it is very important to respect other peoples beliefs....especially if statistically they tend to be more educated and wealthy. I could understand if the demographics of people opposed to something were a large mass of uneducated people that had been persuaded by some type of fanatical leader ... then I think the experts in power should try to stop them. However, if the people opposed to something are a small minority of concerned citizens, who tend to be highly educated and more financially successful.... it does make basic sense that their point of view should be heard.

That appears to be the case with the anti vaxing debate... my wife has an IQ of over 150 and she is opposed to it.... many other people much smarter than I am who have researched it are opposed to mandatory vaccines as well.

Subject: Public email Comment on increasing compulsory vaccine schedule
Date: Thursday, December 20, 2018 11:57:54 AM

I have been a resident of Hawaii for over 20 years and have grown adult and school age children. I am not against the concept of vaccines and have received many myself, but I am against compulsory vaccines and removing religious exemptions. I strongly feel that mandating medical procedures that have documented very serious risks (and also go against people's religious belief system) is a violation of decency, common sense, and the core values that the USA was founded upon.

According to most research, people opposed to mandatory vaccines tend to be more wealthy and highly educated. This is something that should be carefully considered. When people research this issue for themselves they tend to find that the benefits of many vaccines (for non life threatening diseases) do not outweigh the risks. Also, they often learn about the terrible documented corruption that sadly exists in the Pharmaceutical Industry.

Though I do appreciate the good that the pharmaceutical industry does and I usually am very positive about most things and do not like to be overly critical, there are many documented instances of terrible corruption and incompetence in the pharmaceutical and healthcare industries. I urge you to look at all the data. There is a big difference between peer reviewed science and industry funded science and propaganda. Sadly humans are often corrupted by greed and money. The amount of money that is earned through the Vaccine industry alone is estimated at 30 billion per year.

I'm very thankful for our healthcare system and I have many friends who are doctors who are good decent folks. They themselves are victimized by the corruption that has occurred when you have a "for profit" healthcare system. They are truly hoping reforms and more safe guards can be put in place so that the profit motive does not go above caring about people's health.

In many instances the death rate from side effects of the vaccines are greater than the death rate from the disease itself. (research meningitis vaccine) It doesn't make any sense, unless someone is financially benefiting from these vaccines....then it makes sense, but is very much morally wrong and unethical.

I also feel it is important to provide religious exemptions. For some people being injected with anything (especially small amounts of material from aborted fetuses) goes against their core moral religious beliefs. Religious freedom is a cornerstone of our country. Also, sometimes religious beliefs have unintended benefits. In the early 20th century many religious groups were opposed to seeing doctors....and at this time mercury pills were a preferred treatment for many ailments. We now know those religious people were in many instances helping themselves tremendously by not going to doctors and avoiding the terrible effects of injecting mercury.

I hope someone who is making a decision on this issue has taken the time to read this. If you have, thank you. Please consider these arguments and carefully look at other arguments people have made. I know people get very emotional about this subject, for obvious reasons. Being mandated to violate your religious beliefs and put your child at risk of death or serious illness (due to possible documented side effects) in order to attend school is very serious.

Even though we have problems in our healthcare system, Hawaii still has one of the best healthcare services in the country. Lets hope we can keep it this way and make it even better. Lets respect each individuals rights and belief systems. Mandating questionable healthcare practices that have documented serious risksor go against peoples religious beliefs.... is very disrespectful to individuals citizens.... goes against the Hawaiian concept of ALOHA... and has many serious moral and ethical implications...especially when there is a very large profit motive in place.

Wishing you the best,

David Marshall

This handbook discusses biological risk engineering, an extension of industrial hygiene that involves the assessment, control, and decontamination of indoor biological risks. The book synergizes the knowledge of experts in various fields, from law to toxicology, to provide a compendium of information for applying science to limit biological risk.

Biological Risk Engineering Handbook: Infection Control and Decontamination begins with a microbiological dictionary, using pictures to illustrate the basic morphology and culture appearance of fungi, bacteria, viruses and prions. The text then reviews sampling and laboratory procedures to ensure coordination between sampling teams and their ultimate receiving laboratory. The contributing authors further examine interpretation issues associated with toxicological studies and risk assessment in hopes of providing further impetus for synergistic studies related to risk assessment and management of biohazardous agents. Other topics include ventilation design, infection control, and the use of biocides. The discussion of Legionella control and cooling towers serves as a case study of how design, maintenance, and decontamination should be a seamless process. The contributors also discuss patent utility requirements, insurance processes, laws, and current regulations, including a chapter on Tuberculosis that compares OSHA and CDC guidelines. Finally, security is addressed from the standpoint of both homeland security in the United States and the security of individual laboratories.

From assessment methods to design options, **Biological Risk Engineering Handbook** presents state-of-the-art techniques and practices to measure, control, and contain human exposure to biological contaminants. With the concern of biological risk on the rise and the emerging fear today of biological warfare, this handbook allows you to move into the future armed with the information needed to limit this threat.

Testimony by Dr. Renee Joy Dufault, Retired Public Health Service Officer, Former FDA Employee (9 years). Currently serve as volunteer Executive Director, Food Ingredient and Health Research Institute, and teach fulltime at Ka'u High School (Special Education)

Qualifications:

Recipient of Surgeon General's Outstanding Service Medal Award in Recognition of Providing Technical Assistance and Training Locally and Internationally for the Containment of Infectious Disease in Hospitals (05/09/2003)

Lead Author of two chapters in highly cited Biological Risk Engineering Handbook: Infection Control and Decontamination – Chapter Titles include "General Infection Control" and "Medical Setting Infection Control."

Served as Environmental Health Officer, Public Health Service, 1993-2008 Last tour of duty U.S. Food and Drug Administration 9 years

Served as Navy Industrial Hygiene Officer 1991-1993, Camp LeJeune Naval Hospital

Served as Medical Laboratory Specialist in the U.S. Army 1976-1980

Thank you for your kind attention as I provide my testimony against most of the proposed changes in the immunization schedule. I've put together this brochure to explain why most of the proposed changes are not needed: Please follow along. First we'll review the statistics and disease facts.

Current Hawai'i County Statistics

Hep B

Hep A

Diphtheria

Measles

Rubella

Pertussis – Mandatory vaccination recommended before children enter pre-school.

Mumps – Mandatory single dose vaccination recommended before children enter pre-school.
(Not part of MMR)

Tetanus

HPV

HPV – This is a sexually transmitted disease. Sexually active children should certainly be offered this vaccine. This should not be a mandatory vaccine, however because its effectiveness in the human population remains unknown. Human papilloma virus cases are not tracked by Hawai'i or the CDC for that matter. There is no way to even measure the HPV vaccine's effectiveness in the U.S. population!

So agencies are recommending a vaccine for which we have no accountability in terms of its effectiveness? Why? How is this logical? This is what we call a **RED FLAG**.

Red Flag

We need to dig deeper. Where is the justification for recommending the HPV vaccine? HPV is only one of several risk factors for cervical cancer. Furthermore, many, many, people with HPV do not develop cancer. In order to understand why we need to pay attention to this red flag we must ask where this nonsensical push to vaccinate is coming from.

Where is this push to vaccinate every child coming from? Private industry (Big Pharma and others) and non-profits that fund the World Health Organization. For example the Gates Foundation is the biggest funder of the World Health Organization through GAVI Alliance (WHO, Voluntary Contributions 2017, https://www.who.int/about/finances-accountability/reports/A71_INF2-en.pdf) The Gates Foundation has collaborated with pharmaceutical companies for many years to push worldwide vaccination. It recently started its own pharmaceutical company. (Forbes, 2018, <https://www.forbes.com/sites/matthewherper/2018/06/07/bill-and-melinda-gates-start-a-nonprofit-biotech-in-boston/#44d498251a45>) Although they are saying that the new company is going to be a non-profit, the partnerships with for profit companies guarantee there will be a profit motive working somewhere. We cannot believe for a minute that there is no profit motive. This is America!! We have a free market economy where profit is more important than even child health.

In addition to opposing the mandatory requirement for the HPV vaccine, I am in opposition to making the following vaccinations mandatory for the reasons specified in the attached brochure: Hep B, Hep A, Diphtheria, Measles, Rubella, Tetanus. Children need to receive vaccinations according to their individual needs when there is a true risk. Hopefully, you can see the real risk of disease is so low for most of these mandated vaccines. I suspect our children have a higher risk of developing diabetes or heart disease from all of the allowable mercury, lead, arsenic and pesticide residues in our food supply. All you have to do is analyze the death statistics in the U.S. to determine where we need to focus our efforts to promote child health. We need to be wary of corporate interests in making public health policies here in Hawai'i.

Having worked at the FDA for nine years of my Public Health Service career, I can tell you the FDA does not have our back when it comes to mitigating the harm to public health that arises from corporate profit interests. I had to retire early and honorably to publish my findings of

mercury in high fructose corn syrup. This finding has been published along with several follow up articles. We now know there is a link between the allowable inorganic mercury in the food supply and several western disease conditions including Type-2 diabetes and autism. (See list of publications at end of testimony).

If you want to improve child health outcomes and reduce the prevalence of diseases impacting the lives of children and their families (autism, ADHD, type-2 diabetes, hypertension, and heart disease), you might want to focus on mandating the placement of warning labels on foods allowed to contain ingredients with detectable and allowable levels of lead, mercury, and arsenic. Warning labels have been associated with lower autism and ADHD prevalence in the United Kingdom. As a teacher, I assure you our classrooms would function better with less child hyperactivity and inattention.

Conclusion

See attached brochure. The only two vaccines currently needed here on Hawai'i Island are pertussis and mumps. These vaccines are justifiable based on the number of cases in the last ten years and the real risk to child health.

For example the Gates Foundation is the biggest funder of the World Health Organization through GAVI Alliance (WHO, Voluntary Contributions 2017, https://www.who.int/about/finances-accountability/reports/A71_INF2-en.pdf) The Gates Foundation has collaborated with pharmaceutical companies for many years to push worldwide vaccination. It recently started its own pharmaceutical company. (Forbes, 2018, <https://www.forbes.com/sites/matthewherper/2018/06/07/bill-and-melinda-gates-start-a-nonprofit-biotech-in-boston/#44d498251a45>) Although they are saying that the new company is going to be a non-profit, the partnerships with for profit companies guarantee there will be a profit motive working somewhere. We cannot believe for a minute that there is no profit motive. This is America!! We have a free market economy where profit is more important than even child health.

In addition to opposing the mandatory requirement for the HPV vaccine, I am in opposition to making the following vaccinations mandatory for the reasons specified in the attached brochure: Hep B, Hep A, Diphtheria, Measles, Rubella, Tetanus. Children need to receive vaccinations according to their individual needs when there is a true risk. Hopefully, you can see the real risk of disease is so low for most of these mandated vaccines. I suspect our children have a higher risk of developing diabetes or heart disease from all of the allowable mercury, lead, arsenic and pesticide residues in our food supply. All you have to do is analyze the death statistics in the U.S. to determine where we need to focus our efforts to promote child health. We need to be wary of corporate interests in making public health policies here in Hawai'i.

Having worked at the FDA for nine years of my Public Health Service career, I can tell you the FDA does not have our back when it comes to mitigating the harm to public health that arises from corporate profit interests. I had to retire early and honorably to publish my findings of

mercury in high fructose corn syrup. This finding has been published along with several follow up articles. We now know there is a link between the allowable inorganic mercury in the food supply and several western disease conditions including Type-2 diabetes and autism. (See list of publications at end of testimony).

If you want to improve child health outcomes and reduce the prevalence of diseases impacting the lives of children and their families (autism, ADHD, type-2 diabetes, hypertension, and heart disease), you might want to focus on mandating the placement of warning labels on foods allowed to contain ingredients with detectable and allowable levels of lead, mercury, and arsenic. Warning labels have been associated with lower autism and ADHD prevalence in the United Kingdom. As a teacher, I assure you our classrooms would function better with less child hyperactivity and inattention.

Conclusion

See attached brochure. The only two vaccines currently needed here on Hawai'i Island are pertussis and mumps. These vaccines are justifiable based on the number of cases in the last ten years and the real risk to child health.

[REDACTED]
[REDACTED] HAR 11-157 proposed rules update
Thursday, December 20, 2018 10:51:08 PM

Thank you for this opportunity to provide testimony. As a community member, public health advocate, mother, and licensed psychologist (working at a community health center on the Big Island of Hawaii), I am writing to **strongly oppose the HAR 11-157 proposed rules update.**

The mandate violates a parent's right to informed consent and civil liberties: Where there is a risk of injury or death, no matter how small the perceived risk may be, there *must* be a choice. Vaccines are chemically synthesized biopharmaceuticals with known and documented side effects that include permanent injury and death. And, vaccination is an irreversible medical procedure. To mandate a medical procedure with known risks is medically unethical according to the American Medical Association's code of ethics. It is also inhumane a violation of basic human rights. I implore you to consider these critical reasons to oppose or dismiss HAR-11-157.

Moreover, while we may all be born equal, with equal rights, we are NOT all born the same. Each of us is born with different genes and a unique microbiome influenced by epigenetics that affects how we respond to the environments we live in. We do not all respond the same way to infectious diseases and we do not all respond the same way to pharmaceutical products such as vaccines. Public health laws that fail to respect biodiversity and force everyone to be treated the same are unethical and dangerous.

US ranks last for infant mortality, yet first for immunizations: Compared with other industrialized nations, the US administers the most pediatric vaccinations yet ranks the worst - 34th - for infant mortality rate. Norway, on the other hand, has the lowest mortality rate and yet there are no childhood vaccinations routinely given in the first three months of life. A 2 month old American infant, has typically been vaccinated against at least 4 diseases.

No education options for non-complying families: This bill affects *all* school-aged children registered either in public or private schools, home schools, as well as daycare and preschool facilities. The passing of HAR-11-157 combined with Hawaii's compulsory education laws leave parents with religious beliefs against or conscientious concerns about vaccinations no option other than truancy. Families with truant children will thereby face court-determined penalties such as fines, Child Welfare Services involvement, or even jail time.

Both HIPAA and FERPA laws for medical and educational privacy will become obsolete: The **HIPAA Privacy Rule** establishes national standards to protect individuals' medical records and other personal health information. The Family Educational Rights and Privacy Act of 1974 (**FERPA**) is a federal law that protects the privacy of student education records. The law applies to all schools that receive funds under an applicable program of the U.S. Department of Education. If schools are required to request and send information, including medical exemptions, to the state, either these laws are broken or parents are forced into releasing this information. As I see it, this is no different than the psychological abuse that happens when a person is in a relationship in which s/he has no power or control. Parents will face distress and feelings of helplessness if/when they no longer have the right, or control, to choose when and with whom to share private health or educational information. It will be in the state, and government's hands already. Mental health problems may result.

This is not just about vaccines. Anti-choice medical mandate laws are more than a threat to our current health and freedom. When one agrees to today's mandated vaccine schedule or medical procedure, one is also agreeing to tomorrow's vaccine schedule or medical procedure - in the name of "public health." Yet, there is not good evidence or argument on that end and I would not sign an open-ended, vague, indefinite contract where the other party is unknown and can change at any given time, where I control none of the variables but assume all financial and personal responsibility for all possible results or consequences. Would you?

Pharmaceutical companies have no-liability with vaccine reactions: The National Childhood Vaccine Injury Act of 1986 established the National Vaccine Injury Compensation Program (VICP) as a federal no-fault system to compensate persons (or families of persons) who are injured by childhood vaccines, has paid out over \$2.8 billion to families whose children have died or suffered other adverse reactions. In the past 5 years, an average of \$221,000,000 has been paid out per year, which has nearly doubled from years before. It is worth noting that recipients of compensation are not allowed to speak of their case after its been settled.

Control of our healthcare system seems to be up for grabs. I believe that the choice of if, when and how a child is to be vaccinated needs to remain between a family and their doctor. Who has the right to our lives, our health, our future (or that of your children?). Should we have consumer control of our medical system (with consumer protections) or should policy makers dictate how we care for our and our families health? Should we adhere to an evidence-based, scientific approach to medicine or let profit-motivated pharmaceutical companies, who are free from liability, control our health care options?

Finally, I want to point out that most parents who chose not to vaccinate or not to vaccinate on the government's vaccine

schedule are the very parents who have done their homework. It is the educated, middle and upper class parents who have the time and freedom and will to read, reaseach, and converse about concerning topics affecting their children. It is a media-driven misperception that parents who claim exemptions or don't vaccinate (or don't vaccinate on the CDC schedule) are uneducated or misinformed. It's quite the opposite. However, it is often difficult to speak up. Why?

In the 1970's, Dr. Mendelson warned that medical science has become a "religion" and doctors have turned the act of vaccination into "the new sacrament." In today's world, if one refuses to believe that vaccination is a moral/civic duty and dares to question vaccine safety or advocates for the right to decline one or more government recommended vaccines, s/he is in danger of being branded an anti-science heretic, a traitor, and a threat to public health. S/he will be viewed as a person who deserves to be silenced, humiliated, and punished. Is it any wonder that there are not more who are speaking out? Note that each of us who does, likely does so for 10 more who are too afraid.

In conclusion, this proposed legislation ignores and eliminates the fundamental American value of choice as well as a doctor's ethical obligation to provide their patients informed consent. If we are not free to make informed, voluntary decisions about which pharmaceutical products we are willing to take and which treatment options/medical procedures we want, then we are not free in any sense of the word. If this bill passes it will set a very dangerous precedent and there will be no limit on which individual freedoms the State can remove in the name of the greater good.

For these reasons and many more, I urge you to view this bill as inhumane and medically unethical.

Subject: Testimony HAR 11-157
Date: Thursday, December 20, 2018 10:10:15 PM

I strongly oppose HAR 11-157.

Mandatory vaccinations are a violation of one of the most important personal freedoms which is control of what we put in our bodies.

While some of the scientific community states an utmost trust in vaccines, my father developed pneumonia, when he was administered vaccines by the army in the 80s and a 2009 Swine Flu vaccine gave a group of NHS(uk) workers narcolepsy, alongside many other documented cases.

I do not believe people should be required to take medications which can and have failed due to neglect and lack of proper testing, which resulted in the ruining and ending of lives.

Sincerely, Noriah Tronier-Langholz.

Catherine Lightfoot Martin

**Testimony RE: Increasing number and type of Mandatory Vaccines for children
Submitted to the Hawaii Department of Health
By Catherine Martin, resident of [REDACTED]
December 20, 2018**

Aloha,

My name is Catherine Lightfoot Martin, I am a Certified Professional Midwife in East Hawaii Island.

I'd like to share a brief history of childhood vaccinations in the US:

1950's-

- 4 vaccines offered to children (diphtheria, tetanus, pertussis & smallpox).
- Children received only 5 shots by age 2 & NEVER more than 1 vaccine at a time.
- US ranked 3rd in Infant Mortality in the world (only 2 countries had Infant mortality rates better than the U.S.)

1970's-

- Increased number of vaccinations to 14 in early childhood
- CDC had to develop a way to address the growing number of adverse affects being reported (the precursor to the Vaccine Adverse Event Reporting System-VAERS)

1980's-

- Combined the Measles, Mumps and Rubella vaccines into 1 injection, called the MMR, children received this Combo shot at 15 months and again at 18 months
- US ranked 17th in Infant Mortality- whoa.

1990's

- Increased number of required vaccinations to 20 injections,
- Added vaccines for Hep B, Herpes and the flu
- Introduction of thimerosal (mercury preservative) in vaccines
- US ranked 23rd in infant mortality- getting much worse

Now-

- Have seen an increase of nearly 414% in # of vaccines being given to our children since the 1950's
- 40 shots are mandated in childhood total
- 7 of those include Combo shots (multiple vaccines in one injection)
- = 54 vaccines total!
- Americans are now required by law to use more vaccines than any other nation in the world.
- US ranked 49th in 2012 in Infant Mortality---- worse than any other developed country!

*Is this really the BEST we can do to **promote and protect the Health of our children?***

The evidence says NO.

In 1975, Japan raised its minimum vaccination age to 2 years old (meaning 0 vaccines to babies until they reach age 2)----after that the infant mortality rate in that country became the best in the world!

In 1995, Japan changed its policy to 6 injections in the 1st year and only 3 more in 2nd year.... Most children in the US today receive 20 vaccine injections in their first 2 years of life (compared to only 9 in Japan)

*Is this really the BEST we can do **to promote and protect the Health of our children?***

The evidence says NO.

More open-minded countries like the Netherlands have studies showing that eliminating childhood infections and episodes of fevers leads to INCREASED numbers of chronic diseases and cancer... that's right, the people who experienced more fevers in childhood have significantly Lower rates of cancer as adults.

*Is increasing the number and types of vaccinations for our children really the BEST we can do to **promote and protect the Health of our children, our future?***

The evidence overwhelming says NO.

Therefore I urge the Hawaii Department of Health:

- Please DO NOT increase the number or types of vaccinations for our Keiki.

And

- Please continue to offer pathways for Informed Refusal of vaccinations for conscientious objectors.

Let's help lead the way, along with other progressive nations of the world, in choosing what

Really IS Best to **promote and protect the Health of our children!**

Here are some Ideas:

- **Promote Breastfeeding-** protective antibodies are passed from mother to child in breastmilk. We must do more to encourage and support our Mothers in breastfeeding their children through age 1 and beyond for optimal Health.
- If you have a baby in the house: require friends and family to wash their hands when they come into your home. This will help Protect children from being exposed to childhood illnesses until their immune system is fully mature and able to handle it.
- Promote optimal Family Leave for working parents- We must do what we can to support Mothers and/or Fathers in staying home with their infants for as long as possible (6 months or longer) in order to protect our infants until their breastfed immune systems are more mature.

If we can do these things, then our babies (an identified at risk population) will be protected so much better than vaccinating the general population in hopes of not exposing the babies... and our children will have stronger immune systems as they grow into adulthood.

As it is now, we are trying to prevent them from getting childhood illnesses that at worst give them fevers and make them miss a couple weeks of school and in exchange we are sacrificing their long-term health and wellness (creating an immune system that is susceptible to auto-immune disorders and cancer.)

I'm not going to ask you to eliminate all vaccination schedules, I understand that may not be feasible in this culture and climate... But what you CAN do, right now, is Please Do NOT make a mandatory requirement for vaccines for our children. The countries who rank best in the world in infant mortality have Recommended vaccine schedules, Not Mandatory vaccine schedules.... Hawaii can join their ranks and lead the US in being the State with the Best in children's health.

Mahalo for your time and consideration!

An immunized population keeps us all safe, including people who cannot receive vaccines for various health reasons. It's unfortunate that the occasion of updating the immunization requirements to be in line with more current medical recommendations has been taken as an opportunity by people advancing dangerous conspiracy theories to attack the idea of vaccination requirements for public schools. Vaccines are perfectly safe for most people and the presence of medically unjustified unvaccinated students in public schools puts those unvaccinated students at risk as well as those who have legitimate medical reasons for being unvaccinated, those who are too young or too old to be safely vaccinated, and society at large.

The real problem with immunization is that vaccines are available for sale and not provided to everyone who needs them at the point of use for no cost. Whenever prices are involved, some people will go without. It is deeply immoral to provide medicine only to those who can afford to pay, whatever bureaucratic hoops are invented to decide who can "afford" it and who can't.

The state of Hawaii should enforce the CDC's recommendation on vaccinations for school age children. If parents opt out of vaccinations their children should not be allowed to attend public school.

The average parent does not have the medical training or knowledge to make an informed decision in this matter, and the internet is not the go-to place for opinions.

To whom it may concern,

I believe vaccines/immunizations should be that of a personal right and a parents choice what goes into their child's body. Adding more vaccines and also making them mandatory, is to me against human rights and putting our loved children at risk for MANY auto immune and other disabilities. Why when a child is trying to develop, would we put foreign substances into their body and introduce a bunch of new things to which are not part of their natural growth? Immunizations have been known to disrupt the brain and it's functioning, as why we are seeing many children with autism and behavioral disorders!! Please I beg of you, help keep our children healthy, help to choose natural remedies that support healthy growth. There ARE other routes to take to increase the care of our loved ones and not put them at risk. There are studies being shown in other countries that homeoprophalaxis works better in communities, than in those that use vaccines. I am grateful for the awareness that is coming out, and I hope it will be curriculum for doctors and pediatricians to know exactly what makes up each vaccine, instead of it being a money gain if they push them.

I am AGAINST mandatory vaccines.

Thank you for your consideration.

Subject: Opposition to Proposed Increase in Vaccinations
Date: Friday, December 21, 2018 11:10:10 AM

To whom this concern:

I'm writing to express my opposition to the proposed increase in school vaccinations. The proposed list of vaccinations are for non-lethal ailments and pose a harm to many children. I understand that there is scientific evidence to substantiate these vaccines and the evidence is not overwhelming enough to make mandatory vaccinations. This in turn will increase the number of children leaving public schools and increase allergies and autism.

I am a law-abiding, tax paying, voting citizen and respectfully object to the proposed amendments to Title 11, chapter 157.

Sincerely,

Al-Qawi Majidah Lebarre

[REDACTED]

From: [REDACTED]
To: [REDACTED]
Subject: Vaccination requirements
Date: Friday, December 21, 2018 11:35:00 AM

Aloha,

I am emailing you to voice my concern of the proposed changes to the requirements of six new vaccines to the list of required vaccinations for school children. In my opinion, no vaccine should be mandated for any child. This should be a decision made by the child's parent. Instead of mandating vaccines, the government should educate parents about the benefits of vaccines, and still allow the parent to make the final decision.

The following vaccines should absolute not be added.

1. HPV vaccine has had several documented adverse effects and so no parent should be mandated to give this (or any) vaccine to their child. HPV is a sexually transmitted infection. This should not be on the list of mandated vaccines.
2. Influenza vaccines are a false sense of security. Influenza vaccine is created from strains from the previous year and there is no proof it will be effective for the current year's flu virus.
3. Rotavirus vaccine is recommended to be started prior to 15 weeks of age and the vaccine series is not recommended to be started after 15 weeks of age. Therefore should not be mandated in school age children vaccinations.

A parent should maintain the right to decide which vaccines he/she wants to give their child and when they want to give them to their child.

The government needs to make safer and more effective vaccines so parents are more willing to have their children vaccinated.

I strongly disagree with mandating any vaccine.

Aloha,

I am in favor of vaccine requirements and hope that you will pass the proposed amendments.

My name is Amanda Kinsley. I am a resident and home owner in [REDACTED]. I have 2 children, a 4 year old attending Honoka'a elementary preschool and an infant. Both of my children are vaccinated. As a parent I will say, yes at times it can be a little scary taking your child to the doctor and having them get their shots. However, there is no vast conspiracy to cover up the "evils" of vaccines. Rather, there is a great deal of misinformation surrounding vaccines.

I hope that you will vote to pass the proposed amendment based on current science and medicine, rather than on misinformed, emotional based requests of those who are afraid to vaccinate. Vaccines protect us all through 'herd immunity', not just those who are vaccinated. The very young, old, or medically fragile are especially at risk when large groups choose not to vaccinate.

Please vote in favor of science and protecting those who are most vulnerable. Please pass the proposed amendments.

Mahalo and thank you for your time,

Amanda Kinsley

Subject: Opposition of HAR-11-157
Date: Friday, December 21, 2018 7:21:43 PM

Aloha,

I would like to express my concern regarding the proposal of HAR 11-157. As Hawaii informed consent states, "Where there is a risk, there must be a choice."

I do not feel it is constitutional to **require** parents to vaccinate their children until further studies have been done on the safety of vaccines. Senate Bill 732 before the 103rd Congress of the United States known as the "Comprehensive Child Health Immunization Act of 1993", made known the fact that there are risks to vaccines.

In addition, there are many concerning ingredients in vaccines, such as carcinogens, neurotoxins, animal blood, allergens, and heavy metals. As a follower of Jesus Christ, and a pro-life supporter the biggest concern of additives in vaccines to our family is aborted fetal tissue.

Consequently, I would like to make it clear that I do **not** support HAR 11-157. I believe in the **freedom of choice** when it comes to our children's healthcare.

Respectfully,

Danielle S. Fields

Aloha DOH.

After my verbal testimony in [REDACTED]. You stated I could provide more studies. Here you go. Read it all carefully. This will be shared with all legislators to. We the people are NOT ok with this rule change. There was one person in favor of this, she was not a citizen in the U.S. all the other people were affiliated with an organization representing pharmaceutical industry. No individual testimony in favor of HAR-11-157.

But There were over hundred opposing. Why is that? We THE PEOPLE DO NOT WANT THIS. Watch all hearings public on my FB page. Read all the testimonies. Please. Our keiki deserves it.

The added pdf link to the Corvelva study for infrarix hexa contains all contaminates and NO antigens. Came out this week. ALL RISK, NO BENEFIT. This is the trusted science you want us to inject into our keiki. This is absolutely criminal. No question. This should be enough evidence to immediately do a moratorium on vaccines, until all vaccines have been carefully investigated.

Dr. Stephanie Seneff's study pdf. shows traces of Glyphosate in all vaccines. Show us that it is safe to INJECT to our children. Or anyone for that matter.

There are also 60 peer reviewed studies on the danger of hpv vaccine in pdf link.

Thousands of studies on the danger of vaccines on this link. Pick your choice of disease. Many peer reviewed.

<https://www.tandfonline.com/doi/abs/10.1080/15287394.2018.1477640?cookieSet=1>
<<https://www.tandfonline.com/doi/abs/10.1080/15287394.2018.1477640?cookieSet=1>>

LIVE VACCINES SHED and spread Infectious Diseases NOT unvaccinated children!

All live virus vaccines contain LIVE viruses. They may be weakened but they can still replicate and infect both the vaccinated, unvaccinated, immunocompromised and "shed" to people around them for weeks after the vaccine is given.

Which vaccines are LIVE?

Chicken Pox- Varivax Section 5.4 (up to 6 weeks):

<http://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM142812.pdf>
<<http://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM142812.pdf>>

MMR- MMRII page 5 (Up to 28 days):

<http://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM123789.pdf>
<<http://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM123789.pdf>>

Shingles- Zostavax Section 5.2:

<http://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM285015.pdf>
<<http://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM285015.pdf>>

Rotavirus- Rotateq Section 5:5 (Up to 15 days, fecal shedding):

<http://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM142288.pdf>
<<http://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM142288.pdf>>

Small Pox- ACAM2000 Section 5:10 (Only used in the military but highly contagious):

<http://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM142572.pdf>
<<http://www.fda.gov/downloads/BiologicsBloodVaccines/Vaccines/ApprovedProducts/UCM142572.pdf>>

But does that REALLY happen? Yes. Yes it can and does as these studies illustrate:

Varicella transfer after vaccine to pregnant mom:

<http://www.ncbi.nlm.nih.gov/pubmed/9255208> <<http://www.ncbi.nlm.nih.gov/pubmed/9255208>>

Pub Med article on Rotavirus shedding:

<http://www.ncbi.nlm.nih.gov/pubmed/18922486> <<http://www.ncbi.nlm.nih.gov/pubmed/18922486>>

Mumps Vaccine sheds:

<http://www.ncbi.nlm.nih.gov/pubmed/24772647> <<http://www.ncbi.nlm.nih.gov/pubmed/24772647>>

Mumps vaccine sheds:

<http://www.ncbi.nlm.nih.gov/pubmed/16266774> <<http://www.ncbi.nlm.nih.gov/pubmed/16266774>>

Measles virus sheds for 1-13 days after vaccination:

<http://www.ncbi.nlm.nih.gov/pmc/articles/PMC228449/>
<<http://www.ncbi.nlm.nih.gov/pmc/articles/PMC228449/>>

Mumps outbreak in Netherlands linked to those vaccinated twice with MMR:

http://wwwnc.cdc.gov/eid/article/20/4/13-1681_article <http://wwwnc.cdc.gov/eid/article/20/4/13-1681_article>

Measles vaccinated child responsible for outbreak in British Columbia:

<http://www.eurosurveillance.org/images/dynamic/EE/V18N49/art20649.pdf>
<<http://www.eurosurveillance.org/images/dynamic/EE/V18N49/art20649.pdf>>

New York Measles outbreak linked to vaccinated:

<http://cid.oxfordjournals.org/content/early/2014/02/27/cid.ciu105>
<<http://cid.oxfordjournals.org/content/early/2014/02/27/cid.ciu105>>

Measles outbreak among the vaccinated:

<http://www.ncbi.nlm.nih.gov/pubmed/8053748> <<http://www.ncbi.nlm.nih.gov/pubmed/8053748>>

We don't know for certain how long shedding occurs because we don't test for it long term or regularly but in rare instances, it has gone on for years:

<http://www.westernmorningnews.co.uk/Vaccinated-man-spread-polio-30-years/story-27693988-detail/story.html> <<http://www.westernmorningnews.co.uk/Vaccinated-man-spread-polio-30-years/story-27693988-detail/story.html>>

Additionally, the Dtap/Tdap and Polio vaccines that are NOT live has been shown to cause the vaccinated to become asymptomatic carriers whenever exposed, thus the vaccinated can be spreading the illness without knowing at any time:

Pertussis carrier:

<http://www.fda.gov/NewsEvents/Newsroom/PressAnnouncements/ucm376937.htm>
<<http://www.fda.gov/NewsEvents/Newsroom/PressAnnouncements/ucm376937.htm>>

Diphtheria carrier:

<http://www.cdc.gov/diphtheria/clinicians.html> <<http://www.cdc.gov/diphtheria/clinicians.html>>

The polio vaccine “does not stop transmission of the virus.” & “when a person immunized with IPV is infected with wild poliovirus, the virus can still multiply inside the intestines and be shed in the feces, risking continued circulation.”

<http://polioeradication.org/polio-today/polio-prevention/the-vaccines/ipv/>
<<http://polioeradication.org/polio-today/polio-prevention/the-vaccines/ipv/>>

You can also find that most medical facilities are aware of this. Johns Hopkins and St. Jude hospitals are just a few of many who post precautions for recently vaccinated visitors.

WHY does this matter?

Because society is so deathly afraid of these illnesses that they rush out and load up on vaccines and want to even pass laws forcing others who should never be vaccinated to do the same; but the science shows that it's the vaccinated that are at a higher risk of infections because vaccines heavily suppress the immune system, vaccines are directly linked to spreading illnesses because people are routinely injected with them. Be aware of the infection and carrier risk each vaccine has when making your choice as you will- take cautionary measures being around individuals that are immunocompromised if you have been recently vaccinated or around someone with the illnesses even if you don't show symptoms.

ONE HUNDRED AND FIFTEEN studies on vaccine SHEDDING...

[Www.medscienceresearch.com/shedding/](http://www.medscienceresearch.com/shedding/) <<http://www.medscienceresearch.com/shedding/>>

THE DILEMMA OF VACCINE-INDUCED DISEASE AND UNVACCINATED CHILDREN
VACCINE SHEDDING

It has long been known that vaccines can cause the diseases they were meant to immunise against.

For instance, the live oral polio vaccination can cause polio – a disease named vaccine-associated paralytic polio (VAPP), which is mentioned on the UK dept of health website, immunisation.org.uk
<<http://immunisation.org.uk>>

‘If a baby has had the oral polio vaccine, the live virus can be found in the baby's poop for up to six weeks afterwards.’

It was actually for this reason that the OPV was voted out and injectable polio vaccine re-introduced. The oral vaccine was responsible for the ONLY cases of polio in the developing world. (Committee on Immunization Practices meeting, held 20th June 1996).

According to DRAFT ACIP meeting minutes, February 2001, page 28:

And lastly the myth of herd immunity. A theory that has never been proven to work. Impossible hence booster.

<https://jbhandleyblog.com/home/2018/6/7/herd-immunity-a-dishonest-marketing-gimmick>
<<https://jbhandleyblog.com/home/2018/6/7/herd-immunity-a-dishonest-marketing-gimmick>>

And if you care about the real truth of history. Read Dr. Suzannes book. "Dissolving Illusions".

<https://jbhandleyblog.com/home/2018/5/14/savehumanity>

Subject: Request against compulsory vaccinations
Date: Friday, December 21, 2018 8:20:37 PM

Aloha,

We request reconsideration regarding the proposed legislation that would require compulsory vaccinations for all children on the islands.

As parents, we are entrusted with raising our children as best as possible and want to make decisions based on their unique needs.

Being forced to vaccinate on a standard government mandated schedule takes that autonomy away from us and eliminates our ability to work with their pediatrician to give them whatever treatments are best for them as they each grow according to their unique DNA.

Just like Roe vs Wade gave women the liberty to choose how to handle their bodies with regard to pregnancy, having that same choice regarding vaccinations and their timing is the same liberty we hope to maintain as parents while living in America.

Mahalo,

--

Subject: Anti mandatory vaccine statement
Date: Friday, December 21, 2018 9:29:38 AM

Two of my 3 children had severe reactions and disabilities following vaccinations. So I do not want my grand children to get the mandatory injection of massive amounts of aluminum into them. I am a registered nurse and these vaccinations especially the flu have not been properly proven to be safe for the developing brains of children. We need more research from an independent source to prove these are safe and toxin free. - so that an India episode with 450,000 children harmed by inadvertent contamination will not occur here! Then you can make the vaccines mandatory. Melinda Fisher [REDACTED]
Sent from my iPhone

Aloha. My name is Marti Berrett and I am the mother of four children and a resident of [REDACTED]. My first child was born in 1994. Because my husband and I knew nothing about vaccines we decided to postpone vaccinating our first baby. We wanted to do our own research into the possible risks and benefits of vaccines. Since the health risk of vaccination is entirely borne by individuals it is imperative that fully informed consent is observed. Informed consent involves understanding alternatives to suggested treatment, including the option of no treatment, and understanding the risks and benefits of the suggested treatment. Informed consent is central to the practice of medicine and is in direct conflict with anything mandatory.

We quickly discovered that the chicken pox vaccine was going to be added to the CDC's recommended schedule the following year, 1995. This stopped me in my tracks. From my childhood I knew that chicken pox was not a dangerous disease. I thought, "Twenty years from now, young parents might assume chicken pox is a dangerous disease simply because it's on the CDC's schedule." I knew this assumption to be false which spurred me to research other vaccines on the schedule. Following are a few things I have learned.

The National Childhood Vaccine Injury Act of 1986 granted unprecedented, economic immunity to manufacturers for injuries caused by vaccines and eliminated economic incentive for them to make improvements. Congress was aware and concerned by this and, as part of the 1986 Act, charged the Secretary of Health & Human Services (HHS) to submit a biennial report to Congress detailing the improvements in vaccine safety made in the preceding two years. Recently in 2018, HHS shockingly admitted that it never, not even once, submitted a single biennial report to Congress. For the past 32 years HHS and the CDC have touted the safety and efficacy of vaccines without submitting any reports to Congress backing up their claims.

In 1990 the Vaccine Adverse Event Reporting System (VAERS) was established. As a passive reporting system, it relies on individuals to send in reports of their experiences to the CDC. It is estimated that 1 to 10 percent of all vaccine-related health problems are ever reported to VAERS. This means 90% of vaccine injuries go unreported. Total compensation paid over the life of the program is approximately

\$4 billion dollars. US Law regards vaccines as unavoidably unsafe and these payouts are proof of the risks and damages. Keep in mind this payout would be 9 or 10 times higher if 90-100% of vaccine injuries were actually reported.

Since I'm talking money, I would like you to ponder what parents are paid if their child does die from a vaccine versus if a child is injured by a defective car. The National Vaccine Injury Compensation Program will pay parents up to \$250,000 if their child dies from a vaccine. Yes, children and adults have died from vaccines and \$250,000 seems inappropriate and insensitive. Compare that to a family being awarded \$242 million dollars after suing Toyota over a defective front seat. In August 2018 a jury awarded this amount to a family after their two children suffered severe head trauma. \$250,000 for a vaccine induced death versus \$121 million per child from severe car injuries? This is the difference between a manufacturer being protected from liability versus being fully liable for their manufacturing defects. You can bet Toyota is economically incentivized to redesign their seats to avoid further injury. Not so for vaccine manufacturers.

In 2002 the House Government Reform Committee held a hearing on the relationship between childhood vaccinations and autism. Congressman Dan Burton spent time questioning William Egan, the FDA Acting Director. From this hearing I learned that there has only been one test on one ingredient in vaccines, thimerosal. In 1929 Eli Lilly, the manufacturer, tested thimerosal on 27 people that were dying of meningitis. All those people died of meningitis and they concluded there was no correlation between the deaths and the mercury in the vaccines. This is the only human test that has ever been done on thimerosal. Thimerosal is still in vaccines in trace amounts and it is a listed ingredient in the multi-dose flu shot. In fact, other neuro-toxins and hazardous substances in vaccines include: aluminum, formaldehyde, thimerosal, human serum albumin, monkey kidney cells, polysorbate 80, ethanol, and ammonium sulfate just to name a few. High levels of aluminum have been found in the brains of autistic children and people suffering from neurological disorders such as Alzheimer's disease.

In 2012 the House Government Reform Committee held hearings about the autism epidemic. Representative Bill Posey questioned Dr. Colleen Boyle, a Director at the CDC. From this hearing I learned that there has never been a study comparing vaccinated children to unvaccinated children. How can we claim vaccinated children are better off than unvaccinated children if a study does not exist?

In 2014 William Thompson, an expert from the CDC, confessed to having manipulated the data of a key MMR reference study. In 2015 Representative Bill Posey called for Congress to hold a hearing and investigate the CDC's MMR research fraud. No hearing has been called to date.

Today my children are healthy, young adults, and all are vaccine free. I am opposed to the Department of Health adding six new vaccines as a requirement to attend school due to:

1. manufacturer's incurring no liability for vaccine related damages
2. HHS being negligent in their reporting responsibility to Congress, zero reports written in 32 years
3. the risks associated with vaccines including death
4. lack of safety studies conducted on vaccine ingredients, the only one for thimerosal was in 1927
5. no comparative studies on health outcomes of vaccinated versus unvaccinated children
6. the fraud within the CDC as reported by whistleblower William Thompson

Again, vaccines are unavoidably unsafe and must not be mandatory.

Thank you for your time.

Marti Bennett 12/21/18

To Legislators and Administrators Granted Power to Make Decisions Affecting Public Health:

I vehemently OPPOSE HAR 11-157 and any legislation that would prevent me from exercising my human and civil right to freedom of thought, speech, and belief under the Constitution of the United States to make informed voluntary choices regarding my health and the health of those whom God has entrusted into my care.

Nobody should be forced to use pharmaceuticals that carry the risk of harm or failure, especially those made with toxic substances or derived from unethical sources such as aborted human fetuses.

It is religious discrimination to accept exemptions from specific religious organizations and not others. Every individual has the right to exercise their religious beliefs as they so choose. It is my belief that God created our bodies with the power and ability to build and maintain a strong immune system by making healthy choices. Compromising the immune system from birth through the administration of vaccines alters natural immunity for life and is contrary to God's design for the body.

As consumers of anything, we are voting for whatever we put into or on our bodies. Forced vaccinations denies us our "right to vote" against drug and chemical companies, immune from accountability and liability, whose interest is in profit and not our health and well-being.

I strongly encourage you to educate yourself by watching the Youtube video with Del Bigtree called THE IRREFUTABLE ARGUMENT AGAINST VACCINE SAFETY before you attempt to make any more mistakes regarding mandatory vaccinations.

I will pray for each of you to have wisdom to do what is right and for God's mercy when you stand before him accountable for the damage and death that may result from the decisions you make.

Sincerely and respectfully,

Sue Pantano-Saldana

The Institute of Medicine (IOM) Reports and NVIC Statements

The National Academy of Sciences (NAS) was established in 1863 under President Abraham Lincoln's administration to report on science to policymakers and the public. In 1970 the Institute of Medicine (IOM) of NAS – renamed the Health and Medicine Division in March 2016 - was chartered as the health arm of the NAS to provide evidence to the government and private sector that would assist in informed health decisions.

In the National Childhood Vaccine Injury Act of 1986, and Congress directed DHHS to contract with the Institute of Medicine (IOM), to evaluate and report on adverse effects of federally recommended childhood vaccines. Beginning in 1990, IOM appointed committees of experts to review the evidence in the medical literature and from other sources on the safety of government recommended and mandated childhood vaccines.

NVIC's co-founder and president Barbara Loe Fisher was invited to participate as a consumer representative on an Institute of Medicine Vaccine Safety Forum, which sponsored public vaccine safety workshops and published reports on vaccine adverse detection and response and vaccine safety research, and she was a co-editor of the Forum's 1997 report on Risk Communication and Vaccination. Barbara was also invited to make presentations to IOM expert committees reviewing the evidence for vaccine risks in 2001 and 2012.

IOM Vaccine Safety Reports (1991-2013)

IOM published a series of reports on evidence for adverse effects of vaccines between 1991 and 2013 confirming that:

1. Vaccines can and do carry risks for complications that can be greater for some individuals than others and may lead to chronic brain and immune system damage or death. IOM committees published reports in 1991, 1994a, 1994b, and 2012 and found that the following health problems are causally related to vaccination:
 - o Acute encephalopathy (brain inflammation)
 - o Chronic Nervous System Dysfunction (brain damage)
 - o Anaphylaxis (whole-body allergic reaction)
 - o Febrile Seizures (convulsions with fever)
 - o Guillain-Barre Syndrome (peripheral nerve inflammation)
 - o Brachial Neuritis (arm nerve inflammation)
 - o Deltoid Bursitis (shoulder inflammation)
 - o Acute & Chronic Arthritis (joint inflammation)
 - o Syncope (sudden loss of consciousness/fainting)
 - o Hypotonic/Hyporesponsive Episodes (shock and "unusual shock-like state)
 - o Protracted, Inconsolable Crying and Screaming
 - o Vaccine Strain Infections (smallpox, live polio, measles, varicella zoster vaccines)

- Death (smallpox, live polio, measles vaccines)
2. IOM published a report in 2012 revealing that there were continuing significant gaps in scientific knowledge about the biological mechanisms of vaccine injury and death, a point that was made two decades earlier in 1991 and 1994 IOM reports. Because there are not enough methodologically sound epidemiological and biological mechanism studies evaluating vaccine adverse events, the IOM committee could not come to definitive conclusions about causation for many of the reported vaccine reactions involving chronic brain and immune system dysfunction and death. The Committee also concluded that some individuals are more susceptible to vaccine reactions for genetic, biological, environmental and other reasons that have not been fully identified.
- For eight routinely used vaccines, (MMR, DTaP, hepatitis B, hepatitis A, varicella zoster and meningococcal) there were too few scientifically sound studies published in the medical literature to determine whether more than 100 serious brain and immune system problems are or are not caused by the vaccines, including multiple sclerosis, arthritis, lupus, stroke, SIDS, autism and asthma.
 - Both epidemiologic and biological mechanism research suggest that there are known and unknown biological, genetic and environmental high risk factors, which can increase “individual susceptibility” to vaccine reactions. These predispositions can include genetic variants (in human or microbiome DNA), environmental exposures, behaviors and illness or developmental stage, all of which can interact and, while some of the predispositions may be detectable before vaccination, others are not.
3. IOM published a report in 2013 that revealed the federally recommended birth to six-year old child vaccine schedule had not been fully scientifically evaluated and there was not enough scientific evidence for physician committees to determine if the childhood vaccine schedule *is or is not* associated with the development of the following brain and immune system disorders prevalent among children today:
- Asthma
 - Atopy
 - Allergy
 - Autoimmunity
 - Autism
 - Learning disorders
 - Communication disorders
 - Developmental disorders
 - Intellectual disability
 - Attention deficit disorder
 - Disruptive behavior disorder
 - Tics and Tourette’s syndrome
 - Seizures
 - Febrile seizures

- Epilepsy

Since 1982, NVIC has advocated that well-designed, independent, on-going scientific studies must be conducted to: (1) define the various biological mechanisms involved in vaccine injury and death; (2) identify genetic and other biological high risk factors for suffering chronic brain and immune system dysfunction after vaccination; and (3) evaluate short and long-term health outcomes of individuals, who use many vaccines, and those, who use fewer or no vaccines, to determine the health effects of vaccination on individuals and the public health.

Below are links to selected statements by NVIC to the IOM in the accomplishment of these vaccine safety and research advocacy goals.

- <https://www.forbes.com/sites/emilywillingham/2014/02/22/is-the-cdc-hiding-data-about-mercury-vaccines-and-autism/#4a24e4341363>
- <https://autismrawdata.net/blog/simpsonwood>

Aloha my name is Abigail schoder.

For many reasons I strongly opposed Har 11-157 specifically in relation to the very serious health and safety risks and conflicts.

This proposal change offers a serious threat of significant increased risk to our Island and society as a whole.

There is more than enough personal claims and documented scientific evidence proving severe detrimental effects from vaccinations. Including but not limited to: the improper proportional dosage to body weight ratio in administering the vaccine, harmful ingredients such as mercury and proven carcinogenic toxic poisons and even contamination. (See 27 page ref. link below)
https://medscienceresearch.com/contamination/?fbclid=IwAR2LczWCTVRnDTeOf9f_GYCuC_dTnD29VR2KJRR28iqtw6hLYn52qZlh9k

Combine this with a "one size fits all" approach to protocol and now a proposal to increase protocol and we have a recipe for disaster and greater injury. The risk is simply too great.

Countless families, communities and school systems are already suffering from the devastating and debilitating negative affects from vaccines. This is reflected with the United States vaccine injury Court paying out over four billion dollars in settlement to date for injuries and even death.

<https://www.hrsa.gov/sites/default/files/hrsa/vaccine-compensation/data/monthly-stats-december-2018.pdf>

The 1986 National Childhood Injury Act law acknowledges that vaccine injuries and deaths are real and that the vaccine injured and their families should be financially supported. For some reason the same law has allowed the vaccine manufacturers to escape liability for these adverse affects and has put the financial burden on the government. Congress created a "vaccine safety task force" to track and take action to reduce these harmful affects and implement measures to improve vaccine safety. The Sec of HHS was mandated to report to senate every two years regarding this. In the past 31 years they have not once reported to the Senate! On top of this **the number of vaccines recommended for our children has significantly increased already (from 24 doses of 7 vaccines by age 18, to 69 doses of 16 vaccines!**

This clearly shows us that our children and citizens are being treated as real live time "guinea pigs" or experiments. This is both unacceptable and downright dangerous. With this as our current situation, why would a proposal such as Har 11-157 even be entertained? Who is this really benefiting?

<https://www.govinfo.gov/content/pkg/USCODE-2016-title42/pdf/USCODE-2016-title42-chap6A-subchapXIX-part2-subpartc-sec300aa-27.pdf>

<http://candecide.org/government/CAN-HHS-Stipulated-Order-July-2018.pdf>

<https://www.nvic.org/cmstemplates/nvic/pdf/downloads/1983-2017-vaccine-schedules.pdf>

Documented scientific evidence and studies show that recently vaccinated individuals shed the virus for weeks and even months to both vaccinated and un-vaccinated people. These recently vaccinated individuals can carry the disease without symptoms and pass it on to others. There are currently no guidelines in place to quarantine recently vaccinated individuals. They are released directly into the public and into our schools while shedding the viruses. Could the vaccinations themselves be increasing the spread of disease? This is a major public health issue and concern. An increase in number of people vaccinated, dosage and frequency could significantly multiply this

problem and harm our society.

<https://www.westonaprice.org/public-health-officials-know-recently-vaccinated-individuals-spread-disease/>

As you know, the Department of Health itself clearly states on their website that no vaccine is 100% effective. We saw proof of this right here on Kauai when mumps vaccinated children and people did indeed contract the mumps during the outbreak last year. The risks are simply and clearly too high and not worth it.

I'm here today to affirm my right, my families rights and any citizens right to have complete sovereignty over our bodies. This is indeed our birth right. I sincerely asked you to truly listen and respond to our concerns as citizens, parents and caregivers. Thank you for your time and consideration.

Additional REFERENCE details:

<https://www.hrsa.gov/sites/default/files/hrsa/vaccine-compensation/data/monthly-stats-december-2018.pdf>

"How many petitions have been awarded compensation? According to the CDC, from 2006 to 2016 over 3.1 billion doses of covered vaccines "were distributed in the U.S. For petitions filed in this time period, 5,576 petitions were adjudicated by the Court, and of those 3,785 were compensated. This means for every 1 million doses of vaccine that were distributed, 1 individual was compensated. Since 1988, over 20,123 petitions have been filed with the VICP. Over that 30-year time period, 17,576 petitions have been adjudicated, with 6,313 of those determined to be compensable, while 11,263 were dismissed. Total compensation paid over the life of the program is approximately \$4.0 billion."

Contamination

Contamination

(<https://medscienceresearch.com/contan>

Recap of the vaccine contaminants below: Mycoplasma, HIV, syphilis, hepatitis B and C, pestiviruses, mouse brain tissue, bacteriophage, reverse transcriptase, SV40 cancer causing virus, porcine circovirus, endotoxins, coliphages, pseudomonas, fungi,

XMRV, foamy viruses of simian origin, nanoparticles with several metals, antifertility drug hCG, Mycobacterium tuberculosis, simian cytomegalovirus

Veterinary vaccines: chicken anaemia virus, egg drop syndrome virus, avian leukosis virus, Torque Teno virus, RD-114 retrovirus, mycoplasma

Absence of antibodies to HTLV-III in health workers after hepatitis B vaccination.

"A proportion of the plasma for the triply inactivated, plasma-derived hepatitis B vaccine produced in the United States is obtained from homosexual men. Because homosexual men are a high-risk group for the acquired immunodeficiency syndrome (AIDS), concern has emerged that the vaccine could harbor the AIDS agent."

🔍 **Adverse effect versus quality control of the Fuenzalida-Palacios antirabies vaccine.**

"We evaluated the components of the Fuenzalida-Palacios antirabies vaccine, which is still used in most developing countries in human immunization for treatment and prophylaxis. This vaccine is prepared from newborn mouse brains at 1% concentration. Even though the vaccine is considered to have a low myelin content, it is not fully free of myelin or of other undesirable components that might trigger adverse effects after vaccination. The most severe effect is a post-vaccination neuroparalytic accident associated with Guillain-Barré syndrome. In the present study we demonstrate how the vaccines produced and distributed by different laboratories show different component patterns with different degrees of impurity and with varying protein concentrations, indicating that production processes can vary from one laboratory to another. These differences, which could be resolved using a better quality control process, may affect and impair immunization, with consequent risks and adverse effects after vaccination. We used crossed immunoelectrophoresis to evaluate and demonstrate the possibility of quality control in vaccine production, reducing the risk factors possibly involved in these immunizing products."

<https://www.ncbi.nlm.nih.gov/m/pubmed/10030074> (<https://www.ncbi.nlm.nih.gov/m/pubmed/10030074>)

The African polio vaccine-acquired immune deficiency syndrome connection.

"Seroepidemiological, clinical and molecular findings suggest that the acquired immune deficiency syndrome virus human immunodeficiency virus-1 was introduced into the human species at the time (late 1950s) and in the geographic area (Zaire) in which millions of Africans were vaccinated with attenuated poliomyelitis virus strains that were produced in kidney tissue obtained from monkeys. Since monkeys not only harbor viruses that are remarkably similar to and genetically related to human immunodeficiency virus-1, but also served as tissue donors for the African polio vaccine, it is reasonable to suspect that a then non-detectable monkey virus with human-1-like properties was unknowingly co-cultured with the attenuated poliovirus virus and subsequently

administered to the vaccinees. The possibility of such a polio vaccine-acquired immune deficiency syndrome connection is a reminder of the unpredictable danger of artificially crossing natural species-barriers in biomedical laboratories.”

🔍 Assessment of iatrogenic transmission of HCV in Southern Italy: was the cause the Salk polio vaccination?

“Since the first studies on hepatitis C virus (HCV) prevalence were published, it has been evident that southern

Italy is an area of hyperendemicity. A recent study conducted in southern Italy suggested that the high prevalence of HCV infection might be the result of past iatrogenic transmission. Polio vaccination with the parenteral Salk vaccine between 1956 and 1965 by multiple use of unsafe glass syringes may have been one of the major causes of the spread of HCV infection among southern Italian adults who are now older than 40 years of age. Persons born between the 1940s and early 1960s have a nearly 3-fold increased risk of HCV seropositivity than the younger age group. The findings are consistent with a cohort effect of exposure to the Salk parenteral vaccination."

Bridging the gap: human diploid cell strains and the origin of AIDS.

"Although the theory of a chimpanzee origin of HIV-1 with cross-species transfer to man has now gained popularity, a more likely scenario is that chimps and humans were infected by an HIV-1 precursor virus derived from a contaminated poliovaccine. The reason for the rapidity and ease of cross-species transfer of this precursor virus has not been elucidated. We hypothesize that the poliovaccine was passaged in a human diploid cell strain."

Collective experiences of adventitious viruses of animal-derived raw materials and what can be done about them.

“Contamination of animal-derived raw materials with viruses, mycoplasmas, bacteria and fungi is common. These contaminants can interfere with the diagnosis of viral infection, and vaccines produced using infected cell cultures could lead to seroconversion or disease in the vaccinated animal. The purity, safety and efficacy of viral vaccines requires testing of the ingredients, cell substrates and final product. Methods for detection of viruses, especially bovine viral diarrhea virus, in nutrient serum, cell cultures, seed viruses and viral vaccines, and the frequency of their detection at the Center for Veterinary Biologies are discussed.”

Don’t ignore the risk of vaccine contamination

“Sir, Your News and Opinion articles about alleged contamination of vaccines should serve as a warning against over-optimism.

These articles highlight the failure to show any evidence for contamination of Wistar Institute polio vaccine stocks by human and simian immunodeficiency viruses (HIV/SIV), and you appeal for a truce. But — although Edward Hooper is quoted as saying that “vaccine samples released did not include any from batches prepared for use in Africa” — lymphocytes have been detected in other polio vaccines. Half of the vervet monkeys in Southern Africa are SIV positive; these animals were used for preparing early polio vaccines.

Considering the many millions of vaccine doses prepared in primary vervet monkey kidney cultures over a 30 year period, it is inconceivable that some SIV did not contaminate many cultures. By the same yardstick, simian

virus 40 (SV40) contaminated millions of doses of poliovirus vaccine until the animals were screened for this tumour virus.

Edward Hooper and others surely do not intend to undermine the polio vaccine efforts. What is needed is a new awareness of the need for caution — remembering the example of BSE — in view of the current impetus towards xenotransplantation and the accompanying danger of contamination. Our aim should be to improve our vaccines, not to undermine public confidence in them.”

Endogenous retroviruses as potential hazards for vaccines.

“Retroviruses are classified as exogenous or endogenous according to their mode of transmission. Generally, endogenous retroviruses (ERVs) are not pathogenic in their original hosts; however, some ERVs induce diseases. In humans, a novel gammaretrovirus was discovered in patients with prostate cancer or chronic fatigue syndrome. This virus was closely related to xenotropic murine leukemia virus (X-MLV) and designated as xenotropic murine leukemia virus-related virus (XMRV). The origin and transmission route of XMRV are still unknown at present; however, XMRV may be derived from ERVs of rodents because X-MLVs are ERVs of inbred and wild mice. Many live attenuated vaccines for animals are manufactured by using cell lines from animals, which are known to produce infectious ERVs; however, the risks of infection by ERVs from xenospecies through vaccination have been ignored. This brief review gives an overview of ERVs in cats, the potential risks of ERV infection by vaccination, the biological characteristics of RD-114 virus (a feline ERV), which possibly contaminates vaccines for companion animals, and the methods for detection of infectious RD-114 virus.

Evidence of pestivirus RNA in human virus vaccines.

"We examined live virus vaccines against measles, mumps, and rubella for the presence of pestivirus RNA or of pestiviruses by reverse transcription PCR. Pestivirus RNA was detected in two measles-mumps-rubella combined vaccines and in two monovalent vaccines against mumps and rubella."

Experience with preparation an laboratory control of oral poliomyelitis vaccine in Czechoslovakia.

"Among the many problems connected with the preparation and laboratory control of oral poliomyelitis vaccines, one of the most vexed is that of the presence of undesirable, extraneous viruses of simian origin, particularly the foamy viruses. In Czechoslovakia, as elsewhere, these have been encountered in the production of live poliomyelitis vaccine from Sabin strains. Of 596 single lots of primary monkey kidney cell cultures intended for use in vaccine, only 143 lots successfully passed laboratory control tests, mainly because foamy viruses were found. Comparison tests showed that monkey and rabbit kidney cells were equally sensitive for the detection of foamy viruses but that dog kidney cells were less so and, in addition, in 8% of cases contained endogenous cytopathogenic virus agents. The presence of vacuolating agent was not tested for in the control tests discussed in this paper. All vaccine lots which passed control tests and were administered to children in the course of mass vaccination campaigns in Czechoslovakia in 1960 and 1961 proved safe and effective."

🔍 Experimental oral polio vaccines and acquired immune deficiency syndrome.

The simian immunodeficiency virus (SIV) of the common chimpanzee is widely acknowledged as the direct ancestor of HIV-1. There is increasing historical evidence that during the late 1950s, kidneys were routinely excised from central African chimpanzees by scientists who were collaborating with the polio vaccine research of Dr Hilary Koprowski, and sent – inter alia – to vaccine-making laboratories in the USA and Africa, and to unspecified destinations in Belgium. While there is no direct evidence that cells from these kidneys were used as a substrate for growing Dr Koprowski's oral polio vaccines, there is a startling coincidence between places in

Africa where his CHAT vaccine was fed, and the first appearances in the world of HIV-1 group M and group-M-related AIDS. Because of the enormous implications of the hypothesis that AIDS may be an unintended iatrogenic (physician-caused) disease, it is almost inevitable that this theory will engender heated opposition from many of those in the scientific establishment, and those with vested interests.

🔍 Hepatitis B Vaccines—to Switch or Not to Switch

“Shortly after the licensure of Heptavax-B in 1981 and its general availability in July 1982, the discovery of the acquired immunodeficiency syndrome (AIDS) among male homosexuals threatened the success of this product, since some of the hepatitis B surface antigen (HBsAg)-positive plasma donors were members of this high-risk group. Intensive epidemiologic, virological, and serological evaluations were launched, which eventually found no evidence for the transmission of AIDS to recipients of the plasma-derived HBsAg vaccine.”

The injection century: massive unsterile injections and the emergence of human pathogens.

"Unsterile medical injections are common in the less-developed world, where most visits to a doctor result in the (generally unnecessary) administration of intramuscular, or subcutaneous drugs. WHO estimates¹ that every year unsafe injections result in 80 000–160 000 new HIV-1 infections, 8·16 million hepatitis B infections, and 2·3–4·7 million hepatitis C infections worldwide (this figure does not include transfusions). Together, these illnesses account for 1·3 million deaths and 23 million years of lost life."

Jonathan Hutchinson on Vaccination Syphilis

"A century ago, even as today, the opponents of compulsory vaccination for smallpox argued that the complications of the procedure might be worse than the disease. One of the most resolute advocates of compulsory vaccination at the time was Jonathan Hutchinson, then a newly elected honorary member of the New York Dermatological society. Hutchinson made no secret of his contempt for the misguided zealots who supported the antivaccination movement. One may well imagine, therefore, how painful it must have been for him to report in detail his findings on the transmission of syphilis by arm-to-arm vaccination. Hutchinson met the problem with characteristic courage. How he did so is summarized in this article."

Live oral poliovirus vaccines and simian cytomegalovirus.

“Live oral poliovirus vaccines (OPV) are often produced in primary Cercopithecus monkey kidney (CMK) cells. The kidneys of these monkeys are often latently infected with simian cytomegalovirus (SCMV), and CMK cultures are frequently contaminated with SCMV. We tested human, monkey and rabbit tissue culture systems, and found that MRC-5 cells are most sensitive for detection of SCMV. To address the question of whether OPV could be contaminated with infectious SCMV, we inoculated MRC-5 cells with neutralized OPV manufactured in the United States between 1972 and 1998. Infectious SCMV was not found in any of the vaccine lots tested. We also used the polymerase chain reaction (PCR) to search for SCMV DNA in live oral poliovirus vaccines; SCMV DNA sequences were found in several of the vaccine lots manufactured prior to 1992.”

Mortality and morbidity among military personnel and civilians during the 1930s and World War II from transmission of hepatitis during yellow fever vaccination: systematic review.

“During World War II, nearly all US and Allied troops received yellow fever vaccine. Until May 1942, it was both grown and suspended in human serum. In April 1942, major epidemics of hepatitis occurred in US and Allied troops who had received yellow fever vaccine. A rapid and thorough investigation by the US surgeon general followed, and a directive was issued discontinuing the use of human serum in vaccine production. The large number of cases of hepatitis caused by the administration of this vaccine could have been avoided. Had authorities undertaken a thorough review of the literature, they would have discovered published reports, as early as 1885, of postvaccination epidemics of hepatitis in both men and horses. It would take 4 additional decades of experiments and epidemiological research before viruses of hepatitis A, B, C, D, and E were identified, their modes of transmission understood, and their genomes sequenced.”

Multiple sclerosis and hepatitis B vaccination: could minute contamination of the vaccine by partial hepatitis B virus polymerase play a role through molecular mimicry?

“Reports of multiple sclerosis developing after hepatitis B vaccination have led to the concern that this vaccine might be a cause of multiple sclerosis in previously healthy subjects. Some articles evidenced that minor Hepatitis B virus (HBV) polymerase proteins could be produced by alternative transcriptional or translational strategies. Their detection is very difficult because they are in minute concentration and probably enzymatically inactive, however, it was shown that they could be exposed on the outside of the virus particles and also be immunogenic. In addition, HBV polymerase shares significant amino acid similarities with the human myelin basic protein. We hypothesise that some of the apparent adverse reactions to the vaccine could be due to a process called of molecular mimicry, the HBV polymerase, which could be a contaminant in the recombinant or plasma-derived vaccines, could act as autoantigens and induce autoimmune demyelinating diseases such as multiple sclerosis.”

Of Mice and Men: On the Origin of XMRV.

“The novel human retrovirus xenotropic murine leukemia virus-related virus (XMRV) is arguably the most controversial virus of this moment. After its original discovery in prostate cancer tissue from North American patients, it was subsequently detected in individuals with chronic fatigue syndrome from the same continent. However, most other research groups, mainly from Europe, reported negative results. The positive results could possibly be attributed to contamination with mouse products in a number of cases, as XMRV is nearly identical in nucleotide sequence to endogenous retroviruses in the mouse genome. But the detection of integrated XMRV proviruses in prostate cancer tissue proves it to be a genuine virus that replicates in human cells, leaving the question: how did XMRV enter the human population? We will discuss two possible routes: either via direct virus transmission from mouse to human, as repeatedly seen for, e.g., Hantaviruses, or via the use of mouse-related products by humans, including vaccines. We hypothesize that mouse cells or human cell lines used for vaccine production could have been contaminated with a replicating variant of the XMRV precursors encoded by the mouse genome.”

Oral polio vaccine and human cancer: a reassessment of SV40 as a contaminant based upon legal documents.

“The confirmation of the removal by one drug manufacturer, Lederle, has been made public at an international symposium in January 1997, where its representatives stated that all of Lederle’s seeds had been tested and screened to assure that it was free from SV40 virus. However, in litigation involving the Lederle oral polio vaccine, the manufacturer’s internal documents failed to reveal such removal in all of the seeds. The absence of confirmatory testing of the seeds, as well as testimony of a Lederle manager, indicate that this claim of removal of SV40 and the testing for SV40 in all the seeds cannot be fully substantiated. These legal documents and testimony indicate that the scientific community should not be content with prior assumptions that SV40 could not have been in the oral polio vaccine.”

🔍 **Polio, hepatitis B and AIDS: an integrative theory on a possible vaccine induced pandemic.**

“The hypothesis that simian virus 40 (SV40) infected polio vaccines may be linked to the evolution of acquired immunodeficiency disorder (AIDS), and certain cancers, has been advanced. Most recently, investigators discussed the likelihood of gene-reshuffling following SV40 infection as a precursor to acquired immune dysfunction. Findings of recent SV40 infections in four children born after 1982 suggest infections were transmitted vertically along gene lines. Earlier observations proved activation of a retrovirus gene by a hepatitis B virus (HBV) protein. This paper proposes a new integrative theory on the origin of AIDS. It advances the possibility of genetic recombinations with oncogene activation by HBV involving simian viruses that likely infected polio vaccinated blood donors to the initial hepatitis B (HB) vaccine trials conducted on gay men in New York City and Ugandan Blacks in the early to mid-1970s. The socio-economic and even military ramifications associated with this politically challenging thesis are discussed.”

Polio vaccines and the origin of AIDS.

"In particular, it is now known that the early polio vaccines were contaminated with at least one monkey virus, SV40. The transfer of monkey viruses to man via contaminated vaccines is particularly relevant to the acquired immunodeficiency syndrome (AIDS), since the causative agent of AIDS, human immunodeficiency virus (HIV), is thought to be derived from a simian precursor virus. Furthermore, human infection with this virus appears to be a relatively recent event. We hypothesize that the AIDS pandemic may have originated with a contaminated polio vaccine that was administered to inhabitants of Equatorial Africa from 1957 to 1959. The mechanism of evolution of HIV from this vaccine remains to be determined."

Porcine circovirus (PCV) removal by Q sepharose fast flow chromatography.

"The recently discovered contamination of oral rotavirus vaccines led to exposure of millions of infants to porcine circovirus (PCV). PCV was not detected by conventional virus screening tests. Regulatory agencies expect exclusion of adventitious viruses from biological products. Therefore, methods for inactivation/removal of viruses have to be implemented as an additional safety barrier whenever feasible. However, inactivation or removal of PCV is difficult. PCV is highly resistant to widely used physicochemical inactivation procedures. Circoviruses such as PCV are the smallest viruses known and are not expected to be effectively removed by currently-used virus filters due to the small size of the circovirus particles. Anion exchange chromatography such as Q Sepharose®) Fast Flow (QSFF) has been shown to effectively remove a range of viruses including parvoviruses. In this study, we investigated PCV1 removal by virus filtration and by QSFF chromatography. As expected, PCV1 could not be effectively removed by virus filtration. However, PCV1 could be effectively removed by QSFF as used during the purification of monoclonal antibodies (mAbs) and a log₁₀ reduction value (LRV) of 4.12 was obtained.

The Risk of AIDS After Hepatitis Vaccination

“In the recent decision analysis article by Sacks et al¹ in the Dec 28, 1984, issue of The Journal, the authors claim to have calculated the maximum rate of hepatitis B vaccine-induced acquired immunodeficiency syndrome (AIDS) to be eight per 100,000 with 95% confidence. This calculation is based on a study of 40,000 persons who had been vaccinated prior to mid-1982. I do not believe that an extrapolation from this population can be expected to hold true for a vaccine manufactured from today’s pool of donors.”

Should the risk of acquired immunodeficiency syndrome deter hepatitis B vaccination? A decision analysis.

"The current epidemic of acquired immunodeficiency syndrome (AIDS) and fear that its causative agent contaminates the currently available hepatitis B vaccine may have deterred vaccine use. We formulated a decision-analytic model that compares the risk of death from hepatitis B and AIDS in those vaccinated with the risk of death from hepatitis B alone in those who wait two years for a synthetic vaccine. For individuals with 5% annual risk of hepatitis B, the best current estimate is that vaccination now would save 25 lives per 100,000. The best current estimate of the rate of vaccine-induced AIDS is zero, and one can be 95% confident that the rate is less than eight per 100,000. The rate would have to be considerably higher before postponement of vaccination would be rational for those for whom vaccination has been recommended."

Simian cytomegalovirus and contamination of oral poliovirus vaccines.

"In the 1950s the use of primary rhesus macaque kidney cultures to propagate poliovirus for vaccine production led to the contamination of vaccines with simian virus 40 (SV40). African green monkey kidney (AGMK) cultures free of SV40 were used as an alternative cell substrate for vaccine manufacture. In this study we evaluate oral poliovirus seeds, vaccine bulks and vaccines themselves for the presence of a common contaminant of AGMK cultures, simian cytomegalovirus (SCMV). Using sensitive polymerase chain reaction (PCR) techniques, nearly half of the samples analysed were found to be contaminated with SCMV sequences. However, vaccine bulks, positive by PCR for SCMV failed to show any evidence of infectious virus in these studies. One poliovirus vaccine and one seed, propagated on rhesus macaque kidney cultures were found to be positive for the rhesus monkey CMV by PCR."

Simian cytomegalovirus-related stealth virus isolated from the cerebrospinal fluid of a patient with bipolar psychosis and acute encephalopathy.

“A cytopathic ‘stealth’ virus was cultured from the cerebrospinal fluid of a patient with a bipolar psychotic disorder who developed a severe encephalopathy leading to a vegetative state. DNA sequencing of a polymerase chain reaction-amplified product from infected cultures has identified the virus as an African green monkey simian cytomegalovirus (SCMV)-related stealth virus. The virus is similar to the SCMV-related stealth virus isolated from a patient with chronic fatigue syndrome. The findings support the concepts that stealth viruses can account for a spectrum of dysfunctional brain diseases and that some of these viruses may have arisen from live polio viral vaccines.”

Some oral poliovirus vaccines were contaminated with infectious SV40 after 1961.

“Some polio vaccines prepared from 1954 to 1961 were contaminated with infectious SV40. It has been assumed that all polio vaccines were SV40 free in the United States after 1961 and in other countries after 1962. Following a WHO requirement that was prompted by the detection of SV40 in some human tumors, we conducted a multilaboratory study to test for SV40 polio vaccines prepared after 1961. Vaccine samples from 13 countries and the WHO seed were initially tested by PCR. The possible presence of intact and/or infectious SV40 DNA in PCR-positive samples was tested by transfection and infection of permissive CV-1 cells. All results were verified by immunohistochemistry, cloning, and sequencing. All the vaccines were SV40 free, except for vaccines from a major eastern European manufacturer that contained infectious SV40. We determined that the procedure used by this manufacturer to inactivate SV40 in oral poliovirus vaccine seed stocks based on heat

inactivation in the presence of MgCl₂ did not completely inactivate SV40. These SV40-contaminated vaccines were produced from early 1960s to about 1978 and were used throughout the world. Our findings underscore the potential risks of using primary monkey cells for preparing poliovirus vaccines, because of the possible contamination with SV40 or other monkey viruses, and emphasize the importance of using well-characterized cell substrates that are free from adventitious agents. Moreover, our results indicate possible geographic differences in SV40 exposure and offer a possible explanation for the different percentage of SV40-positive tumors detected in some laboratories.”

[SV40 as a possible cofactor in the etiopathogenesis of mesothelioma and other human tumors].

"Simian virus 40 (SV40) has been introduced into the human population with contaminated polio vaccines between 1955 and 1963. Previous research conducted by southern blot hybridization and recent analysis by PCR have shown the presence of SV40 sequences in human brain tumors, mesotheliomas and osteosarcomas as well as in normal tissues such as blood and sperm fluids. SV40 RNA and T antigen were detected in the same tissues. All the samples were coinfecting by BK Virus (BKV), suggesting that BKV may have a helper function for SV40 replication in human cells. The presence of SV40 in human tumors suggests that the virus may be a cofactor in the etiopathogenesis of human neoplasia. In addition, blood and semen may represent the vectors for transmission of SV40 by horizontal infection in the human population."

Veterinary

Testing for viral contaminants of veterinary vaccines in Hungary.

"The safety of veterinary vaccines is of paramount importance and it is significantly jeopardised by extraneous agents such as bacteria, mycoplasma, Chlamydia and viruses. Several critical steps of vaccine manufacture involve a potential risk of viral contamination. Viruses, as extraneous, agents can be divided into two main groups. Group 1 agents, such as Pestivirus, chicken anaemia virus (CAV), and egg drop syndrome virus (EDSV) are well-known to manufacturers and authorities. Compendial detection methods, clear guidelines and legislation have been established to minimise the risk of contamination with these agents. Contrary to group 1, group 2 agents like Torque Teno virus (TTV) or RD114, a replication-competent feline gamma-retrovirus, have only recently been recognised and their role as contaminants needs further investigation. Randomly selected veterinary vaccines used between 1992 and 2009 were tested by nucleic acid amplification for CAV, EDSV, and TTV. Pestivirus contamination was examined in 33 vaccines used between 1996 and 2006 and a further 27 vaccines used between 2007 and 2009 based on random selection of these vaccines. In addition to random tests done on vaccines used from 2007 on, 12 batches of live Aujeszky's disease vaccines submitted to our laboratory for Official Control Authority Batch Release (OCABR) were also tested for Pestivirus."

🌐 **Tetanus vaccine may be laced with anti-fertility drug. International / developing countries.**

“A priest, president of Human Life International (HLI) based in Maryland, has asked Congress to investigate reports of women in some developing countries unknowingly receiving a tetanus vaccine laced with the anti-fertility drug human chorionic gonadotropin (hCG). If it is true, he wants Congress to publicly condemn the mass vaccinations and to cut off funding to UN agencies and other involved organizations. The natural hormone hCG is needed to maintain pregnancy. The hormone would produce antibodies against hCG to prevent pregnancy. In the fall of 1994, the Pro Life Committee of Mexico was suspicious of the protocols for the tetanus toxoid campaign because they excluded all males and children and called for multiple injections of the vaccine in only women of reproductive age. Yet, one injection provides protection for at least 10 years. The Committee had vials of the tetanus vaccine analyzed for hCG. It informed HLI about the tetanus toxoid vaccine. HLI then told its World Council members and HLI affiliates in more than 60 countries. Similar tetanus vaccines laced with hCG have been uncovered in the Philippines and in Nicaragua. In addition to the World Health Organization (WHO), other organizations involved in the development of an anti-fertility vaccine using hCG include the UN Population Fund, the UN Development Programme, the World Bank, the Population Council, the Rockefeller Foundation, the US National Institute of Child Health and Human Development, the All India Institute of Medical Sciences, and Uppsala, Helsinki, and Ohio State universities. The priest objects that, if indeed the purpose of the mass vaccinations is to prevent pregnancies, women are uninformed, unsuspecting, and unconsenting victims.”

The Weston A. Price Foundation

Public Health Officials Know: Recently Vaccinated Individuals Spread Disease

MARCH 3, 2015 BY LESLIE MANOOKIAN

([HTTPS://WWW.WESTONAPRICE.ORG/AUTHOR/LMANOOKIAN/](https://www.westonaprice.org/author/lmanookian/))

WASHINGTON, D.C. –March 3, 2015– [[GlobeNewsWire \(http://globeonewswire.com/news-release/2015/03/03/712042/10123084/en/Public-Health-Officials-Know-Recently-Vaccinated-Individuals-Spread-Disease.html\)](http://globeonewswire.com/news-release/2015/03/03/712042/10123084/en/Public-Health-Officials-Know-Recently-Vaccinated-Individuals-Spread-Disease.html)] — Physicians and public health officials know that recently vaccinated individuals can spread disease and that contact with the immunocompromised can be especially dangerous. For example, the Johns Hopkins Patient Guide warns the immunocompromised to “Avoid contact with children who are recently vaccinated,” and to “Tell friends and family who are sick, or have recently had a live vaccine (such as chicken pox, measles, rubella, intranasal influenza, polio or smallpox) not to visit.”¹

A statement on the website of St. Jude’s Hospital warns parents not to allow people to visit children undergoing cancer treatment if they have received oral polio or smallpox vaccines within four weeks, have received the nasal flu vaccine within one week, or have rashes after receiving the chickenpox vaccine or MMR (measles, mumps, rubella) vaccine.²

“The public health community is blaming unvaccinated children for the outbreak of measles at Disneyland, but the illnesses could just as easily have occurred due to contact with a recently vaccinated individual,” says Sally Fallon Morell, president of the Weston A. Price Foundation. The Foundation promotes a healthy diet, non-toxic lifestyle and freedom of medical choice for parents and their children. “Evidence indicates that recently vaccinated individuals should be quarantined in order to protect the public.”

Scientific evidence demonstrates that individuals vaccinated with live virus vaccines such as MMR (measles, mumps and rubella), rotavirus, chicken pox, shingles and influenza can shed the virus for many weeks or months afterwards and infect the vaccinated and unvaccinated alike. ^{3,4,5,6,7,8,9,10,11,12}

Furthermore, vaccine recipients can carry diseases in the back of their throat and infect others while displaying no symptoms of a disease.^{13,14,15}

Both unvaccinated and vaccinated individuals are at risk from exposure to those recently vaccinated. Vaccine failure is widespread; vaccine-induced immunity is not permanent and recent outbreaks of diseases such as whooping cough, mumps and measles have occurred in fully vaccinated populations.^{16,17} Flu vaccine recipients become more susceptible to future infection after repeated vaccination.^{18,19}

Adults have contracted polio from recently vaccinated infants. A father from Staten Island ended up in a wheel chair after contracting polio while changing his daughter's diaper. He received a 22.5 million dollar award in 2009. ^{20,21}

"Vaccine failure and failure to acknowledge that live virus vaccines can spread disease have resulted in an increase in outbreaks of infectious disease in both vaccinated and unvaccinated individuals," says Leslie Manookian, producer of The Greater Good. "CDC should instruct physicians who administer vaccinations to inform their patients about the risks posed to others by those who've been recently vaccinated."

According to the Weston A. Price Foundation, the best protection against infectious disease is a healthy immune system, supported by adequate vitamin A and vitamin C. Well-nourished children easily recover from infectious disease and rarely suffer complications.

The number of measles deaths declined from 7575 in 1920 (10,000 per year in many years in the 1910s) to an average of 432 each year from 1958-1962.²² The vaccine was introduced in 1963. Between 2005 and 2014, there have been no deaths from measles in the U.S. and 108 deaths reported after the MMR vaccine.²³

The Weston A. Price Foundation is a 501(c)(3) nutrition education foundation with the mission of disseminating accurate, science-based information on diet and health. Named after nutrition pioneer Weston A. Price, DDS, author of Nutrition and Physical Degeneration, the Washington, DC-based Foundation publishes a quarterly journal for its 15,000 members,

supports 600 local chapters worldwide and hosts a yearly international conference. The Foundation phone number is (202) 363-4394, www.westonaprice.org, info@westonaprice.org.

To whom it may concern,

December 21, 2018

On behalf of the Kauai Community College Nursing program we are here in support of the new Hawai'i school mandated HPV and Hep A vaccine initiative. The Human papillomavirus causes various genital cancers including cervical cancer. In a study done by Tom et al., in 2016, it was found that the HPV vaccine has been available to the Hawai'i pediatric population; however, since 2013 vaccine use has been suboptimal with only 38% of females and 31% of males ages 13-17, completing all three doses of the vaccine. This new school mandate will increase the completion rates of the three step vaccination series among the adolescent population thus preventing cancer. It is important that parents are informed about this vaccine's ability to prevent cancer in their children as well as protecting themselves. The Center for Disease Control recently expanded their recommendation for HPV vaccinations to men and women between the ages of 27-45 because of its effectiveness. However, the recommendation is that children be vaccinated between 9 and 11 years old. The reason for the early vaccination is prevention of HPV BEFORE being exposed. In 2018, Robert et al., studied school located vaccination policies, currently only two states, Virginia and Rhode Island, and Washington D.C., have school mandated HPV vaccination requirements. In their study, all three have high uptake and completion rates of the HPV vaccination series. With the new vaccine requirements in Hawaii, we should expect similar improvements in vaccine completion rates and hopefully a reduction in cancer.

Ask yourselves, if you could get an injection that would prevent cancer, would you?

Roberts, M. C., Murphy, T., Moss, J. L., Wheldon, C. W., & Psek, W. (2018). A qualitative comparative analysis of combined state health policies related to human papillomavirus vaccine uptake in the United States. *American Journal of Public Health*,

Dirty Vaccines: New Study Reveals Prevalence of Contaminants

Celeste McGovern

Every Human Vaccine Tested Was Contaminated by Unsafe Levels of Metals and Debris Linked to Cancer and Autoimmune Disease, New Study Reports

Researchers examining 44 samples of 30 different vaccines found dangerous contaminants, including red blood cells in one vaccine and metal toxicants in every single sample tested – except in one animal vaccine.

Using extremely sensitive new technologies not used in vaccine manufacturing, Italian scientists reported they were “baffled” by their discoveries which included single particles and aggregates of organic debris including red cells of human or possibly animal origin and metals including lead, tungsten, gold, and chromium, that have been linked to autoimmune disease and leukemia.

In the [study](#), published this week in the *International Journal of Vaccines and Vaccination*, the researchers led by [Antonietta Gatti](#), of the National Council of Research of Italy and the Scientific Director of [Nanodiagnostics](#), say their results “show the presence of micro- and nano-sized particulate matter composed of inorganic elements in vaccine samples” not declared in the products’ ingredients lists.

Lead particles were found in the cervical cancer vaccines, Gardasil and Cervarix, for example, and in the seasonal flu vaccine Aggripal manufactured by Novartis as well as in the Meningetec vaccine meant to protect against meningitis C.

Samples of an infant vaccine called Infarix Hexa (against diphtheria, tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type B) manufactured by GlaxoSmithKline was found to contain stainless steel, tungsten and a gold-zinc aggregate.

Other metal contaminants included platinum, silver, bismuth, iron, and chromium. Chromium (alone or in alloy with iron and nickel) was identified in 25 of the human vaccines from Italy and France that were tested.

GSK’s Fluarix vaccine for children three years and older contained 11 metals and aggregates of metals. Similar aggregates to those identified in the vaccines have been shown to be prevalent in cases of [leukemia](#), the researchers noted.

Many of the vaccines contained iron and iron alloys which, according to the researchers, “can [corrode](#) and the [corrosion products](#) exert a toxicity affecting the tissues”.

CMSRI_Corrosive Debris Meme_v1.pngThe researchers supply an image of an

area in a drop of Sanofi Pasteur MSD's Repevax (diphtheria, pertussis, tetanus, polio) vaccine "where the morphology of red cells - we cannot tell whether they are human or animal- is clearly visible" along with the presence of "debris" composed of aluminum, bromine, silicon, potassium and titanium.

Feligen, the only veterinary vaccine tested in the 44 total vaccines sampled, proved to be the only sample free from inorganic contamination.

The investigation revealed aluminum and sodium chloride, the usual component of saline, as was expected, because they are named ingredients of most vaccines. Using a Field Emission Gun Environmental Electron Scanning Microscope, the researchers produced photos of this aluminum salt which formed white crystalline branches similar to frost on a windowpane on the top of the droplets of vaccine liquid. A German-made vaccine against allergies produced a layer of inorganic salts so thick that the researchers could not penetrate the drop to detect other particulate contaminants.

Aluminum has a documented neurotoxicity all by itself. The French veterinary vaccines exclude it for this reason. The human ones don't. The researchers express concern about synergy of multiple toxins added to this known neurotoxin. "It is a well-known fact in toxicology that contaminants exert a mutual, synergic effect, and as the number of contaminants increases, the effects grow less and less predictable. The more so when some substances are unknown."

"The quantity of foreign bodies detected and, in some cases, their unusual chemical compositions baffled us," the researchers note. "In most circumstances, the combinations detected are very odd as they have no technical use, cannot be found in any material handbook and look like the result of the random formation occurring, for example, when waste is burnt. In any case, whatever their origin, they should not be present in any injectable medicament, let alone in vaccines, more in particular those meant for infants."

Donate to support independent research:

**Drug companies shouldn't do it, but they do.
Government agencies should do it, but they don't.
Unbiased, independent medical research - it's up to us.
Please Help.
Donate Today**

Undesirable impact

The study explains that these foreign injected impurities may explain a vast array of apparently unrelated adverse events associated with vaccination from headaches and seizures to fatigue, muscle pain, paralysis and sudden infant death syndrome. More likely than not, they speculate, vaccine contaminants will "have a more serious impact on very small organisms like those of children."

Once inside a body, foreign material in a vaccine shot, whether it is meant to be there as in the case of an aluminum, or not, in the case of contaminants, launches the formidable immune system into action.

As with anything small and foreign, its reaction to vaccine ingredients is potent, poorly understood, unpredictable, and as the Italian researchers say, may be “undesirable.” The immune system may dispatch an army of large white blood cells called macrophages to engulf the foreign bodies and contain them in swellings and granulomas at the injection site. But if the contaminants are swept away in the blood’s circulation to any distant site or organ including the microbiota, which regulate numerous functions including the immune system, their effect could be felt long after they covertly entered the body.

In some cases, the immune system may initiate an inflammatory assault against what it perceives as invader. This may include the launch of a host of players called cytokines. Some of these chemical messengers like interleukin-6 are incriminated in autism.

Because these contaminants may persist in the body and stimulate the immune system, they may induce chronic inflammation and can manifest as autoimmune diseases when the immune system turns on its host's own cells as in multiple sclerosis or type 1 diabetes.

It’s also been shown that the contaminants found in the vaccines can enter cell nuclei and interact with DNA, the researchers note. No one knows what that can do.

Vaccine DangersDark history

Vaccines have a long and sordid history of contamination. In 1955 batches of polio vaccine containing live polio virus infected and paralysed hundreds of children. The tragedy became known as the Cutter Incident for the laboratory where the vaccines had passed safety tests with flying colors.

But there are dozens of other “incidents” which would better be called acts of criminal negligence, including:

- The polio vaccine doled out between 1955 and 1963 was contaminated with simian virus 40 (SV40) from monkey kidney cells used to produce the vaccine. It’s been linked to the growing epidemic of cancer.
- In 2007, Merck & Company, Inc. recalled 1.2 million doses of Hib vaccines due to contamination with bacteria called *cereus*, a potentially lethal food-poisoning bug.
- In 2009, more than 40,000 doses of a meningitis C vaccine for babies were withdrawn from the British market when they were found to be contaminated with blood-poisoning bacteria, *S aureus*.
- In 2010, deep sequence analysis of eight different live attenuated virus vaccines revealed unexpected viral sequences in three of them: retrovirus avian leukosis was found in a measles vaccine, a virus similar to simian retrovirus was identified in Rotateq anti-diarrhea vaccine developed by CDC consultant Paul Offit, and the entire genome sequence of porcine cirovirus1 was found in Rotarix leading the FDA to suspend the rotavirus vaccine.
- In 2014, The US Food and Drug Administration ordered GlaxoSmithKline to

review the manufacturing operation of its flu vaccine when it found microbiological contamination of products purporting to be sterile.

- In 2013, Merck & Company, Inc. recalled one batch of Gardasil when glass particles were discovered in several phials.
- Recently it was reported that Sanofi Pasteur refused to recall its ActHIB vaccine for babies, even though it knew it was contaminated with glass shards. The FDA didn't object.

There are dozens of these cases, and even if vaccine manufacturers are issued multiple "warnings" action is rarely ever taken to clean the vaccine manufacture process. Since pharmaceutical companies have blanket indemnity from lawsuits for faulty vaccines, there is no incentive for them to clean up their act.

Clear and present danger

The study investigators conclude that the vaccine contamination they found is likely accidental. "Our hypothesis is that this contamination is unintentional, since it is probably due to polluted components or procedures of industrial processes (e.g. filtrations) used to produce vaccines, not investigated and not detected by the Producers".

Discussion about why pharmaceutical companies don't produce clean vaccines is one thing. But the reality of vaccines as they are now is another. It doesn't change what is being injected into millions of people today. Dangerous unintended toxins are in every one of the vaccines tested in this investigation, except one for cats.

This research doesn't just show that vaccines are full of crud that top scientists can't even define. It makes a mockery of health oversight agencies like the FDA and CDC and their lies that vaccines undergo adequate safety checks and risk assessment.

It doesn't merely reveal that the long-term consequences of vaccinating cannot even be assessed. If anti-cancer vaccines like Gardasil and Cervarix contain cancer-causing aggregates of toxic metals, their use as a weapon against a cancer a girl has zero chance of getting before age 21 is not just useless. It is egregious abuse.

Now, every vaccine's claims to saving lives must be weighed against its risks of causing cancer, neurodevelopmental disease, autoimmune disease and every other immune-mediated "mystery" disorder now epidemic and soaring.

The results of these investigations not only negate every assertion that vaccines are "safe and effective", but they confirm that they are actually a clear and present danger.

Subject: STOP this maiming & killing of our children
Date: Friday, December 21, 2018 4:30:12 PM

There is so much imperial, science-base evidence as to the extreme damage, including incapacitating perfectly healthy children and adults - also including death, that it is extremely hard to believe that anyone in their right mind would even consider forcing vaccinations upon all the people.

In all fairness, "all sides" of this proposition should very carefully be investigated and considered.

I know that all of us - each and every one - are super busy these days - - especially at this holiday time - when it was decided to have so-called public discussion on this matter.

I include links that are clear and concise - thus will take up little of your time to check out.

I implore you to "do due diligence" before proceeding in this matter, and unbiasedly be aware of all the ramifications of this proposal.

There are thousands of cases of human lives being destroyed by vaccines and it is proved many times over that the vaccinated children/ people expose others to the very "illness" the vaccines are propertied to protect against.

<https://www.youtube.com/watch?v=ZDg7CUh53ys>

Please check out at least a few of these 335 Abstracts regarding vaccines - PLEASE BE INFORMED !!

.....

100s Reject Vaccine - timesofindia.indiatimes.com

MEERUT: Hundreds of madrassas across western Uttar Pradesh have refused permission to health officials to administer measles-rubella vaccines to students, putting lakhs of children at risk. In Meerut alone, at least 70 of the 272 seminaries have refused entry to health officials. According to these messages, the vaccine can make a child impotent.". R eports from across the country of children falling sick after vaccination have added to the fear. According to a government report, over 49,000 children were killed in 2015 due to it.

Subject: Support HAR 11-157
Date: Friday, December 21, 2018 10:31:34 PM

To whom it may concern,

I am a Nurse Practitioner and a mother, writing to express my concern for the opposition toward this bill. Following the CDC schedule of vaccines is well-studied and established, and it makes sense. Disease burden and associated financial and emotional costs are slashed by preventing disease.

People who are fortunate enough to be able to afford medical care perceive the risk of foregoing vaccination as minimal, but this is short-sighted. Transmitting disease to those who cannot afford proper medical care can be devastating. Children have the right to go to school and be protected, not exposed to potentially life threatening or altering disease.

As a society, we must do better, we have a duty to protect our own youth, as well as those in our community who cannot stand up for themselves. It is unacceptable to have abundant knowledge and access to science and to blatantly disregard it because we "feel" differently. This has nothing to do with feelings, and everything to do with knowledge.

Please, I urge you to help protect our future generations and support HAR 11-157.

Kindly,

Jennifer Nill, DNP, FNP-BC

Subject: Supporting The Updated Immunization Guidelines
Date: Friday, December 21, 2018 10:31:43 AM

I am writing to strongly support the updated immunization guidelines. The proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The science beyond vaccine safety is not questionable, and I am dismayed by the efforts of the anti-vaccination proponents to make their opposition appear anything other than isolated misguided voices fueled by unfortunate misconceptions and fears.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Subject: I OPPOSE HAR 11-157
Date: Saturday, December 22, 2018 6:29:58 AM

I OPPOSE HAR 11-157.

I am a 29 year resident of the State of Hawaii, a husband, a father, and a citizen of the United States of America. Compulsory and/or mandatory vaccinations are a misuse of the of the power of the state, which is the use of aggressive force.

It is an aggressive act to compel what decisions are made concerning my body and the body and the bodies of my family. It is a violation of and an assault on the body. The state has no right to do that, because I am a flesh and blood human being.

The subject of vaccines is highly debated and controversial. I am basing my opposition on many things but a few are most concerning. There has not been enough time to truly know if the long term effects are safe enough so that the benefits outweigh the risks. There is evidence that the ingredients used as preservatives in vaccines are dangerous and toxic. I have met and experienced many parents whom report injuries inflicted upon the children after receiving vaccinations. The anecdotal evidence is overwhelming when one searches on the internet for reports of vaccine injuries.

A separate argument could be made about the effectiveness of vaccinations. It seems that many who receive vaccinations end up getting infected and sick from what they were trying to prevent, seasonal flu shots are one example. Why must they be compulsory if those who voluntarily get vaccinations are supposed to be protected from those who do not. My opting out is not a violation of someone's inalienable rights. To cite ideas about herd health are invalid arguments. They only prove that vaccinations are less effective than advertised.

There may be some merit to vaccine theory but as of its current application it is an assault on the sovereignty of the body of the individual.

I oppose injecting heavy metals and chemical preservatives into my body or the bodies of my family.

This legislation might not work to increasing the number of people taking vaccines. It will increase the number of parents who opt out of the DOE school system. If this legislation, passes my family will be obligated to homeschool. This is an attack on equality. My child will not have the equal right to public education because the state has taken away the rights of the parent to choose whether or not to vaccinate. It should be unlawful to use tax payer funds for public education and then make it impossible for parents to enjoy their right to public education.

From: [REDACTED]
To: [REDACTED]
Subject: OPPOSE HAR 11-157
Date: Saturday, December 22, 2018 9:40:14 AM

I strongly oppose HAR 11-157. My children have been vaccinated according to the schedule set out by our doctor up until this point but under no circumstances will I allow them to have the HPV vaccine. A vaccine that prevents STD's is a private decision between parents, children and their doctor. The flu vaccine should also be decided upon privately. Vaccines in general should not be required in order to go to school. What goes into my child's body should not be decided by the government.

Sincerely,
Michelle Scotti

Subject: Oppose Mandatory Vaccinations
Date: Saturday, December 22, 2018 7:26:31 AM

I highly oppose mandatory vaccinations.

They are not safe for our children.

I pay lots of taxes and my children have a right to attend public school.

We have a right to choose whether to vaccinate or not.

It is against my religion.

This is America, where we are supposed to have these simple freedoms to live a life of liberty and the pursuit of health and happiness.

No one has a right to force the poisoning of children.

As a mother and health care professional, the state of Hawaii has a duty to ensure the health and well-being of its people. One way to fulfill that duty is through stricter vaccination rules. This is the best way to protect the community.

As a therapist, I have seen how the elderly suffer because of the flu. There is a huge cost upon everyone when the flu hits. A vaccine can help protect the vulnerable and should become a priority.

Alternative health and a distrust in science and evidence-based medicine is very popular but dangerous. This is what's driving the need to reestablish stricter guidelines to keep our community healthy. Fake medicine claims to help people but when someone gets a preventable disease, real medicine is what will alleviate suffering and help one recover.

I am a retired family physician. In my 35 year career with Kaiser Permanente, I was also a professor of family medicine and had teaching appointments at three Southern California Medical Schools. I approved of thousands of childhood immunizations.

I favor some immunizations and acknowledge their effectiveness.

I am opposed to adding more immunizations to the Hawaii childhood regulations.

The child's new immune system is overwhelmed by all these foreign body injections.

In my view, most of the present immunizations are either not very effective or not even necessary. The new ones are even worse. Often times, their side effects are worse than the possibility of acquiring the targeted the disease.

In all cases, the parents should be able to opt out.

My name is Irene Kelly. I am a tax paying resident of Hawaii residing at:
[REDACTED]

I am writing to DOH in STRONG OPPOSITION of HAR 11-157. I would like to submit the following published paper in testimony to support that the HPV vaccine is highly flawed. I am also strongly against the government and the pharmaceutical industry using our children as experimental pawns so that legislators and the pharmaceutical industry can profit.

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4635939/>

Further I am strongly against mandatory medical procedures and firmly believe that if there is a risk there must be a choice. The Vigibase database of the World Health Organization has compiled more than 86,000 serious advert reactions to the HPV vaccine, with over \$5 million paid to families injured by HPV vaccine.

Will the state of Hawaii, DOH and DOE be responsible and liable for injuries caused by this mandate? Injuries that include: nervous system and autoimmune disorders, respiratory disorders, vascular disorders, reproductive system disorders, cardiac disorders, blood and lymphatic system disorders, seizures, paralysis, blindness, pancreatitis, and death!!

HPV is not a communicable disease. Children cannot pass HPV like a cold in school. Plus HPV can take years (10-30 years) to result in cancer which is plenty of time for screening, treatment and prevention. There is nothing wrong with annual pelvic exams. We should be teaching children about reproductive health in school, the value of annual exams and safe sex. Further, my own pediatrician believes this vaccine to be deeply flawed and does not recommend it!! MY DOCTOR!! This important decision should be left to doctors and families.

Again, I and my family strongly oppose the HPV vaccine and refuse to allow my tax dollars to be used to support such an unethical and deeply flawed vaccine and mandatory program in Hawaii.

Regards,
Irene Kelly

To Whom it may concern,
Mandatory vaccination has no place in America. Taking away our rights as to how we protect our children is a clear violation of our rights. You simply can not make something mandatory that has clear evidence to show the potential for very dangerous side effects. I will pull my very healthy child from school before I would expose him to the ridiculous vaccination schedule the pharmaceutical company's have decided upon. I do not think it would be in the best interest of Hawaii's precious Keiki to make vaccination mandatory.
Mahalo for your consideration,
Amy Arnett-Smith

Subject: OPPOSING CH 11-157
Date: Sunday, December 23, 2018 9:15:01 AM

Aloha,

I strongly oppose CH11-157.

First of all, when there is a risk there must be a choice!! There has been numerous vaccine related injuries and even deaths that occurred specifically from the HPV vaccine that you are planning on mandating all 7th graders with this bill. HPV is a SEXUALLY TRANSMITTED DISEASE!!! To require all 7th graders to be vaccinated against HPV is wrong especially given that the nature of this disease is an STD. This is a decision that must and should be made by the parents! Why would a parent want to vaccinate their child if their child is not sexually active especially given the numerous reports of its vaccine injuries from this particular vaccine.

In addition, all vaccines should be a decision made by the parents including flu vaccines and should not be required for preschoolers. Vaccine injuries are a real issue for some parents. Mandating vaccines when there are clear evidence of possible vaccine injuries. Would parents be permitted to sue the state if a vaccine injury occurs and the state policies and regulations force parents to vaccinate? These vaccine injuries vary in severity but can cause permanent health issues, complications for life and even death in severe cases.

Thank you!

From: [REDACTED]
To: [REDACTED]
Subject: Testimony Opposing Proposed Changes to HAR 11-157
Date: Sunday, December 23, 2018 1:17:56 PM

To whom it may concern at the DOH,

I am writing to express my heartfelt opposition to the proposed rule changes to HAR 11-157. As a father and concerned citizen I am also alarmed and disturbed by the general shifting trends in the DOH's approach to vaccination issues which these proposed changes seem to reflect. They strike me as both un-democratic and un-Hawaiian.

I and my family are NOT "anti-vaccination." I and my wife have received immunizations and at this time plan to have our children receive certain shots as well, as and when appropriate. I do not question the fundamental medical science of artificial immunization, nor its ability to spare countless people from life-threatening or truly life-altering diseases such as Smallpox, Polio, and Ebola.

However, we ARE alarmed by the trend toward more and more vaccines being given to younger and younger children for less and less serious diseases, as well as the increasing pressure from pharmaceutical companies to gradually erode patients' fundamental human right to choose and/or refuse medical treatment (ie vaccines), under the guise of "protecting public health" or "promoting the common good"—while the successful efforts by vaccine manufacturers to lobby for the passage of legislation to exempt themselves for liability from injuries caused by their products is particularly disturbing, immoral, and unprecedented (not to mention seemingly hypocritical on some level). Such trends serve only to polarize the debate and side-line legitimate, evidence-based discussion and independent study around vaccinations, while further alienating much of the public and eroding trust in our government entities.

Skepticism and even outright concern regarding the aggressive scheduling, sheer overwhelming quantity, and specific timing of shots currently recommended by the CDC is not in any way a fringe idea. The widespread conflict of interest in the sprawling body of vaccine research is also of concern--again, this is not a "conspiracy theory," but well documented. Some of the recommendations are apparently not even evidence-based--such as administering Hep B starting at birth to ALL babies, despite the fact that Hep B is NOT a childhood illness and is not (according to the CDC themselves) spread by casual contact. Many pro-vaccination doctors have spoken out about their concerns with the CDC recommendations, such as Dr Robert Sears, MD, FAAP, and Dr. Paul Thomas, MD, who have both written whole books that mention these issues, in an attempt to provide parents with the information to make more informed decisions. In his popular book The Vaccine Book, Dr Sears writes that he is pro-vaccine, but also that his is pro-informed consent, and that while he believes most vaccines are indeed safe for most children, there is also an inherent risk with any vaccine (some more than others), and that any doctor who tells you otherwise is lying. Both these doctors have created their own "alternative schedules"--as have countless others--in an attempt to best serve and protect their patients. Such modifications as avoiding giving multiple live vaccines at one time, avoiding giving more than one shot containing aluminum at one time, and delaying certain less critical and/or more problematic shots till a child is older (with a more developed immune system) are common themes. None of these concerns is addressed by the CDC recommendations (in fact, they violate all three of these evidence-based

cautionary principles).

The CDC's blanket, statistically-modeled schedule also makes no allowance for circumstances that greatly affect disease risk (both the individual's risk of contraction, severity of illness, and risk of complications, as well as risk of transmission to others), such as whether a child is breastfed and for how long, whether he/she will be in daycare from infancy or kept at home until school age, family diet and lifestyle habits, and so much more--all of which can have HUGE impacts. Vaccinations are really only a tiny piece of the puzzle when it comes to raising healthy children.

Ultimately, our children are not statistics. Each case is different, and every parent wants the best for their child, and every doctor the best for their patients. And for the reasons mentioned above and others, the science is absolutely not "settled." Nor are all vaccines equally vital to public health or equally safe for the recipients. Therefore medical decisions regarding if, when, and how to administer immunizations should be left to patients (or their parents) in cooperation with their doctor. For the State to use coercion (no matter how well-intentioned), either directly or indirectly, to infringe upon an individual's right to choose or refuse care, is nothing less than a violation of human rights.

Thank you for your serious consideration of these concerns, and your work on our behalf. I wish you and yours health and happiness for the holidays and the new year!

Mahalo nui loa,

Sky Roversi-Deal

From: [REDACTED]
To: [REDACTED]
Subject: Testimony
Date: Sunday, December 23, 2018 7:47:21 PM

I would like to share my testimony in support of vaccinations and maintaining mandatory immunizations as a doctor and parent of a nine-month old.

Vaccinations have been proven to be safe through multiple scientific studies over the past few decades. They protect us from preventable diseases that can kill or seriously impair our children. Antivaccine rhetoric is becoming concerning in Hawaii, and is putting our Hawaii keiki at risk of multiple preventable diseases. Anti-vaccine advocates use inaccurate information and pseudoscience to scare parents who get nervous about the vaccination process. In order for our children to be safe from these diseases, I strongly recommend we adhere to the CDC guidelines for mandatory vaccinations. We have seat belt laws for the same reasons; it benefits our collective health and safety when we all abide by those safety laws and rules. In the case of vaccinations, these laws not only promote our own safety, but also the safety of people around us.

I attended the public hearing in Kailua Kona at the West Hawaii Civic Center on December 20th, 2018. Many of the speakers expressed misinformed views against vaccinations. I was shocked at how many speakers clearly had a financial conflict of interest in testifying against mandatory vaccinations. This presents a clear conflict of interest in their testimony.

For example, one speaker began by promoting her own book. She brought it with her and held it up to promote it to the people in the room or anyone watching the video recording. She subsequently brought up many disproven claims, such as the link between autism and thimerosal, which has shown to be false in multiple studies conducted since 1999.

Another speaker used this platform to promote a group that he leads. He acknowledged that this group is something that he modeled off of Tony Robbins, the self help writer and entertainer with no medical or scientific background. This speaker was moved by Robbins' sentiment that germ theory is not accurate, and that diseases actually come from within. He apparently claims that you can fight disease by changing your mindset. These speakers, and others like them, stand to benefit from the dissemination of inaccurate or false information to promote their own self-interest, and instill unfounded fear in vaccinations and their benefits.

Additionally, there was a doctor that claimed to be putting herself at risk by speaking against mandatory vaccinations. She practices in an area on Hawaii Island which has a growing population of non-vaccinators. Most doctors in the area understand the risk that not vaccinating poses to the greater community, and will not accept nonvaccinators into their practice. The nonvaccinators in this area of Hawaii find themselves in need of a doctor that will see their children despite not having the mandatory vaccinations. Often, these

patients tend to be from more affluent socio-economic backgrounds, and will pay a lot of money to see someone who identifies with their views. Therefore, a doctor willing to accept and promote an anti-vaccine viewpoint would see a direct financial benefit from more patients joining their practice. Again, this demonstrates a clear conflict of interest and goes against all advice of the major medical associations, like the American Association of Pediatrics.

I was unable to stay for all of the speakers at this public hearing and provide my direct testimony. However, I could see that many of these speakers had much to gain from their testimony in supporting their anti-vaccine views. There is great harm that can be done to our community by spreading inaccurate information for personal or other financial gain. This is extremely dangerous to our safety and most of all, our keiki. These conflicts of interest could mean the difference of life or death for some children when it comes to vaccinations.

I would like to acknowledge that I personally have no financial incentives or conflicts of interest in the vaccine argument. I am an optometrist, and I do not administer vaccines. I am solely concerned about the safety of my own child and the children in my community. I strongly believe that the State of Hawaii Department of Health needs to conduct educational sessions to counter the misinformation that is being disseminated by anti-vaccine groups. There have been more and more outbreaks in the State of Hawaii, and we need to prevent outbreaks like the one that occurred in Disneyland in 2014 with measles. Let's not wait until there are preventable deaths that have occurred to take action. I strongly support mandatory vaccinations and immunizations.

Thank you for your time.
Dr. Janet Mitchell, O.D.

To: [REDACTED]
Subject: Opposition of HAR-11-157
Date: Sunday, December 23, 2018 8:05:03 PM

Aloha,

I would like to express my concern regarding the proposal of HAR 11-157. As Hawaii informed consent states, "Where there is a risk, there must be a choice."

I do not feel it is constitutional to **require** parents to vaccinate their children until further studies have been done on the safety of vaccines. Senate Bill 732 before the 103rd Congress of the United States known as the "Comprehensive Child Health Immunization Act of 1993", made known the fact that there are risks to vaccines.

In addition, there are many concerning ingredients in vaccines, such as carcinogens, neurotoxins, animal blood, allergens, and heavy metals. As a follower of Jesus Christ, and a pro-life supporter the biggest concern of additives in vaccines to our family is aborted fetal tissue.

Consequently, I would like to make it clear that I do **not** support HAR 11-157. I believe in the **freedom of choice** when it comes to our children's healthcare.

Respectfully,

Robert R. Fields

Dear folks at the DOH,

I attended the hearing for Kaua'i County on Friday 12/21 for testimony regarding the proposed changes to HAR 11-157. I hoped to help bring some serious concerns regarding the hearing and how it was conducted to your attention.

The room in which the hear was held could only hold 40 people at one time, which was vastly inadequate for the number of people attending (mostly to voice opposition to the rule change, I noticed), as was the time allotted (2 hours), which meant only a fraction of the people who came from all over the island to give spoken testimony were able to do so, while some were never able to enter the building at all. (Nor was there anyone present from the DOH in person listening to testimony that I could see--aside from the facilitator). I would like to give the organizers the benefit of the doubt and assume they were simply caught unprepared for the volume of attendees and/or were limited by scheduling constraints and budget concerns. Because otherwise, unfortunately, one would be more likely to view the entire hearing as a sham and a mockery of the democratic process, as well as an insult to the dozens of people who took time out of their lives on a busy, pre-holiday week to attend and give heartfelt testimony--which I sincerely have to hope was not the intent. However, I noted that many people attending DID quickly make such assumptions, creating a generally tense mood at the hearing of frustration, anger, and cynicism.

Thank you for your time and consideration of this matter, and a very happy holidays.

Sincerely,
Sky Roversi-Deal

I OPPOSE HAR 11-157

From: [REDACTED]
To: [REDACTED]
Subject: HAR 11-157
Date: Sunday, December 23, 2018 9:38:07 PM

I am writing in request to oppose
HAR 11-157.

Parents should always have a choice on the health care of their children, especially when there are risks associated with the treatments being mandated.

I have a friend whose daughter now suffers from frequent seizures after a bad reaction to vaccines.

Some people argue that their kids will be at risk if not everyone is vaccinated. If vaccines are effective, there should be no risk of exposure for the children whose parents have decided to vaccinate.

Thank you for keeping our rights safe as parents. No matter what one believes is best on the vaccine issue, it should always be the parents right to decide what's safest for their children.

Thank you for your time and attention to these matters.

Sincerely,
Emily Gambino

Aloha Kakou

I am hoping you read this testimony, it would have been more respectful for DOH to attend the hearings, make sure all could come that worked, the deciding board come to the hearing and show aloha. This is a violation of human rights. ethical rights and sovereign rights. This is cultural insensitive for many reasons including violating protocols that should be adhered to in the time of Lonoikamakahiki. These are war crimes and we love our keiki.

here is my testimony although I testified in person too.

Subject: Testimony HAR:11-157
Date: Sunday, December 23, 2018 4:52:32 PM

Aloha!

As a mom and resident of Hawaii I would like to express my concerns towards proposed rule changes to include new VACCINE REQUIREMENTS for Hawaii children .

I have come to find that freedom is often an illusion awarded to those who do as they are told. When it comes to vaccines it's exactly what happened.

We trusted governments and doctors and our children started to become more and more sick with autoimmune diseases neurological disorders and started dying.

This isn't about whether or not you are for or against vaccines, this is about having the power to choose.

Here are my reasons why I don't agree with the proposed rule HAR 11-157, why I decided not to continue in vaccination of my son and why I don't consider vaccines as "safe and effective"

1. Vaccines Have Never Been Confirmed To Increase Immunity or Resistance To Disease
<http://www.whale.to/vaccines/antibody.html>

2. Vaccine Manufacturers Refuse To Conduct Any Research To Prove Vaccines Increase Resistance to Disease or Immunity and The Government OKs This Entire Process – so after we learned that vaccines were never proven to make a person more immune to disease in the real world (*because vaccine research only tests antibody response, which doesn't relate to increased immunity*), we asked why this research isn't being done. At that point we discovered that the government themselves along with both science and medicine all block this research from being done because they deem such research unethical.

3. Babies Don't Have Fully Developed Immune Systems Until 1-4 Years After Birth – infants do not have fully developed (*or even close to developed*) immune systems until [between 1-4 years of age](#). ([Baby's Immune System](#))

Baby's Immune System

As with all other organs and systems in the body, a newborn is not born with a fully developed immune system at birth. Rather, their immunity – a protective function consisting of cells, proteins, and

depending on what research is being reviewed. Regardless, all research is firm that no fully active immune system is available inside an infant less than 1 year of age. When we asked our doctor why vaccines were required for newborns, our doctor responded that vaccines were used to increase function of the immune system to help with greater disease resistance. I asked, “*how can a vaccine stimulate an infant’s immune system when no immune system is fully present to stimulate?*”

4. We Actually Read A Vaccine Insert – under the international medical law of informed consent, each patient exposed to a procedure that could kill or permanently injure them, must be given the related documents legally warning of that risk. We weren’t even aware at the time that each vaccine insert legally declares that each and every vaccine can either kill our child (*directly or indirectly*) or that our new born son could be crippled for life from the vaccine, which has never been proven to increase immunity in the real world. We also must remember that government, medicine and science block the research that would clarify if vaccinated people are actually more immune to disease compared to non vaccinated people. So no research exists to prove if the vaccine will increase immunity or resistance to disease in my son plus the vaccine is legally documented to have the potential to kill or permanently injure my daughter. This decision was becoming clear for my husband and I, as we were both more than a little shocked at what we were discovering. In the end we had to ask for the vaccine insert and that request was delayed as much as possible. When we received a vaccine insert it was more than obvious why the international medical law of informed consent was being broken in regards to providing one. If all parents were forced to read one of these inserts, very few would move ahead with vaccination of themselves or their children. Basically, we were now stepping out of discovering that vaccination was unscientific, immoral and unethical but we were also stepping into an area where not forwarding the vaccine insert was in contravention of a well documented international medical law. [Click here to read the vaccine inserts \(FDA Product Approval: View All](#)

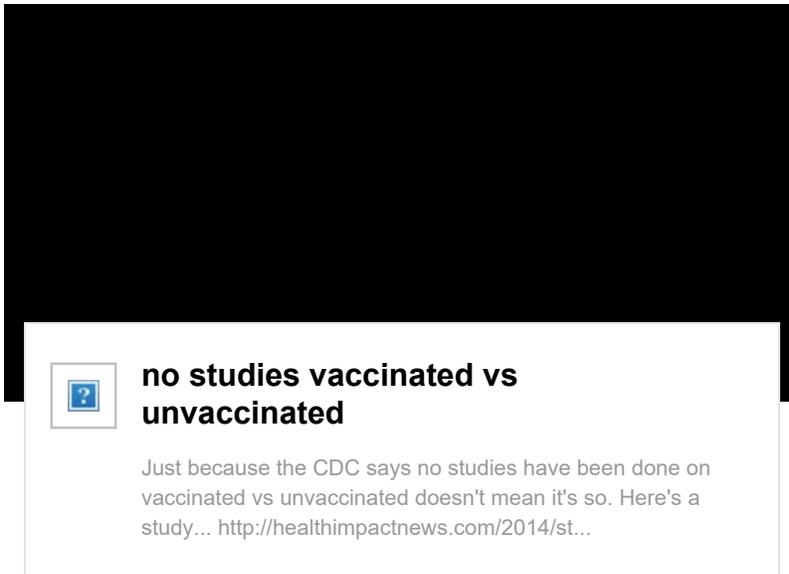

FDA Product Approval: View All

of the vaccines you may be considering.

5. A Blatant Disregard for the Most Basic of Scientific Protocol – it was beyond obvious that pro vaccine science was flying in the face of the most basic and most accepted conventional scientific protocols. For example, in high school we all learned the scientific

method. The scientific method revolves around forming a hypothesis and then testing that hypothesis. Pro vaccine science proposes the hypothesis that vaccinating increases someone's immunity and resistance to disease compared to doing nothing. (*not taking the vaccine*) There's only problem though. As stated earlier, [that research has never been done.](#) ([no studies vaccinated vs unvaccinated](#))

 **no studies vaccinated vs unvaccinated**

Just because the CDC says no studies have been done on vaccinated vs unvaccinated doesn't mean it's so. Here's a study... <http://healthimpactnews.com/2014/st...>

How does this pass as science where I'm supposed to inject my child with an untested vaccine that comes with the side effects death and/or permanent injury? I guess it can pass as science when you don't question your role as patient and your commands from the top of the government or science pyramid but where I'm originally from, that sort of behavior gets you into a whole wack of trouble. As a kid from a rough neighborhood, where the people in power were caught regularly abusing children, I got used to questioning things... especially when government and authority were involved. Science is also supposed to be an unbiased quest for truth but all the negative data on vaccines is being ignored by everyone selling or pushing the vaccines and the appropriate research that should have been done decades ago, is being blocked for reasons that sound official but make little sense. Would it be so hard to study the vaccinated vs the unvaccinated for disease incidence, when people walk in sick every day to hospitals around the world? If someone has the flu at a hospital, how hard would it be to ask, "Did you get the flu shot this year?" Are we really to believe that this sort of research can't be done? I know nurses and they have told me that when there's a flu outbreak declared at the hospital it's well known that every single person in that hospital who has the flu, has taken their flu shot in that current year. Also regarding pro vaccine research, which takes longer to read over in its entirety, the companies conducting the research always were vaccine makers and the government never questioned or reviewed their findings. Claims of research involving "unvaccinated control groups" often documented that the unvaccinated groups were also injected with highly toxic material. It's not scientific on any grounds to allow parties with a vested interest in the research outcomes to conduct the research and of course injecting people with known poisons and calling them the "unvaccinated control group" isn't scientific either. It's corruption. There were red flags all over the place and when it comes to the health of a child, it was starting to become clear that the public were not being told anywhere near the truth regarding vaccination.

6. **Vaccines and Autism** – like everything else along the way, the research showed the

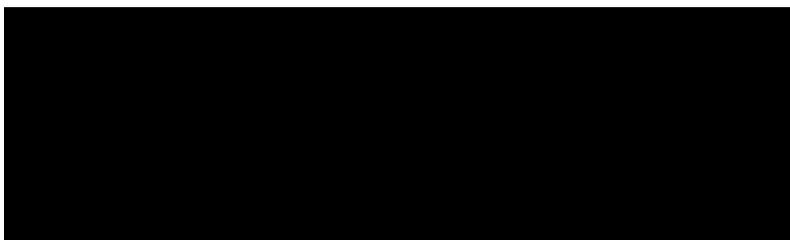

opposite of what we were being told was true. The amount of evidence that vaccines do cause Autism is massive and [I documented most everything I found \(Is There Any Evidence That Vaccines Cause Autism?\)](#)

Is There Any Evidence That Vaccines Cause Autism?

1. Some vaccine inserts have listed Autism and death (SIDS) as occurring to children receiving the vaccination, after the vaccine was approved for use by the public. A vaccine insert is where the truth of the vaccine must be listed legally, in case a

to show my wife and then moved it into papers that I could share with other parents. [Click here to see the evidence I compiled](#) (same link as above) regarding vaccinations having a direct link to Autism. What was also odd is that when I talked to doctors about the vaccine and Autism link, they told me it was unproven. I then asked them if Autism was a form of brain damage and they agreed it was. Then I showed them the vaccine insert I carried with me regarding the side effects of the very common MMR vaccine and I circled every side effect that I believed could cause brain damage. I asked the doctor if the side effects I circled could cause brain damage in a vaccinated child, as a direct side effect of vaccination and they admitted yes it could. If a vaccine can cause brain damage and Autism is brain damage, how can vaccines be proven not to cause Autism just because a doctor calls the damage a different name? After very little research it became obvious that no one selling, producing or administering the vaccines wanted anything to do with our logical questions and wanted to hurry us out of the doctor's office and hurry in the next parent, who would take the vaccinations without question or resistance. The non questioning patient who did exactly as they were told was always welcome. We were not.

7. Medical Doctors and PhD Scientists That Warn About The Dangers of Vaccination – I came across a [long list of medical doctors and PhD scientists \(Medical Doctors and PhD Scientists Speak Out Against Vaccinations\)](#)

Medical Doctors and PhD Scientists Speak Out Against Vaccinations

Below is a list of videos (and some articles) where medical doctors and PhD scientists come forward to discuss the unhealthy effects of vaccines. Each professional presents documented research, facts and statistics to prove, when taken in its' total

who openly try to warn the public about the dangers of vaccination regarding the same exact points I reviewed above plus much more. What is also odd is that no doctor I ran into, who was in favor of vaccination, could do anything but verbally declare that vaccines were safe and effective, that vaccines prevent disease, that vaccines were the greatest invention in the history of health care and that vaccines don't cause Autism. Behind the advertised slogans and catch phrases of conventional vaccine mythology there was no real science to back these claims. So we have people who just utter these magic pro vaccine phrases without scientific validation and then we have this very long list of [medical doctors and scientists](#) who take their time to explain exactly how vaccination isn't safe or effective. So there was the bullying and pressure packed approach of the system that manufacturers, sells and administers the vaccines compared to medical doctors (*with nothing to gain and everything to lose*) taking their time to explain clearly that the public is being lied to about vaccination, on all levels. I may not know everything about vaccination but I know enough to tell the difference between a self serving bully and someone who truly cares about children. That I know for sure.

8. The Place Where They Give The Most Vaccines To Infants Has The Greatest Rate of Infant Deaths In The World – the United States has the most numerous vaccine schedule before the age of 1 in the world, suggesting 26 separate vaccinations. The US has one of the [highest infant mortality](http://healthimpactnews.com/2011/studies-show-that-the-countries-with-the-most-vaccines-have-the-worst-infant-death-rate/) (<http://healthimpactnews.com/2011/studies-show-that-the-countries-with-the-most-vaccines-have-the-worst-infant-death-rate/>)

rates out of all developed nations....DESPITE the highest health budget expenditure on the planet. Inside the US is the state of Mississippi, where vaccines are mandatory save very few exemptions, [Mississippi has the highest infant mortality rates inside the US](http://healthimpactnews.com/2014/mississippi-first-in-infant-vaccination-rates-last-in-infant-mortalities/). (<http://healthimpactnews.com/2014/mississippi-first-in-infant-vaccination-rates-last-in-infant-mortalities/>)

I took statistics in University and although this isn't conclusive regarding the conclusion that it's only the vaccines that are killing infants, it definitely means there's a significant correlation. Taken by itself, these statistics raise a massive red flag. Combine these statistics with everything else I discovered and the big picture comes into focus.

9. MORE THAN HALF A MILLION REPORTED VACCINE INJURIES IS CONSIDERED "RARE?!?!?"

I KNEW that "government" and media were lying to us about the safety of vaccines, but I had no idea just how bad it really is until I decided to do a little investigating.

I went to VAERS: [Search VAERS Database](#)

Search VAERS Database

I located the download links for the "government" data bases of vaccine injuries:

<https://vaers.hhs.gov/data/data>

I clicked on and downloaded the data reports for ALL 25 years listed since VAERS started keeping records. I wrote down all the figures and then totalled them up. MORE THAN 531,000 cases have been reported ... JUST in the U.S.!!!

How many cases are missed (or OVERLOOKED) because the "science professionals," doctors and/or coroners refuse to admit damages caused by vaccines?

HOW CAN OVER HALF A MILLION INJURIES EVER BE CONSIDERED "RARE?"

DO YOUR RESEARCH BEFORE VACCINATING!

Secret Government Database of Vaccine-Damaged Children

Federal Admission of Vaccine Risks:

In 1986, Congress officially acknowledged the reality of vaccine-caused injuries and death by creating and passing The National Childhood Vaccine Injury Act (Public Law 99-660). The safety reform portion of this law requires doctors to provide parents with information about the benefits and risks of childhood vaccines prior to vaccination, and to report vaccine reactions to federal health officials. Doctors are required by law to report suspected cases of vaccine damage. To simplify and centralize this legal requisite, federal health officials established the Vaccine Adverse Event Reporting System (VAERS) -- operated by the Centers for Disease Control and Prevention (CDC), and the Food and Drug Administration (FDA).

[ThinkTwice Global Vaccine Institute: Secret Vaccine Database](#)

ThinkTwice Global Vaccine Institute:

Secret Vaccine Database

THINKTWICE! Vaccine reactions can be avoided. The U.S. government keeps a secret database of several thousand children recently injured or killed by immunizations. Thinktwice!

BREAKING NEWS FROM ITALY:

NO ANTIGENS found in the Infanrix Hexa vaccine, only chemicals.

"With the onset of government vaccine mandates, which suddenly required Italian children to be injected with 11 vaccines to attend school, the Italians are fighting back. First, they voted out the government that pushed for the mandates calling their movement #GovernmentofChange. Then on December 4, the new Italian health minister kicked out all 30 members of the health policy advisory board.

On December 13, Corvelva, a scientific research group, announced it had received €10,000 (US\$11,350) from the Italian National Order of Biologists with plans to use the money to test the contents of every vaccine currently on the market. The result of their first test was released on December 16, and the report is a doozie.

You certainly won't hear this in the MSM.

The first vaccine they thoroughly tested was Infanrix Hexa – a six-in-one vaccine manufactured by GlaxoSmithKline (GSK) that is *supposed* to contain the following antigens: tetanus, diphtheria and pertussis toxoids; inactivated poliomyelitis viral strains 1-2-3; and hepatitis B surface antigen. Shockingly, Corvelva found NONE of these antigens in the vaccine, meaning, that NO antibodies to the intended antigens will be created.

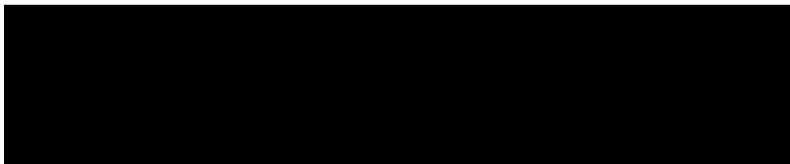

And it gets worse. In addition to no vaccine antigens, they found the following:

traces of 65 chemical cross-contaminants from other manufacturing lines;
chemical toxins;
unrecognizable macromolecules;
various free bacterial peptides that are potential allergens and are capable of inducing autoimmune reactions.

These findings could bring justice to parents who lost their children in 2009 when 36 children died and more than 1,700 were injured in a "clinical trial" – the nice name for human experimentation.

I suspect that as they continue to test each of the vaccines in the childhood schedule, they will find metallic compounds, nanotechnology and a long list of chemical contaminants."

[Vaccinegate: Initial results on Infanrix Hexa chemical composition](#)

Vaccinegate: Initial results on Infanrix Hexa chemical composition

By Staff Corvelva

When we started these analysis, from the metagenomics to the chemical ones, we had a lot of questions and we were only looking for answers... After...

-Dr. Sherri Tenpenny

Hawai'i please don't become the place with the most vaccinated children in US.
Hawai'i please leave parents the right to choose what's the best for their children because everyone is different!

Hawai'i please don't become a Big Pharma poppet.

WHERE THERE IS A RISK THERE HAVE TO BE A CHOICE!!!!

Aloha,

In Hawai'i we are blessed with abundant Sunshine. In Hawai'i we are blessed with abundant pure water. In Hawai'i we are blessed with some of the freshest air on the planet. We are blessed with pleasant weather unmatched the world over. We have a warm fresh Ocean to play in, to enjoy, like Hawaiians of Old. We have so much Fresh healthy food, we are blessed to have the fresh healthy food. We have more and more Organic Farmers, working with Nature, balancing the environment in the soil to bring us food full f Nutrients WITHOUT Toxins. We have an active outdoor life for anyone who chooses to enjoy that. I see all ages enjoying it daily in my time here. There is a trail up from Sunset Beach elementary school, a trail that in some places is VERY Steep, Very Challenging, to the extent that ropes are provided in many places so assist one if needed to prevent falls or slipping in the sometimes muddy conditions. I hike this trail regularly when I am spending time at Sunset Beach. I see children, at time barely past the toddler stage, climbing this trail with wonder coming from their voices and eyes. Excitement, Glee, all the things we want to see in our Keiki. It brings such a smile to my face and heart. All the things I describe here are the makings of Health. They are the makings of Strong Natural Immunity.

Given what I have described above, Why in God's name, Why in the Name of all the God's of old Hawai'i, would we now propose rules forcing deadly Toxins into our most valued Treasure, Our Very Future, Our Keiki?

Health, REAL Health, does NOT come from a Needle. Health, REAL Health, does NOT come from a Pill. It comes from what I described in my first paragraph.

You know, if the History I have read of Hawai'i is accurate, Moneyed Interests Stole this beautiful land from the Hawaiians of Old. Will you let this happen a second time? This time stealing a more valuable treasure than the land, our Keiki

Vaccine Injuries are REAL. Vaccine DEATHS are REAL. The FACT is, since it was created in the Reagan Era, in the 80's I believe, the Vaccine injury Compensation Program has paid out over 4 BILLION Dollars, \$4,000,000,000, in claims for Vaccine Injury and Death. I have heard it said that this is a Fraction of what would have been paid out if all the Vaccine Injuries and Deaths had been taken into account. Let that sink it. I mean really, take a moment and let that sin in...

I will share one Real Life Tragedy, of the thousands that are out there. It is with the HPV

Vaccine given to a young boy. This young boy is now Dead. He was an athlete, an outdoorsman, a bright promising young man with good parents. He is now dead, from a Vaccine given to prevent a cancer that is SO RARE, and So Preventable by what I said in my first paragraph above, that I would classify his death as a Homicide. Why do I say this? Because some of the people who push these vaccines KNOW the problems with Vaccines, and they push them for WHAT?

PROFIT, GREED, SELFISH EGO... Very similar reasons this Beautiful land was stolen from the Old Hawaiians.

Here is the young man's story.

<https://healthimpactnews.com/2018/utah-teen-dies-from-gardasil-vaccine-injuries/>

Utah Teen Dies from Gardasil Vaccine Injuries - Health Impact News

In 2016 we published the story of Colton Berrett, who received the Gardasil HPV vaccine at the age of 13 and became paralyzed from the neck down. We published

healthimpactnews.com

These people who push these Vaccine think they know what is right for everyone. They tell you the Science is IN. You know who's science is in? Their Science. NOT ALL THE SCIENCE. This past fall, an event was organized called "One Conversation". This event was organized so that folks who have serious concerns about vaccines, could get together with folks who favor and push vaccines could sit down and discuss the issue openly and honestly. So ALL the Science could be discussed. NOT just the Science that say Vaccines are Great and Necessary. So there were to be six folks who had concerns and six folks who favored vaccines. It was all set to happen. Well, guess what happened? At the last moment, the folks, Doctors and Researchers who favored vaccines, BACKED OUT? Why? I think it was because they knew they would have to face Facts, Science, that showed the REAL DANGERS of Vaccines. Here is the link to this event, that went on with six empty chairs...

https://oneconversationatatime.com/participants?fbclid=IwAR1M8qSfkPLU_gAw_JKoJzwCu2R0pD7gaoIVzN8reNM1_DcQF_rSqVSuvjM

To whom it may concern,

I am a long time 30 year resident of Hawaii, and raised family here without vaccines and without any adverse effects. I oppose this new recommendation HAR 11-157 becoming law. There is no proof that it has any benefit to anyone, especially young children. You must act responsibly and do not impose this dangerous ruling. There are countless cases of people young and old having severe if not disabling effects from the additives used in making the immunization products. **Let it always be the choice of informed adults and parents to decide what is best for them!**

Sincerely, Steven Line. ([REDACTED] resident, tax payer, and business owner)

Dear DOH:

Please do not be swayed by the testimony of those conspiracy theorists who have shown up at public meetings to demand the cessation of common sense public health measures that protect all of us.

Please adhere to the recommendations and findings of credible institutions such as CDC, NIH, and WHO. Those zealots that would have you halt immunizations of students based on paranoid claims backed by fully discredited “research” are putting the health of all of us at risk. For most citizens, childhood immunizations are a no-brainer, so we have no motivation to show up and mouth off at a public meeting. I’m appalled that so many are getting their misinformation from alternative “news” sources that they can show up en masse at a hearing that most of us didn’t even know was happening and appear to constitute some short of majority of opinion. As public health officials it is your duty to follow the facts and serve the public good regardless of how many nut cases come out of the woodwork to voice their adherence to the nonsense-de-jour.

Thank you.

Hawaii State Department of Health
1250 Punchbowl St.
Honolulu, HI 96813

Dear Dr. Bruce Anderson and Hawaii State Department of Health Staff:

I am writing on behalf of myself, my family, and my community to express unequivocal support for vaccines. I want to strongly support the Hawaii State Department of Health in affirming the importance of mandatory vaccinations, for the following reasons:

- 1. Vaccines protect the health of children and adults and save lives.**
- 2. Vaccines prevent life-threatening diseases, including forms of cancer.**
- 3. Vaccines have been part of the fabric of our society for decades and are one of the most significant medical innovations of the modern era.**

The impact from vaccines improving the health of the planet and our local communities is indisputable. Here are few facts from this incredible and important history of vaccines:

- As a result of the introduction of mass vaccinations, smallpox was declared eradicated from the world in 1977.
- Polio, a disease that routinely afflicted 13,000 to 20,000 Americans every year in the United States before the availability of the vaccine, was officially eliminated from the Western Hemisphere in 1991.

As has been extensively documented and studied by the United Nations and UNICEF, globally, vaccines prevent the deaths of roughly 2.5 million children per year. According to the article “Economic Evaluation of the Routine Childhood Immunization Program in the United States” published in the journal *Pediatrics* in 2009, data shows that just for children born in the United States in 2009, routine childhood immunizations will prevent approximately 42,000 early deaths and 20 million cases of disease with savings of more than \$82 billion in societal costs.

Although vaccines are the safest and most cost-effective way of preventing disease, disability and death, the United States has witnessed outbreaks of vaccine-preventable diseases, as highlighted by the measles outbreak at Disneyland in 2014. We should do everything we can in Hawaii to prevent these vaccine-preventable outbreaks from occurring here

In another example in 2012, **48,277 cases of pertussis** (whooping cough) were reported to the Centers for Disease Control and Prevention (CDC), including 20 pertussis-related deaths, as reported and documented by the CDC. **This was the most reported cases of pertussis since 1955.** In addition, each year, more than 200,000 individuals are hospitalized and 3,000-49,000 deaths occur from influenza-related complications, which could be greatly reduced with increased vaccinations.

Claims that vaccines are unsafe when administered according to expert recommendations have been disproven by a robust and thoroughly researched body of medical literature, including an exhaustive review by the National Academy of Medicine. Delaying or not requiring vaccines only leaves our State and our communities at risk of disease, particularly children. Hawaii State Department of Health should redouble efforts to make needed investments in patient and family education about the importance of vaccines in order to increase the rate of vaccination among all populations.

In conclusion, the Hawaii State Department of Health should vigorously promote and defend the importance of vaccines. The Hawaii State Department of Health should share this message, loudly and clearly:

Vaccines are safe. Vaccines are effective. Vaccines save lives.

Our communities across the state of Hawaii need accurate and detailed information regarding the robust, extensive scientific evidence supporting vaccine safety and effectiveness. Please continue to require and promote vaccinations to keep our beautiful State of Hawaii healthy and safe!

Sincerely,

Joe Roth

Subject: Immunizations update
Date: Monday, December 24, 2018 8:59:31 AM

Thank you for this opportunity to provide testimony. As a community member and public health advocate, I am writing to **strongly support the HAR 11-157 proposed rules update.**

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you for your consideration.

Dr. Lois Gregg

Family Physician, 22 years in [REDACTED]

Hawaii State Department of Health

1250 Punchbowl St.

Honolulu, HI 96813

Dear Dr. Bruce Anderson and Hawaii State Department of Health Staff:

I am writing on behalf of myself, my family, and my community to express unequivocal support for vaccines. I want to strongly support the Hawaii State Department of Health in affirming the importance of mandatory vaccinations, for the following reasons:

- 1. Vaccines protect the health of children and adults and save lives.**
- 2. Vaccines prevent life-threatening diseases, including forms of cancer.**
- 3. Vaccines have been part of the fabric of our society for decades and are one of the most significant medical innovations of the modern era.**

The impact from vaccines improving the health of the planet and our local communities is indisputable. Here are few facts from this incredible and important history of vaccines:

- As a result of the introduction of mass vaccinations, smallpox was declared eradicated from the world in 1977.
- Polio, a disease that routinely afflicted 13,000 to 20,000 Americans every year in the United States before the availability of the vaccine, was officially eliminated from the Western Hemisphere in 1991.

As has been extensively documented and studied by the United Nations and UNICEF, globally, vaccines prevent the deaths of roughly 2.5 million children per year. According to the article “Economic Evaluation of the Routine Childhood Immunization Program in the United States” published in the journal *Pediatrics* in 2009, data shows that just for children born in the United States in 2009, routine childhood immunizations will prevent approximately 42,000 early deaths and 20 million cases of disease with savings of more than \$82 billion in societal costs.

Although vaccines are the safest and most cost-effective way of preventing disease, disability and death, the United States has witnessed outbreaks of vaccine-preventable diseases, as highlighted by the measles outbreak at Disneyland in 2014. We should do everything we can in Hawaii to prevent these vaccine-preventable outbreaks from occurring here

In another example in 2012, **48,277 cases of pertussis** (whooping cough) were reported to the Centers for Disease Control and Prevention (CDC), including 20 pertussis-related deaths, as reported and documented by the CDC. **This was the most reported cases of pertussis since 1955.** In addition, each year, more than 200,000 individuals are hospitalized and 3,000-49,000 deaths occur from influenza-related complications, which could be greatly reduced with increased vaccinations.

Claims that vaccines are unsafe when administered according to expert recommendations have been disproven by a robust and thoroughly researched body of medical literature, including an exhaustive review by the National Academy of Medicine. Delaying or not requiring vaccines only leaves our State and our communities at risk of disease, particularly children. Hawaii State Department of Health should redouble efforts to make needed investments in patient and family education about the importance of vaccines in order to increase the rate of vaccination among all populations.

In conclusion, the Hawaii State Department of Health should vigorously promote and defend the importance of vaccines. The Hawaii State Department of Health should share this message, loudly and clearly:

Vaccines are safe. Vaccines are effective. Vaccines save lives.

Our communities across the state of Hawaii need accurate and detailed information regarding the robust, extensive scientific evidence supporting vaccine safety and effectiveness. Please continue to require and promote vaccinations to keep our beautiful State of Hawaii healthy and safe!

Sincerely,

Henry J. Roth, Ph. D.

To whom it may concern,

As a mother of an unvaccinated toddler I strongly oppose passing a law that makes vaccines mandatory. It is a violation of people's personal and religious beliefs and we live in a country that has separation of church and state.

Here is some of the personal research I have done:

[Vaccines:](#)

Subject: opposition to HAR 11-157
Date: Monday, December 24, 2018 4:36:17 PM

To whom it may concern,

I am writing on behalf of myself, Crystal Dudoit, and my spouse, Frederick Huihui, to oppose HAR 11-157. We are the parents of two healthy, unvaccinated boys. I myself have only had a couple vaccines that my mother thought that I needed for school. She didn't know there was a "religious exemption" or she would have gone that route. I developed asthma after a tetanus shot I received when I was 12, and I'm not the only one who's reported that. But beyond the reported side effects and the lack of scientific research on these effects, I'd like to bring it back to basic human rights.

As parents our job is to keep our children safe. We take our knowledge and beliefs and make the best decisions that we can for our children. There are many beliefs about what safety and health mean. We can't force people to eat fruits and vegetables, even though its good for them. We can't force people to stop drinking and smoking even though it will inevitably lead to a serious illness. We can't force a person who is dying from cancer to do chemotherapy, or any type of therapy. So tell me why we would want to force healthy kids to take a controversial drug, that may or may not have negative side effects, that their parents may or may not approve of?

I respect other parents decisions and I hope that others will respect ours. After all if they immunize their children, then theoretically their children should be "protected" right?

We are free to choose our religion. We are free to choose our own political beliefs. We are free to do with our bodies as we wish. Why should our choice for immunizations for ourselves and our children be any different?

Mahalo

Alicia 'Ilikea Kam
Written Testimony Opposing HAR 11-157
12.24.2018

To the Hawai'i Department of Health,

*Mai ka la hiki a ka la kau
Mai ka ho'oku'i a ka halawai
Mai ka hina kua
Mai ka hina alo
Mai ka 'akau o ka lani*

Aloha mai kakou, my name is Alicia 'Ilikea Kam. I am a parent and an educator as well as a cultural practitioner. I work for the Department of Education and I am deeply concerned about the effects of the DOH making a blanket inclusion of additional vaccinations in the State of Hawai'i education entrance policies.

My first concern is for the health and well-being of my children. There is enough research about the risk of vaccinations yet the majority of our health industry ignores that research for the better good of their businesses such as that of the infamous pharmaceutical companies for example who use non FDA approved equipment, practices and drugs without proper research then issue costly recalls due to malpractice suits and patient deaths. According to HRS 671-3 (1), parents should be given informed consent. Never have I been given proper informed consent as described by law. I have not been provided all of the risks involved in such treatment (vaccinations). I have not been provided with alternatives to such treatment including the benefits of alternative treatments. What I have been given is a piece of paper that I need to read and sign stating that I decline vaccinations which is then kept on file in the doctor's office.

We do not even know what ingredients are used in the vaccinations today. I doubt that the nurses who administer them even know themselves. When

I told a nurse once that I wanted her to check the ingredients for Thimerosal or any related ingredients, she looked at me puzzled because all she had in her hand was a vaccination-filled needle. She did not know what was used as the preservative of the vaccination. She could not tell me what the ingredients were. Don't even get me started on the unstoppable agony and pain a baby experiences when getting a vaccination shot. What about the red solid raised bump around the injection area? Isn't that an allergic reaction to the shot followed by fever and sickness?

My second concern is that as parents and Hawaiians, we are being culturally denied! Less than 20 years ago here in Hawai'i a cultural right of Hawaiian people was vastly denied. All around our state women who gave birth in a hospital were forced to "incinerate" the placentas of their newborns. Whether or not the 'iewe, or placenta really were incinerated is unknown. What is known is that at the time the medical world was denying us a cultural birth right that the most respected elders of our mo'oku'auhau were treated as "medical waste." How dare you call my 'iewe, produced by my own body, which brought forth life, light out of darkness as described in the oldest chant of our people (the Kumulipo)(2). How dare you call my 'iewe containing my DNA and the DNA of my ancestors medical waste! It took many testimonies, oppositions and protests to overturn this policy within our state. It is now allowable to take home your newborn's placenta instead of volunteer it to the hospital. How long will it take until we can parent our keiki the way we feel is fit? How long will it take before the state of Hawai'i allows us to parent by making our own informed medical decisions? How long until this cultural practice is no longer denied to us?

My last concern is the effect this will have on schools. State law and board policy 4140 requires all children age 5 and older to attend public or private schools (there are exceptions for home schooling although all home schooled children are in fact enrolled at public schools under 4140). I will not give my children an additional amount of vaccinations (up to 75 perhaps) to comply to this law and attend school unknowing the result on my child. I know a number of parents who feel the same way. How will the schools react when hundreds of children per school are not attending school? Schools will lose federal funding by count day. School administrators will be cornered into taking parents to court for compulsory

education non compliance. How will the courts react? If I stay home with my children because they are not allowed at school, not only do I suffer financially but so does my family and the school I work at! Have all of these facets even been considered??? This last concern alone can be explored further with many more scenarios that could only result in disaster!

Please consider these points when making a decision.

na‘u me ka mahalo ha‘aha‘a,

Alicia M. ‘Ilikea Kam

Thank you for this opportunity to provide testimony. As a parent and community member I STRONGLY OPPOSE HAR-11-157.

I believe the requirements to mandate the HPV vaccine for 7th graders and the Flu vaccine for all children attending school violates a parent's freedom of choice for healthcare for their children. These two vaccine in particular are controversial. The HPV vaccine protects against a sexual transmitted disease and has nothing to do with school. Children do not have sex in school! In addition, the long term research about this vaccine is conflicting and some of the potential side effects are very serious. It is each family's right to choose to risk those side effects or not. Especially since this is a sexually transmitted disease and can otherwise be prevented.

The same is true for the flu vaccine. This is a controversial vaccine that has been proven to work in 60% of case at best and only 10% at worst. No vaccine is without risk and it should be the family's choice to accept the possible side effects or risk catching the disease, especially with a flawed vaccine such as this one.

I do want to note that our family is not generally against vaccines. All 3 of our children are vaccinated and us parents also receive necessary vaccines. We do strongly believe that it is our choice for our family which vaccines to get when. HAR 11-157 will take that choice away. This is why I strongly OPPOSE.

Thank you for your time,

Katja Bajema

May you have a wonderful day.
Aloha, Katja

Subject: comments on immunization schedule update
Date: Monday, December 24, 2018 3:12:47 PM

Hello,

As much as I understand your desire to update immunization protocols, there are a couple of issues that warrant your consideration in my opinion:

(1) From my perspective the immunization system is not broken, and even if there are now new vaccines recommended, more restrictions on parental choice are not necessary, .

(2) freedom of choice: medical choices are an individual human right not to be dictated by the government. People should always have the ability to opt out, as long as they are aware of the consequences to themselves and others of doing so.

(3) the lack of good research is a real issue: I've read the studies that illustrate that correlation is not causation when it comes to the onset of adverse childhood reactions to vaccines, but in science the precautionary principle should apply. Some people think this means that we should all weigh the risk of getting a serious, even life-threatening illness against the risk of long-term health concerns that arise as a result of vaccinations - and opt for vaccination. But what isn't clear is that there is proof that vaccines are actually safe. Much research has been published showing that they don't appear to directly cause certain diseases or conditions, but as we know, research can only isolate a few variables, and the human body is incredibly complex, so it doesn't seem that any of the research has actually proven that vaccines don't cause harm just because groups of people with and without vaccines appear to have the same prevalence of diseases in the short-term. This is of no comfort to people who not only experience acute adverse reactions or watch their children doing so, but it ignores the potential for negative health affects that might come to be in the long-term. Such a longitudinal analysis is nearly impossible to conduct accurately given how many variations there are among human beings over time, but there are so many relatively new conditions and diseases that we currently don't understand or know how to cure, and as such we have no idea what may be causing them. Because we cannot prove with certainty that vaccinations are not contributing causes to such conditions and diseases, doesn't the precautionary principle apply?

Most people will continue to vaccinate because they are willing to take the risk of adverse immunization effects compared with the impacts of the diseases, and this is fine. And I understand that public health agencies must take a firm stance on this issue in an effort to keep these diseases in check, if not eradicate them. But there is in fact collateral damage, which the federal government knows given the existence of the VAERS system and the millions of dollars in payments made to families to address neurological and other permanent conditions without parents needing to "prove" causation. This may seem to be a small price for society to pay for low disease rates, but that's only easy to say when it's not you or your child. As such, parents deserve the right to decide for themselves what risks they are willing to take. Yes, non-vaccinators do benefit from the safety of herd mentality, which only exists because so many have vaccinated, but choosing to vaccinate is a choice just as choosing to opt out is, and people deserve the right to decide for themselves.

Thank you for accepting public comment on this issue.

Michael Kramer

HAR 11-157, I, Michelle lejeune, **STRONGLY OPPOSE** mandatory vaccines because it causes autism and other autoimmune disorders to our children. Shame on you for trying to propose this law.

From: [REDACTED]
To: [REDACTED]
Subject: Strongly oppose HAR 11-157 proposed new rules.
Date: Monday, December 24, 2018 8:15:37 PM

Aloha,

I am grateful for this opportunity to provide testimony. As a community member and concerned parent, I am writing to strongly oppose the HAR 11-157 proposed rules update.

I write this on Christmas Eve, as it is that important to me and many people I know.

I oppose HAR 11-157 because medical health and freedom is of utmost importance to me. There have been no long term double blind safety studies done on this cocktail of vaccines given to our children. I believe they are more harmful than the diseases they aim to give immunity to. Did you know that the aluminum adjuvant in many vaccines crosses the blood brain barrier and can create heavy metal-induced diseases such as Alzheimer's? I have studied the effects of vaccines for years and am appalled at the lack of awareness and social irresponsibility with which they are associated.

I oppose including early-child-hood centers into this rule, is not acceptable without consent of the early-child-hood centers themselves and parents, to my knowledge none have been informed or been invited into the process of this proposal. It creates extra expenses, training and equipment and enrollment for new children.

I request the attorney of the DOH to legally check if this reporting system in conflict with HIPAA & Family Education Protection Act 20 U.S.C. § 1232g and making schools involuntary break the law by following your current rule.

I oppose HAR 11-157 for being incomplete proposal and by not offering the draft of the standard medical and religious exemption forms. I not accept that DOH decides without public input on their final form and should have been a part of this proposal. They can make needed medical exemptions unnecessary more complicated or easy. We simply don't know, because they are missing.

The HPV that would be compulsory for all 7th graders is especially dangerous and there have been many side effects and deaths associated with it.

I respectfully request that the proposed changes to HAR 11-157 be opposed and request that for further changes on immunization a communication link will be established between the DOH & DOE to inform all schools, teachers, parents and who else will be affected by the change, by informing us about the intentions including a summary of the full implication of the rule change.

Please consider the long term safety and health of our innocent school children.
Vaccines do not give long term immunity, but they do reduce overall health and burden the immune system.

Mahalo,
Maluhia Abhayada

Cc: [REDACTED]; [REDACTED]
Subject: Subject: HAR 11-157, I OPPOSE
Date: Monday, December 24, 2018 2:11:02 PM

Aloha Hawaii Department of Health,

I STRONGLY OPPOSE THE HAR 11-157 PROPOSED RULES UPDATE.
I OPPOSE INCREASING VACCINE REQUIREMENTS.

Vaccinations are a medical procedure which carries risk of serious health consequences including autism, autoimmune disease, seizures, paralysis, and death. GreenMedInfo.com has compiled a document containing over 300 pages of abstracts from peer reviewed journals demonstrating that vaccines are neither as safe nor as effective as their proponents claim. These abstracts cover every vaccine currently mandated by Hawaii law and all of the proposed additional vaccines. Here is a link to the document. gmipub_58635_anti-therapeutic_action_vaccination_all-3.pdf

To bring a human component to this discussion, I offer this video testimony from Brenda and David McDowell, whose three healthy, normally developing 9 month old triplets each became severely autistic within hours of receiving a single dose of pneumococcal vaccine. While correlation does not prove causation, the circumstantial evidence in favor of the vaccine causing this severe decline is enormous and geneticists have told the family it is statistically impossible for this have been caused by genetics alone. Note that the parents received no compensation because they were told they could not sue anyone because they had signed for the shots. By the time the parents learned about the vaccine reporting system, it was past the deadline for reporting an adverse effect. <https://www.naturalnews.com/2018-12-23-triplets-all-become-autistic-within-hours-of-vaccination-see-shocking-video.html>

The proposed rules update would substantially increase the number of vaccinations required in Hawaii, however, there has never been a study done to test the efficacy or safety of the combined vaccines already mandated, let alone a study that includes the additional proposed vaccines.

I OPPOSE INCREASING REQUIREMENTS FOR MEDICAL AND RELIGIOUS EXEMPTION.

'The US Supreme Court has ruled that vaccines are "unavoidably unsafe". Vaccine manufacturers are exempt from liability in the event of adverse reaction to their products. Meanwhile the Vaccine Injury court has paid out over \$3 billion in damages.

The Universal Declaration on Bioethics and Human Rights, adopted by UNESCO October 19, 2005 states:

'Any preventative, diagnostic and therapeutic medical intervention is only to be carried out with the prior, free and informed consent of the person concerned, based on adequate information.'

It is essential that individuals and parents retain the right of refusal for any medical procedure that may damage their or their child's health. Parents and individuals must also have the right to refuse procedures that violate their religious beliefs or conscience.

While this proposed bill seeks to further restrict those rights, the federal HHS has recently established the Conscience and Religious Freedom Division to protect those rights. I would like to see the Hawaii DHS move in the direction of greater protection of individual rights, adding a philosophical exemption to the current medical and religious exemptions.

Thank you,

Shosannah Chantara

Delaying or not requiring vaccines only leaves our State and our communities at risk of disease, particularly children. Hawaii State Department of Health should redouble efforts to make needed investments in patient and family education about the importance of vaccines in order to increase the rate of vaccination among all populations.

In conclusion, the Hawaii State Department of Health should vigorously promote and defend the importance of vaccines. The Hawaii State Department of Health should share this message, loudly and clearly:

Vaccines are safe. Vaccines are effective. Vaccines save lives.

Our communities across the state of Hawaii need accurate and detailed information regarding the robust, extensive scientific evidence supporting vaccine safety and effectiveness. Please continue to require and promote vaccinations to keep our beautiful State of Hawaii healthy and safe!

Sincerely,

Jack Mitchell

December 23, 2018

Hawaii State Department of Health
1250 Punchbowl St.
Honolulu, HI 96813

Dear Dr. Bruce Anderson and Hawaii State Department of Health Staff:

I am writing on behalf of myself, my family, and my community to express unequivocal support for vaccines. I want to strongly support the Hawaii State Department of Health in affirming the importance of mandatory vaccinations, for the following reasons:

- 1. Vaccines protect the health of children and adults and save lives.**
- 2. Vaccines prevent life-threatening diseases, including forms of cancer.**
- 3. Vaccines have been part of the fabric of our society for decades and are one of the most significant medical innovations of the modern era.**

The impact from vaccines improving the health of the planet and our local communities is indisputable. Here are few facts from this incredible and important history of vaccines:

- As a result of the introduction of mass vaccinations, smallpox was declared eradicated from the world in 1977.
- Polio, a disease that routinely afflicted 13,000 to 20,000 Americans every year in the United States before the availability of the vaccine, was officially eliminated from the Western Hemisphere in 1991.

As has been extensively documented and studied by the United Nations and UNICEF, globally, vaccines prevent the deaths of roughly 2.5 million children per year. According to the article “Economic Evaluation of the Routine Childhood Immunization Program in the United States” published in the journal *Pediatrics* in 2009, data shows that just for children born in the United States in 2009, routine childhood immunizations will prevent approximately 42,000 early deaths and 20 million cases of disease with savings of more than \$82 billion in societal costs.

Although vaccines are the safest and most cost-effective way of preventing disease, disability and death, the United States has witnessed outbreaks of vaccine-preventable diseases, as highlighted by the measles outbreak at Disneyland in 2014. We should do everything we can in Hawaii to prevent these vaccine-preventable outbreaks from occurring here

In another example in 2012, **48,277 cases of pertussis**(whooping cough) were reported to the Centers for Disease Control and Prevention (CDC), including 20 pertussis-related deaths, as reported and documented by the CDC. **This was the most reported cases of pertussis since 1955.** In addition, each year, more than 200,000 individuals are hospitalized and 3,000-49,000

deaths occur from influenza-related complications, which could be greatly reduced with increased vaccinations.

Claims that vaccines are unsafe when administered according to expert recommendations have been disproven by a robust and thoroughly researched body of medical literature, including an exhaustive review by the National Academy of Medicine. Delaying or not requiring vaccines only leaves our State and our communities at risk of disease, particularly children. Hawaii State Department of Health should redouble efforts to make needed investments in patient and family education about the importance of vaccines in order to increase the rate of vaccination among all populations.

In conclusion, the Hawaii State Department of Health should vigorously promote and defend the importance of vaccines. The Hawaii State Department of Health should share this message, loudly and clearly:

Vaccines are safe. Vaccines are effective. Vaccines save lives.

Our communities across the state of Hawaii need accurate and detailed information regarding the robust, extensive scientific evidence supporting vaccine safety and effectiveness. Please continue to require and promote vaccinations to keep our beautiful State of Hawaii healthy and safe!

Sincerely,

Mary Sanchez

Date: Monday, December 24, 2018 3:03:30 PM

ALOHA

Thank you for reading my testimony.

I am strongly opposed to the proposed rule changes to HR 11-157.

As a religious leader in this community I have witnessed adverse effects following the immunization of some children here. There are many studies out now questioning the safety as well as the efficacy of these immunizations, as well as whether they are causing negative side-effects.

Please do not force families to be required to have their children immunized. If there's even a question about these immunizations being unsafe and possibly causing harm, then parents must have the choice to immunize or not.

I speak for the community and my grandchildren here on Maui.

Thank you,
Reverend Bodhi Be

Showing Up For Death Nourishing Life

Subject: HAR 11-157
Date: Monday, December 24, 2018 12:29:23 PM

To the Disease Outbreak Control Division,
To the Department of Health,
To the Humans working for the public's well-being,

I strongly oppose HAR 11-157.

I also orally testified at the Kaua'i public hearing on Dec. 21, 2018 strongly opposing HAR 11-157.

I strongly oppose any proposal of rules taking away the right to autonomy.

This is a violation of human rights and constitutional rights.

How do you continue to bulldoze over known and said violations?

The public hearings are for YOU to hear what the public opinions are to help YOU gather what the public needs are.

It is very clear that the public says NO to HAR 11-157 throughout the entire Hawaiian islands. It is NOT OK to continue to ignore DEATHS and BAD OUTCOMES from vaccines received in human bodies.

We are not experiments, samples nor robots to test how vaccines are effective or not.

One death is enough to acknowledge vaccines are not safe.

One bad outcome is enough to acknowledge vaccines are not safe.

It is not about scientific proof, the deaths has occurred, the bad outcomes have occurred.

Very clear.

The many bad outcomes the families have had to deal with, it is their experience that matters and speaks the loudest and most clearly that deaths and bad outcomes have occurred and that they have chosen after the bad outcome in one or more of their children that they have decided not to vaccinate the others, showing the grand difference in a healthy NORMAL child versus a dead child/mentally disabled child.

You cannot take away choice.

It is the parent's choice through thorough informed consent that they choose to vaccinate or not, their children who THEY care for for 24/7.

The government shall not mandate vaccines into any human being, ever.

Please educate yourself and others with some of the resources provided here for you.

1. The literature demonstrates clearly negative impacts of aluminum on the nervous system across the age span:

[Immunol Res](#). 2013 Jul;56(2-3):304-16. doi: 10.1007/s12026-013-8403-1.

Aluminum in the central nervous system (CNS): toxicity in humans and animals, vaccine adjuvants, and autoimmunity.

[Shaw CA](#)¹, [Tomljenovic L](#).

2. Science: Increase in cancer cases as a consequence of eliminating febrile infectious

diseases:

https://www.wanttoknow.info/health/cancer_link_vaccination_fever_research.pdf

3. Vaccines manufactured in human fetal cell lines contain unacceptably high levels of fetal DNA fragment contaminants. The human genome naturally contains regions that are susceptible to double strand break formation and DNA insertional mutagenesis. The "Wakefield Scare" created a natural experiment that may demonstrate a causal relationship between fetal cell-line manufactured vaccines and ASD prevalence:

[Issues Law Med](#). 2015 Spring;30(1):47-70.

Epidemiologic and Molecular Relationship Between Vaccine Manufacture and Autism Spectrum Disorder (ASD) Prevalence.

[Deisher TA](#), [Doan NV](#), [Koyama K](#), [Bwabye S](#).

And we/you very much know that the vaccinated people are the carriers of the specific viruses they have been vaccinated for since the “immune system has created antibodies against that virus to circulate in that body” they can tolerate being carriers of the virus.

*The solution is for the government to apply support/fund/access to build healthier soils, eat fresh garden vegetables, have clean water, exercise, educate how to prepare home remedies to keep the immune system healthy and strong, to stay home if the child is sick, to stay home if a parent is sick, to offer genuine help to families who are sick, to cover healthcare costs.

A healthy happy community will build everlasting support to the government that helps out the people who make up the community!

Thank you for this opportunity to provide testimony.
As a former school teacher for children with severe disabilities, mom and community member,
I OPPOSE THE PROPOSED RULE CHANGES HAR 11-157.

I am opposed to mandatory vaccines and over regulation for school children. I have met many children whose condition was caused or made worse by vaccinations. I believe that it is a parent's right to choose whether or not they want their children to be vaccinated.

I am also concerned that the requirements to report on children who aren't vaccinated does not comply with privacy laws (The Family Educational Rights and Privacy Act (FERPA), *20 U.S.C. § 1232g, requires written parental consent before personally identifiable information from your child's education records is disclosed to the health department.* & HIPPA) in our schools and I miss the draft for new standardized medical & religious exemption forms are not part of this proposal, even so they very important part of the process and need to be discussed with professionals and public.

At this point, there is not enough evidence to prove that vaccines are safe for all children and especially for this population demographic. There is no one fits all solution. Informed consent, medical freedom are very important for this country and its people.

There is a huge list of potential side effects that may come from vaccinations. In fact, there is even a special court known as vaccine court created to handle issues with side effects and damages to children.

Toxic ingredients are allowed to be added to vaccinations without any responsibility on the part of the vaccine companies. The rules for safety in vaccines are almost non-existent.

For these reasons and many more, I strongly oppose bill 11-157 requiring mandatory vaccinations for school children. Parents need choices on what's best for their kids!

Sincerely,
Kamala Knudsen, Kauai

I am writing to oppose HAR 11-157 for reasons these additional changes impose our community more mandately immunization and takes away our choice to not to immunize our children. I have worked with children with autism in public school system for over 10 years and I have been exposed to testimony from parents of autistic children stating strong link of immunization and autism. This experience led me to deeper research of immunization and autism link and have learned that certain heavy metals such as Mercury are used in vaccine as ingredients. There are more harmful toxic ingredients in vaccines that I do not choose to put in my child body. Immunization should remain to be personal choice and I strongly oppose HAR 11-157.

Aloha...

I strongly Oppose HAR 11-157.

As a physician specializing in integrative medicine I have had the great fortune to serve young people for decades that have had been adversely affected by vaccines.

In 2007 I had 2 high school girls neurologically impaired within 24 hours of receiving the HPV vaccine.

I can tell more stories... hundreds.... but I will save you the agony of sifting through the details. Please reconsider these new standards.

Thank you as you have my support to oppose the HAR 11-157.

Subject: I oppose strongly HAR 11-157
Date: Tuesday, December 25, 2018 4:10:26 PM

Thank you for this opportunity to provide testimony. As a community member of the island of [REDACTED], and human rights advocate, graphic designer, doula, founder of a former pre school coop and a mom.

I spend my last holiday month informing people about this rule change and explaining its implications in balanced view as possible. I talked to moms, dads, nurses, midwives, child care center directors, school principals and nurses people of this and other islands that vaccinate, selectively vaccinate, not vaccinate at all and experienced vaccine injuries.

I speaking for myself and also will reflect my over all impressions from discussing this rule change. I am not a anti-vaxxer, I am pro choice, for informed consent and balanced communication. I come from a family of nurses and medical professionals and able to read scientific studies and papers in certain areas that i was taught on and taught myself, nerveless I am not calling myself a medical professional, and inviting balanced talk from all sides with open hearts and ears.

I am writing to **strongly oppose the HAR 11-157 proposed rules update.**

I oppose HAR 11-157

1. for being a incomplete proposal, by not offering the draft of the standard medical and religious exemption forms. I not accept that DOH assumes power to decide without public input on their final form and the drafts should have been a part of this proposal. Medical exemptions can be made unnecessary more complicated or beneficial. We the public simply don't know, because they are missing.

I oppose HAR 11-157-2 definitions:

1. extending the rules to child hood center, to any early child hood center I spoke, was not aware of this at all. Who got even informed on this? , especially for smaller businesses this will change alot, incl the enrollment procedure and the reporting security, training and equipment needed. Some where worried it will alter the amount of kids that will enroll in future and open gates to more unprofessional child care solutions.
2. Blanket adopting the "ACIP's - General best practice guidelines for immunization" and its further amendments as as part to our rule and let go of the freedom and independence as a State of Hawaii to compile our own Guidelines.

I oppose HAR 11-157-6.4 Reporting

1. I request the general attorney of the DOH to legally check if this already done reporting system in conflict with HIPAA & Family Education Protection Act 20 U.S.C. § 1232g and making schools involuntary break the law by following your current rule and either pause the reporting with names and change to pure statistics or and offer options for parents a. to be informed and b to opt out or in.
2. No parent that filed for medical or religious exemption with a child in the DOE schools to my knowledge can recall to sign or had any option to agree or disagree with the consent that the school will be reporting their children's names, The Family Educational Rights and Privacy Act (FERPA), 20 U.S.C. § 1232g, requires written parental consent before personally identifiable information from your child's education records is disclosed to the health department. In fact most thought that was a new addition to the rule, because they did not know that their schools already doing this including me.
3. Informed Choice is already mandated by the State of Hawaii and is failing to be abided by many healthcare practitioners. Healthcare Practitioners must give an informed choice, that includes speaking about the alternatives to the procedure that they are using. Vaccines need to by law show both sides.

I oppose HAR 11-157 Exhibit A,

1. The added six vaccines (baby-college) are NOT tested with the Hawaii diverse demographic in mind and will over regulate our school requirements from 5 vaccines to 9 vaccines (k-12) and as one example adds HPV as a requirement, making us one of the most regulated states in all USA. Safety & Risk assessment needs to be done first. For example, HPV been taken out of Japans requirements for 5 years due to many adverse reactions. <https://www.hpv-yakugai.net/2018/06/29/5years-english/>
2. The time frame was to short for me to look deeper from both sides into the other six vaccines or current regulated once that may need a update.
3. The proposed rules update is especially disturbing for students first entering 7th grade or higher to receive the HPV. This is especially true for the HPV vaccine which may prevents HPV-related cancers and spread not in school, with that is not a school measure and should stat a choice for parents and thier teenager to make.

I oppose HAR 11-157 Exhibit B

- Please keep in mind we do have many ethnics reside on these islands, and safety studies, to my knowledge and research ACIP guidelines where never designed or tested for this unique demographic. There is no one fits all solution.
- I oppose to Exhibit B, blanket adopting the “best practice guidelines for Immunization”

We all must revisit the safety, health benefit and risk balance here

No vaccine is 100% effective for everyone and not everyone can handle the same amount of vaccination. Additional vaccination needs to stay a choice a parent, guided with respect by their Pediatrician/MD/ND/RN....

The medical community is urged to offer informed consent. Parents & Patient should

be given opportunity to ask questions and clarify all doubts. There must not be any kind of coercion. Consent must be voluntary, and patient should have the freedom to revoke the consent. Consent given under fear of injury/intimidation, misconception or misrepresentation of facts can be held invalid.

The process of the public hearing and your efforts of informing the people of Hawaii been unacceptable. Initially DOH Hawaii planed only one public hearing, with outside pressure you extended the meeting to the outer islands. The timings often excluded teacher, educators, small business child care center to attend, beside it was already heart for parents in one for many very special holiday times. On top of that no key decision maker was present, you ignored the petition delivered to you before the Maui hearing, a request from the public and we were told that you will review the hours of testimony using the transcript. Please explain this process.

I missed the effort to inform the public and any PR to this issue from your side was not explaining all the implication and selling it as a harmless little update to what? Most states do not have 9 vaccines as requirement, especially not HPV (only 3 do as of November 2018) California as comparison has only 5 vaccines required. Their problem is the difficult medical exemption and loss of religious exemption. I urge you to study what that meant for California. For me this is a wolf in a sheepskin, a Trojan. Also I request to consider all testimonies as valid even so they thought its about mandatory vaccination which equals taken the exemption away, because you did not inform the public in detail. Also many know, and so I had to learn in the last month, that the DOH tried to take it away in the past via legislation and also its clear that you would prefer it, after reviewing the interviews of Dr.Park and HIC intentions.

I request to invite open communication and informed consent with the next approach, and invite Parents, Schools and any one affected with an letter about your approach.

Please check if you received my first testimonial (nov 26), i never revived a confirmation. This is my follow up to my oral testimony on Kaua'i that I could hardly finish within 2 min.

I hope you open up a opportunity offering a open heart to the people of Hawaii that experienced vaccine injuries, and how the process was is for them, and for to how many did had to go through a hell for not being accepted as a vaccine injury and had to report to VEARS themselves, even so their once healthy child has now a diagnose for autism spectrum or other diagnoses of chronic illnesses and autoimmune disorders and the timing of the change is very clearly documented, with this behavior of the medical community is breaking their own oath, to nor harm the people. which seems to be a result of not being educated on this issue but being educated rather how to deal with vaccine denier, in a way to keep them out. Senator Russell Ruderman explained the process well in his testimony, its not uncommon. I know one thing as a mom and assisting moms with their birth and children, they do know their babies and they need to be listened to and not ignored or talked down. If you want truth about this, create a better reporting system and demand your

professionals to use VEARS and a local system and ability to recognize adverse events to see what really is going on. Hawaii is not the mainland. I have upmost respect for the medical community over all, and I hope in future we can foster a balanced communication and strife away to create a black and white situation.. all or nothing. The truth for me is in the middle, and all sides need to open up and have a discussion on it. We are the best vaccinated state as HIC sais. So why we need to force down a huge update. We all will be watching all the rule changes and legislation form this time on closely.

I respectfully request that the proposed changes to HAR 11-157 be opposed and request that for further changes on immunization a communication link will be established between the DOH & DOE to inform all schools, teachers, parents and who else will be affected by the change, by informing us about the intentions including a summary of the full implication of the rule change. Also to create a essay to any rule change to explain the details for the public to translate the intentions, implications and changes.

Merry Christmas to you all

Date: Tuesday, December 25, 2018 8:11:33 AM

Aloha,

I represent myself, Neal Chantara, a father of 3, now adult, very healthy children, all unvaccinated.

I choose not to receive flu shots nor any other such things.

My wife and I extensively researched the pros and cons of vaccinating 30 years ago and made the decision not to vaccinate for very good reasons.

From what I have loosely followed over the years, vaccinations seem to only be getting worse. We now know there is mercury in many of them and the vaccination to autism connection is statistically significant.

If the vaccinations really work, why are those vaccinated afraid of others not receiving the vaccine?

Regardless, I strongly believe we have the freedom and God given right to choose for ourselves and our young children.

Many thanks,
Neal Chantara

Subject: Oppose Mandatory Vaccinations Until There is Mandatory Disclosure
Date: Tuesday, December 25, 2018 3:18:36 PM

TWIMC:

Oppose mandatory vaccinations until there is authentic mandatory disclosure.
I am a board certified internist licensed to practice medicine in Hawaii.

In these current shameful times of rampant corruption in business, government, health care, science, media, education, and law enforcement I am unable to support new mandates for vaccination until there is proven reliable science to support such mandates. Also necessary would be public accountability and support for the consequences, intended and unintended, of such mandates. When honesty, accountability, transparency, life, people, and the planet finally become more important than money, then maybe we will be able to make informed decisions based on truth and not based on biased toxic profiteering.

Stop poisoning my patients from the toxic air, water, food, clothing, shelter, communication (5G), and health practices that currently dominate our American deathstyle. Human experimentation without consent are War Crimes. Everyone involved in promotion, implementation, and profiteering from this toxic deathstyle will be held personally and financially responsible for all harms inflicted.

Thank you for your very kind attention.

Joseph Kohn MD

HAR-11-157

Tuesday, December 25, 2018 8:33:56 PM

My name is Jessica Penner and I strongly oppose HAR-11-157.

I was born and raised on ██████████, and I am a mother of 3. I am here to advocate for the health of our children. This includes limiting their exposure to *any* toxic chemicals including the ones present in vaccines.

This rule doubles the number of vaccines required for our children to enter school.

Growing up on Kauai in the 80's and 90's, I can recall less than a handful of peers that had any type of serious or chronic issue.

Fast forward to today and I could stand here and testify all day long about all the people I know and their very real and debilitating health issues.

Is this all in my head? Or are we really sicker than ever?

Let's look at the facts.

We in the US spend over 10k per person per year on healthcare. This is twice as much all other developed nations.

<https://www.healthsystemtracker.org/chart-collection/health-spending-u-s-compare-countries/#item-start>

Despite this fact: According to the CDC and AAP:

60% of all US adults have one chronic health condition and 40% have two or more.

<https://www.cdc.gov/chronicdisease/pdf/nccdphp-overview-508.pdf>

As of 2011: 54% of all children in the US have a chronic health condition such as Asthma, Eczema, Hay Fever, Life threatening food allergy, celiac disease, obesity, diabetes, autism, ADHD, learning disability, or severe mental health issues.

<https://www.academicpedsjnl.net/article/S1876-2859%2810%2900250-0/abstract>

1 in 6 children has a developmental disability, and 13% of our children now require special education.

<https://nces.ed.gov/fastfacts/display.asp?id=64>

The CDC will tell you that they don't know what is driving these chronic conditions, but that they are sure it's NOT VACCINES.

Can we trust them though?

Members of the CDC and ACIP (the people who decide which vaccines become mandated) can and do individually own or share ownership in over 50 vaccine patents.

Here is what ACIP member at the time Dr. Paul Offit had to say when asked about his potential conflict of interest in 1999:

"I am a co-holder of a patent for a (rotavirus) vaccine. If this vaccine were to become a routinely recommended, I would make money off of that," Offit said. "When I review safety data, am I biased? That answer is really easy: absolutely not."

Well, rights to Dr. Offit's Rotavirus vaccine were sold in 2009 for 182 million dollars. Estimates of the money he received for this sale are between 29 and 42 MILLION dollars.

Rotavirus IS ONE OF THE NEW VACCINES REQUIRED FOR OUR KIDS DUE TO THIS RULE CHANGE. (show Exhibit A)

<https://www.ageofautism.com/2009/02/voting-himself-rich-cdc-vaccine-adviser-made-29-million-or-more-after-using-role-to-create-market.html>

But that's not even the worst information I'm presenting today.

The national childhood vaccine injury act of 1986 removed all liability from vaccine manufacturers and tasked Health and Human Services with the sole responsibility of ensuring vaccine safety. This law also stipulated that HHS file reports every two years documenting their efforts on vaccine safety and reducing adverse events.

Did you know that HHS was recently sued for access to these reports and lost? They conceded **that they have NEVER, NOT ONCE IN 31 YEARS** done a safety study OR reported to the Senate on their efforts regarding vaccine safety. **The are in direct violation of the law.**

This fact alone is enough to invalidate their demand on us to vaccinate.

<https://www.upi.com/UPI-Investigates-The-vaccine-conflict/44221058841736/#ixzz5aG0jNgwt>

<http://www.lawfirms.com/resources/environment/environment-health/cdc-members-own-more-50-patents-connected-vaccinations>

Global vaccine revenues have gone from hundreds of millions in the 80's to over 32.2 Billion in 2014. And expected to almost double to nearly 60 billion dollars by 2020.

<https://www.statista.com/statistics/265102/revenues-in-the-global-vaccine-market/>

Pharmaceutical companies are the most powerful lobbying group in the united states and have spent over 4 Billion dollars persuading our politicians to enact favorable legislation. They spend 50% more money than the next most powerful lobbying group - the insurance industry.

And they outspend oil and gas 2 to 1.

<https://www.opensecrets.org/lobby/top.php?indexType=i>

Our government has a history of failing to protect us from high profit industry. Big Lead, Big Oil, Big Ag, Big Tobacco, Big Pharma... this situation is unfortunately just another chapter of the same old story.

We as parents are the last line of our children's defense. Do not make us choose between more vaccines or the free education granted to us by the United States constitution.

To force this on us or take away our rights as citizens is coercion, harassment, and persecution. It is just plain wrong.

December 25th 2018

Christmas Day eve

Testimony in regards to *HAR 11-157 Immunization and Examination*

There is no human right more fundamental than the freedom to think rationally and follow our conscience when making a decision whether to risk our life or the lives of our children for any reason.

The Bill of Rights in the US constitution makes it clear that the respect for the natural rights of individuals limits the power of the state. As Thomas Jefferson put it “minorities possess their equal rights which equal laws must protect and to violate would be oppression”.

Unequal vaccine risk is a burden on vulnerable children in the name of public health.

There are only two laws that ask American citizens to risk their lives.

- 1) Federal law - the military draft. Requires all healthy adult males to risk their lives in a war declared by the government to protect National security. Adults objected to a war for religious beliefs or conscience can obtain a conscientious objection exemption without being punished.
- 2) State law- Requires all healthy children to risk their lives in a war doctors declared on microbes more than two centuries ago. But unlike adults who are not punished for following their conscience in refusing to fight in a war to protect national security. Parents can be punished for following their conscience and refusing to risk their children’s lives in a war to theoretically protect public health.

State Sanctions include- Segregation, loss of the unvaccinated child right to public school, permitting pediatricians to deny medical care to children who have not received one or more vaccines.

These two different laws require healthy US citizens to risk injury or death.

One conscripting adults in what governments clearly defines as an emergency military action, the other conscripting children in the mandatory vaccine program that is not defined as an emergency military action but is treated like one.

No two children are alike I am sure we agree. Vaccine risks are not shared equally by all. Some children are more at risk than others. Either biologically, genetically or environmentally at risk to be killed or damaged by vaccines. Please do not sweep this inconvenient truth under the rug. In 1987- congress gave doctors the broad liability shield (similar to the one congress gave Vaccine Manufactures in 1986), to protect them from a broad range (most) of vaccine injury lawsuits. Doctors don’t have to worry about getting sued for being militant enforcers of vaccines.

There should be limits placed on the authority that public health officials and their physician’s colleges exercise in a constitutional democracy. They should not be given unchecked power to

order parents to play vaccine roulette with their child's lives and punish them for refusing to obey that order.

Laws that fail to respect biodiversity and force parents to risk their children's lives in a war that they cannot refuse to fight without being punished are not American in nature.

Science that cannot be ignored:

1) Sun Yat-sen University's (In the top 10 universities in China) Dr. Zhibin Yao American-educated (University of Pittsburgh) and the author of 33 peer-reviewed studies, but he's also the lead author of the three most important biological studies ever done analyzing how, exactly, the Hepatitis B vaccine can cause autism. In 2015, Dr. Yao was the lead author of "[Neonatal vaccination with bacillus Calmette-Guérin and hepatitis B vaccines modulates hippocampal synaptic plasticity in rats](#)," the first study that ever looked at the impact ANY vaccine might have on the brains of rats.

Dr. Zhibin's did 3 studies with the Hep B vaccine.

2015- This is the first study to test the effects of immune activation by vaccination on brain development. All other studies of immune activation have used essentially pathological conditions that mimic infection and induce a strong fever. A criticism I have heard often from vaccine advocates is that the immune activation experiments are not relevant to vaccines because vaccines cause a milder immune activation than injections of poly-IC or lipopolysaccharide (two types of immune system activators). This new study demonstrates that vaccines can affect brain development via immune activation. Hence, the immune activation experiments are relevant to vaccines...The hep B vaccine increased IL-6 in the hippocampus (the only brain region analyzed for cytokines).

2016 - "This work reveals for the first time that early HBV vaccination induces impairments in behavior and hippocampal neurogenesis. This work provides innovative data supporting the long suspected potential association of HBV with certain neuropsychiatric disorders such as autism and multiple sclerosis."

2018- "These findings suggest that clinical events involving neonatal IL-4 over-exposure, including neonatal hepatitis B vaccination and asthma in human infants, may have adverse effects on neurobehavioral development."

Above can be referenced to: <https://jbhandleyblog.com/home/hepatitsb2018>

Please see Exhibit 1

I say to myself "this is just one vaccine being researched, there are so many more" but "no other research about them is yet available like this one". I would say that would leave me skeptical about its true safety.

Definition of safety from the Merriam Webster's dictionary- the condition of being safe from undergoing or causing hurt, injury, or loss.

The insert in every vaccine administered contradicts the above definition of safety.

You CANNOT say vaccines are SAFE!

Please also see

Exhibit 2 Vaccine Safety

Exhibit 3 Peer Review

- 2) STAFFORDSHIRE, England—In early December 2017, [Dr. Chris Exley of Keele University](#) in England and his colleagues published a paper that for the first time looked at the brain tissue of subjects with autism to determine the level of aluminum (note: they spell “aluminum” as “aluminium” in the United Kingdom) found within their brain tissue. For anyone trying to convince the world that “the science is settled and vaccines don’t cause autism,” the study’s findings are deeply contradictory to that statement. In a [blog post](#) written by Professor Exley on the day his study was published, he explained the groundbreaking results:

“...while the aluminium content of each of the 5 brains [of people with autism] was shockingly high it was the location of the aluminium in the brain tissue which served as the standout observation...The new evidence strongly suggests that aluminium is entering the brain in ASD [autism spectrum disorders] via pro-inflammatory cells which have become loaded up with aluminium in the blood and/or lymph, much as has been [demonstrated](#) for monocytes at injection sites for vaccines including aluminium adjuvants.”

Dr. Exley’s study — [“Aluminium in brain tissue and autism”](#) — is the final piece of a puzzle that first started to come together in 2004, and picked up steam since 2010, that has dramatically furthered the scientific understanding of exactly how a vaccine can trigger autism. This timeline is critical to recognize, because the Vaccine Court in the United States dismissed the vaccine-autism hypothesis in 2009, long before most of what I’m about to explain even existed. Science is a continuum, an emergence of truth through many different studies that often have to be pieced together before the picture becomes clear. And, scientific progress can sometimes move slowly until that moment when an emerging truth presents itself in such a way that it can no longer be denied.

Mystifyingly, aluminum has never experienced biological testing to consider its safety for being injected into babies, having been “grandfathered” into our modern safety standards. Canadian scientists Dr. Chris Shaw and Dr. Lucija Tomljenovic addressed this omission in a critical study they published in 2011 in *Current Medicinal Chemistry* titled, “Aluminum Vaccine Adjuvants: Are they Safe?” They wrote:

*“Aluminum is an experimentally demonstrated neurotoxin and the most commonly used vaccine adjuvant. Despite almost 90 years of widespread use of aluminum adjuvants, medical science’s understanding about their mechanisms of action is still remarkably poor. There is also a concerning scarcity of data on toxicology and pharmacokinetics of these compounds. **In spite of this, the notion that aluminum in vaccines is safe appears to be widely accepted.** Experimental research, however, clearly shows that aluminum adjuvants have a potential to induce serious immunological disorders in humans. In particular, aluminum in adjuvant form carries a risk for autoimmunity, long-term brain inflammation and associated neurological complications and may thus have profound and widespread adverse health consequences.”*

Please see Exhibit 5 Mitkus

Science is NEVER closed!!

Science is forever on going and those of us who doubt and question are the very reason why science gets better!

The US vaccinates the most out of the top developed countries in the world- Yet we have the highest rate of SIDS, Autism, maternal death and we have a seriously sick young population. Something is wrong!

It is your duty to review this science!!

Prove to Kauai that you are really questioning these injections and how they are affecting our Children's bodies!

Regarding the actual public hearing on 12/21/2018. The time, date, and capacity of the room brings suspicion that this mandate is being passed through without true openness and notification to the public. There was NOT enough seating, nor a TV supplied so those of us waiting outside. There were just as many people outside as there were inside and we could NOT be part of the "Public hearing". We had to wait in the blazing hot sun for over 90 min with no idea of what was being discussed inside. The one government official that did attend the hearing gave ample notice to the DOH that there was going to be a large turnout of people. The room provided could hold max 40 people! There was no shown effort to make accommodations available, it actually looked like it was purposeful... This did not go unnoticed but those who attended nor by those not able to make the hearing due to the heat of the holidays, also noted.

The DOH has not conducted/provided safety reports about vaccines to congress for over 30 years, why would we trust your mandates? Either they have been lazy or are hiding information from the public.

There is no liability by the vaccine manufacturers who create these products or liability for doctors administering them. If my child or myself is injured or killed by a vaccine no one is held liable for its damage. Why would I trust an entity with no incentive to provide a safe product??

There is ample hard science that PROVES that vaccines are causing BRAIN DAMAGE and are causing autism and an assortment of other ailments. This science is growing and will be most available in countries other than the US (which is gaged by big pharma).

All around us there are more and children who become autistic, sick or have chronic immune system problems... interestingly enough after they received a round of vaccines.

We are noticing, we are concerned and these "mandates" are only making us more enraged about what we are seeing.

You are being held accountable, you need to listen to your public!

Mahalo,

Kelly Morgan

Re: HAR 11-157, I Strongly Oppose.

For many reasons this is dangerous, we as a community should not be forced to inject our growing children with substances that could harm them. All vaccines have side effects stated in there packaging if there is a risk we should have a choice. By taking away our children's opportunity to go to school with requiring parents to play roulette with there health, you are limiting our freedom. Not to mention other economic and sociological aspects that will change. Please keep our freedoms.

Much Appreciated

Attachments: [Hawaii Revised Statutes 671 informed choice .docx](#)

To whom it may concern,
My name is misha kassel, I'm a board certified emergency Medicine physician here on Oahu. I'm not opposed to vaccines if they are a choose made a by a patient or parent after receiving risks and benefits. Having a right to informed consent is critical as a patient and also as part of the physician patient relationship. Mandatory vaccinations take out this critical component of physician patient relationship and patients rights. There are risks with vaccinations and risks without and that decision should be left to parents and patients after reviewing those. Please do the reasonable and decent thing and not remove that. If you have further questions or would like to talk with me further, please contact me. Sincerely with aloha,
Misha kassel md

Subject: TESTIMONY RE-HAR11-157
Date: Tuesday, December 25, 2018 12:15:30 PM

Martha Stephens
[REDACTED]

December 25, 2019

Dear Governor Ing, Dr. Pressler and all Hawaii DOH and DOH Partners,

Hawaii RE-HAR11-157 is an unethical and blatant criminal overreach of the Hawaii DOH under Corporate Federal Government of the United States and would strip Hawaii people of their basic human rights of informed consent about their personal health and the health of their children. I strongly oppose RE-HAR-157.

The Geneva Conventions specifically protect Informed Consent – the right to say “NO!” to any medical intervention, including vaccination, without penalty, pressure or punishment.

“Very few, if any, prospective vaccine recipients, or their natural guardians, know vaccine ingredient/content facts or are given valid factual information about a vaccine, especially the toxic ingredients, contraindications and adverse reactions for each vaccine as listed on its package insert, so as to make an intelligent informed consent before the injection of toxic chemicals, viruses, metals, foreign DNA, excipients, cell fragments, drugs, adjuvants, bacteria, fungi and nano-particles contained in vaccines, into one’s body or one’s children’s bodies.

Since vaccinations are both medical procedures [breaking the skin or otherwise inserting a foreign solution] and pharmaceutical drugs, there is “double-indemnity” of sorts involved, which healthcare consumers are not educated about and to which they are subjugated, unknowingly. Since vaccinations are both medical procedures [breaking the skin or otherwise inserting a foreign solution] and pharmaceutical drugs, there is “double-indemnity” of sorts involved, which healthcare consumers are not educated about and to which they are subjugated, unknowingly.

The Centers for Disease Control, under the aegis of the Food and Drug Administration, have failed the Public Trust and have lost public confidence. The agency, like so many other Federal agencies, is viewed by the public as serving the interest of politically connected “crony” corporations, but not the safety interests of the public. Under such circumstance, the urgency of the redress for which this Petition is submitted should be compelling. The Public will not trust the Federal Public Health Authorities without a clear Regulation faithfully implementing Informed Consent as the sine qua non [essential element or condition] of Public Health interventions. The Public Interest can only be met by imposing on the regulated drug companies the obligation to include in their Package Inserts strong acknowledgment of the Right to Informed Consent.

Counsel Fucetola asserted, “The Constitution for the United States of America requires the President, and all Executive Agencies, such as the FDA, to see to it that the laws be ‘faithfully executed...’ (Article II, Section 2). This means that requirements of law, such as Informed Consent, are a proper subject for reasonably implementing regulations. We are asking FDA to implement Informed Consent to the fullest extent required by law. There are regulations and statutes covering the situation where there is a formal experiment with an Independent Review Board protecting Informed Consent, but no implementing regulations where there is no IRB. This includes all drugs and vaccines after they have been approved and released to the public.”

Something the CDC/FDA, medical profession and Big Pharma seem to ignore is that the United States is bound to observe the Nuremberg Code by virtue of the US having promulgated the Code in the first place! Furthermore, the Geneva Conventions, which form the core of international humanitarian law, are also binding upon the USA. Both bind the USA by treaty to implement fully Informed Consent, which does not happen regarding vaccinations in the USA!

The Petition states that

A key element in the international protections secured by the Allied Victory [of which the USA was a party] and subsequent codification of health-related international law was recognition that no person could be forced to accept any medical intervention that was contrary to conscience and that all medical interventions were to be carried out only with fully informed [and therefore meaningfully willing] consent.

To which I would like to interject that, however, preceded Big Pharma's strong arm (sic) "consensus science" and marketing strategies which, essentially, have been the vaccine industry's "claim to fame."

According to Counsel Fucetola, while Humanitarian Law was given great impetus by the horrors of World War II, these basic ideas have also been distorted to further an internationalist depopulation program, called Agenda 21, including the Global Health Security Initiative (GHSI) that perverts the meaning of fundamental human rights to further justify tyrannical globalist control. We need a clear regulation for Informed Consent to prevent "deemed" or "assumed" consent from being used to justify mass, involuntary vaccination or other "treatment" programs through aerial spraying, vaccine-bearing GMO vectors and other methodologies that do not include direct injection by needle.

The Petition to the FDA alleges an emergency situation, invoking provisions of the Administrative Procedures Act that lets FDA act expeditiously without first providing many months of fact-finding and public comment. This is to prevent delays in implementing the Informed Consent Regulation. Under emergency circumstances (such as the current clear and present threat to Informed Consent represented by various State enactments revoking religious and philosophical conscientious objections to vaccination) the public hearings can happen after the initial emergency regulation.

Interestingly, I found the Petition states that "The United States Government has no legitimate interest in promoting FDA-approved vaccination mandates in violation of Informed Consent."

Counsel Fucetola explained this assertion is based on several Supreme Court cases cited in the Petition. The Court has held that the U.S. government has no "interest" in preventing the public from making what it considers bad decisions with truthful information. *Thompson vs Western States*, 2002.

The intent of the Petition is to clarify that Federal Law, which must implement the Right of Informed Consent, supersedes state-law restrictions on freedom of choice in vaccination. Even if state laws mandating vaccines are adopted, individuals retain their fundamental human rights which supersede state restrictions on conscientious objection.

Here's another question that both the Petition and I ask, "How is one to effectively assert the Right to Informed Consent, enshrined in International Humanitarian Law, for oneself and those over whom one has guardianship?"

Dr. Rima reminds us that Advanced Care Directives and similar documents should always reference Informed Consent and can include statements such as "I do not give informed consent to any vaccinations."

Counsel Fucetola explained, "Without clear regulations protecting Informed Consent, people will have to litigate, on a case-by-case basis, how the right is to be enforced, greatly burdening the exercise of that right. Since the law is settled, that the Right to Informed Consent is a fundamental human right, it is a waste of judicial resources to have to litigate case after case to vindicate the right. This is what we expect the regulation we've requested will prevent. The FDA simply has to require that all drug (including vaccine) 'package inserts' clearly explain the Right to Informed Consent."

I'd like to end this interview with reminding readers of the Hippocratic Oath most physicians take where in part they say, "Nor shall any man's entreaty prevail upon me to administer poison to anyone." I guess either the medical professions disregard and don't read vaccine package inserts, or somehow they've convince themselves that injecting poisons into infants and children is permissible. Is it possible that it's because it is so profitable? " By Catherine J. Frompovich

The Geneva Conventions specifically protect Informed Consent – the right to say "NO!" to any medical intervention, including vaccination, without penalty, pressure or punishment.

Governor Ing, Dr. Pressler and decision makers of Hawaii DOH the underlying agenda of the United Nations, United States Corporation of DC/Federal Government and its donors shame on you for now by passing legislation. This is not about health but Corporate interests in profit and depopulation.

All the data is available and you have now seen it. There is more research and statistics done by the public than any other entity involved. I wonder why?

Regardless of your belief in vaccines, All our rights are taken allowing a for profit Corporation backed by unknown entities to inject ANY and ALL citizens with unknown substances. This is the end game of this nefarious world agenda in the day and age of nano particulate technology and bio warfare. Vaccines are ineffective and uncontrollable.

Do the right thing and end this war on the Hawaiian peoples rights.

"When people vaccinate their children, they're not doing it because of the documented research. They're doing it because they're afraid not to, because the entire system is designed to punish people who don't comply. Vaccination is about compliance and given vaccines are proven to cripple and kill children, without an increase in immunity or

resistance to disease, people are literally being bullied to inject poison into their own children. The need to "belong" is strong within the human animal and this is the only thing moving a parent to vaccinate. It certainly isn't the documented research that's getting a parent to inject their children with poison. That we know for sure."

--Jason Christoff

Subject: Oppose Mandatory Vaccinations Until There is Mandatory Disclosure
Date: Tuesday, December 25, 2018 3:18:36 PM

TWIMC:

Oppose mandatory vaccinations until there is authentic mandatory disclosure.
I am a board certified internist licensed to practice medicine in Hawaii.

In these current shameful times of rampant corruption in business, government, health care, science, media, education, and law enforcement I am unable to support new mandates for vaccination until there is proven reliable science to support such mandates. Also necessary would be public accountability and support for the consequences, intended and unintended, of such mandates. When honesty, accountability, transparency, life, people, and the planet finally become more important than money, then maybe we will be able to make informed decisions based on truth and not based on biased toxic profiteering.

Stop poisoning my patients from the toxic air, water, food, clothing, shelter, communication (5G), and health practices that currently dominate our American deathstyle. Human experimentation without consent are War Crimes. Everyone involved in promotion, implementation, and profiteering from this toxic deathstyle will be held personally and financially responsible for all harms inflicted.

Thank you for your very kind attention.

Joseph Kohn MD

Subject: WE STRONGLY OPPOSE MANDATORY VACCINATIONS
Date: Tuesday, December 25, 2018 3:34:15 PM

Re: HAR 11-157,

I am shocked that such a proposal would even be put forward.

I have been tracking the vaccination issue since my first child was born 42 years old. There is clearly more risk of danger to the body by having immunizations. Personally, I educated myself with the reasons to choose not to vaccinate and choose not to have any of our 3 children vaccinated. All the grown children have been healthy their whole lives. I have close friends who did immunize with vaccine and it went bad for their children. One became paraplegic and the other diagnosed with Asperger's Autism. He is not able to function in a normal capacity and needs supervision.

I strongly believe that it is MORE DETRIMENTAL TO THE HEALTH OF A CHILD TO BE VACCINATED. I strongly believe that the parents of the child needs to right to opt out of vaccines. There are just too many court cases and documented stories of children being healthy and normal and then had a great degenerative decline shortly after receiving them.. I do not believe it is constitutional to force vaccines on anyone. WE INSIST ON OUR RIGHT TO INFORMED CONSENT !
thank you, Laura Binstock, on behalf of our Ohana of 7 adults

Testimony to Oppose HAR 11-157
Tuesday, December 25, 2018 5:53:53 PM

Dear Department of Health,

Aloha and a warm Happy Holidays to you all. I am writing to strongly oppose HAR 11-157. I am informing the Hawaii Department of Health that according to the CDC's website, there are "limitations in our knowledge of the risks associated with vaccines" and vaccinations have the following problems:

1. Limited understanding of biological processes that underlie adverse events
2. Incomplete and inconsistent information from individual reports
3. Poorly constructed research studies (not enough people enrolled for the period of time)
4. Inadequate systems to track vaccine side effects
5. Few experimental studies were published in the medical literature. (1)

The above very revealing admissions from the US Centers for Disease Control (CDC) completely undercut the overconfidence exhibited by the Hawaii Department of Health which is pushing for more mandatory vaccinations with HAR 11-157. Similarly, the Vaccine Injury Compensation Program compensation numbers are, not only not reassuring, but, frankly astonishing, and should give not just all parents, but all people in general (including the DOH), serious pause. If vaccines are "safe and effective" as our medical practitioners and politicians constantly tell us via mainstream media outlets, then why is there a running payout total from 1988 up to now of over \$4 billion, according to the US Health Resources and Services Administration. This is the elephant in the room, and the DOH is either unaware, looking the other way or blindly following orders from the CDC and ACIP. Whichever the case, all are unacceptable, because children are being harmed every day and the DOH is allowing it to happen and about to worsen the situation with the HAR 11-157 changes. If I can find Adverse Event information on the CDC and VAERS websites in a 30 second Google search, so can you. It's your duty.

When there is risk there must be a choice. The risks are real and proven. I will leave you with some shocking information for the public record: In the manufacturer insert label for Gardasil-9 (made by Merck) it states the following on page 7, Section 6.1:

"Serious Adverse Events in Clinical Studies: Serious adverse events were collected throughout the entire study period (range one month to 48 months post-last dose) for the seven clinical studies for GARDASIL 9. Out of the 15,705 individuals who were administered GARDASIL 9 and had safety follow-up, 354 reported a serious adverse event; representing 2.3% of the population." (2)

Let me make this crystal clear - 1 out of 50 children will suffer a serious adverse event after taking Gardasil-9. That's 2% of our children. How can the DOH mandate a vaccine that has this high a number of guaranteed adverse events? In post-market safety surveillance here's what Merck found, adverse events that include:

“Blood and lymphatic system disorders: Autoimmune hemolytic anemia, idiopathic thrombocytopenic purpura, lymphadenopathy.

Respiratory, thoracic and mediastinal disorders: Pulmonary embolus.

Gastrointestinal disorders: Nausea, pancreatitis, vomiting.

General disorders and administration site conditions: Asthenia, chills, death, fatigue, malaise.

Immune system disorders: Autoimmune diseases, hypersensitivity reactions including anaphylactic/anaphylactoid reactions, bronchospasm, and urticaria.

Musculoskeletal and connective tissue disorders: Arthralgia, myalgia.

Nervous system disorders: Acute disseminated encephalomyelitis, dizziness, Guillain-Barré syndrome, headache, motor neuron disease, paralysis, seizures, syncope (including syncope associated with tonic-clonic movements and other seizure-like activity) sometimes resulting in falling with injury, transverse myelitis.

Infections and infestations: Cellulitis.

Vascular disorders: Deep venous thrombosis.” (3)

The DOH must put HAR 11-157 on the shelf and not sign it in to law. The HPV Vaccine is NOT SAFE. There may be promise for future versions of vaccines for this cancer, but Merck's current Gardasil-9 is not the one, it is a total failure. Mark my words, Gardasil-9 will become the next Vioxx. Merck is in court right now for fraudulent premarket trials. I've seen the data, they will be found guilty. If the Hawaii DOH, who swears to protect and improve the health and environment for all people in Hawai'i, pushes HAR 11-157 through, the DOH will be implicit with Merck's poorly and fraudulently studied product. Why take this chance? Why risk our children's lives?

Need I remind you - the Hawaii DOH philosophy states the following, “Health, that optimal state of physical, mental, social and environmental well-being, is a right and responsibility of all of Hawaii's people.” Well, I am Hawaii's people, and I am saying that we have a right to philosophically say no to Gardasil-9, a harmful

medical product that has 500mcg of AAHS (aluminum adjuvant) in it. 500mcg of a known neurotoxin! (4). Informed consent must be allowed, there must be a choice that the parent can make without the need for a Religious or Medical Exemption.

Please, Department of Health, I respectfully ask that you do thorough research on Gardasil-9 and it's severe and numerous risks before mandating it for all of Hawaii's children. Consult the VAERS data and read the entire manufacturers insert label. Read the plethora of studies on aluminum and it's toxicity in humans. It will show you that the benefits do not outweigh the risks of adverse events in this case. The science is there, the numbers are there, all you have to do is look. The people of Hawaii are depending on you to do what's right. It's your kuleana. Don't forget that the CDC and ACIP only make recommendations, not laws. The DOH doesn't have to mandate what they recommend. Many states and countries are doing the research and not implementing ACIP or CDC guidelines. Many states and countries are well aware of the extreme conflicts of interest with ACIP members being patent holders for the very vaccines they recommend. I urge you to heed all of this and make Hawaii a shining example of optimal health and limited severe adverse reactions to vaccines like Gardasil-9 by not signing HAR 11-157. This bill puts us all at risk. What's at stake is literally the future of the human race. Please, I beg you, do not knowingly harm our children with this bill.

Shannah Fagundes, representing myself and my children. Re: HAR 11-157, I STRONGLY OPPOSE. This really resonates with me. My kids are homeschooled. My son expressed interest in trying out public school. I have to decide if it's really worth it to expose him to the dangers of vaccines, when we already have a child who reacted negatively to a vaccine. He should be able to attend, regardless of his vaccination status. It isn't fair to him to be excluded. He's a healthy child, rarely ever getting sick. He deserves to be in public school with his peers.

Thank you,
Shannah Fagundes

I strongly oppose the above proposed rule because I question the safety of many vaccines and the number of vaccines proposed especially for infants and toddlers.. Many people have negative reactions to certain ingredients in vaccines which should be studied further. There must be a choice for any vaccine. Mandatory vaccination should not be allowe

My child was perfectly healthy until she received her vaccines. Shortly after, she developed over 15 allergies. I will never give her another vaccine. Forcing kids to be vaccinated is an over reach of power and should be punishable by jail. You have no right to bully or force parents to vaccinate their child. Any public official that forces unsafe drugs from criminal pharmaceutical companies should be jailed. The pharmaceutical companies and DOH should be held liable for any damages. Not allowing a child to get an education based on not polluting their bodies is criminal! YOU Should ALL BE JAILED FOR NEGLIGENCE!!! One day you will answer to YHVH, the creator and the injury or death of innocent kids will be on your hands!!!! STOP PROMOTING CRIMINAL DRUGS!!! Just remember when someone's kid dies or is permanently injured from the HPV vaccines it's your fault! You sided with pharmaceutical companies and lobbyists vs the safety and personal choice of the people!

Date: Tuesday, December 25, 2018 9:08:15 PM

To Hawaii Department of Health
Comments on increasing vaccination schedule and reducing opportunities to opt out.

I represent myself and my family, and I STRONGLY OPPOSE!!!!!!

The number of vaccines increases every year, and along with them the number of injuries, and even worse, deaths. Such risk should NOT be mandatory, no matter how big or small. No matter what side of the argument we stand on. NO MATTER WHAT!! Don't take away our right to choose.

Taking away the choice for a parent to decide what is injected into our babies, when we feel there is the possibility of dangerous injury or death as a result, goes against everything this country stands for. It's taking away our American rights, and even the idea shocks me, but so did Donald Trump running for president, and that became a reality. I feel so strongly about this that I am taking time away from my family to testify to you, on Christmas Day, and plead with you- Please don't **INFRINGE** on my **RIGHT TO INFORMED CONSENT**.
IT IS UN- AMERICAN!

Sincerely,

Katherine E. Roberts

Please give these decisions a little more time. The latest microbiology studies are showing a huge pending breakthrough and medical knowledge relating to the symbiotic relationships between human cells bacteria and even virus. Horizontal gene transfer is a topic in biology that is on the minds of every researcher, and Physicians who are keeping up. Even though now there seems to be nothing but positive affects from almost every vaccine, the negative effects may prove to be a lot more subtle. The healthy human biome contains many thousands of species, horizontal gene transfer now a fact between these microbes and the human cells, may very well play a part in how combating one potential threat may decrease the resistance to a subtle multitude of threats by changing the biome.

I want my Granddaughters health to be optimized to protect them from the revenges of noncommunicable diseases, especially cancers, not influenza vaccines which do not even have effectiveness above 70%.

Aloha DOH,

This is the second testimony of Clare Loprinzi, an Indigenous Practitioner in Hawaii in opposition to HAR 11-157. This law is culturally offensive and insensitive to many peoples in Hawaii, and to the Indigenous Practitioners who hold traditions of healing much safer and more effective than the mandatory vaccines. We have generations of proof and we are strong.

The indigenous rights belong to those who, being indigenous peoples, are defined by being the original people of a land that has been conquered and colonized by outsiders. The issue of indigenous rights is also associated with other levels of human struggle. Mandatory Vaccines is now a human struggle for their children. Indigenous communities, peoples, and nations are those that, having a historical continuity with pre-invasion and pre-colonial societies that developed on their territories, consider themselves distinct from other sectors of the societies now prevailing in those territories, or parts of them. Indigenous Practitioners continue to use the ancestral wisdom that preserves food, land and cultural sovereignty including relevant diverse healthcare options throughout life. Vaccines contain DNA from aborted fetuses and other toxic components which change DNA. To create a mandatory law that would force children to get vaccines in order to be educated not only violates the DOH Human Right of the child to obtain education in schools but violates cultural rights to keep our DNA to be passed down to future generations as documented in the Kumulipo. (1)(4)(5)(6)(8) The taking of stem cells from the 'iewe (placenta), the cord blood, and the foreskin is a human right and something that the child was given to keep them healthy. As stated by Hawaiian Cultural Practitioner and DOE kumu, Ilikea Kam, "Less than 20 years ago here in Hawai'i a cultural right of Hawaiian people was vastly denied. All around our state women who gave birth in a hospital were forced to "incinerate" the placentas of their newborns. Whether or not the 'iewe, or placenta really were incinerated is unknown. What is known is that at the time the medical world was denying us a cultural birth right that the most respected elders of our mo'okū'auhau were treated as "medical waste." Indigenous Practitioners know that the taking of stem cells from the baby's cordblood or foreskin, using aborted stem cells, or the illegal taking of the first stem cells that produced what they wanted from Henrietta Lacks in unethical and violation of human rights of the child, indigenous rights and not mentioned in an "informed choice for vaccines."

The mandatory vaccination contains other DNA, adjuvants, aluminum and other toxicities that Indigenous rights object to as they already their natural medicines that protect human health.(1) Imposing mandatory vaccination schedules originating from the Federal agency of the occupying power, the CDC, this is in fact a War Crime, since no such vaccination schedule exists for the occupied Hawaiian Kingdom. (2)(5)(9)In fact Medical Doctors, under Hawaii Revised Statutes 671-3, requires a thorough informed consent for vaccinations since they are a treatment or procedure, that also includes recognized alternative treatments or procedures. (3) This is not for the most part being done, instead bullying parents and paying Pediatricians a big bonus if 90 % of their patients (babies and children) are vaccinated and forcing programs to endorse vaccinations or funding will be cut is happening .

Lastly in my added testimony in opposition to oppose HAR 11-157, is to address the topic of the inclusion of Naturopathic Physicians as providers capable of assessing Medical exemptions, while imposing stringent adherence to an alien allopathic Medical paradigm for making such assessments is a hollow and patronizing inclusion. This is not only rude but again illegal since they are recognized Physicians in the State of Hawaii. It is time that the DOH collaborates instead of confrontation with all branches of healthcare.

I demand that the DOH listen to the people, it has been overwhelming opposition at each hearing. The time is now for a diverse committee of representations of healthcare practitioners, community members, Native Hawaiians, Legislatures (all who must not have an invested interest in the billion dollar business of vaccines) and parents to come together and talk. I suggest that Lt. Governor Dr. Josh Green is a good person to moderate this discussion. If not we all know if approved, this law will be in the courts and the people will be there. We can not allow this to happen because so many children and young adults will be effected. This is our kuleana.

Me ka haahaa o Lonoikamakahiki,

Clare Loprinzi, Indigenous Practitioner, Traditional Midwife, MCH (Maternal/Child Healthcare) Degree

I am writing to share my thoughts on the importance of keeping immunization rates high in the state of Hawai'i.

I am the parent of a nearly six year old child who will be attending Haiku Elementary, starting in January, who just finished three and a half years of chemotherapy for acute leukemia. My child is the reason people who care about others vaccinate- even though they themselves may be healthy/lucky enough, if exposed to a life threatening illness, to fight it off with minimal effect and no long term damage, my child has an immune system that may take years to recover after being suppressed with chemo for so long. There are much greater odds than normal, for my child, that an illness as simple as chicken pox could go systemic, attacking his organs, including his brain. We are simply hoping the humans around us are vaccinated, because with his damaged immune system, even once he gets all his vaccines again after having his immunity wiped out by treatment, they will likely not be as effective in protecting him as they would be a normal, healthy child. He will always be more at risk, and dependent on those around him to form a wall of protection around him with their immunity.

I get that there are risks to vaccinating. They are frightening for a parent who thinks reading google sites filled with pseudoscience and conspiracy theories qualifies as research, who only hears the worst stories of vaccine reactions and never knows how many devastating epidemics vaccines have saved us all from, and how much disease-related death there was only 100 years ago. It is easy to assume our greatest threat comes from the pharmaceutical industry when the success of modern medicine has removed other threats so effectively. Please consider our family and so many others like us, and work on our behalf to pass laws protecting us.

Thank you.

Bobby, Susan, Daniel, and Alexander Koehn

Subject: HAR 11-157 OPPOSE
Date: Wednesday, December 26, 2018 10:48:45 PM

To whom it may concern:

The vaccine behemoth was a 1 billion dollar industry when I was a student 30 years ago. Presently this industry stands at 61 billion. We'd be fools to disregard that this industry has a financial incentive. Especially since the USA vaccinates more per capita by far than any other developed country and yet we are still very sick with escalating morbidity and diminishing life expectancies. Is this liability from vaccines? Well we don't know because there are no long term studies!

Our Hawaii State constitution states in the Bill of Rights:

1. All political power of this State is inherent in the people; and the responsibility for the exercise thereof rests with the people. All government is founded on this authority.
2. All persons are free by nature and are equal in their inherent and inalienable rights. Among these rights are the enjoyment of life, liberty and the pursuit of happiness, and the acquiring and possessing property. These rights cannot endure unless the people recognize their corresponding obligations and responsibilities.

You, our government officials are bound by oath to fulfill these obligations to the People. I personally cannot pursue happiness if I or my children must sacrifice themselves for the greater good by disregarding **informed consent**. It is my right to refuse any other kind of treatment if it is not agreeable to my best determinations. Why should vaccines be any different? ESPECIALLY when vaccine manufacturers are indemnified against any liability and vaccine compensation requirements have been amended many times that legitimate claims must wait for unreasonable periods to be considered. Still many claims are disregarded and compensation is nil for deaths or serious AE's from vaccines. Hawaii wants to take on more liability?

Currently there is no methodology to *screen* patients for vaccines that might possibly maim or exterminate the recipient. Where else in medicine does this same dynamic stand? If a physician advises surgery or toxic chemotherapy shouldn't I have a choice?

The Institute of Medicine (IOM) now known as the National Academy of Medicine is the premier overseer of US policy on healthcare. In the 1991 they published a paper reviewing vaccine research and concluded that this research was 'woefully inadequate'. Subsequent papers seem to exonerate this proclamation without due diligence by the IOM. However, they had published a nearly 900 page document outlining vaccine adverse events.

Adverse Events of Vaccines: Evidence and Causality
released Aug 25, 2011

Furthermore, the Association of American Physicians and Surgeons, a conservative group of MD/DO physicians numbering more than 40,000 members have placed a moratorium on mandatory vaccines. This policy stands today since there are no long term studies, most short term studies are on monovalent vaccines not polyvalent vaccines and there is no screening methodology.

Additionally, the New Zealand medical Journal published an important paper on 5/24/96 that former N I H researcher J. Barthelow Classen, M.D. concluded that there was a whopping 60% increase in juvenile diabetes from Hep B vaccine. He advocated waiting at least until the infants were 2 years old to reduce the risk.

Regarding HPV vaccine: the vaccine adverse event reporting system (VAERS) received 58,000 adverse event reports. HPV as you may know accounts for 3% of all cancers. To date HPV has caused 14 deaths and 376 serious injuries. Less than a third of all claims received have not been compensated. Under reporting all vaccine injuries is common place.

Please reconsider this mandate and let the People determine their fate not misled bureaucrats endeavoring to do the right thing.

Thank you for your consideration. OPPOSE HAR 11-157

Subject: HAR 11-157, I oppose
Date: Wednesday, December 26, 2018 4:02:50 PM

To whom this concerns:

I am writing to oppose HAR 11–157.

The trend toward more and more vaccines being given to younger and younger children for less and less serious diseases is alarming and needs to be abruptly stopped until science proves beyond a shadow of a doubt that this trend is actually benefiting the children's and communities health now and into the future.

The CDC recommendations are apparently not even evidence-based--such as administering Hep B starting at birth to ALL babies, despite the fact that Hep B is NOT a childhood illness and is not (according to the CDC themselves) spread by casual contact. Many pro-vaccination doctors have spoken out about their concerns with the CDC recommendations,

Many pediatricians have employed more sane strategies for vaccinating their patients. Avoiding giving multiple live vaccines at one time, avoiding giving more than one shot containing aluminum at one time, and delaying certain less critical and/or more problematic shots till a child is older (with a more developed immune system) are common themes. None of these concerns is addressed by the CDC recommendations (in fact, they violate all three of these evidence-based cautionary principles).

The HPV vaccine has been found to have huge negative consequences for young girls and should not be given to anyone until it is studied with the gold standard double blind real placebo studies.

The successful efforts by vaccine manufacturers to lobby for the passage of legislation to exempt themselves for liability from injuries caused by their products is particularly disturbing, immoral, and unprecedented.

Thank you for your time, Maria Maitino

Subject: HAR 11-157 Testimony
Date: Wednesday, December 26, 2018 3:41:09 PM

Aloha again,

I am writing to oppose HAR 11-157 but also to add/ask:

1. Why were no deciding members of the DOH at outer island meetings? It makes the community feel unheard.
2. Can you please add more outer island hearings so that everyone has a chance to be heard? Maui's meeting was too short for everyone in attendance.
3. What proof can you provide those who testify that our opinions, research, questions, etc. are being considered?
4. What kinds of gatherings are happening in schools that Hawaii's children need supposed "protection" from HPV, a sexually transmitted disease?

I do not believe the suggested changes listed in HAR 11-157 are necessary or best for Hawaii's keiki. I am also left feeling unheard as a citizen of Hawaii. What does the DOH plan to do about this? I would appreciate a response other than "we received your email."

Mahalo,
Lori Auldridge, M.A., M.F.A.

From: [REDACTED]
To: [REDACTED]
Subject: HAR11-157...vaccination proposal
Date: Wednesday, December 26, 2018 12:46:00 PM

Aloha,

My name is Lisa Kerman and I've been a resident of [REDACTED] for the past 8 years. I am writing today in strong opposition to the proposed HAR11-157. I am actually appalled that the state is looking at mandating these vaccines. I strongly disagree that the state take it in their hands to determine how we're going to raise our children and to what degree we're willing to poison them in order to enroll them in the public & private school system.

It is not okay by me that we're looking at the possibility of mandating vaccines. It's not okay by me that it could become mandatory for human beings to be injected with foreign matter such as mercury, aluminum, animal & human cells, cells from abortive fetal tissue, formaldehyde, bacterial, viruses (some of which are known carcinogens that are known to cause breast cancer), antibiotics, to name a few. And, it's not okay by me that big business could make a financial killing on the many people that these vaccines may kill or at least compromise over time.

The U.S. supreme court has ruled that vaccinations are unavoidably unsafe...yes, unavoidably unsafe. The many side effects from the proposed vaccines include asthma, allergies, eczema, ADD, ADHD, ear infections, insulin dependent diabetes, autoimmune diseases (autoimmune diseases are increasing at an alarming rate), just to name a few. This sounds like a human experiment to me, and a very lethal one at that.

The CDC is reputed to be an independent government agency making vaccine recommendations to the public. They are the agency charged with vaccine safety oversight, and yet the CDC owns patents on at least 56 different vaccines. They purchase and sell 4.1 billion dollars in vaccines annually including vaccines for Flu, Rotavirus, Hepatitis A, HIV, Anthrax, Rabies, Dengue Fever, West Nile Virus, Group A Strip, Pneumococcal Disease, Meningococcal Disease, RSV, Gastroenteritis, Japanese Encephalitis, SARS, Rift Valley Fever, Chlamydomphila Pneumoniae, among various other patents. There clearly appears to be a huge conflict of interest here. The CDC...Center for Disease Control that is supposedly and independent government agency...is actually a subsidiary of Big Pharma.

The vaccine industry is a 54 billion dollar industry and the side effects elicited from these vaccines also make up a huge business for the pharmaceutical industry. The first drugs make you sick, then there's more drugs prescribed to try to clear up the problems that the first drugs created. Sounds like great job security to me. The vaccine injury compensation program that went into effect in 1986 has paid out 3.2 billion dollars in vaccine injury claims through a government program, which is actually estimated to be only 10% of the total vaccine injured population. So no, it's definitely not okay by me that we douse our children with up to 69 doses of recommended childhood vaccines. Enough already!

If vaccines become mandatory for children entering school here in Hawaii, we will be the highest vaccinated state in the nation. Out of all the dozens of people that testified in Kauai on December 21st, there were only three people in favor of implementing mandatory vaccinations in the state of Hawaii.. It's pretty obvious that the majority of people in our state are opposed to HAR11-157. If this proposal passes, I know a number of parents who will be withdrawing their children from public school and will be opting to home school them instead.

One last thing. I attended the hearing at the health department in Lihue, on December 21st...4 days before Christmas when people are either off island for the holidays or else they're busy with loved ones on island (many of us felt that this was intentional as to keep the hearing " short & sweet" and unattended). I arrived just a little before 2:00 when the meeting was due to begin. The room held 40 people, but when I arrived...the room was at full capacity. Another several dozen people were lined up at the door to get in. I stood outside for the first hour of the hearing and as one person left the room, another one from the line was allowed in. They didn't have it broadcasted outside so that we could at least hear what was being said. I did find out that Dr. Jannet Berreman, the Director of the Department of Health was in attendance which I was appreciative of. So, I am requesting that 1) when an issue of such grand importance arises, please supply a room that will hold all the attendees, 2) I would really appreciate it if hearings around issues of great importance, (as this one obviously is) would be held at times other than busy holidays and 3) that the deciding politicians actually listen to the transcripts from the statewide hearings.

From the attendance that took place at the various hearings around the state, it's obvious that the majority of Hawaii residents...are passionate about keeping mandatory vaccinations out of the equation.

Thank you for your time, happy holidays and please, don't be convinced by the profiting CDC & Big Pharma that vaccinating is the necessary action to take here,

Lisa Kerman

From: [REDACTED]
To: [REDACTED]
Subject: Hawaii Mandatory Vaccine
Date: Wednesday, December 26, 2018 3:23:44 PM

Dear Dept. of Health,

I am outraged and alarmed to learn that you are considering injecting students with the highly questionable and controversial vaccine. I consider such action to be a violation of the Helsinki Protocol which requires informed consent before such experiments.

I agree with Sen. Ruderman's comments that "Proposing to increase required vaccines to the highest number in our most-vaccinated nation is irresponsible."

I oppose mandatory medical procedures of any kind. Forced injections of any kind call to mind the notorious Tuskegee experiments.

Experiment on innocent, healthy people is a crime. There is ample evidence of the harmful side effects of these injections. That's why the pharmaceutical industry pressured congress to pass a law making it nearly impossible to sue Merck and their ilk.

This proposal seems a violation of the your department stands for.

Please do not experiment on our children.

Thank you
Anita Hallard

Hawaii Vaccination Regulations & Laws

Wednesday, December 26, 2018 3:25:03 PM

With regards to the proposed changes to Hawaii vaccination regulations and laws, I'm writing to oppose ALL mandatory vaccinations. This means I oppose all additions to the current schedule of vaccinations that are required for attendance at public educational institutions. This also means I oppose any reduction of exemptions, such as exemptions for medical, religious, philosophical, or personal reasons.

To take away a parent's right to make an informed medical decision for their child is unconstitutional.

Sincerely
L. Bowlin

Dear Dept. of Health,

I am outraged and alarmed to learn that you are considering injecting students with the highly questionable and controversial vaccine. I consider such action to be a violation of the Helsinki Protocol which requires informed consent before such experiments.

I agree with Sen. Ruderman's comments that "Proposing to increase required vaccines to the highest number in our most-vaccinated nation is irresponsible."

I oppose mandatory medical procedures of any kind. Forced injections of any kind call to mind the notorious Tuskegee experiments.

Experiment on innocent, healthy people is a crime. There is ample evidence of the harmful side effects of these injections. That's why the pharmaceutical industry pressured congress to pass a law making it nearly impossible to sue Merck and their ilk.

This proposal seems a violation of the your department stands for.

Do not experiment on our children.

Mark Sheehan, Ph.D.

To Whom it may concern ,I'm writing to state that I strongly oppose changes to the proposal rules.Everyone has the right to decline for themselves or for their children vaccines ,for medical and religious values. Thanks for protecting our civil rights by making it mandatory for the children to participate in schools we pay for with our taxes.And please have a real conversation and allow each island adequate time and space for testimonials,and public comments regarding the proposal. I , Amy Cutler, oppose HAR-11-157 mandatory vaccines.

I am citing Hawaii Revised Statues 671-3, informed consent as my reason for opposition.

I want freedom of choice when it comes to what happened to my body and the bodies of my children. Also, all of the children of hawaii and their parents.

Thank you for your consideration in this matter. Do what's right and oppose HAR-11-157!!

Amy Cutler

Subject: I OPPOSE HAR 11-157
Date: Wednesday, December 26, 2018 3:26:09 PM

Aloha Hawaii Department of Health,

Thank you for this opportunity to provide testimony.

I STRONGLY OPPOSE THE HAR 11-157 PROPOSED RULES UPDATE!

I OPPOSE INCREASING VACCINE REQUIREMENTS. The risks of adverse reactions include death, seizures, paralysis, infertility, autoimmune disorders, seizures, developmental disorders, allergies, and more. Over 500,000 adverse effects to vaccines have been reported to VAERS. Over 59,000 adverse effects from the HPV vaccine have been reported to VAERS, including 425 deaths.

**THERE IS NO DENYING THAT VACCINES CAN CAUSE ADVERSE REACTIONS!
\$4 BILLION HAS BEEN GIVEN BY THE NATIONAL VACCINE INJURY COMPENSATION PROGRAM FOR INJURIES AND DEATHS CAUSED BY VACCINES.**

The most compensated vaccine injuries are for the Influenza vaccine. Please read the data available at the website:

<https://www.hrsa.gov/vaccine-compensation/data/index.html>

Please read this study by the National Center for Biotechnology Information that concludes:

"NATIONS THAT REQUIRE MORE VACCINE DOSES TEND TO HAVE HIGHER INFANT MORTALITY RATES."

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3170075/>

I OPPOSE INCREASING VACCINE REQUIREMENTS BECAUSE IT WILL INCREASE ADVERSE REACTIONS AND DEATHS!

I OPPOSE INCREASING REQUIREMENTS FOR MEDICAL AND RELIGIOUS EXEMPTION. Complicating the exemption process would contribute to more allergic reactions and adverse reactions for susceptible genetic types. We must be allowed to refuse the injections of toxic metals, harmful chemicals, allergens, and xenobiological agents such as animal and fetal derived DNA.

I OPPOSE ADOPTING THE ADVISORY COMMITTEE ON IMMUNIZATION PRACTICES (ACIP) RECOMENDATIONS. These recommendations have not been proven safe and pose risks of severe adverse reactions.

HEALTH FREEDOM AND INFORMED CONSENT ARE BASIC HUMAN RIGHTS! Everybody must be allowed the right to chose or refuse what it put into the body. Vaccination is a medical intervention that carries a risk of injury or death. The right to informed consent to any medical intervention that can kill or injure you or your child is a human right.

Please consider the health concerns of everyone susceptible to adverse reactions to immunizations.

Thank you again for the opportunity to provide testimony opposing the HAR 11-157 proposed rules update and the adverse consequences it would cause.

Mahalo,
Michael Donaldson
Hawaii resident and father of 3 children

Subject: I OPPOSE HAR 11-157 proposed rules
Date: Wednesday, December 26, 2018 2:31:12 PM

Aloha & thank you for this opportunity to provide testimony. As a community member and mother I am writing to **strongly oppose the HAR 11-157 proposed rules update.**

I oppose HAR 11-157 Exhibit A, are NOT made with the Hawaii diverse demographic in mind and will over regulate our school requirements from 5 to 9 (k-12) and adds HPV as a requirement, making us one of the most regulated states in all USA. Safety & Risk assessment needs to be done first. For example, HPV been taken out of Japans requirements for 5 years due to many adverse reactions. <https://www.hpv-yakugai.net/2018/06/29/5years-english/>

Please keep in mind we do have many ethnics reside on these islands, and safety studies, nor ACIP guidelines where never designed or tested for this unique demographic. There is no one fits all solution.

I oppose to Exhibit B, blanket adopting the “best practice guidelines for Immunization” as part to our rule and let go of the freedom and independence as a State of Hawaii to compile our own Guidelines.

I oppose including early-child-hood centers into this rule, is not acceptable without consent of the early-child-hood centers themselves and parents, to my knowledge none have been informed or been invited into the process of this proposal. It creates extra expenses, training and equipment and enrollment for new children.

I request the attorney of the DOH to legally check if this reporting system in conflict with HIPAA & Family Education Protection Act 20 U.S.C. § 1232g and making schools involuntary break the law by following your current rule.

I oppose HAR 11-157 for being incomplete proposal and by not offering the draft of the standard medical and religious exemption forms. I not accept that DOH decides without public input on their final form and should have been a part of this proposal. They can make needed medical exemptions unnecessary

more complicated or easy. We simply don't know, because they are missing.

Thank you,

Meredith Cross

Subject: I OPPOSE HAR 11-157 proposed rules
Date: Wednesday, December 26, 2018 11:49:50 AM

Aloha & thank you for this opportunity to provide testimony.

As a community member and mother, I am writing to strongly oppose the HAR 11-157 proposed rules update.

I oppose HAR 11-157 Exhibit A, are NOT made with the Hawaii diverse demographic in mind and will over regulate our school requirements from 5 to 9 (k-12) and add HPV as a requirement, making us one of the most regulated states in the entire USA. Safety & Risk assessments need to be conducted first. For example, HPV has been removed from Japan's requirements for the past 5 years due to many adverse reactions. <https://www.hpv-yakugai.net/2018/06/29/5years-english/>

Please keep in mind we do have people of many ethnicities residing on these islands, and neither safety studies nor ACIP guidelines where ever designed or tested for this unique demographic. There is no one-size-fits-all solution.

I oppose Exhibit B, blanket adopting the "best practice guidelines for Immunization" as part of our rule and it would require relinquishing of the freedom and independence of the State of Hawaii to compile our own Guidelines.

I oppose including early-childhood centers into this rule. This is unacceptable given the lack of consent on the part of the early-childhood centers themselves as well as of parents or legal guardians. To my knowledge none have been informed or been invited into the process of this proposal. It would add extra expenses, and the need for training and equipment in the enrollment for new children.

I request the attorney of the DOH to legally check if this reporting system in conflict with HIPAA & Family Education Protection Act 20 U.S.C. § 1232g and making schools involuntary break the law by following your current rule.

I oppose HAR 11-157 for being an incomplete proposal and for not offering the draft of the standard medical and religious exemption forms. I do not accept, that DOH is making decisions without public input on their final form which should have been a part of this proposal. They can make required medical exemptions unnecessary, more complicated or easy. We simply don't know, because they are missing.

No parent who filed for medical or religious exemption with a child in the DOE schools can to my knowledge recall to sign or had any option to agree or disagree with the proposal, that the school will be reporting their children's names. The Family Educational Rights and Privacy Act (FERPA), 20 U.S.C. § 1232g, requires written parental consent before personally identifiable information from one's child's education records is disclosed to the health department. In fact, most thought, that was a new addition to the rule, because they did not know that their schools are already doing, this including myself.

Informed Choice is already mandated by the State of Hawaii and is failing to be abided by many healthcare practitioners. Healthcare Practitioners must, by law, give an informed choice, which includes speaking about the alternatives to the procedures and vaccines that they are using, and provide options to patients.

We all know that the State of Hawaii is unique, we need to do our best to preserve as much independence as possible till all the question of whose land this is are answered. And anyone looking into history and the process can answer the question, even if we are avoiding it.

The proposed rule update is especially disturbing for students first entering 7th grade or higher

who may receive the HPV vaccine. This is especially true for the HPV vaccine which claims to prevent HPV-related cancers which cannot be spread in school, thereby rendering it a measure that is not applicable to schools.

We all must revisit the safety, health benefit and risk balance here

No vaccine is 100% effective for everyone and not everyone can handle the same amount of vaccination. Additional vaccination needs to stay a choice for parents and legal guardians, guided with respect by their predication/MD/ND. The medical community is urged to offer informed consent. Parents & Patient should be given an opportunity to ask questions and have all their doubts clarified. There must not be any kind of coercion. Consent must be voluntary, and patients should have the freedom to revoke their consent. Consent given under fear of injury/intimidation, misconception or misrepresentation of facts can be held invalid. The process of the public hearing and your efforts of informing the people of Hawaii have been unacceptable. Initially, you planed only one public hearing, with pressure you extended the meeting to the outer islands. The timing often excluded teachers, educators, small business and childcare center owners to attend, beside which, it was already difficult for parents with the nearing holidays and school pick-up times coinciding with meeting start times. On top of that, no key decision maker was present at any meeting. You ignored the petition delivered to you before the Maui hearing, a request from the public, and we were told that you will review the hours of testimony using the transcript. Please explain this process. Also, I missed the effort to inform the public and read with disgust, labeling up front anyone who will oppose the proposed rules, with a name and category.

This issue affects especially people who vaccinate, and if they oppose any part, they are labeled by your public relations staff which creates assumptions about those going to speak up. I request to invite open communication and informed consent with the next approach, and stay away from labeling the opposition as one group, negating their diversely.

I respectfully request that the proposed changes to HAR 11-157 be opposed and request, that with further changes on immunization, a communication link be established between the DOH & DOE to inform all schools, teachers, parents and all others who would be affected by the change, by informing us about the intentions. including a summary of the full implication of the rule change.

Respectfully,

December 26, 2018 Lucia Kocak, [REDACTED]

PS. Despite lack of official independent research to back the current vaccine schedule as noted by the recent lawsuit led and won by Mr. Robert F Kennedy against the HHS for the lack of vaccine safety testing and effectiveness over the past 30 plus years (<https://healthimpactnews.com/2018/hhs-sued-for-not-upholding-vaccine-safety-testing-mandated-by-law/>), research HAS been done by independent doctors and researcher since vaccines were first introduced, proving their harmful ingredients and negative effects on the human gut biome, which is responsible for our health, thereby rendering most harmful to the human body. Herd immunity has also been proven an unsound myth. The authors of these types of rule changes ought to do their due diligence and first conduct their own thorough research on vaccine safety and effectiveness, and not simply rely on the proven-to-be inaccurate and in some cases non-existent or falsified tests offered by the billion-dollar industry selling them. It behoves anyone willing to take on the responsibility for the health and well-being of other people's children by injecting them with foreign substances without their parents consent, to know the facts and the full implications of such an action as they will then be fully liable for any damage done to the children.

I oppose HAR 11-157
Wednesday, December 26, 2018 12:12:05 PM

You

Aloha my name is Abigail schoder.

For many reasons I strongly opposed Har 11-157 specifically in relation to the very serious health and safety risks and conflicts.

This proposal change offers a serious threat of significant increased risk to our Island and society as a whole. I am writing today to affirm my right, my families rights and any citizens right to have COMPLETE sovereignty over our bodies.

There is more than enough personal claims and documented scientific evidence proving severe detrimental effects from vaccinations. Including but not limited to: the improper proportional dosage to body weight ratio in administrating the vaccine, harmful ingredients such as mercury and proven carcinogenic toxic poisons and even contamination. (See 27 page ref. link below)
https://medscienceresearch.com/contamination/?fbclid=IwAR2LczWCTVRnDTeOf9f_GYCuC_dTnD29VR2KJRR28iqtw6hLYn52qZlh9k

Combine this with a "one size fits all" approach to protocol and now a proposal to increase protocol and we have a recipe for disaster and greater injury. The risk is simply too great.

Countless families, communities and school systems are already suffering from the devastating and debilitating negative affects from vaccines. This is reflected with the United States vaccine injury Court paying out over four billion dollars in settlement to date for injuries and even death.

<https://www.hrsa.gov/sites/default/files/hrsa/vaccine-compensation/data/monthly-stats-december-2018.pdf>

The 1986 National Childhood Injury Act law acknowledges that vaccine injuries and deaths are real and that the vaccine injured and their families should be financially supported. For some reason the same law has allowed the vaccine manufacturers to escape liability for these adverse affects and has put the financial burden on the government. Congress created a "vaccine safety task force" to track and take action to reduce these harmful affects and implement measures to improve vaccine safety. The Sec of HHS was mandated to report to senate every two years regarding this. In the past 31 years they have not once reported to the Senate! On top of this **the number of vaccines recommended for our children has significantly increased already (from 24 doses of 7 vaccines by age 18, to 69 doses of 16 vaccines!**

This clearly shows us that our children and citizens are being treated as real live time "guinea pigs" or experiments. This is both unacceptable and downright dangerous. With this as our current situation, why would a proposal such as Har 11-157 even be entertained? Who is this really benefiting?

<https://www.govinfo.gov/content/pkg/USCODE-2016-title42/pdf/USCODE-2016-title42-chap6A-subchapXIX-part2-subpartc-sec300aa-27.pdf>

<http://icandecide.org/government/ICAN-HHS-Stipulated-Order-July-2018.pdf>

<https://www.nvic.org/cmstemplates/nvic/pdf/downloads/1983-2017-vaccine-schedules.pdf>

Documented scientific evidence and studies show that recently vaccinated individuals shed the virus for weeks and even months to both vaccinated and unvaccinated people. These recently vaccinated individuals can carry the disease without symptoms and pass it on to others. There are currently no guidelines in place to quarantine recently vaccinated individuals. They are released directly into the public and into our schools while shedding the viruses. Could the vaccinations themselves be increasing the spread of disease? This is a major public health issue and concern. An increase in number of people vaccinated, dosage and frequency could significantly multiply this problem and harm our society.

<https://www.westonaprice.org/public-health-officials-know-recently-vaccinated-individuals-spread-disease/>

As you know, the Department of Health itself clearly states on their website that no vaccine is 100% effective. We saw proof of this right here on Kauai when mumps vaccinated children and people did indeed contract the mumps during the outbreak last year. The risks are simply and clearly too high and not worth it.

Again, I'm writing today to affirm my right, my families rights and any citizens right to have COMPLETE sovereignty over our bodies. This is indeed our birth right. I sincerely asked you to truly listen and respond to our concerns as citizens, parents and caregivers. Thank you for your time and consideration.

Abigail Schoder

Additional REFERENCE details:

<https://www.hrsa.gov/sites/default/files/hrsa/vaccine-compensation/data/monthly-stats-december-2018.pdf>

"How many petitions have been awarded compensation? According to the CDC, from 2006 to 2016 over 3.1 billion doses of covered vaccines "were distributed in the U.S. For petitions filed in this time period, 5,576 petitions were adjudicated by the Court, and of those 3,785 were compensated. This means for every 1 million doses of vaccine that were distributed, 1 individual was compensated. Since 1988, over 20,123 petitions have been filed with the VICP. Over that 30-year time period, 17,576 petitions have been adjudicated, with 6,313 of those determined to be compensable, while 11,263 were dismissed. Total compensation paid over the life of the program is approximately \$4.0 billion."

Aloha DOH,

Mahalo for the opportunity to submit testimony.

This is Yana. I spoke a couple times so you guys should know who I am. Sorry if I got a little serious during my testimony. I'm not suing anyone anytime soon :).

However I will keep researching this topic and continue to try and find new and innovative SCIENTIFIC information on this topic for you all to consider in your decision making process.

You all have an amazing and unique opportunity to stand for TRUTH AND JUSTICE right now. We all truly want health and happiness for ourselves and our babies.

Lets try and have a mature, healthy happy conversation about this and have a civil question and answer discussion panel as many that have given testimony request.

I very much so, hope that the DOE and everyone making decisions is yearning for truth and information as much as I am and that you find it within yourselves, for the sake of our children to come to the table and have a good discussion with the community about this topic.

A panel where not only do you hear testimony, but also answer our questions and demonstrate that you fully acknowledge and answer our concerns into the matter of mandatory vaccinations.

Just for fun, here is one more study I'd like for you to consider:

Dec 22, 2018 by Richard Harris

Research published in a major medical journal concludes that a parachute is no more effective than an empty backpack at protecting you from harm if you have to jump from an aircraft.

But before you leap to any rash conclusions, you had better hear the whole story.

The gold standard for medical research is a study that randomly assigns volunteers to try an intervention or to go without one and be part of a control group.

For some reason, nobody has ever done a randomized controlled trial of parachutes. In fact, medical researchers [often use the parachute example](#) when they argue they don't need to do a study because they're so sure they already know something works.

[Cardiologist Robert Yeh](#), an associate professor at Harvard Medical School and attending physician at Beth Israel Deaconess Medical Center, got a wicked idea one day. He and his colleagues would actually attempt the parachute study to make a few choice points about the potential pitfalls of research shortcuts.

They started by talking to their seatmates on airliners.

"We'd strike up a conversation and say, 'Would you be willing to be randomized in a study where you had a 50 percent chance of jumping out of this airplane with — versus without — a parachute?' " Yeh says.

Only a few people said yes to this outrageous invitation, and they were excluded for reasons of questionable mental health.

The scientists had much better success asking members of their own research teams from Harvard, University of California, Los Angeles (Where Yeh's brother is a surgery professor), and University of Michigan (where a buddy works) about volunteering to participate in the experiment on other aircraft.

In all, 23 people agreed to be randomly given either a backpack or a parachute and then to jump from a biplane on Martha's Vineyard in Massachusetts or from a helicopter in Michigan.

Relying on two locations and only two kinds of aircraft gave the researchers quite a skewed sample. But this sort of problem crops up frequently in studies, which was part of the point Yeh and his team were trying to make.

Still, photos taken during the experiment show the volunteers were only too happy to take part. "I think people are laughing all of the way to the ground," Yeh says.

Oh, there's one important detail here. The drop in the study was about 2 feet total, because the biplane and helicopter were parked.

Nobody suffered any injuries. Surprise, surprise. So it's technically true that parachutes offered no better protection for these jumpers than the backpacks.

"But, of course, that is a ludicrous result," Yeh says. "The real answer is that that trial did not show a benefit because of the types of patients who were enrolled."

If they had enrolled people at high risk for injury, that is people in *flying* aircraft, the results would have been quite different (not to mention unethical).

But something like this happens in everyday medical research. It's far too easy for scientists who have already anticipated the outcome of their research to cherry-pick patients and circumstances to achieve the results they expect to see. This research paper carried that idea to the ridiculous extreme.

The [study's findings](#) were published in the traditionally lighthearted Christmas issue of the medical journal, *BMJ*.

"It's a little bit of a parable, to say we have to look at the fine print, we have to understand the context in which research is designed and conducted to really properly interpret the

results," Yeh says. Scientists often read just the conclusion of a study and then draw their own conclusions that are far more sweeping than are justified by the actual findings.

This is a real problem in science.

"I know that people often don't look detailed enough into what is being investigated to know how to interpret the results of a trial," says [Cecile Janssens](#), an epidemiology professor at Emory University.

Janssens was delighted to come across the paper on Twitter. She says like a lot of research, its results are accurate as far as they go, but "the results can only be generalized to situations where people jump out of an aircraft within a few feet above the ground."

She plans to give this paper to her students with a straight face and see how long it takes for them to get the deeper points about scientific methodology buried in this absurd experiment.

"It will be unforgettable," she says — far better than assigning a straight-ahead scientific study.

Yeh is pleased to see that the fun he had with his colleagues is turning into a teaching tool. He also savors some of the more subtle lessons buried in the paper.

For example, the scientists attempted to submit it to a government registry of research studies, which is required for many studies involving human subjects. They chose one in Sri Lanka to reduce the risk that it would be discovered in advance, spoiling the joke. It was rejected.

"They thought that a trial conducted in this manner could not lead to scientifically valid evidence," he said.

"They're right!" he adds with a laugh.

In fact, the paper acknowledges that the research team members cracked themselves up so much that "all authors suffered substantial abdominal discomfort from laughter."

"Our greatest accomplishment from all of this was we felt very good that we were able to cite Sir Isaac Newton in the paper," he says. They referred to Newton's classic 1687 paper establishing the law of gravity.

Yes, gravity is a law. Mess with it at your own risk.

Dear Sirs:

I am writing to oppose RE 11-157

This is not about the dangers of vaccination and the amount of children that have been damaged by them. This is about our choice as parents to make an informed decision and for our right to choose what is best for our children.

The medical industry is as corrupt as it gets as we can see when look at the amount of people that are addicted to opioids that were launched although the pharmaceuticals behind them knew they were addictive.

Someone is pushing for extra vaccines, doctors are getting paid in the form of Bonuses for pushing vaccines and other medications without researching the background of their patients. Please ,help children to have a chance and protect them from the greed in the medical industry.

Subject: I strongly oppose 11-157 proposed rules
Date: Wednesday, December 26, 2018 4:00:15 PM

Aloha,

I strongly oppose 11-157 proposed rules.

I am a licensed Naturopathic Doctor as well as a mother and grandmother. In my family practice as a primary care doctor in Vermont and Hawaii for 24 years, I have had many vaccine injured babies, children, and adults come to me for treatment.

There are many reasons that I oppose the 11-157 proposed rules. I will mention a few of the important reasons due to time.

It is unlawful to require more vaccinations, especially for a child to be able to enter schools and preschools.

Unfortunately, vaccines are not safe and many children and adults have been injured and often debilitated. Reported vaccine injuries can be seen on the VAERS database.

There have never been proper scientific, double- blind studies done to determine the safety and efficacy of individual vaccines, and no studies have been conducted to evaluate the safety of combining multiple vaccinations in one shot or in one office visit , or the cumulative affects of 48 vaccinations starting from birth through early childhood on the current recommended vaccine schedule (before the added proposed vaccines)!

It is absolutely unlawful to require medical interventions that have a history of causing harm and death, and that have not been studied adequately individually , combined, or cumulative over time.

The vaccines are manufactured with many chemicals and adjuvants that are neurotoxic and toxic to living beings in general like aluminum, mercury compounds, formaldehyde, phenol, polysorbate 80, to name a few. Some contain material from aborted human fetuses, dog kidneys, genetically modified insects and viruses. How do these interact with a baby or adult's DNA? Do you know? No studies have been done. Animal and aborted human cells can easily be contaminated by other unknown viruses, which may lead to the recipient developing cancer , autoimmune and other conditions. Has this been studied? No.

Gardasil, an hpv vaccine, that is being proposed for requirement, has been shown to have many terrible side effects and reactions, yet hpv is a very slow growing cancer that is easily treated and screamed for.

Due to time I must end here,

Mahalo,

Dr. Donna Caplan, ND

Hawaii State Department of Health
1250 Punchbowl St.
Honolulu, HI 96813

Dear Dr. Bruce Anderson and Hawaii State Department of Health Staff:

I am writing on behalf of myself, my family, and my community to express unequivocal support for vaccines. I want to strongly support the Hawaii State Department of Health in affirming the importance of mandatory vaccinations, for the following reasons:

- 1. Vaccines protect the health of children and adults and save lives.**
- 2. Vaccines prevent life-threatening diseases, including forms of cancer.**
- 3. Vaccines have been part of the fabric of our society for decades and are one of the most significant medical innovations of the modern era.**

The impact from vaccines improving the health of the planet and our local communities is indisputable. Here are few facts from this incredible and important history of vaccines:

- As a result of the introduction of mass vaccinations, smallpox was declared eradicated from the world in 1977.
- Polio, a disease that routinely afflicted 13,000 to 20,000 Americans every year in the United States before the availability of the vaccine, was officially eliminated from the Western Hemisphere in 1991.

As has been extensively documented and studied by the United Nations and UNICEF, globally, vaccines prevent the deaths of roughly 2.5 million children per year. According to the article "Economic Evaluation of the Routine Childhood Immunization Program in the United States" published in the journal *Pediatrics* in 2009, data shows that just for children born in the United States in 2009, routine childhood immunizations will prevent approximately 42,000 early deaths and 20 million cases of disease with savings of more than \$82 billion in societal costs.

Although vaccines are the safest and most cost-effective way of preventing disease, disability and death, the United States has witnessed outbreaks of vaccine-preventable diseases, as highlighted by the measles outbreak at Disneyland in 2014. We should do everything we can in Hawaii to prevent these vaccine-preventable outbreaks from occurring here

In another example in 2012, **48,277 cases of pertussis** (whooping cough) were reported to the Centers for Disease Control and Prevention (CDC), including 20 pertussis-related deaths, as reported and documented by the CDC. **This was the most reported cases of pertussis since 1955.** In addition, each year, more than 200,000 individuals are hospitalized and 3,000-49,000 deaths occur from influenza-related complications, which could be greatly reduced with increased vaccinations.

Claims that vaccines are unsafe when administered according to expert recommendations have been disproven by a robust and thoroughly researched body of medical literature, including an exhaustive review by the National Academy of Medicine. Delaying or not requiring vaccines only leaves our State and our communities at risk of disease, particularly children. Hawaii State Department of Health should redouble efforts to make needed investments in patient and family education about the importance of vaccines in order to increase the rate of vaccination among all populations.

In conclusion, the Hawaii State Department of Health should vigorously promote and defend the importance of vaccines. The Hawaii State Department of Health should share this message, loudly and clearly:

Vaccines are safe. Vaccines are effective. Vaccines save lives.

Our communities across the state of Hawaii need accurate and detailed information regarding the robust, extensive scientific evidence supporting vaccine safety and effectiveness. Please continue to require and promote vaccinations to keep our beautiful State of Hawaii healthy and safe!

Sincerely,
Ally Brown

I'm writing in my testimony against the immunization mandate. I don't believe in creating mandates that exclude people who do or don't decide to vaccinate their children. I believe vaccinations have done great harm to many children all across the world. I don't think there has been enough testing to prove these vaccines are harmless. I would not feed my kids something I believe bad for them, let alone knowingly inject something into my precious child that I believe harmful. I'm asking you to prove to me these products your pushing on us are safe and do more good than harm. If mandates expand and normal things like joining public schools and sports and what not are decided upon by your vaccine status, many people will pull away from that society and create their own where they feel safe and free. We all want to live our lives the best we can and I'm asking to be able to live mine with freedom of choice and freedom to decide what is best for my children. As I am sure you want that choice for yourself and yours.

Hawaii State Department of Health
1250 Punchbowl St.
Honolulu, HI 96813

Dear Dr. Bruce Anderson and Hawaii State Department of Health Staff:

I am writing on behalf of myself, my family, and my community to express unequivocal support for vaccines. I want to strongly support the Hawaii State Department of Health in affirming the importance of mandatory vaccinations, for the following reasons:

- 1. Vaccines protect the health of children and adults and save lives.**
- 2. Vaccines prevent life-threatening diseases, including forms of cancer.**
- 3. Vaccines have been part of the fabric of our society for decades and are one of the most significant medical innovations of the modern era.**

The impact from vaccines improving the health of the planet and our local communities is indisputable. Here are few facts from this incredible and important history of vaccines:

- As a result of the introduction of mass vaccinations, smallpox was declared eradicated from the world in 1977.
- Polio, a disease that routinely afflicted 13,000 to 20,000 Americans every year in the United States before the availability of the vaccine, was officially eliminated from the Western Hemisphere in 1991.

As has been extensively documented and studied by the United Nations and UNICEF, globally, vaccines prevent the deaths of roughly 2.5 million children per year. According to the article "Economic Evaluation of the Routine Childhood Immunization Program in the United States" published in the journal *Pediatrics* in 2009, data shows that just for children born in the United States in 2009, routine childhood immunizations will prevent approximately 42,000 early deaths and 20 million cases of disease with savings of more than \$82 billion in societal costs.

Although vaccines are the safest and most cost-effective way of preventing disease, disability and death, the United States has witnessed outbreaks of vaccine-preventable diseases, as highlighted by the measles outbreak at Disneyland in 2014. We should do everything we can in Hawaii to prevent these vaccine-preventable outbreaks from occurring here

In another example in 2012, **48,277 cases of pertussis** (whooping cough) were reported to the Centers for Disease Control and Prevention (CDC), including 20 pertussis-related deaths, as reported and documented by the CDC. **This was the most reported cases of pertussis since 1955.** In addition, each year, more than 200,000 individuals are hospitalized and 3,000-49,000 deaths occur from influenza-related complications, which could be greatly reduced with increased vaccinations.

Claims that vaccines are unsafe when administered according to expert recommendations have been disproven by a robust and thoroughly researched body of medical literature, including an exhaustive review by the National Academy of Medicine. Delaying or not requiring vaccines only leaves our State and our communities at risk of disease, particularly children. Hawaii State Department of Health should redouble efforts to make needed investments in patient and family education about the importance of vaccines in order to increase the rate of vaccination among all populations.

In conclusion, the Hawaii State Department of Health should vigorously promote and defend the importance of vaccines. The Hawaii State Department of Health should share this message, loudly and clearly:

Vaccines are safe. Vaccines are effective. Vaccines save lives.

Our communities across the state of Hawaii need accurate and detailed information regarding the robust, extensive scientific evidence supporting vaccine safety and effectiveness. Please continue to require and promote vaccinations to keep our beautiful State of Hawaii healthy and safe!

Informed Consent / NO Mandated Vaccines

Wednesday, December 26, 2018 12:12:01 PM

Aloha ~

Ask the teachers about the increase of ADHD/ autism and learning/ health issues! (especially in SPED) I taught here for 35 years and believe me ~ the children are in DANGER!

https://www.naturalnews.com/052265_vaccine_experiments_Bill_Gates_India.html

<http://mauiindependent.org/hawaii-dept-of-health-tries-to-force-hazardous-ineffective-hpv-vaccine-on-all-public-school-children/?fbclid=IwAR1dvnQrBqhKaBTuNbGZ7DK98mFI03fwMSjrF5Bx45ZHYlrZgDPulAcDyyo>

“ALL the Vaccines Are Contaminated - Every Last One of Them

"The chief, if not the sole, cause of the monstrous increase in cancer has been vaccination" - Dr. Robert Robert Bell, CM, MSc, MD, FACS, FRCSC Cancer Clinical Research Unit (CCRU), once Vice President International Society for Cancer Research at the Princess Margaret Cancer Centre

(WASHINGTON, D.C.) - Have you been rushing out to get a yearly flu vaccine or diligently taking your children for the 40 or so mandated childhood vaccines?

That's really a shame because you have unwittingly been trading a run-of-the-mill flu or just the measles, for loading up your or your children's bodies with cancer and other deadly viruses, a destructive bacteria, a chemical selected to damage fertility, and with synthetic DNA that threatens to damage your own DNA - the biologic code for your existence.

Who is saying the vaccines are contaminated?

None other than the (now deceased) head of vaccines at Merck, Dr. Maurice Hillerman, who on camera admitted that Merck's Hepatitis B vaccines, contaminated with a virus, caused the AIDS epidemic in the US. He went on to say that all of Merck's vaccines are contaminated with cancer and other viruses. (The US government has conceded the HEB B vaccine causes Lupus. That vaccine is mandated for every infant in the US on the day of birth, and is associated with MS as well.)

<http://www.salem-news.com/articles/november292011/vaccines-contaminated-se.php>

Or they might recognize that so is Dr. Larry Palevsky, a board certified NY pediatrician, who for ten years routinely gave vaccines to his patients until he noticed them losing eye contact and then began looking into the vaccines he had blindly trusted. He found that they are ALL contaminated with viruses that are so small they can never be removed. He no longer gives any vaccines. He now treats his young patients for autism and other neurologic injuries from vaccines.

Donald W. Scott, the editor of The Journal of Degenerative Diseases and the co-founder of the Common Cause Medical Research Foundation, links vaccines to AIDS (as did Hillerman) and

to US bio-weapons research, and says they are contaminated with mycoplasma, a primitive bacteria that takes apart cell walls.

Perhaps the highest scientific authority saying vaccines are contaminated is Garth Nicolson. He is a cell biologist and editor of the Journal of Clinical and Experimental Metastasis, and the Journal of Cellular Biochemistry. He is one of the most cited scientists in the world, having published over 600 medical and scientific peer-reviewed papers, edited over 14 books, and served on the editorial boards of 28 medical and scientific journals. He is not just saying that vaccines are contaminated with mycoplasma but is warning the US that they are. Nicolson goes further and says that we are all being damaged by them and contracting chronic degenerative diseases that.

That damage translates into lifelong patients (and thus life-long profit) for the pharmaceutical industry making the vaccines and he says doesn't appear to be accidental.

According To CIA Statistics: As Shots Increase, U.S. Lifespan Is DECREASING

All the vaccines mandated to children and many other vaccines as well, including the seasonal flu vaccines being mandated to health care workers, are contaminated with polysorbate 80, the central ingredient in a pharmaceutical industry patent to damage fertility. The pharmaceutical industry has a long history of seeking a vaccine that would covertly sterilize whole populations. So, in addition to being contaminated with cancer and other viruses, and with the bacteria mycoplasma, vaccines are intentionally "contaminated" with a chemical as well, which is, given the patent, a "patently" sought-after sterilizing agent.

Beyond containing polysorbate 80 and cancer and other viruses, and likely mycoplasma, the Gardasil vaccines are contaminated in an additional way. It and all the new vaccines are contaminated with genetically engineered DNA. It can contaminate people's DNA, just as genetically engineered crops can contaminate normal crops. Gardasil itself is contaminated with a man-made version of the HPV DNA, the very virus it was supposed to protect against, which now it threatens not only altering kids' healthy DNA with synthetic DNA (!) but with a diseased version.

The California law even approves in advance, ALL yet-to-be made (and completely untested) vaccines for sexually transmitted diseases, though of the two current Merck vaccines they are pushing on children, one Merck vaccine caused AIDS and causes Lupus and the other Merck vaccine is contaminated in multiple ways and proving highly lethal. Children will be the ones to decide whether to take the vaccines, and they will make that decision after being forced to see videos of people dying terrible deaths from cancer. Not only would the vaccine be given without parental consent, but parents are denied knowledge that the vaccine is going to be given or that it was given. If the child has a seizure or dies afterward, parents may not see their own children's medical records.

This is what is left of the "informed consent" meant to provide human rights to protect the world from pharmaceutical industry abuses against mankind.

After World War II, it was Merck which received the flight capital of the pharmaceutical industry indicted for crimes against humanity, human enslavement and mass murder.

In the case of children, rather than their facing childhood diseases of insignificant threat, they

are, by legal mandate, being bombarded repeatedly throughout their childhood with viruses that cause diseases (including cancer), a cell-destroying bacteria, a threat to the very integrity of their DNA, and a chemical specifically chosen to impair fertility. And laws are being written to add to the already long list of vaccines they must take, including two mandated Merck vaccines. One is an old Merck vaccine that caused AIDS and is causing Lupus. The other is a Merck vaccine claiming to prevent cervical cancer though girls have little chance of contracting it in the first place (and boys, none!) and it can easily be detected by pap smear and treated successfully and there is NO evidence the vaccine prevents it. Meanwhile, it is killing children.

Subject: OPPOSE HAR-A57
Date: Wednesday, December 26, 2018 2:34:00 PM

To the DOH Hawaii,

My name is Ione Chittenden and I OPOPOSE HAR 11-157! As the mother of an autistic child, I saw what vaccines did to my child and I don't want the same to happen to other families. I've been called crazy for believing that vaccines harmed my child but unless you've seen it happen to your own, many won't believe it. She is our only child and she was very much wanted. We tried for many years to have a child and finally had her with the help of in vitro fertilization. We adored her every sound & movement. Then she had the MMR shot and everything changed. We saw the changes that the MMR vaccine did to her. But we didn't make the connection to the vaccines until we took her back for more shots. That is when the more severe symptoms of autism appeared. She stopped talking and behaviorally, she was out of control! We needed speech therapy, occupational therapy and consulted with specialists, non of which was covered by our health insurance so we had to pay out of pocket! We tried to get DDD services for our child but was denied for 7 years!!!!!! In 2015, things got so bad! Our child was destroying our house, her school cut her school hours down to only 2 a day and we could not find help!!! I finally contacted Senator Rudderman's office for help and his office helped to get us on the waiver program.

You, the DOH, want to force vaccines, but then hold back services to the families of the children who get hurt by the vaccines. I know of other families that had a hard time getting DDD services as well. If this bill passes, I fear that many more families will go through the same hardship that we went through when we were looking for help! We've exhausted all of our retirement by paying out of pocket for therapies that weren't covered under our medical. Now we are left worrying what will happen to our child after we die.

I believe that passing this bill is fueled by the greed of the pharmaceutical companies. Please do not pass this bill. More children will be hurt, more families will have their hopes and dreams destroyed and their lives turned upside down. In closing, I would like for you to please look at your DOH mission statement and goals. Passing this bill goes against what your mission statement stands for!

MISSION STATEMENT

The mission of the Department of Health is to protect and improve the health and environment for all people in Hawai'i .

Philosophy

Health, that optimal state of physical, mental, social and environmental well-being, is a right and responsibility of all of Hawaii's people.

Goals

- Promote health and well-being
- Prevent disease and injury
- Promote healthy lifestyles and workplaces
- Promote the strength and integrity of families and communities

To prevent pollution and promote and preserve a clean, healthy and natural environment

- Promote resource conservation (recycling)
- Protect and enhance air and water quality

To assure basic physical and mental health care (the five A's)

- Affordable
- Appropriate
- Assured quality
- Available
- Accessible

Guiding Principles

- Ensure that core public health functions – assessment, policy, and assurance – are implemented or maintained.
- Ensure that federal mandates, including court-ordered settlements are satisfied.
- Ensure that resources are directed at those problems that pose the greatest risk to the public's health and the environment.
- Ensure that appropriate and cost-effective resources are dispersed geographically and satisfy principles 1 to 3.
- Ensure that the health department is the service provider of last resort for uninsurable populations and where there is no other satisfactory alternative.

Subject: Oppose increased mandatory vaccinations
Date: Wednesday, December 26, 2018 3:44:21 PM

To the Immunization Branch
Hawaii State Department of Health

The very topic of mandatory vaccinations is abhorrent to many people. It reeks of authoritarianism, communism and nazism - virtually every negative "ism" is evoked when the term "mandatory vaccinations" is heard. It assumes that the individual's right to privacy and freedom of choice is non-existent. It strikes at the heart of what it means to be an American living in a Constitutional republic.

Not only Americans are horrified at the thought - in the words Dr. Hiroko Mori, former head of the infectious disease section at the former Institute of Public Health, Japan: "The right to choose should be recognized as a fundamental human right."

<https://www.japantimes.co.jp/life/2014/10/04/lifestyle/vaccination-choice-two-unknowns/>

'Mandatory vaccinations' implies not only that the individual has no such rights, but that they are incapable of deciding, based on the facts, what is best for their own health and the health of their children.

Therein lies the rub - in today's information age, in a climate of medicine for profit, where pharmaceutical corporations wield their billions of dollars like weapons of war and saturate the airwaves with direct-to-consumer advertising, (U.S. being only one of two countries in the world to allow this), and pay their lobbyists to write the legislation that protects them from vaccine liability, in this climate it is exceedingly difficult to find any facts on the topic of vaccines efficacy and safety.

Let's go back in time and look at the early polio vaccines. The original Salk vaccine made of inactivated viruses was replaced by the Sabin oral polio vaccine of three vaccine strain polioviruses cultured from primary cell monkey kidneys. One of the monkeys carried a virus known to cause cancer tumors - SV40. In spite of this fact, public health officials recommended that all children receive this oral polio vaccine. Between 1954 and 1961 over 100 million children and adults received this vaccine. Doctors assumed that the cancer causing virus was removed from the vaccine, however it was discovered that up until 1978 it was still present in the vaccine. (Cutrone r, Lednicky J, Dunn G et al. [Some Oral Poliovirus Vaccines Were Contaminated with Infectious SV40 after 1961](#). *Cancer Res* 2005; 65: 10273-10279.)

Of course, the fact that half of all people today will have some kind of cancer must simply be a coincidence...right? "Correlation is not causation" is the mantra we hear so often from those scientists dependent on corporate dollars.

Speaking of which, let's look at the vaccine studies done by scientists funded by the protected class of vaccine manufacturing pharmaceutical corporations, which the CDC relies on. Can we be assured that they present all the pertinent data, free of bias? Hardly.

In the opinion of the Chief Editor of the world's most prestigious medical journal, The Lancet:

“The case against science is straightforward: much of the scientific literature, perhaps half, may simply be untrue. Afflicted by studies with small sample sizes, tiny effects, invalid exploratory analyses, and flagrant conflicts of interest, together with an obsession for pursuing fashionable trends of dubious importance, science has taken a turn towards darkness.” - “Offline: What is medicine's 5 sigma?” Richard Horton, editor The Lancet www.thelancet.com vol385 April 11, 2015.

But that's not all. Listen to what the editor at the New England Medical Journal has to say: Marcia Angell: “it is simply no longer possible to believe much of the clinical research that is published, or to rely on the judgment of trusted physicians or authoritative medical guidelines. I take no pleasure in this conclusion, which I reached slowly and reluctantly over my two decades as an editor of *The New England Journal of Medicine*”

So, Hawaii Department of Health now asks us to follow the recommendations made by the CDC for these ‘mandatory vaccinations’. Vaccinations are violent, invasive procedures that may result in death, paralysis or permanent disability. And we are asked to do so, because the CDC says it is a good thing.

Let's watch a video as the CDC's "Advisory Committee on Immunization Practices" decides whether to approve the new Hep B vaccine: <https://thevaccinereaction.org/2018/09/acip-voting-on-a-new-vaccine/>

"Is there any comment on using this vaccine at the same time as other adjuvanted vaccines? *We have no data to make a recommendation one way or the other.* So just to sort of put this in context of other vaccines, while pre-clinical studies were not done using this vaccine simultaneously, our general approach to immunizations is that they can be given at the same time in different limbs.

Are multiple adjuvanted vaccines used in Europe or other markets?

Not to my knowledge. Okay, I think unless there's any further discussion we will take a vote on this recommendation. *So... the voting is completed and it is unanimous to support this recommendation to approve the hepatitis B vaccine.*”

In other words, this committee has decided to approve a vaccine known to cause myocardial infarctions and see what happens to the millions of guinea pig people who will unwittingly be testing it.

Is the entire CDC corrupted beyond all repair by pharmaceutical money? Thanks to the efforts of independent journalists we can look at former CDC Director Thomas Frieden for a glimmer of just how bad it could be. Not simply that he was arrested for sexual abuse, but the possible billions in scandals. <https://www.coreysdigs.com/cdc/cdc-thomas-frieden-billions-in-potential-scandals/>

There are too many reasons to list here as to why I oppose mandatory vaccinations. Suffice it to say that not only should the CDC recommendations not be implemented, but the philosophical exemption should be reinstated.

Sincerely,

Vicki Vierra

OPPOSE MANDATORY VACCINATION

Wednesday, December 26, 2018 5:13:31 PM

My name Debra Parzych and I STRONGLY oppose mandatory vaccination! There is a huge list of dangers associated with vaccines and when there are dangers present there MUST be a choice!!

Debra Parzych

Sent from my iPhone

From: [REDACTED]
To: [REDACTED]
Subject: Opposition Testimony to HAR 11-157
Date: Wednesday, December 26, 2018 10:11:05 AM

Dear Sir or Madam,

Please oppose HAR11-157 mandating the extremely unsafe HPV vaccine and terribly inefficient Flu shot for children to attend public school.

I urge you to listen to the countless stories of harm these shots have caused.

I urge you to please understand we are not a "1 size fits all" population- especially when it comes to our health!

I was in the military for 4 years and subjected to over 40 doses of vaccines.

Within a few months I was experiencing hair loss, and psoriasis. I was only 23 yrs old! Years later with genetic testing I found out that I have a genetic mutation called MTHFR, which in short means my body is unable to properly detox like normal. This means any toxins I'm exposed to stay within me leading to autoimmune diseases without me making effort to detox with supplements and interventions.

I have kids. My 9yr old daughter was fully vaccinated according to schedule and she has had problems with anxiety, sensory disorder (extremely sensitive to noises and lights and crowded places), she also suffered from damage to her development in executive processes due to her inability to detox from the toxic ingredients in the vaccines.

HPV vaccine is dangerous and does not prevent cancer. Young children are not at risk and this should just be optional for sexually active teens and adults.

The flu shot does not prevent anyone from contracting the influenza virus- it simply reduces your symptoms, therefore you may have the virus, and still attend school and spread the virus infecting others because you aren't displaying symptoms! This is not acceptable. My son had the flu this year and we kept him home, we let him rest and gave him extra vitamin C, elderberry Syrup, probiotics, and kept him hydrated, he was better in 3 days.

I do not fear disease simply because someone is selling a vaccine for it.

You shouldn't either. Please take time, & due diligence to understand how these vaccines are made, how they supposedly work, what the true risks are, and why they only give a "1 size fits all dose"... why so many parents are afraid of being forced to inject toxic substances into their children.

HPV vaccine has been pulled from schedule in many countries due to safety concerns and flu vaccine has the most reported vaccine for injury . These vaccines are not going to contribute to better health but may actually cause more health issues than the could hypothetically prevent.

Thank you for your time and consideration.

Please be pono.

Respectfully,
Jessica Oliveira

Subject: TESTIMONY OPPOSING Ch 11-157
Date: Wednesday, December 26, 2018 7:54:58 AM

RE: Testimony STRONGLY OPPOSING the Hawaii DOH's proposed amendments to HAR Ch. 11-157, Examination and Immunization

The Department of Health held several public hearings across the islands, on Honolulu, Maui/Molokai (video conference), Lanai, Kauai, Hilo, and Kona as per the public schedule posted on their website.[\[1\]](#)

Although oral testimony was provided in front of a DOH hearings officer, Steven Jacobsen and Unknown, both publicly stated at every meeting that they had not read or was not familiar with the proposed language and that they were not there to make any decisions.

None of the decision makers were present at any of the hearings, only DOH staffers. The only senior DOH staff seen a couple of hearings was Ron Balajadia of the Immunization Branch, under Dr. Sarah Park, State Epidemiologist.

The DOH recorded over 12 hours of oral testimony from the public on the proposed amendments and requested written testimony. An overwhelming majority of testifiers described personal stories of vaccine injuries, facts and evidence of vaccine injuries and dangers. Only a handful of practitioners testified in support.

The Hearings Officers stated that the DOH would review the audio and written testimonies and would make a decision. Neither Hearings Officer could provide any time frame. When pressed for the names of the decision makers, the Hearings Officers could not provide any names for the record.

This lack of transparency in the administrative process demonstrated that the DOH, specifically the Disease Outbreak Control Division, Immunization Branch under Dr. Sarah Park cannot be allowed to amend, repeal or adopt any administrative rules without additional oversight.

Ch. 11-157 amendments proposes to adopt ACIP guidelines while also mandating several additional vaccines at various school levels, with the additional authority to adopt future amendments as they occur. However, important decisions related to our children cannot be left to individuals who make decisions but are not responsible for the health consequences that may occur from these mandates.

Under the National Childhood Vaccine Injury Act of 1986, specifically 42 USC 300aa-27, the Department of Health and Human Services (DHHS) is required "to improve the safety profile of childhood vaccines, which includes licensing, manufacturing, processing, testing, labeling, warning, use instructions, distribution, storage, administration, field surveillance, adverse reaction reporting, and recall of reactogenic lots or batches, of vaccines, and research on

vaccines, in order to reduce the risks of adverse reactions to vaccines.” These are the same childhood vaccines recommended by the CDC on behalf of the federal government.

However, a recent FOIA request showed that DHHS admitted that it has never conducted any studies or research demonstrating the safety of childhood vaccines recommended by the federal government as required by 42 USC 300aa-27.[2] The federal government was unable to show and continues to be unable to show that childhood vaccines are any safer than they were when they were first introduced onto the market, in some instances, many decades ago.

As the Hawaii DOH attempts to mandate these very same vaccines recommended by the ACIP, a federal advisory committee to the CDC, which falls under DHHS, the issues remain the same. If DHHS has not conducted any studies in the last 30 years on the safety of vaccines, then the ACIP, which has never conducted any clinical studies itself, by default, cannot also claim that its recommendations regarding the CDC recommended childhood vaccines are safe related to adverse reactions.

ACIP guidelines and its vaccine recommendations should not be mandated by the DOH in the proposed Ch. 11-157. These recommendations are intended to only be recommendations where parents and doctors discuss the risks and benefits of vaccines before making an informed decision. To mandate vaccines without evidence of safety is unconscionable and irresponsible by the Hawaii Department of Health, the Director of Health, the State Epidemiologist, the Governor and the State of Hawaii and any other individual involved in making this monumental decision.

Please find included, a link to 50 studies questioning the safety of vaccines published since 2010[3] which I am submitting as evidence for DOH review to OPPOSE Ch. 11-157.

Thank you,

Teresa Chao, RPh, MBA, MJ

Subject: TESTIMONY OPPOSING CH 11-157
Date: Wednesday, December 26, 2018 3:26:04 PM

TESTIMONY STRONGLY OPPOSING DOH Ch. 11-157 for the following reasons:

The DOH submitted an application to the Small Business Regulatory Review Board (SBRRB) entitled, "Pre-Public Hearing Small Business Impact Statement to the Small Business Regulatory Review Board" received on June 27, 2017.

At the Maui public hearing held on December 14, 2018, the DOH hearings officer, Steve Jacobson stated that the public could submit questions via email so that the DOH would have the opportunity to address public concerns. Therefore, I am requesting the DOH Immunization Branch and the DOH Disease Outbreak Control Division to provide a written response to the following questions related to the above Impact statement and DOH responses. The questions are as follows:

1. Through a request to the SBRRB, records showed that the SBRRB received the DOH's Pre-Public Hearing Small Business Impact Statement to the Small Business Regulatory Review Board on June 27, 2017. In addition the DOH also submitted at that time, two documents, and a version of HAR Chapter 11-157, dated May 26, 2017 and a copy of the ACIP guidance.

On July 19, 2017, the SBRRB voted to send the proposed rules dated May 26, 2017 to a public hearing. However, the version of Chapter 11-157 dated May 26, 2017 is **DIFFERENT** from the version that is currently posted on the DOH website which is dated September 5, 2018. The September 5, 2018 version was also the version that was debated on at the public hearing on Oahu on November 1, 2018 and will be the same version for the remaining hearings on the outer islands.

There are substantive differences in these versions of Ch. 11-157 relating to the tuberculin testing and the process to move these proposed rules to public hearing should have been readdressed but was not.

QUESTION: Was the DOH legally or ethically required to submit an up-dated Ch. 11-157, at minimum to the SBRRB and when did the DOH disclose this change of information to the SBRRB?

2. Page 2, question 1, basically asks how small businesses may be adversely affected by the proposed rules. The DOH responded "The health care providers should not be adversely affected by the proposed rules. Child care centers, compulsory schools and post-secondary should not be affected by the proposed rules."

QUESTION: What documents, notes, or additional information did the DOH use to support their assertion that these providers "should not be adversely affected?"

QUESTION: What additional written information, testimonies or summaries of information were submitted by health care providers, child care centers, compulsory schools and post-secondary providers that support the DOH's claim that these providers "should not be adversely affected?"

3. Page 2, question 2, asks for dollar amounts of increased direct costs in fees, fines, and indirect costs including reporting, recordkeeping, equipment construction, labor, professional services, revenue

loss, or other costs associated with compliance.

The DOH response was "Increased indirect costs associated with enhance screening and recordkeeping may be incurred by some schools and post-secondary schools. The Department does not anticipate any increased costs associated with compliance to health care providers." However, no dollar amounts were provided as required.

QUESTION: The DOH admitted that "some schools and post-secondary schools" may incur increased costs. What are these estimated dollar amounts?

QUESTION: What information did the DOH use to assert that health care providers are not anticipated to incur any increased costs?"

4. Page 2, question 3, asks for the probable monetary costs and benefits to the agency or other agencies directly affected.

QUESTION: The DOH stated that it estimates that the additional requirements necessary for implementation have been determined to be \$60,000 for the 1st year and \$5,000 for additional years. Where is the cost analysis showing how the DOH arrived at both of these figures and what is the plan the DOH intends to implement to achieve these goals?

QUESTION: Since the Department of Education is another agency that will be affected by the additional recordkeeping and monitoring as described in the proposed rules, what information did the DOH use to determine the probable monetary costs for the Department of Education to implement these additional requirements?

5. Page 3, question 4, asks for the methods the DOH considered or used to reduce the impact on small business. The DOH's response was that "the training provided would assist the providers and affected organizations to understand the changes to the requirements so that they would be able to screen records appropriately."

QUESTION: When small businesses are required to provide the man-power to implement the recommendations proposed by Ch. 11-157, exactly what are the expected duties necessary to properly screen the documents and what are the estimated costs in man-power and supplies needed to satisfy this requirement?

6. On page 3, question 7, the question asks how the DOH involved small business in the development of the proposed rules.

DOH's response was that "the 'School and Immunization Requirements Working Group' was made up of representatives from private compulsory and post-secondary institutions, the American Academy of Pediatrics, Hawaii Chapter, the Hawaii Association of Independent Schools, and Kaiser Permanente, Department of Education, the Department of Human Services, and Tuberculosis Control, Public Health Nursing, Disease Investigation, and Immunization Branches of the Department of Health."

However, there are NO small businesses or individuals represented in this working group. Therefore, it is questionable as to whether any small businesses were involved in the development of the proposed Ch.11-157 rules.

QUESTION: If there were small businesses or individuals in the 'School and Immunization Requirements Working Group,' please identify them by name or by name of business.

7. On Page 3, question 7a, asks if there were any **recommendations** made by small businesses and whether the recommendations were incorporated in the proposed rule. If yes, explain, if no, why not.

Instead of answering "yes" or "no" to this question, the DOH stated that the 'School and Immunization Requirements Working Group' member organizations emphasized the need for delayed effective date to allow training materials and training to take place of the rules' effective date.

QUESTION: Why did the DOH fail to directly answer this question? Is it because they did not appear to have solicited any responses from small businesses such as daycare business owners, individual providers or the like in their working group?

The exclusion of small businesses from the working group implies that small businesses such as daycare centers and individual providers did not provide any recommendations and thus their input were not incorporated into the proposed rule.

Further, the DOH's solution of providing training and training materials was created by LARGE businesses which included Kaiser Permanente, the HAIS for private schools, and post-secondary institutions which include community colleges and universities.

This omission of small businesses from the working group should invalidate this entire application and the DOH should be required to properly solicit input from small businesses such as daycare centers, other child-care facilities, and individual small business owners before the proposed amendment is allowed to move forward.

1. On page 3, question 8, asks whether "the proposed rules include provisions that are more stringent than those mandated by a comparable or related federal, state, or county standards, with an explanation of the reason for imposing the more stringent standard."

The DOH's response states that "the proposed school examination and immunization regulations are consistent with the United States Centers for Disease Control and Prevention's Advisory Committee on Immunization Practices (ACIP) recommendations and are comparable to and in some instances less stringent than other states' school and post-secondary school immunization and examination requirements. The proposed rules are not more stringent than any comparable or related federal, state or county standards."

The DOH's statement is false. There are three problems with the DOH response:

- A. The DOH states that "their school examination and immunization regulations are consistent with the ACIP recommendations." However, the issue is that the DOH appears to be misrepresenting ACIP guidelines as federal, state, and county standards when they are not. ACIP guidelines are only recommendations issued by a federal advisory committee. They are not mandates or laws from the federal or state governments.
- B. The DOH claims that the ACIP recommendations are comparable to and in some instances less

stringent than other state immunization requirements. However, some states have philosophical exemptions but Hawaii does not. Also, ACIP guidelines support very specific recommendations for medical exemptions which would make Hawaii's medical exemptions more strict compared to other states. Hawaii's religious exemption is also more strict in that the document must be certified and the "person's religious beliefs must prohibit the practice of immunization" compared to other states with looser requirements.

In states that only have medical restrictions such as Mississippi,[\[1\]](#) only 9 vaccinations (DTap, IPV, Hepatitis B, MMR, Varicella)[\[2\]](#) are required for school entry from K to 12th grade and only Tdap is required for 7th grade for a total of 17 injections. West Virginia[\[3\]](#) only requires 9 vaccinations (DTap, IPV, MMR, Varicella, Hepatitis B) [\[4\]](#) for school entry from K to 12th grade for a total of 14 injections. California's K-12 children require 9 vaccinations (DTap, IPV or OPV, Hepatitis B, MMR and Varicella)[\[5\]](#) for a total of 16 injections.[\[6\]](#) The Hepatitis A, HPV, and meningococcal vaccines are not required compared to the DOH's proposed rules which would require these vaccinations.

Further, only 2 states require HPV. Virginia[\[7\]](#) requires HPV for 6th graders, however, the parent or guardian, at the parent or guardian's sole discretion, may elect for the child to not receive the HPV vaccine, unlike DOH's proposed rules which would mandate HPV for all 7th graders. Rhode Island allows a simple religious exemption form[\[8\]](#) which does not require the "certification of a person's religious beliefs prohibit[ing] the practice of immunization" as per DOH's current rules.

The current Hawaii immunization requirements for K-12 are 9 vaccinations (DTP, IPV or OPB, MMR, Hepatitis B and Varicella)[\[9\]](#) for a total of 16 to 17 injections (depending on timing) which is currently similar to other states. However, with DOH's the proposed rules, children from K-12, would also be required to receive an additional 3 vaccinations, including Hepatitis A, HPV, and MCV as 6 injections for a total of 23 to 24 injections for K-12. For post-secondary students the number of vaccines could increase by 5 vaccinations or as 8 injections or more but the number of doses may vary since number of doses are not specifically outlined in the DOH's proposed rules. *(The number of vaccinations were based on my interpretation of DOH's proposed rules. Many doses are open to interpretation since the rules do not stipulate the number of doses, address timing of doses that overlap into other grades, and need for extra doses due to timing or age, and the need for additional series of vaccines for older adults attending post-secondary schools.)*

Thus, the DOH's Ch. 11-157 appears to be **MORE** stringent rather than less stringent than any comparable or related federal, state or county standards. These findings contradict the DOH's written statement of being "not more stringent" than any comparable or related federal, state or county standards.

- A. Most states comply with the Federal Educational Rights to Privacy Act (FERPA) in their state laws and rules which require written parental consent before releasing any educational records, including vaccinations records and exemptions, except for limited emergency situations. Hawaii's Department of Education, HAR Ch. 8-34[\[10\]](#) protects these educational records, and does not authorize the DOE to release educational records to the DOH. Yet, both the current[\[11\]](#) and proposed DOH rules[\[12\]](#) require DOE schools to automatically release educational records on a regular basis from the schools to the DOH thus violating FERPA. The DOH does not have the authority to force schools to violate federal FERPA law.

Since the Hawaii Department of Education receives millions of dollars in federal funding from the US Department of Education and from the Office of Special Education Programs, known violations of FERPA could result in the withholding of these federal funds.

1. In a follow-up to page 3, question 8, if the DOH has misrepresented their response where their proposed rules are actually MORE stringent rather than “not more stringent” than any comparable or related federal, state or county standards, as they have claimed, then this “Pre-Public Hearing Small Business Impact Statement” should again be deemed invalid.

Because if the answer is supposed to be “yes” to question 8 where these rules are more stringent, then the DOH would be required to provide information comparing the costs and benefits of the proposed rules to the costs and benefits of the comparable federal, state or county laws which would require responses to the additional 5 items below requiring a more in depth analysis of the following:

- the public purposes of the proposed rule,
- the text of the related federal, state, or county law, including information about the purposes and applicability of the law,
- a comparison between the proposed rule and the related federal, state, or county law, including a comparison of their purposes, application, and administration,
- a comparison of the monetary costs and benefits of the proposed rule with the costs and benefits of imposing or deferring to the related, federal, state or county law, as well as a description of the manner in which any additional fees from the proposed rules will be used and,
- a comparison of the adverse effects on small business imposed by the proposed rule with the adverse effects of the related federal, state or county law.

QUESTION: Will the DOH conduct a cost analysis presenting the costs and benefits of the proposed rules to the costs and benefits of the comparable federal, state or county law, which includes the above 5 items.

QUESTION: If the DOH will not conduct a cost analysis, can the DOH definitively demonstrate that the DOH’s proposed rules are “not more stringent than any comparable or related federal, state or county standards?”

In conclusion, the DOH’s “Pre-Public Hearing Small Business Impact Statement to the Small Business Regulatory Review Board” dated June 27, 2017 has many questionable items and the public deserves answers before Ch11-157 hearings are adopted including the following:

1. **The differences in the Ch. 11-157 versions submitted to the SBRRB which was voted on in July 19, 2017 and moved to public hearing.**
2. The vague and non-committal responses provided by the DOH when dollar amounts were specifically asked for.
3. The absence of a daycare provider, or child care center representative, or individual small business representatives on the School Examination and Immunization Requirements Working Group and the inappropriate DOH response provided when recommendations from these small businesses were required.

4. The DOH's claim that their proposed rules are not more stringent than any comparable or related federal, state or county standards when there is evidence to the contrary.
5. The need for a cost analysis if the DOH's their proposed rules are indeed MORE stringent than any comparable or related federal, state or county standards.

The issues raised related the impact of the DOH's Chapter 11-157 proposed rules on small businesses must be more thoroughly evaluated and reviewed before any further consideration can be given to move these changes forward through the SBRRB process. Please provide a written response for public review.

Date: Wednesday, December 26, 2018 8:12:43 AM

To Whom It May Concern:

My name is Alison Miller, I am a [REDACTED] resident of over 15 years and a parent and I strongly oppose bill Har 11-157. There is enough research and information circling the medical communities that raises strong health concern as to the safety of vaccinations, the effectiveness of them or adverse reactions caused by them. I have peers in the medical community and have researched and viewed documentaries that demonstrate the ingredients in vaccinations can potentially be damaging and create harm while questionably.

Health News articles report, vaccines Are 'Unavoidably Unsafe'. Both the U.S. Congress and the Supreme Court have concluded that government licensed vaccines are "unavoidably unsafe,"² and this is what precipitated the decision to grant drug companies immunity against vaccine injuries and deaths. See more documentation.

<https://www.nvic.org/NVIC-Vaccine-News/June-2016/defending-religious-exemption-to-vaccination.aspx>

Thank you for your opposition to this bill.

Sincerely,

Alison Miller

Subject: Protest Mandatory Immunization
Date: Wednesday, December 26, 2018 8:23:16 AM

We have a right to choose what we inject into our bloodstream.

“Imagine if you will a country where 1% control almost all the wealth and power (big pharma). And the other 99% are so brainwashed they fight vigorously to keep it that way.”

First, our entire mainstream food, supplement and drug supply has become so corrupted, companies we've trusted for decades are committing heinous crimes in the name of profit. Just today, Johnson and Johnson is charged because a three year old was hospitalized due to metal in her intestines from her vitamin gummy bears! This same company also admitted to using asbestos in their baby powders. These companies that rule the market place our ruining lives for the sake of profit.

Daily I read articles on vaccine injury. A new father hospitalized for the flu vaccine with extreme nerve damage, he can not move or open his eyes. He's blinded. Lou Ferigno—aka the Hulk—hospitalized after the pneumonia vaccine. Very sick but recovering. Deaths from the HPV vaccine are climbing now that this is mainstream. And countless other mothers and fathers who claim their once bright lively toddler suddenly turned to stone, days or within weeks of the MMR vaccine. Injuries from DTAP range as the highest—none of this is reported in mainstream news because big pharma controls the media. They also control the government. There are two pharmaceutical lobbyists per one senator in the US government today! Think about that. That means their ears are filled with lies and their pocket books are being filled with money to campaign to make every American take their drugs! They want us sick and dependent for our entire lives.

Now the science behind vaccines might make good sense, but it is the adjuvants and metals they add to preserve [the vaccines](#) that are monumentally damaging to your health. Would you in good conscience inject your children (or yourself) with the following lethal ingredients?

--Mercury -- most toxic substance/metal known to man, they claim to have removed it, however, it continues to show up in the flu vaccine, and others. It's a powerful immunosuppressant amongst myriad other things. When you hear from the vaccine safety promoters that new studies have shown that ethylmercury (in thimerosal) disappears from the blood within several days. Actually, the mercury

leaves the plasma and enters the brain, where it is de-ethylated and remains for a lifetime, wreaking havoc on the brain.

--Aluminum—first added in 1926, another known neurotoxin—DNA damage, cell damage, binds to ATP and affects energy production in all cells. It's linked to dementia, autism, Parkinsons—1 in eight seniors have dementia now (hello flu shot), in less than a decade, it'll be one in four. What's the common thread here?

--Formaldehyde—used to embalm dead bodies. Need we say more? You want that in your kids?

--Peanut oil – why was there a plague of children suddenly with peanut allergies. No one could explain. Well, it was used in vaccines as a preservative for a time. Hmm.

--MSG—a known neurotoxin! You won't eat it, but you'd inject it?

--Also DNA residues, gelatin, antibiotics—like we need more of those!

--And not listed on official ingredient lists are bacterial and viral contaminants, which can include their particulate, fragmented matter.

This is frightening! Connect the dots! They are not saving lives.

In 1983, before the autism epidemic began, children received 10 vaccinations before attending school and the autism incidence was 1 in 10,000. Today, they receive 24+ vaccines before they turn 1, and 36+ by the time they start school and the autism rate is now 1 in 150 births! Do the math!

There are over one million children with autism and the numbers continue to grow. This is a medial disaster of monumental proportions. The link to the vaccine program is scientifically and logically compelling but these same medical elitists refuse to listen. Like smoking and lung cancer, we have enough proof today to call a halt to the present excessive vaccine program and ban any level of mercury in vaccines.

Vaccines are tested for a brief period if at all!!! Three weeks. They have never tested what repeated vaccinations and the current volume/quantity of vaccinations do to animals/humans. We are guinea pigs for big pharma's bottomline—making them BILLIONS of dollars. The vaccine schedule for an infant born in America, before the age of one, is the equivalent of giving an adult one shot a day. Our bodies are so polluted from these toxic injections.

Independent third party studies are vilified and struck from record, almost none are accepted into medical literature. That's what billions of dollars will do.

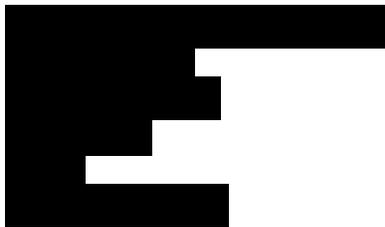

Lastly -- CHINA -- The Chinese are now the largest vaccine manufacturers in the world, with over 400 biopharmaceutical companies making vaccines and poor quality drugs for the world. The FDA admits that it inspects only 1.8 percent of the 714 drug firms in China and that, according to a GAO study, FDA inspections may be done 13 years apart (In the US it's spaced 2 years apart).

--More frightening is that the inspectors must depend on Chinese translators and US companies who purchase [the vaccines](#) must have a Chinese communist official serve as its legal representative. One CEO was quoted as saying "every piece of information you get (from the Chinese) is suspect."

--With thousands of people dying and getting sick, not only in China, but in hundreds of nations receiving China's tainted pharmaceutical products, future vaccines are an even greater danger.

No thank you. Count my children out of this twisted program that claims to protect our health while destroying bodies and minds. But hey, it does make the 'elite few' billions of dollars!

Subject: testimony regarding mandatory immunizations HR 11-157
Date: Wednesday, December 26, 2018 8:54:29 AM

I am writing in opposition for mandatory immunizations. This is unconstitutional! There is absolutely no evidence that immunizations are safe, and to force our children to be immunized is a communist act! Our country is based on freedom! Freedom to choose what is right for our own bodies and minds. There are far to many complications with immunizations to force them on our human race.

My grandmother was opposed to vaccinations, because my uncle was affected by them. She educated our family about the threat of complications from immunizations my cousin was not vaccinated. My cousin was valedictorian of her class with a full scholarship to Berkley! She has never been affected by her lack of immunization. My son was vaccinated as a child, and he was clearly affected by the immunizations that he received. As he has grown I have not given him any more vaccinations because it is DANGEROUS!

There is no proof that having a child vaccinated will protect them! There is considerable information that vaccinations are dangerous, please educate yourselves on this matter, before you choose to put our children at risk!

We have the right to informed consent, we have the right to freedom of of religion, and should be able to opt out if we choose to do so!

Sincerely,
Marisa provost

RE: HAR 11-157

Wednesday, December 26, 2018 8:59:13 AM

Aloha Bruce,

Thank you for the returned call...

Here are my concerns – first and foremost the right to choose the best healthcare regime for ourselves.

The practice of one size fits all vaccines/immunizations clearly is not working. By making this a requirement to attend school, we are limiting our kid's future.

The choice between risks of becoming vaccine injured or not going to school, is not fair!

Vaccines need better outcomes for all, before being required.

The U.S. Supreme Court ruled vaccines are “unavoidably unsafe” and the U.S. government has paid out approximately \$3.9 billion for vaccine injury claims..

Thank you for your consideration, Luan Vick

From: [REDACTED]
To: [REDACTED]
Subject: : I OPPOSE HAR 11-157 proposed rules
Date: Wednesday, December 26, 2018 10:35:05 AM

Aloha & thank you for this opportunity to provide testimony. As a community member and mother of 3,

I oppose HAR 11-157 Exhibit A

It is made without taking the diverse demographic in Hawaii in mind and will over regulate our school requirements from 5 to 9 (k-12). Further, it adds HPV as a requirement, making us one of the most regulated states in all of the USA. Safety & Risk assessment MUST be done first. For example, HPV been taken out of Japan's requirements for 5 years due to many adverse reactions.
<https://www.hpv-yakugai.net/2018/06/29/5years-english/>

Please keep in mind ACIP guidelines where never designed or tested for our unique demographic. There is no one fits all solution.

I oppose Exhibit B

Blanket adoption of the “best practice guidelines for Immunization” as part to our rules and letting go of the freedom and independence as a State to compile our own Guidelines is unacceptable.

Further, I oppose including early-child-hood centers in this rule. There must be consent from the early-child-hood centers themselves and parents. To my knowledge center and parents remain uninformed or have yet to be invited into the process of this proposal. This lack of information creates extra expenses, training, equipment when enrolling new children.

I request the attorney of the DOH to legally verify if this reporting system is in direct conflict with HIPAA & Family Education Protection Act 20 U.S.C. § 1232g. If so, the law will make schools involuntarily break the law by following your

current rule.

I oppose HAR 11-157 for being an incomplete proposal. It fails to offer a draft of the standard medical and religious exemption forms. I am unwilling to accept that DOH has the right to decide without public input what the final form will be. They can make needed medical exemptions unnecessary more complicated or easy. We, the public, are in the dark because these forms are missing.

Informed Choice is already mandated by the State of Hawaii and is failing to be abided by many healthcare practitioners. Healthcare Practitioners must give an informed choice, that includes speaking about the alternatives to the procedure that they are using. Vaccines must by law show both sides.

We all must revisit the safety, health benefit and risk balance here. No vaccine is 100% effective for everyone and not everyone can handle the same amount of vaccination. Additional vaccination needs to stay a choice, a parent guided one. The medical community is urged to offer informed consent.

Parents & Patient MUST be given opportunity to ask questions and clarify all doubts.

The process MUST be free of any kind of coercion.

Consent MUST be voluntary, and patient should have the freedom to revoke the consent.

Consent given under fear of injury/intimidation, misconception or misrepresentation of facts MUST be held invalid.

I respectfully request that the proposed changes to HAR 11-157 be opposed and request that for further changes on immunization a communication link be established between the DOH & DOE to inform all schools, teachers, parents and who ever else will be affected by the change. We MUST be informed as to DOH's intentions. This MUST include a summary of the full implication of the rule change.

To those concerned,

I am writing to include my testimony in opposition to HA 11-157 and the suggested changes to Hawaii's current vaccine requirements. I support anyone who chooses to vaccinate, but I also support those who wish not to vaccinate. Any law that makes vaccines mandatory, even though certain exemptions are allowed, confuses those who are not informed of their rights and the law. If HA 11-157 is enacted Hawaii will be the most vaccinated state in the United States. I am attaching information that I would suggest you consider before adding any of these new vaccines to our children's schedule. Research and scientific studies have shown that vaccines are not 100% safe or effective. I admonish your panel to read and consider the validity of this information for the benefit of our children.

Sincerely,

Robert Abell, N.D.

Subject: Opposed to New Immunization Bill
Date: Wednesday, December 26, 2018 11:26:15 AM

To whom it concerns,

My name is Jodee Inouye-Agsalog and I am a mother of 3 beautiful children. I just wanted to Express my opposition to the new Immunization Bill on the table. I believe that it's a very sensitive subject for many families and that ultimately it should be the choice of that family to decide what is best for their children.

Mahalo,
Jodee Inouye-Agsalog

From: [REDACTED]
To: [REDACTED]
Subject: Testimony regarding new vaccine requirements
Date: Wednesday, December 26, 2018 12:26:46 PM

To Whom It May Concern,

I am writing to ask that you not increase the amount/type of vaccines required to attend school. No vaccines should be mandated to receive education. Education is a right that should not be leveraged by mandatory injections, especially when such injections have never been through proper safety studies and the manufacturers are exempt from litigations regarding injuries/death caused by their products. Please allow me to explain.

In 1986, the vaccine manufacturers were bombarded with lawsuits regarding injury/death caused by their product. They threatened to discontinue making vaccines unless they were protected against litigation. President Reagan granted this request even though he recognized that this action would also remove any motivation for the manufacturers to improve and ensure vaccine safety. He instructed the Department of Health and Human Services to work on improving vaccine safety. They were supposed to report on their progress every two years. Robert Kennedy Jr. recently won a lawsuit against the DHS regarding these reports. The DHS settled by signing a declaration that they have no record of studies to improve vaccine safety. So, vaccine manufacturers have been free of legal liability for the past 32 years, and the government department that was supposed to oversee vaccine safety has been doing absolutely nothing.

I have been reading the inserts for the vaccines. Each insert describes the safety studies that were conducted in order to be approved for use. Not one single vaccine currently in use has been tested against an inert placebo. They are all tested against another vaccine, combination of vaccines, or the adjuvant ingredients without the virus. In other words, they are testing toxins against toxins. When there is no significant difference in adverse reactions between the two groups, the new vaccine is deemed safe. If they conducted a true double blind inert placebo study we would have much more accurate data to judge safety. Unfortunately, there has never been a study like this done on any vaccines in use.

The HPV vaccine currently in use, GARDASIL 9, is a very dangerous vaccine that harms more than it protects. It was approved for use without completing thorough studies, and the manufacturer openly admits this in the insert. There are at least four statements in the GARDASIL 9 insert where they say the results were “**Inferred**” based on something other than a test using the GARDASIL 9. Don’t our children deserve better, more rigorous safety testing before a product like this is forced upon them? There are many testimonies from teens that are now living with debilitating conditions as a result of this vaccine. This vaccine should be illegal.

The Whooping Cough vaccines that now use acellular pertussis fail to protect against the disease. Studies have proven that the vaccine only prevents symptoms, it does not prevent infection or spread of infection. In other words, those that are vaccinated with Acellular Pertusis can become silent carriers and put others at greater risk. Please do not mandate a vaccine that does not work.

Our children are experiencing chronic conditions never witnessed in children of previous generations. Autism rates are now 1 in 59 when they were previously 1 in 10,000 in the 1970's. The argument is that they are just diagnosing it better, but we all know this is not the only reason for the stark increase. While it is likely that there are other environmental factors involved, we cannot disregard the correlation between the increase in vaccines and the increase in autism. Studies have come out as recently as this year that are proving a connection between injected aluminum and autistic behavior in animals. I plead with you to wait until further studies are conducted before mandating more vaccines for our children. Please do not subject the children of Hawaii to be used as guinea pigs for these new vaccines. The science is not settled, the truths are still being revealed, and we must protect our children. I urge you to say no to increasing vaccine mandates.

Aloha,

Emi Ayau

Re: HAR 11-157, I STRONGLY OPPOSE these rules. Big Pharmaceutical wins and the people, especially the children, lose.

At the very least, remove the rule that gives s free pass to new vaccines in the pipeline. Do lawmakers realize within a few years approximately 300 new shots will enter the marketplace?

It is malfeasant and without forethought to demand that parents submit their keiki to this kind of chicanery.

I wouldn't want my children subjected to this heresy. Would you?

Subject: Re: HAR 11-157 DOH-Proposed Rule Changes Pertaining to Hawai'i Vaccination Policy
Date: Wednesday, December 26, 2018 1:28:35 PM

Aloha, my name is Taur Kiggins and I am in strong opposition to HAR 11-157.

I want to ask that everyone here as a medical professional consider a few questions. Has history ever shown the medical establishment to be wrong about a medical procedure, drug or therapy? True science is willing to question methodical dogma, even when the majority scoff at the idea. I have no doubt most of you are deeply caring individuals who have a desire to heal and protect. That's why you do what you do. That's also why I urge you to reflect on the education you received regarding vaccines. It being the one of the most routine treatments in any pediatrician's office, did you spend countless hours learning all of the ingredients, the adverse reactions, and how to identify them? Or was it mostly about the benefits? Did you learn how to give true fully informed consent? Where are you required by federal law to report reactions (that hopefully you know how to identify)? What is the history of each disease and the huge mortality and incidence decrease in the 20th century prior to the introductions of the vaccines? Brave and learned medical professionals have stepped forward, admitting they didn't learn much about vaccines in school, and now, after reading the literature from both sides for themselves are standing up, concerned about the safety of vaccines. Have you heard what your contemporaries have to say?

A fact I trust you will not lose sight of is that safety testing for vaccines fails the golden standard of every other pharmaceutical drug. Among the failings in vaccine safety studies are adjuvant safety testing individually and when combined as administered on the schedule.

Listed in the Vaccine Excipient & Media Summary (1) some *known* adjuvants include: formaldehyde, blood-brain opening polysorbate 80, phenoxyethanol, ammonium sulfate, human serum albumen, human-diploid fibroblast cell cultures WI-38, human diploid cells MRC-5. Fun fact: vaccine-creator Stanley Plotkin admitted in a deposition earlier 2018 that during said vaccine development, it took 76 aborted fetuses to get the right tissues needed for the culture (2). Also included is fetal bovine serum, monkey kidney cells, african green monkey (VERO) cells, porcine derived gelatin (and porcine circoviruses in Rotarix) as well as egg and yeast proteins. There are 60 or so more metal, chemical, human and animal organisms as adjuvants, including the controversial thimerosal still in multi-dose flu vials. (3) This is what's being mandated into our keiki's muscle tissue.

If that isn't alarming, I trust the *unlisted* contaminants discovered in vaccines in these studies (4, 5) from Italy in 2017 & 2018 will be a surprise. Contaminants found include: Barium, lead, stainless steel, tungsten, gold-zinc, platinum, silver, bismuth, iron, chromium, lead particles, morphologies of red cells (human or animal origin is unknown), and "debris" composed of aluminum, bromine, silicon, potassium and titanium. In some they also could not find the protein antigens that the vaccines were supposed to have. Other independent tests have found glyphosate. (6)

Now for Aluminum. Many childhood vaccines contain it. Aluminum is a known neurotoxin. After learning that many "placebos" used in "safety studies" [including HPV(7)] are either other vaccines or aluminum adjuvant, I was surprised, and I would hope it surprises you too. Placebos are supposed to be inert. Saline is a great placebo. If IA (injected aluminum) placebos were themselves shown to cause damage, would that nullify the study since the control contained this harmful substance?

You may be surprised to hear that they do cause harm. There is one study, known as the Mitkus study that vaccine advocates reference when questioned about the safety of IA. (8) It came under severe scrutiny this year from leading experts in the world on the neurotoxicity of Al. In the paper criticizing the methods of the Mitkus study, the authors also mention other countries who have studies implicating aluminum-containing vaccines in chronic illness:

"The occurrence of *myalgia* and *arthralgia*, *chronic fatigue* and *neurological disorders* following multiple injections of aluminum-containing vaccines against hepatitis B, tetanus and human papilloma virus (HPV) has been reported in many countries: Australia, Canada, Denmark, France, United Kingdom, Italy, Israel, Japan, Mexico, Portugal, and USA." (9)

Recent studies have regarded IA as "poorly biodegradable", with the potential to become "*insidiously unsafe*, especially in the case of *over-immunization* and immature/alterd blood brain barrier..." as well as having potential for neurotoxic effects after long-term accumulation. (10, 11, 12, 13, 14)

To summarize the cited works, here is a summary of what a decade of emerging science on IA toxicity is saying. It can:

- 1) impair brain development,
- 2) remain in the brain much longer than thought,
- 3) is brought into the brain by macrophages that grab the IA from the vaccine injection site and recirculate it,
- 4) may actually be worse when injected in small doses repeatedly (like in vaccination) and,
- 5) remarkably high levels of aluminum have been found in brains of people diagnosed with autism. (15, 16, 17, 19, 20, 21)

IA is also showing to be implicit in damaging motor neurons creating conditions for Parkinson's, Lou Gehrig's and Alzheimers (81)

I realize this hearing is about changes in the already mandatory schedule (unless exempt). But after reviewing the science, please explain how mandating the injections of even more aluminum and other toxic adjuvants into our children will be of benefit to them in the long term? WE HEAR YOU that they can achieve less cases of acute childhood illnesses, I am not saying they are useless. But are they faultless? Emerging science says NO, and it is looking bleak in regard to long-term damage, far worse than the vaccine narrative suggests. Not all children are made the same and forward with more mandates is a mistake. Before making Hawai'i the state with the most mandatory vaccinations for public education... lets wait and see what comes of these aluminum studies. Do the pediatricians and nurses here know this and other information shared? If you do, how could you not inform us of this? And if you don't, then why the hell don't you? DOH you've got about 8-10 hours of hearing videos, a book we all sent you about HPV, and at least a few hundred written testimonies with study links and references to look at. We expect answers to our questions, and knowledgable references to our citations. You have some work to do. Do it, and then honestly weigh the potential consequences of your decisions. How much long term risk will our youth be subjected to because of careless mandates relying on *flawed and outdated science*? You have been given notice.

Where there is scientifically proven risk, there must be choice. Choice that does not take away our children's right to public education. I have faith that the decision makers of the DOH, and also pediatricians and healthcare professionals...you are people of reason, willing to listen, and are big enough to change course when the facts warrant a change. You are leaders and we are depending on you to do more bench research and read more than what is handed to you. Listen. Learn. I have no doubts that there are outside, corporate and other pressures rushing to get these changes stamped and sealed. We compel you to wait until you have updated your knowledge on this subject, as it will affect every child in this state. Mahalo

Subject: RE: Mandatory HPV vaccine
Date: Wednesday, December 26, 2018 2:24:08 PM

Aloha,

It seems like enough HPV vaccinated people have bad reactions that we should proceed with utmost caution. Certainly, mandatory vaccination must be reconsidered. Big Pharma and it's sometimes flawed research in the name of profit, must be put in check. Seems like a lawsuit(s) is likely.

Sincerely,

John Naylor

In opposition

Aloha, I am submitting my testimony regarding the increase in required vaccines for Hawaii's children. I strongly oppose this requirement as I see it as a violation of my religious freedom. There are cells from aborted babies in several of the vaccines that are currently used. I believe that abortion is murder and these cells are used without the consent of the person who they belonged to. To force me to inject my child with these cells violates my children's rights religious rights as well.

Mahalo for your consideration.

Rachel Struempf

Dear DOH Hawaii,

I herby email you on the subject of mandatory vaccinations in Hawaii.

I am a mom of a healthy 7 month old boy, to this day he hasn't been sick once. He was born at home at has never seen a pediatrician.

He is growing and developing in the expected way. I refuse to vaccinate him since I believe a little body like his isn't build to deal with the poisonous cocktail that is a vaccination. I believe that IF I wanna give him any vaccinations, I want it to be on our terms.

I am an immigrant to the United States, I am from Germany and when I went through my application process for my green card, I had to get 4 vaccines in one day. I was sick for 5 days after. I was ok with it, but I am a grown woman with a strong immune system.

I am not afraid of autism, I am not afraid the vaccination could change my healthy baby - I simply don't want to put those chemicals into my sons body.

He is raised vegan, local foods, organic and non gmo.

I wanna have my choice. America is all about freedom, the land of the free - tell me sir - where is the freedom of our choices anymore?

I also request another hearing on the subject, I was able to attend the first one, but many families weren't able to make it - on a Friday afternoon (because guess what? Keiki are at school and parents at work).

Mahalo for your time,

Please confirm the receiving of my email,

Kind regards,
Petra Gilmore

Aloha,

I am writing to oppose your proposal to change the current vaccination requirements by adding more mandatory vaccines to the list.

I am not attaching any of the many scientific and research based reasons not to vaccinate according to your proposed requirements because I know that many others already have.

However, I will say that it is my right to maintain my own and my children's health as I see fit and it is also our legal right to public education. I also happen to be involved in Hawaii state education as a director of a public charter school board, which gives me first hand experience of families choosing not to vaccinate and using the religious exemption to excuse them. If more vaccines are added, you will see more religious exemptions than before which may jeopardize the validity and allowance of the exemptions. Families will then exit the school system which would burden the schools with reduced per pupil funding.

For families choosing to vaccinate they are doing so under the guidance of their healthcare practitioner who should be the one to make the recommendations if they agree that you think are appropriate. Schools and other places of employment under the thumb of the health department should not be the ones dictating whether those who enter are vaccinated.

Health freedom is an inalienable right.

Mahalo,

A concerned Hawaii resident

As a local teacher I strongly oppose HAR 11-157 mandatory vaccines.

Hawaii Revised Statutes 671-3 – Informed consent Current as of: 2016 | Check for updates | Other versions

671-3 Informed consent. (a) The Hawaii medical board may establish standards for health care providers to follow in giving information to a patient, or to a patient's guardian or legal surrogate if the patient lacks the capacity to give an informed consent, to ensure that the patient's consent to treatment is an informed consent. The standards shall be consistent with subsection (b) and may include:

Terms Used In Hawaii Revised Statutes 671-3

Health care provider: means a physician, osteopathic physician, surgeon, or physician assistant licensed under chapter 453, a podiatrist licensed under chapter 463E, a health care facility as defined in section 323D-2, and the employees of any of them. See Hawaii Revised Statutes 671-1

(1) The substantive content of the information to be given;
(2) The manner in which the information is to be given by the health care provider;
and (3) The manner in which consent is to be given by the patient or the patient's guardian or legal surrogate.

(b) The following information shall be supplied to the patient or the patient's guardian or legal surrogate prior to obtaining consent to a proposed medical or surgical treatment or a diagnostic or therapeutic procedure:

(1) The condition to be treated;
(2) A description of the proposed treatment or procedure;
(3) The intended and anticipated results of the proposed treatment or procedure; (4) The recognized alternative treatments or procedures, including the option of not providing these treatments or procedures;
(5) The recognized material risks of serious complications or mortality associated with:
(A) The proposed treatment or procedure;
(B) The recognized alternative treatments or procedures; and (C) Not undergoing any treatment or procedure; and
(6) The recognized benefits of the recognized alternative treatments or procedures.

House Report 106–977
THE VACCINE INJURY COMPENSATION PROGRAM:
COMMITTEE ON GOVERNMENT REFORM

While the Vaccine Adverse Events Reporting System [VAERS] may be lauded as the “front line” of vaccine safety, the lack of enforcement provisions and effective monitoring of reporting practices preclude accurate assessments of the extent to which adverse events are actually reported. Former FDA Commissioner David A. Kessler has estimated that VAERS reports currently represent only a fraction of the serious adverse events.

The quality of VAERS data has been questioned. Because reports are submitted from a variety of sources, some inexperienced in completing data forms for medical studies, many reports omit important data and contain obvious errors. Assessment is further complicated by the administration of multiple vaccines at the same time, following currently recommended vaccine schedules, because there may be no conclusive way to determine which vaccine or combination of vaccines caused the specific adverse event

Electronic Support for Public Health–
Vaccine Adverse

Event Reporting System (ESP:VAERS)

Inclusive dates: 12/01/07 -09/30/10

Principal Investigator: Lazarus, Ross, MBBS, MPH, MMed, GDCompSci

Team members: Michael Klompas, MD, MPH

Performing Organization: Harvard Pilgrim Health Care, Inc. Project Officer: Steve Bernstein

Results

Preliminary data were collected from June 2006 through October 2009 on 715,000 patients,

and 1.4 million doses (of 45 different vaccines) were given to 376,452 individuals. Of these

doses, 35,570 possible reactions (2.6 percent of vaccinations) were identified. This is an average

of 890 possible events, an average of 1.3 events per clinician, per month. These data were

presented at the 2009 AMIA conference.

Adverse events from drugs and vaccines are common, but underreported.

Although 25% of

ambulatory patients experience an adverse drug event, less than 0.3% of all adverse

drug events

and 1-13% of serious events are reported to the Food and Drug Administration (FDA).

Likewise, fewer than 1% of vaccine adverse events are reported. Low reporting rates preclude or slow the identification of “problem” drugs and vaccines that endanger public health.

New surveillance methods for drug and vaccine adverse effects are needed.

Unfortunately, there was never an opportunity to perform system performance assessments because the necessary CDC

contacts were no longer available and the CDC consultants responsible for receiving data were no longer responsive to our multiple requests to proceed with testing and evaluation.

Child influenza vaccination

Ramifications of adverse events in children in Australia

BMJ 2010; 340 doi: [Ramifications of adverse events in children in Australia](#)

(Published 09 June 2010) Cite this as: BMJ 2010;340:c2994

During the 18-year period from 1990 through 2007 just 88 cases of Kawasaki Disease in children under 5 were reported to VAERS. During the same period about 88 million U.S. children passed through the 0-5 age group; consequently the incidence rate reported to VAERS was 0.10 KD cases per 100,000 person-years. (Pediatr Infect Dis J 28:943, 2009) From 1988 to

2006 the published KD incidence for U.S. children under 5 rose from 11.0 to 20.8 per 100,000 person-years. (Pediatrics 111:448, 2003. Pediatrics 112:495, 2003. Pediatr Infect Dis J 29:483, 2010) Even for infants 3-6 months old, when suspicion for vaccine adverse effects should be especially high, KD incidence as reported to VAERS was 0.11 while published background rates were 23.1 (2000) and 24.6 (2006); fewer than 1 in 200 KD

cases were reported to VAERS.

It is bewildering, therefore, to learn that FDA and CDC officials used VAERS data to dismiss a placebo-controlled trial that found a 5-fold KD risk associated with RotaTeq-RR=4.9; 95% CI

0.6, 239. (Pediatr Infect Dis J 28:943, 2009. 6/15/07.) If confirmed by a larger trial, the KD risk associated with RotaTeq would translate to an extra 4000 U.S. cases annually

(it is worth noting that rotates is Paul Offit's vaccine Offit is an ACIP member and it is my understanding that he did not recuse himself from decision making for this vaccine, but that is heresay)- Joe

HSTA has a committee who also works with the civil rights of students...mandated vaccines are a violation of civil rights...so stating the mandatory informed choice and FERBA is essential in your statement. does not need to be pages...just bring up main concerns and also send it to me when you are done and send to immunization@doh.hawaii.gov gotta be in by 25th....make it simple.

Here are some thoughts cite a reference

To whom it may concern,

Re: HAR 11-157, I OPPOSE MANDATORY VACCINATIONS

For many people this would be taking away their freedom to make their own wise Health choices. There are many people who have religious beliefs and or strong convictions that would opposed receiving vaccinations.

It would be seen as a violation of their body, health and morals

There is plenty of anecdotal evidence and research that point to an increase in Autism with vaccinations, as well as triggering autoimmune disorders.

Please do not allow this bill to be passed. We believe this would be a violation of our constitutional right to protect our bodies and our children's bodies from unproven and unsafe Health experimentation.

Vaccination companies are protected from any lawsuit and any type of legal and medical reimbursement for side effects caused by vaccinations.

Please support informed medical consent and freedom of Health choices. Thank you and mahalo,

Nattalia Whalen, R.N.

Subject: TESTIMONY OPPOSING Ch 11-157
Date: Wednesday, December 26, 2018 7:54:58 AM

RE: Testimony STRONGLY OPPOSING the Hawaii DOH's proposed amendments to HAR Ch. 11-157, Examination and Immunization

The Department of Health held several public hearings across the islands, on Honolulu, Maui/Molokai (video conference), Lanai, Kauai, Hilo, and Kona as per the public schedule posted on their website.[\[1\]](#)

Although oral testimony was provided in front of a DOH hearings officer, Steven Jacobsen and Unknown, both publicly stated at every meeting that they had not read or was not familiar with the proposed language and that they were not there to make any decisions.

None of the decision makers were present at any of the hearings, only DOH staffers. The only senior DOH staff seen a couple of hearings was Ron Balajadia of the Immunization Branch, under Dr. Sarah Park, State Epidemiologist.

The DOH recorded over 12 hours of oral testimony from the public on the proposed amendments and requested written testimony. An overwhelming majority of testifiers described personal stories of vaccine injuries, facts and evidence of vaccine injuries and dangers. Only a handful of practitioners testified in support.

The Hearings Officers stated that the DOH would review the audio and written testimonies and would make a decision. Neither Hearings Officer could provide any time frame. When pressed for the names of the decision makers, the Hearings Officers could not provide any names for the record.

This lack of transparency in the administrative process demonstrated that the DOH, specifically the Disease Outbreak Control Division, Immunization Branch under Dr. Sarah Park cannot be allowed to amend, repeal or adopt any administrative rules without additional oversight.

Ch. 11-157 amendments proposes to adopt ACIP guidelines while also mandating several additional vaccines at various school levels, with the additional authority to adopt future amendments as they occur. However, important decisions related to our children cannot be left to individuals who make decisions but are not responsible for the health consequences that may occur from these mandates.

Under the National Childhood Vaccine Injury Act of 1986, specifically 42 USC 300aa-27, the Department of Health and Human Services (DHHS) is required "to improve the safety profile of childhood vaccines, which includes licensing, manufacturing, processing, testing, labeling, warning, use instructions, distribution, storage, administration, field surveillance, adverse reaction reporting, and recall of reactogenic lots or batches, of vaccines, and research on

vaccines, in order to reduce the risks of adverse reactions to vaccines.” These are the same childhood vaccines recommended by the CDC on behalf of the federal government.

However, a recent FOIA request showed that DHHS admitted that it has never conducted any studies or research demonstrating the safety of childhood vaccines recommended by the federal government as required by 42 USC 300aa-27.[2] The federal government was unable to show and continues to be unable to show that childhood vaccines are any safer than they were when they were first introduced onto the market, in some instances, many decades ago.

As the Hawaii DOH attempts to mandate these very same vaccines recommended by the ACIP, a federal advisory committee to the CDC, which falls under DHHS, the issues remain the same. If DHHS has not conducted any studies in the last 30 years on the safety of vaccines, then the ACIP, which has never conducted any clinical studies itself, by default, cannot also claim that its recommendations regarding the CDC recommended childhood vaccines are safe related to adverse reactions.

ACIP guidelines and its vaccine recommendations should not be mandated by the DOH in the proposed Ch. 11-157. These recommendations are intended to only be recommendations where parents and doctors discuss the risks and benefits of vaccines before making an informed decision. To mandate vaccines without evidence of safety is unconscionable and irresponsible by the Hawaii Department of Health, the Director of Health, the State Epidemiologist, the Governor and the State of Hawaii and any other individual involved in making this monumental decision.

Please find included, a link to 50 studies questioning the safety of vaccines published since 2010[3] which I am submitting as evidence for DOH review to OPPOSE Ch. 11-157.

Thank you,

Teresa Chao, RPh, MBA, MJ

Subject: Testimony Submittal
Date: Wednesday, December 26, 2018 3:35:31 PM

Aloha Hawaii Health Department

And thank you for taking comments on the issue of increasing the amount of vaccinations mandated for public school children. The issue of vaccinations sometimes seems so black and white (like many things in our divided society today), and I really do appreciate your openness to a public dialogue on this important matter.

My name is Katie and I'm a Nutritional Therapist in [REDACTED] helping women recover from a debilitating chronic disease called endometriosis. There is no cure, so I help women find symptom management through nutrition, movement, and medical care. This is what holistic care is, a mix of natural, nutritional, lifestyle, *and* medical. Chronic disease sufferers don't have the option to be black or white - all natural versus all western medical - it must be a mix of the two.

And this is exactly how I feel about vaccines. I myself am vaccinated, I grew up believing in vaccines, and I still do. To a degree - as in I can accept the current vaccines mandates by the school system. They have a proven track record of success in mitigating the spread of potentially deadly and quite destructive infectious diseases in our community.

The issue our keiki face today, however, is an onslaught of vaccines for so many more diseases than were available when I was growing up. Although there is, of course, an aim to "save kids" from any sickness at all, I am gravely worried about the efficacy of these newly proposed mandated vaccines and the lack of liability from the global pharmaceutical corporations who make them.

Researchers from Kaiser Permanente Northern California, for example, have recently shown the efficacy of the 2018 flu shot to start waning within weeks of getting it - about 16% for every 2 weeks after vaccination [1]. Another study by Rice University on the 2018 flu vaccine is predicting a measly 20% efficacy [2]. Combine that low efficacy with the amount mercury, polysorbate 80, and formaldehyde being injected directly into the bloodstream of very small humans not just one, but every single year, and it simply doesn't make sense. At all. To mandate this.

As for Gardesil, first of all, mandating a vaccination for a sexually transmitted disease without the consent of the body it's intended for is criminal, in my mind, Second, there's simply no need. The cervical cancer diagnosis rate in the United States is about 8/100,000, which would be near completely avoidable with regular PAP exams as recommended. So why would we mandate a vaccination where even the package insert itself declares a rate of 2.5% serious adverse events within the 15 day trial monitoring period?? That's 2,500 life-altering events per 100,000 women, within 15 days. How about instead we increase education during sex ed on the absolute importance of PAP smears?

On top of that, of course, is the incredible amount of aluminum contained within Gardisil 9 - 1500mcg for the recommended 3 shot dose. The FDA recommended limit for ingested aluminum is 5 mcg per kilogram per day, so for an 80 pound child that would be 180 mcg. To be clear, ingested aluminum is very different than injected aluminum, since very little that's ingested actually makes it into the bloodstream - estimated at .3%. Injected aluminum is a totally different story as it has no barriers to bypass (like your digestive system) and can immediately be stored in muscles, organs, tissues, or the brain.

So back to that 1500 mcg of aluminum, let's do the math. If the FDA's upper limit for that 80 pound kid is 180 mcg of aluminum and we assume they absorb .3%, that means .54 mcg of that into the bloodstream. One Gardisil 9 shot is 500 mcg aluminum straight into the blood stream. That's 925x more aluminum than the upper limit in one day. No thank you, not for my child, nor should that be tolerable for any child. We as adults need to tell the manufacturers to find another way if this is absolutely so necessary,

As for the liability issue, why is there so much aluminum in the vaccines? Because it's a cheap preservative filler and the pharmaceutical companies making these vaccines have absolutely no liability to the consumer they're mandating their ineffective product on. In 2011 the U.S. Supreme Court shielded drug companies from all liability for harm caused by vaccines mandated by government when companies could have made a safer vaccine [3]. That means no vaccine manufacturer is liable for any harm caused by their product.

To put this in perspective, if chicken manufacturers were not liable for E. Coli outbreaks in their processing plants and the State of Hawaii mandated every family eat chicken every week, would you be okay with that? Probably not.

So yes, my baby boy will get his dTap, his MMR, his Polio, and the rest of current mandates. But he won't get Gardesil, nor will he get any flu shot. Although I know I could use the religious exemption - that's not the point. Like vaccines were created to "protect the herd" I think we also need to protect the herd from corporate interests making a LOT of money mandating new vaccines. In fact, in 2012 there were 300 more vaccines in the pipeline [4], all being created without any liability as they move to market. Where will the mandated vaccines stop if not here? Now?

Let's educate our kids about HPV in real ways - teaching safer sex and the importance of annual exams. Let's prevent the transmission of flu through hand washing, mandating sick kids stay home, and focusing on diet and nutrition (which would also really help the diabetes

issue in Hawaii). Let's also mandate in turn that vaccine manufacturers take responsibility for their product, so that we as a community know they actually care about our health and wellbeing.

Thanks so much for your consideration and all you do protecting the future of our keiki

Katie Edmonds

Daer Rep. Onishi -

Thank you so much for your prompt reply! I appreciate it.

Volumes have been written on the topic of vaccine safety and industry corruption. I only briefly touched on the main reasons why it may be dangerous to comply with CDC recommendations. I didn't even include that former CDC Director Frieden prevented a Senior Scientist in the Vaccine agency from testifying before Congress that the CDC threw away data about MMR shots and autism.

In addition, a fortune has been spent on a propaganda campaign trying to convince the public that there is no correlation between autism and vaccinations in any way, yet autism is listed as a side effect on a vaccination package insert, and a special court had to be set up to adjudicate the thousands of cases against the vaccine manufacturers so they wouldn't all go bankrupt - a special court outside of the judicial system that favors the defendants and sets an incredibly high bar of proof for the vaccine-injured victims.

There are no long term studies done on the safety of giving multiple vaccines to children at once. The CDC is content to let the multiple doses be given and watch over the ensuing decades to see how many disabilities are created. Once the manufacturers were given immunity from liability, the vaccine schedule jumped alarmingly, and continues to climb every year. U.S. has highest rate of vaccinations and the worst infant mortality in the developed world.

For the state to deny poor children an education because their parents decide to err on the side of their child's personal safety is discrimination of the most heinous sort. The state forces the poor child to become a guinea pig for corrupt profit-seeking corporations. This partnership of corporations and government is the definition of fascism.

Thank you for your time and attention.

Subject: Oppose increased mandatory vaccinations

To the Immunization Branch
Hawaii State Department of Health

The very topic of mandatory vaccinations is abhorrent to many people. It reeks of authoritarianism, communism and nazism - virtually every negative "ism" is evoked when the term "mandatory vaccinations" is heard. It assumes that the individual's right to privacy and freedom of choice is non-existent. It strikes at the heart of what it means to be an American living in a Constitutional republic.

Not only Americans are horrified at the thought - in the words Dr. Hiroko Mori, former head of the infectious disease section at the former Institute of Public Health, Japan: "The right to choose should be recognized as a fundamental human right."
<https://www.japantimes.co.jp/life/2014/10/04/lifestyle/vaccination-choice-two-unknowns/>

'Mandatory vaccinations' implies not only that the individual has no such rights, but that they are incapable of deciding, based on the facts, what is best for their own health and the health of their children.

Therein lies the rub - in today's information age, in a climate of medicine for profit, where pharmaceutical corporations wield their billions of dollars like weapons of war and saturate the airwaves with direct-to-consumer advertising, (U.S. being only one of two countries in the world to allow this), and pay their lobbyists to write the legislation that protects them from vaccine liability, in this climate it is exceedingly difficult to find any facts on the topic of vaccines efficacy and safety.

Let's go back in time and look at the early polio vaccines. The original Salk vaccine made of inactivated viruses was replaced by the Sabin oral polio vaccine of three vaccine strain polioviruses cultured from primary cell monkey kidneys. One of the monkeys carried a virus known to cause cancer tumors - SV40. In spite of this fact, public health officials recommended that all children receive this oral polio vaccine. Between 1954 and 1961 over 100 million children and adults received this vaccine. Doctors assumed that the cancer causing virus was removed from the vaccine, however it was discovered that up until 1978 it was still present in the vaccine. (Cutrone r, Lednický J, Dunn G et al. [Some Oral Poliovirus Vaccines Were Contaminated with Infectious SV40 after 1961](#). *Cancer Res* 2005; 65: 10273-10279.)

Of course, the fact that half of all people today will have some kind of cancer must simply be a coincidence...right? "Correlation is not causation" is the mantra we hear so often from those scientists dependent on corporate dollars.

Speaking of which, let's look at the vaccine studies done by scientists funded by the protected class of vaccine manufacturing pharmaceutical corporations, which the CDC relies on. Can we be assured that they present all the pertinent data, free of bias? Hardly.

In the opinion of the Chief Editor of the world's most prestigious medical journal, The Lancet: "The case against science is straightforward: much of the scientific literature, perhaps half, may simply be untrue. Afflicted by studies with small sample sizes, tiny effects, invalid exploratory analyses, and flagrant conflicts of interest, together with an obsession for pursuing fashionable trends of dubious importance, science has taken a turn towards darkness." - "Offline: What is medicine's 5 sigma?" Richard Horton, editor The Lancet
www.thelancet.com vol385 April 11, 2015.

But that's not all. Listen to what the editor at the New England Medical Journal has to say: Marcia Angell: "it is simply no longer possible to believe much of the clinical research that is published, or to rely on the judgment of trusted physicians or authoritative medical guidelines. I take no pleasure in this conclusion, which I reached slowly and reluctantly over my two decades as an editor of *The New England Journal of Medicine*"

So, Hawaii Department of Health now asks us to follow the recommendations made by the CDC for these 'mandatory vaccinations'. Vaccinations are violent, invasive procedures that may result in death, paralysis or permanent disability. And we are asked to do so, because the CDC says it is a good thing.

Let's watch a video as the CDC's "Advisory Committee on Immunization Practices" decides whether to approve the new Hep B vaccine:
<https://thevaccinereaction.org/2018/09/acip-voting-on-a-new-vaccine/>

"Is there any comment on using this vaccine at the same time as other adjuvanted vaccines?"

We have no data to make a recommendation one way or the other. So just to sort of put this in context of other vaccines, while pre-clinical studies were not done using this vaccine simultaneously, our general approach to immunizations is that they can be given at the same time in different limbs.

Are multiple adjuvanted vaccines used in Europe or other markets?

Not to my knowledge. Okay, I think unless there's any further discussion we will take a vote on this recommendation. *So... the voting is completed and it is unanimous to support this recommendation to approve the hepatitis B vaccine."*

In other words, this committee has decided to approve a vaccine known to cause myocardial infarctions and see what happens to the millions of guinea pig people who will unwittingly be testing it.

Is the entire CDC corrupted beyond all repair by pharmaceutical money? Thanks to the efforts of independent journalists we can look at former CDC Director Thomas Frieden for a glimmer of just how bad it could be. Not simply that he was arrested for sexual abuse, but the possible billions in scandals. <https://www.coreysdigs.com/cdc/cdc-thomas-frieden-billions-in-potential-scandals/>

There are too many reasons to list here as to why I oppose mandatory vaccinations. Suffice it to say that not only should the CDC recommendations not be implemented, but the philosophical exemption should be reinstated.

Sincerely,

Vicki Vierra

Subject: Re: Mandatory vaccinations for HPV and other mandatory vaccinations. (Opposing forced vaccinations)
Date: Wednesday, December 26, 2018 3:50:40 PM

Aloha to the health department and board of education as well as legislators, I am writing this letter in opposition to the new guidelines and proposed rules that will effectively force vaccinations on our children. I can understand a policy like this being implemented in North Korea, but in America? The land of the free? This is beyond comprehension.

I am opposing this also because HPV apparently causes cervical cancer. Preventing cervical cancer requires yearly pap smears and there is no evidence that forced vaccinations will be of service to the public. It will however add to the scheduled list of mandatory vaccinations and be a windfall for the pharmaceutical companies.

Do the math. Crunch the numbers. 72 vaccinations per child attending public schools. How much are the pharmaceutical companies charging per vaccination? How many children attend public schools? How many newborn babies are injected with the vaccinations and accompanying aluminum, formaldehyde and other toxic chemicals? Has the legislature thought just about who is going to pay for this? And what of the damage done to the millions of babies due to exposure to cheaply made vaccinations?

If indeed the public's health was the agenda of these agencies, the pharmaceutical companies would provide these vaccinations for free to the people and not make the government and insurance companies pay for them. I am not opposed to all vaccinations but with our children being exposed to 30 vaccinations within the first year of life, and then by the time they are 18, 72 doses of various vaccinations will be injected directly into the sensitive tissues of our children, this can hardly be called safe, nor integritous on the part of big pharma.

It's very clear that this is about making money for the pharmaceutical companies. With the new proposed rules effectively eliminating parents' rights to protect their children from the proven harmful potential side effects of such an aggressive vaccination schedule through various religious exemptions and such, will only make the pharmaceutical companies richer. And who will pay for this? Who will pay for the damage being done to our keiki? There IS a Vaccine Injury fund for those many children and adults that have been forced to take these toxic chemicals directly into their blood stream.

As a patriotic American citizen, I believe in freedom. The right to choose what happens to our bodies. Vaccinations used to help but now it's clear we have passed the law of diminishing returns. We cannot deny the rates of autism and other debilitating diseases occurring within the vaccinated populations of babies, children and adults.

If the department of health wants to prevent cervical cancer, then stick to the yearly pap smears. Eat organic. Live healthy. That's what prevents cervical and other cancers. There are so many diseases out there, the pharmaceutical companies will never be able to keep up, but they'll keep coercing the public into paying for their injections while our citizens suffer in this allegedly free country via rules and regulations imposed on us by the legislature.

Let's keep America a free country shall we? This is nothing short of fascism disguised in the good will of our lovely pharmaceutical corporations that proclaim to "care" about us. We no longer trust the medical establishment as it exists today. I can understand it necessary to have a few vaccinations, but 30 within the first year of life? I feel like I'm living in the twilight zone and America is fast becoming one of the many nations that no longer fit the description "free".
God Bless America

God Save America from the multi national corporations that care nothing about our health and well being, and put profits over people.

We the people, vigorously oppose this ruling.

Amen.

Melanie.

Subject: Testimony Opposing HAR 11-157
Date: Wednesday, December 26, 2018 3:56:37 PM

To Whom It May Concern at the Department of Health:

Based on a research and after talk to physicians and health care practitioners I have made an informed choice and not vaccinate. I believe it's every parent right to decide about it's child health, and it's decision has to be based on acknowledgment of all the aspects of "pros and cons" of vaccines and not on compulsion.

Mass vaccination of population has started in 1920. That times the child would get only a few vaccines, which were helpful indeed in prevention of a mass epidemics actual for that times. The benefits of that vaccines were greater indeed than it's harm because it was just a small number of it and a risk of epidemic were high. In a last 100 years the situation has changed dramatically. The choice of modern different hygienic and cleaning products minimized the risk of dangerous mass epidemic explosions. That risk is not real and dangerous nowadays compare to the risk of vaccines that every child has to be exposed to. Two or three vaccines became much bigger number, and the danger of some of it's components like mercury, aluminum etc, that accommodates in a humans body is much greater today than 100 years ago.

Many vaccines today are tested on animals, such as rats, and it's benefits are proofed. But the truth is that no one rat does not get the number of vaccines that child does, so the risks from it's components accommodated in a body is still unknown. Why would my child become a "laboratory rabbit"?

Thank You,
Sofia Petrova

Subject: Fw: HAR 11-157 - I OPPOSE
Date: Wednesday, December 26, 2018 4:02:20 PM

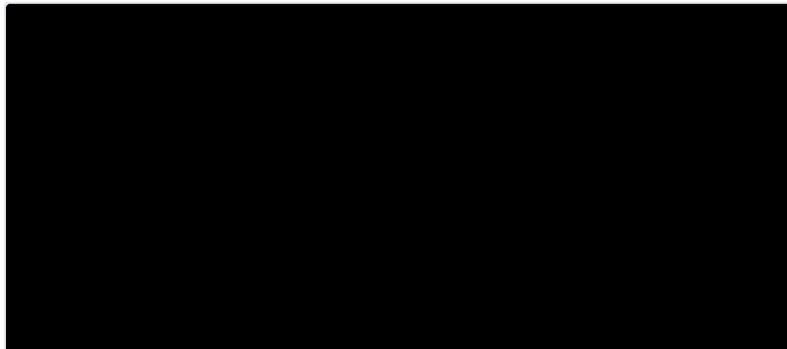

Aloha Hawaii Department of Health,

Thank you for this opportunity to provide testimony.

I Strongly OPPOSE the HAR 11-157 Proposed Rules Update.

I oppose HAR 11-157 for being an incomplete proposal, by not offering the draft of the standard medical and religious exemption forms. I do not accept that DOH assumes power to decide without public input on their final form, and the drafts should have been a part of this proposal. Medical exemptions can be made unnecessary, more complicated or beneficial. We the public simply don't know, because they are missing.

The added six vaccines (baby-college) are NOT tested with the Hawaii diverse demographic in mind and will over regulate our school requirements from 5 vaccines to 9 vaccines (k-12) and as one example adds HPV as a requirement, making us one of the most regulated states in all USA. Safety & Risk assessment needs to be done first. For example, HPV been taken out of Japans requirements for 5 years due to many adverse reactions. [Five Years Since the Suspension of Proactive Recommendation of the Human Papillomavirus \(HPV\) Vaccine in Japan](#)

Five Years Since the Suspension of Proactive
Recommendation of the Human...

To: [REDACTED]
Subject: FW: In strong opposition to HAR 11-157
Date: Wednesday, December 26, 2018 11:34:01 AM

My family is in **STRONG DISSAGREEMENT with the proposed changes to HAR 11-157.**

While the changes might be well intended, they infringe on all Hawaii's residents to determine what is best for their own children, and **will allow the state to do harm to susceptible children.**

Separation of government policies and personal beliefs is ingrained in America's core freedoms, and this separation is codified in our bill of rights and supported in all constitutional amendments.

It is our firm belief that current usage of vaccinations, flu shots, and antibiotics cause more harm than good.

Keep in the front of your minds that the facts have not changed: **All vaccines are not safe for all children.**

And a child's parents know better than the state of their child's health issues and drug allergies.

Ask any local pediatrician: We know how to treat these targeted diseases effectively, but we do not know how to cure a child who reacts negatively to these drugs.

So please educate yourselves on the effectiveness and dangers of many vaccines (<https://thevaccinereaction.org/vaccination/risk-failure-reports/>) ***BEFORE*** approving these proposed rule changes.

The consequences of a severe reaction associated with a forced inoculation of an individual far outweigh the benefits to society.

Please, as a caring parent and firm believer in our individual rights as Americans,

Do the pono thing for our keiki – **DO NOT PASS** these proposed rule

amendments.

- Randy Wolfshagen,

“You may choose to look the other way, but you can never say again that you did not know.”

My apology - I am late in conveying my personal support for the proposed revisions to the State of Hawai'i Department of Health rules as spelled out in HEARING DOCKET NO. R-157-18-07.

There are many science-based reasons to support the existing mandatory vaccination requirements and proposed changes. I work at a public school where it is clear that our children, families and community are better off for having been vaccinated.

Thank you for this opportunity to comment and for strengthening the requirements.

I am sure you saw the OPINION piece written by the staff of West Hawai'i Today after reporting on a very one-sided hearing here in Kona. However, in case you missed it, here it is - and I am also grateful for their support for the proposed rule changes.

Subject: Mahalo for thoughtful Opinion piece 12-23-18 clarifying the reasons families should have their children vaccinated and that being mandatory is very meaningful public policy.

Aloha Tom -

I am writing as a community resident, not speaking on behalf of any organization or institution.

I'm not sure if this should be addressed to you, but I want to personally thank West Hawai'i Today for taking a clear, concise, science-based position in support of continuing to vaccinate our children here in Hawai'i against serious,

potentially death-causing diseases for their own well-being and that of their families and the community.

It was alarming to see the news story conveying many false statements several days earlier after a public hearing, but I understand the quandry faced. Your response in the Dec. 23, 2018 Opinion article is spot on. We cannot let "junk science and rhetoric that runs counter to precious medical advancement and science" define our public policy.

Thank you for taking the time and having the courage to support good science and thoughtful public policy. Yours is a powerful voice and I do hope both the general community and our State Department of Health leadership are listening.

Subject: HAR 11-157 - I OPPOSE
Date: Wednesday, December 26, 2018 10:08:51 AM

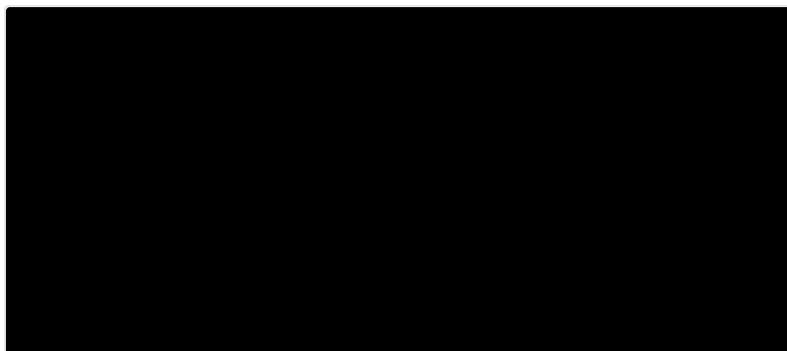

Aloha Hawaii Department of Health,

Thank you for this opportunity to provide testimony.

I Strongly OPPOSE the HAR 11-157 Proposed Rules Update.

I oppose HAR 11-157 for being an incomplete proposal, by not offering the draft of the standard medical and religious exemption forms. I do not accept that DOH assumes power to decide without public input on their final form, and the drafts should have been a part of this proposal. Medical exemptions can be made unnecessary, more complicated or beneficial. We the public simply don't know, because they are missing.

The added six vaccines (baby-college) are NOT tested with the Hawaii diverse demographic in mind and will over regulate our school requirements from 5 vaccines to 9 vaccines (k-12) and as one example adds HPV as a requirement, making us one of the most regulated states in all USA. Safety & Risk assessment needs to be done first. For example, HPV been taken out of Japans requirements for 5 years due to many adverse reactions. [Five Years Since the Suspension of Proactive Recommendation of the Human Papillomavirus \(HPV\) Vaccine in Japan](#)

Five Years Since the Suspension of Proactive Recommendation of the Human...

PDF Download

In addition, the process of the public hearing and your efforts of informing the people of Hawaii been unacceptable. Initially DOH Hawaii planed only one public hearing, with outside pressure you extended the meeting to the outer islands. The timings often excluded teacher, educators, small business child care center to attend, beside

it was already heart for parents in one for many very special holiday times. On top of that no key decision maker was present, you ignored the petition delivered to you before the Maui hearing, a request from the public and we were told that you will review the hours of testimony using the transcript. Please explain this process.

I respectfully request that the proposed changes to HAR 11-157 be opposed and I request that for further changes on immunization a communication link will be established between the DOH & DOE to inform all schools, teachers, parents and who else will be affected by the change, by informing us about the intentions, including a summary of the full implication of the rule change.

Thank you for your time,

Sincerely,

Victoria Holloway, [REDACTED] Decemebr 26, 2018

Subject: HAR 11-157 - immunization requirement to attend school
Date: Wednesday, December 26, 2018 3:46:52 PM

To DOH Immunization Branch Chief Ronald Balajadia and to whomever else it may concern:

Regarding proposed rule HAR 11-157: I am in opposition. Requirement of any vaccine to attend school or daycare infringes on parental rights.

We are all familiar with the often used mantra, "safe and effective", to describe vaccines and to dismiss any questions or concerns about vaccines. There is evidence that contradicts that description however. If you would like further and more detailed, peer reviewed information please go to the website: Physicians for Informed Consent.

Ultimately what I, and those of us opposing HAR 11-157, want is for all people to have informed consent and be given the choice of whether or not to vaccinate ourselves and/or our children.

Thank you for your time and consideration.

Aloha
Sincerely,
Rocio Bueno

Wednesday, December 26, 2018 3:03:30 PM

To Whom it may concern:

I am a mother of two sons, a nurse practitioner, and certified nurse midwife and I am against the HAR 11-157 bill requiring mandatory vaccination of all children regardless of parental opposition. With appropriate informed consent all parents should be allowed to make the decisions regarding vaccinations for their families. I take pride in advising my patients of current recommendations by the CDC and WHO but also honor their choices once they have made a decision based on informed consent and education by their providers and pediatricians. There are documented adverse reactions, and I personally know patients who have been victim to vaccine injury. The National Vaccine Injury Compensation Program (VICP) was created for cases such as these and is evidence that vaccine injury does occur.

With the ever increasing list of required vaccines and minimal evidence of safety with newer recommendations. I ask that this bill be dropped or vetoed. Preserve the right of our families to make their choices. It is well studied and document that children that are vaccinated can still contract the disease or be carriers that can infect others.

Mandatory vaccination does not eliminate the problem. As found evident by the EU ASSET project, "the enforcement of mandatory vaccinations does not appear to be relevant in determining childhood immunisation rate in the analysed countries. Those [countries] where a vaccination is mandatory do not usually reach better coverage than neighbour or similar countries where there is no legal obligation." So therefore why take away our rights with this forceful bill. Energy towards efforts for clearer patient-provider informed consent, education around vaccines, and further RCT studies proving the efficacy of vaccines should be the goal.

Thank you for taking the time to accept and consider testimony against this bill.

Mahalo

Subject: HAR 11-157
Date: Wednesday, December 26, 2018 4:12:53 PM

Aloha,

I am writing to oppose HAR 11-157 for mandatory vaccines. I think there should always be an option of what we are putting into our bodies and our children's bodies.

My father had an adverse reaction from the flu shot 3 years ago where he developed Guillain Barre Syndrome (GBS). He hadn't had a flu shot in almost 20 years and due to traveling for work thought it might be a good idea. The same day he said he felt odd and knew something was not right. The next day he felt really sick and weak, and by the end of the day had double vision, weakness, severe headache and body aches. He went to the ER and when they were doing the routine check in his blood pressure was abnormally high. They initially thought he had a stroke. When the neurologist was involved and did all of the test it was obvious that it was a direct linked to the flu vaccine and not a stroke. The Dr. said my dad was one of the lucky ones all of his other patients at that time would not be walking out of the hospital like he was. For 6 months he had intensive rehabilitation and detoxing of his system to regain strength in his body. He had to wear special glasses to help his eyes correct the severe double vision he was experiencing. Chiropractic and acupuncture appointment after appointment and after a year he was starting to feel like himself again and three years later I feel so blessed that he is fully back to himself.

They cannot pinpoint why it happened to him, if its genetic or not. What I know is I never want anyone I know to go through any of that. I am so grateful that my father has access to the absolute best Dr.'s at the Mayo clinic who gave him the best treatment plan possible.

The 3 vaccines that you are talking about have just awful track records in other countries where they have already stopped requiring them. They are not properly tested and to force that upon people is just wrong. The medical repercussions that they may have in the future are unknown, but why is that even a risk we want to take with our future generations.

Subject: Statement against changes to mandatory immunizations
Date: Wednesday, December 26, 2018 1:52:46 PM

To Whom It May Concern in the Hawaii DOE, the state legislature, and DOE Immunization Branch Chair Ronald Balajadia:

As a citizen, a father, a medical doctor, and a Big Island resident I believe that your proposed changes to increase immunizations to school children is unconstitutional and inappropriate. For the record, I am not anti-vaccination. Immunizations have saved millions of lives and have been one of the most important public health measures for disease prevention in history, after indoor plumbing and improved hygienic practices. Further, my own children are vaccinated and attend school. Yet, I do not believe that increasing the volume of mandatory vaccinations is appropriate or safe. I am also very concerned about the safety profile of the HPV vaccination and I do not believe that HPV prevention is a necessary public health measure under any circumstance. I am likewise uncertain about the efficacy of the Influenza vaccine and therefore do not think it should be mandatory under any circumstance. The Meningococcal vaccine is a very good vaccine and is appropriate for young people who will be living in close quarters, such as in college dormitories and in military barracks. This vaccine should be mandatory in those scenarios and thus should continue to be optional and administered under the professional guidance of a health care professional, based on sound medical guidelines and not on a mandatory, universal one-size-fits-all public health measure. The immunizations that we already have our children receiving as universal public health and prevention measures are sufficient.

In summary, HPV, Influenza, and Meningococcal immunizations should not become mandatory for school participation. They should continue to be optional. I am pro-vaccine and also pro-american. We cannot mandate immunizations in order for children to receive government sponsored education. This is medical harassment and is an obstruction of our basic rights as americans. I am not suggesting that we go backwards, I am suggesting that we do not continue adding more vaccines to the list of mandatory vaccines. It is irresponsible and unconstitutional. It will force many more children into homeschooling, which will put more kids at risk than any proposed health risk from HPV, Flu, or N. meningitis.

Please reconsider this inappropriate public health recommendation. If you really want to make a public health impact on children then re-appropriate state funds into nutrition and nutrition education.

Sincerely,
Justin Groode, MD

The Moral Right to Conscientious, Philosophical and Personal Belief Exemption to Vaccination

We have a right to choose what we inject into our bloodstream.

I absolutely oppose the Health Department to make it mandatory vaccine doses for our children. My child has been damaged with severe learning problems and I do believe it was all the heavy amount of vaccines she received to be allowed into the United States after being adopted from Kazakhstan Russia. I took her through a year detox of all these metals and toxins that were in her vaccines with a specialist biochemist after extensive blood work. The change was so dramatic. She began speaking from being mute, increased in learning speed and her movements of her limbs and coordination became soft fluid and normal. It was such a joy to see what getting rid of these vaccines and their poisons did. I had her on rigid health diet for 14 years and I did not want her ever again to have anymore vaccines.

My nutritionist Shannon Nering's letter I have also included as she is more eloquent at explaining the situation. Please read below.

First, our entire mainstream food, supplement and drug supply has become so corrupted, companies we've trusted for decades are committing heinous crimes in the name of profit. Just today, Johnson and Johnson is charged because a three year old was hospitalized due to metal in her intestines from her vitamin gummy bears! This same company also admitted to using asbestos in their baby powders. These companies that rule the market place our ruining lives for the sake of profit.

Daily I read articles on vaccine injury. A new father hospitalized for the flu vaccine with extreme nerve damage, he can not move or open his eyes. He's blinded. Lou Ferigno—aka the Hulk—hospitalized after the pneumonia vaccine. Very sick but recovering. Deaths from the HPV vaccine are climbing now that this is mainstream. And countless other mothers and fathers who claim their once bright lively toddler suddenly turned to stone, days or within weeks of the MMR vaccine. Injuries from DTAP range as the highest—none of this is reported in mainstream news because big pharma controls the media. They also control the government. There are two pharmaceutical lobbyists per one senator in the US government today! Think about that. That means their ears are filled with lies and their pocket books are being filled with money to campaign to make every American take their drugs! They want us sick and dependent for our entire lives.

Now the science behind vaccines might make good sense, but it is the adjuvants and metals they add to preserve [the vaccines](#) that are monumentally damaging to your health. Would you in good conscience inject your children (or yourself) with the following lethal ingredients?

--Mercury -- most toxic substance/metal known to man, they claim to have removed it, however, it continues to show up in the flu vaccine, and others. It's a powerful immunosuppressant amongst myriad other things. When you hear from the vaccine safety

promoters that new studies have shown that ethylmercury (in thimerosal) disappears from the blood within several days. Actually, the mercury leaves the plasma and enters the brain, where it is de-ethylated and remains for a lifetime, wreaking havoc on the brain.

--Aluminum—first added in 1926, another known neurotoxin—DNA damage, cell damage, binds to ATP and affects energy production in all cells. It's linked to dementia, autism, Parkinsons—1 in eight seniors have dementia now (hello flu shot), in less than a decade, it'll be one in four. What's the common thread here?

--Formaldehyde—used to embalm dead bodies. Need we say more? You want that in your kids?

--Peanut oil – why was there a plague of children suddenly with peanut allergies. No one could explain. Well, it was used in vaccines as a preservative for a time. Hmm.

--MSG—a known neurotoxin! You won't eat it, but you'd inject it?

--Also DNA residues, gelatin, antibiotics—like we need more of those!

--And not listed on official ingredient lists are bacterial and viral contaminants, which can include their particulate, fragmented matter.

This is frightening! Connect the dots! They are not saving lives.

In 1983, before the autism epidemic began, children received 10 vaccinations before attending school and the autism incidence was 1 in 10,000. Today, they receive 24+ vaccines before they turn 1, and 36+ by the time they start school and the autism rate is now 1 in 150 births! Do the math!

There are over one million children with autism and the numbers continue to grow. This is a medial disaster of monumental proportions. The link to the vaccine program is scientifically and logically compelling but these same medical elitists refuse to listen. Like smoking and lung cancer, we have enough proof today to call a halt to the present excessive vaccine program and ban any level of mercury in vaccines.

Vaccines are tested for a brief period if at all!!! Three weeks. They have never tested what repeated vaccinations and the current volume/quantity of vaccinations do to animals/humans. We are guinea pigs for big pharma's bottomline—making them BILLIONS of dollars. The vaccine schedule for an infant born in America, before the age of one, is the equivalent of giving an adult one shot a day. Our bodies are so polluted from these toxic injections.

Independent third party studies are vilified and struck from record, almost none are accepted into medical literature. That's what billions of dollars will do.

Lastly -- CHINA -- The Chinese are now the largest vaccine manufacturers in the world, with over 400 biopharmaceutical companies making vaccines and poor quality drugs for the world. The FDA admits that it inspects only 1.8 percent of the 714 drug firms in China and that, according to a GAO study, FDA inspections may be done 13 years apart (In the US it's spaced 2 years apart).

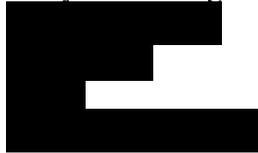

--More frightening is that the inspectors must depend on Chinese translators and US

companies who purchase [the vaccines](#) must have a Chinese communist official serve as its legal representative. One CEO was quoted as saying “every piece of information you get (from the Chinese) is suspect.”

--With thousands of people dying and getting sick, not only in China, but in hundreds of nations receiving China’s tainted pharmaceutical products, future vaccines are an even greater danger.

No thank you. Count my children out of this twisted program that claims to protect our health while destroying bodies and minds. But hey, it does make the ‘elite few’ billions of dollars!

Sincerely,
Shannon Nering ,
Mary Ellen Ringler

Subject: Strongly oppose
Date: Wednesday, December 26, 2018 3:10:21 PM

To whom it may concern,

I am writing to share that I strongly oppose the HAR 11-157 proposal to require more vaccinations for the children of Hawaii state than any other state in the country.

My name is Erica Bergquist and I have been an educator of young children for 13 years. I hold a Masters degree in Education and have a 10 year old daughter who has never had any vaccinations. She is the healthiest person I've ever met having only ever contracted a cold.

When I was pregnant with my daughter, I wasn't sure about vaccinations. I attended several talks and read many informative books, learning both pros and cons of the realities of vaccines.

I learned much.

It is a common belief that the Polio vaccine saved thousands of families, when in fact studies show that the live-virus polio vaccine is the major cause of polio in the United States today.

In addition, the diphtheria and tetanus vaccines are 'stabilized' with formaldehyde- a known carcinogenic.

Lastly, the measles and pertussis vaccines may cause seizures, brain damage, and death.

If vaccines offered benefits only, the government wouldn't need to mandate them.

Much has changed in recent decades in the ingredients of vaccinations. I recently read that some vaccines still carry mercury as a preservative as well as aborted fetal parts, not to mention animal parts as well.

Please consider these extremely important facts about vaccines when considering requiring them of Hawaii's families. Families need choices when it comes to their children. Many parents are unfortunately brainwashed by mainstream media which portrays the necessity of vaccinations. Most are unaware of the billion dollar medical and insurance companies behind the vaccine industry.

As an educated and informed parent and teacher of young children, I beg you to not only consider the possible damaging effects of vaccines on children, but also the fact that this new law is taking away people's rights to make health choices of their own for their beloved children.

It is a slippery slope when taking away parent's rights and choices concerning their children. What will they take away next? What will they require next?

Please contact me if you have further questions.

Sincerely,
Erica Bergquist

Subject: Strongly Oppose Possible Vaccination Changes
Date: Wednesday, December 26, 2018 9:35:14 AM

Hello,

My name is Sonni Dawkins and I live in [REDACTED]. I am a mother of two. I strongly oppose the bill to uphold new vaccine requirements for Hawaii. And I support an informed consent status. If there is a risk, there should be choice.

Because there are no long term efficacy studies required by the FDA or CDC, force vaccination causes our children to be the long term study which is inhumane.

Injecting foreign bodies, chemicals and metals into the tissues and bloodstream completely forgoes the bodies natural defense system, surpassing the skin and mucous membranes. This allows these substances to travel to places like the brain without being broken down first (and wrecking havoc on the myelin sheath and areas of the brain.

We should have a choice and decide as parents what the bigger damage would be for our kids-incurring a vaccine injury or contracting the disease.

If you need more information, you can research Miller's Critical Evaluation of Vaccine studies or visit vaxbook.org.

To: [REDACTED]
Subject: support for HAR 11-157 from Hawaii Academy of Family Physicians
Date: Wednesday, December 26, 2018 4:33:17 PM

The Hawaii Academy of Family Physicians representing over 330 family physicians statewide strongly supports the HAR 11-157 proposed rules update.

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

We respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you for your consideration,

Nicole Apoliona, MD, FAAFP
President, Hawaii Academy of Family Physicians

RE: public hearing for the proposed amendment and compilation of Hawaii Administrative Rules (HAR) Title 11, Chapter 157, "Examination and Immunization."

I strongly oppose the proposed amendment and compilation of Hawaii Administrative Rules (HAR) Title 11, Chapter 157, "Examination and Immunization."

* I'm requesting that this hearing be held on EVERY island.

My name is Natasha Sky. I am a Hawaii resident, voter, mother, health advocate and member of Hawaii for Informed Consent. I'm writing today with my strong concern on the DOH planned changes on immunization policy.

Currently, 18 states allow philosophical exemptions for those who object to immunizations because of personal, moral or other beliefs. **In Virginia, parents can receive a personal exemption only for the HPV vaccine. If Hawaii mandates HPV for school attendance there should be a philosophical exemption available to opt out of this vaccine for a disease which is non communicable, no long-term safety studies and a higher reported number of incidences of adverse reactions than other vaccines. Please consider in the future to follow policy of these states and support adding a philosophical exemption.

HPV vaccine should not be required for school as it does not have any protection to prevention of an outbreak or being spread in a social setting.

When it comes to the changes on MEDICAL EXEMPTIONS please follow example of Illinois SB1410- "A healthcare provider may consider including without limitation the nationally accepted recommendations from federal agencies such as the Advisory Committee on Immunization Practices, the information outlined in the relevant vaccine information statement, and vaccine package inserts, ALONG WITH THE HEALTHCARE PROVIDERS CLINICAL JUDGEMENT, to determine whether any child may be more susceptible to experiencing an adverse vaccine reaction than the general population, and if so, the healthcare provider may exempt the child from an immunization or adopt an individualized immunization schedule." We cannot remove the practitioners ability to use his/her judgement to issue

medical exemptions. This infringes on the doctor patient relationship and violates a doctors right to do their job.

Mandating Medical exemptions to be filed with the DOH is a HIPPA violation.

Requiring schools to file exemptions with DOH is a FERPA violation.

The current religious exemption policy is fine as it is, there is no need for a form to be provided by DOH, with extra requirements, infringing on our religious rights. We do NOT need to prove our religious beliefs. It is unconstitutional. IF however, a DOH form is required for religious exemption please include "The religious exception stated need not be directed by the tenets of an established religious organization."

"In May 2017, Del Bigtree & Robert F. Kennedy, Jr. suspected that HHS was not fulfilling its critical vaccine safety obligations as required by Congress in The National Childhood Vaccine Injury Act of 1986 of assuring improvements in the licensing, manufacturing, adverse reaction reporting, research, safety and efficacy testing of vaccines in order to reduce the risk of adverse vaccine reactions. A lawsuit revealed that HHS had never, not even once, submitted a single biennial report to Congress detailing the improvements in vaccine safety." <http://icandecide.org/government/ICAN-HHS-Stipulated-Order-July-2018.pdf>

↑↑Our state shouldn't follow ACIP due to lack of safety studies. The general issue of following the ACIP schedule is that there are no studies on the synergistic affect of each vaccine that keeps getting added to the schedule.

"Adding to public concern about vaccines is the fact that immunization is mandated by many state and local school entry requirements. Because of this widespread use, safety problems with vaccines can have a potential impact on large numbers of persons." – CDC

Anti-choice mandates violate civil liberties. Mandated medical procedures degrade modern medicine and destroy the foundations of our health care system. When you give up the power to choose what can be done to your body — in this case what can be injected into you or your child's body — you are no longer a free, autonomous, sovereign individual.

Please have public hearings held on every island concerning these proposed rule changes that will immensely affect our state. Residents need to ask questions and be made aware of such rule changes before they are made.

Sincerely,
Natasha Sky

My name is Natasha Sky. I am a Hawaii resident, voter, mother, health advocate and member of Hawaii for Informed Consent. I'm writing today with my strong concern on the DOH planned changes on immunization policy.

Currently, 18 states allow philosophical exemptions for those who object to immunizations because of personal, moral or other beliefs. **In Virginia, parents can receive a personal exemption only for the HPV vaccine. If Hawaii mandates HPV for school attendance there should be a philosophical exemption available to opt out of this vaccine for a disease which is non communicable, no long-term safety studies and a higher reported number of incidences of adverse reactions than other vaccines. Please consider in the future to follow policy of these states and support adding a philosophical exemption. HPV vaccine should not be required for school as it does not have any protection to prevention of an outbreak or being spread in a social setting.

When it comes to the changes on MEDICAL EXEMPTIONS please follow example of Illinois SB1410-

"A healthcare provider may consider including without limitation the nationally accepted recommendations from federal agencies such as the Advisory Committee on Immunization Practices, the information outlined in the relevant vaccine information statement, and vaccine package inserts, **ALONG WITH THE HEALTHCARE PROVIDERS CLINICAL JUDGEMENT**, to determine whether any child may be more susceptible to experiencing an adverse vaccine reaction than the general population, and if so, the healthcare provider may exempt the child from an immunization or adopt an individualized immunization schedule." We cannot remove the practitioners ability to use his/her judgement to issue medical exemptions. This infringes on the doctor patient relationship and violates a doctors right to do their job.

Mandating Medical exemptions to be filed with the DOH is a HIPPA violation.

Requiring schools to file exemptions with DOH is a FERPA violation.

The current religious exemption policy is fine as it is, there is no need for a form to be provided by DOH, with extra requirements, infringing on our religious rights. We do NOT need to prove our religious beliefs. It is unconstitutional. IF however, a DOH form is required for religious exemption please include "The religious exception stated need not be directed by the tenets of an established religious organization."

"In May 2017, Del Bigtree & Robert F. Kennedy, Jr. suspected that HHS was not fulfilling its critical vaccine safety obligations as required by Congress in The National Childhood Vaccine Injury Act of 1986 of assuring improvements in the licensing, manufacturing, adverse reaction reporting, research, safety and efficacy testing of vaccines in order to reduce the risk of adverse vaccine reactions. A lawsuit revealed that HHS had never, not even once, submitted a single biennial report to Congress detailing the improvements in vaccine safety." <http://icandecide.org/government/ICAN-HHS-Stipulated-Order-July-2018.pdf>

↑↑Our state shouldn't follow ACIP due to lack of safety studies. The general issue of following the ACIP schedule is that there are no studies on the synergistic affect of each vaccine that keeps getting added to the schedule.

"Adding to public concern about vaccines is the fact that immunization is mandated by many state and local school entry requirements. Because of this widespread use, safety problems with vaccines can have a potential impact on large numbers of persons." – CDC

Anti-choice mandates violate civil liberties. Mandated medical procedures degrade modern medicine and destroy the foundations of our health care system. When you give up the power to choose what can be done to your body — in this case what can be injected into you or your child's body — you are no longer a free, autonomous, sovereign individual.

Please have public hearings held on every island concerning these proposed rule changes that will immensely affect our state. Residents need to ask questions and be made aware of such rule changes before they are made.

Sincerely,

Natasha Sky

If there is RISK, there must be choice

Aloha DOH,

Mahalo for the opportunity to submit testimony.

This is Yana. I spoke a couple times so you guys should know who I am. Sorry if I got a little serious during my testimony. I'm not suing anyone anytime soon :).

However I will keep researching this topic and continue to try and find new and innovative SCIENTIFIC information on this topic for you all to consider in your decision making process.

You all have an amazing and unique opportunity to stand for TRUTH AND JUSTICE right now. We all truly want health and happiness for ourselves and our babies.

Lets try and have a mature, healthy happy conversation about this and have a civil question and answer discussion panel as many that have given testimony request.

I very much so, hope that the DOE and everyone making decisions is yearning for truth and information as much as I am and that you find it within yourselves, for the sake of our children to come to the table and have a good discussion with the community about this topic.

A panel where not only do you hear testimony, but also answer our questions and demonstrate that you fully acknowledge and answer our concerns into the matter of mandatory vaccinations.

Just for fun, here is one more study I'd like for you to consider:

Dec 22, 2018 by Richard Harris

Research published in a major medical journal concludes that a parachute is no more effective than an empty backpack at protecting you from harm

if you have to jump from an aircraft.

But before you leap to any rash conclusions, you had better hear the whole story.

The gold standard for medical research is a study that randomly assigns volunteers to try an intervention or to go without one and be part of a control group.

For some reason, nobody has ever done a randomized controlled trial of parachutes. In fact, medical researchers often use the parachute example when they argue they don't need to do a study because they're so sure they already know something works.

Cardiologist Robert Yeh, an associate professor at Harvard Medical School and attending physician at Beth Israel Deaconess Medical Center, got a wicked idea one day. He and his colleagues would actually attempt the parachute study to make a few choice points about the potential pitfalls of research shortcuts.

They started by talking to their seatmates on airliners.

"We'd strike up a conversation and say, 'Would you be willing to be randomized in a study where you had a 50 percent chance of jumping out of this airplane with — versus without — a parachute?' " Yeh says.

Only a few people said yes to this outrageous invitation, and they were excluded for reasons of questionable mental health.

The scientists had much better success asking members of their own research teams from Harvard, University of California, Los Angeles (Where Yeh's brother is a surgery professor), and University of Michigan (where a buddy works) about volunteering to participate in the experiment on other aircraft.

In all, 23 people agreed to be randomly given either a backpack or a parachute and then to jump from a biplane on Martha's Vineyard in Massachusetts or from a helicopter in Michigan.

Relying on two locations and only two kinds of aircraft gave the researchers quite a skewed sample. But this sort of problem crops up frequently in studies, which was part of the point Yeh and his team were trying to make.

Still, photos taken during the experiment show the volunteers were only too happy to take part. "I think people are laughing all of the way to the ground," Yeh says.

Oh, there's one important detail here. The drop in the study was about 2 feet total, because the biplane and helicopter were parked.

Nobody suffered any injuries. Surprise, surprise. So it's technically true that parachutes offered no better protection for these jumpers than the backpacks.

"But, of course, that is a ludicrous result," Yeh says. "The real answer is that that trial did not show a benefit because of the types of patients who were enrolled."

If they had enrolled people at high risk for injury, that is people in *flying aircraft*, the results would have been quite different (not to mention unethical).

But something like this happens in everyday medical research. It's far too easy for scientists who have already anticipated the outcome of their research to cherry-pick patients and circumstances to achieve the results they expect to see. This research paper carried that idea to the ridiculous extreme.

The [study's findings](#) were published in the traditionally lighthearted Christmas issue of the medical journal, *BMJ*.

"It's a little bit of a parable, to say we have to look at the fine print, we have to understand the context in which research is designed and conducted to really properly interpret the results," Yeh says. Scientists often read just the conclusion of a study and then draw their own conclusions that are far more sweeping than are justified by the actual findings.

This is a real problem in science.

"I know that people often don't look detailed enough into what is being investigated to know how to interpret the results of a trial," says [Cecile Janssens](#), an epidemiology professor at Emory University.

Janssens was delighted to come across the paper on Twitter. She says like a lot of research, its results are accurate as far as they go, but "the

results can only be generalized to situations where people jump out of an aircraft within a few feet above the ground."

She plans to give this paper to her students with a straight face and see how long it takes for them to get the deeper points about scientific methodology buried in this absurd experiment.

"It will be unforgettable," she says — far better than assigning a straight-ahead scientific study.

Yeh is pleased to see that the fun he had with his colleagues is turning into a teaching tool. He also savors some of the more subtle lessons buried in the paper.

For example, the scientists attempted to submit it to a government registry of research studies, which is required for many studies involving human subjects. They chose one in Sri Lanka to reduce the risk that it would be discovered in advance, spoiling the joke. It was rejected.

"They thought that a trial conducted in this manner could not lead to scientifically valid evidence," he said.

"They're right!" he adds with a laugh.

In fact, the paper acknowledges that the research team members cracked themselves up so much that "all authors suffered substantial abdominal discomfort from laughter."

"Our greatest accomplishment from all of this was we felt very good that we were able to cite Sir Isaac Newton in the paper," he says. They referred to Newton's classic 1687 paper establishing the law of gravity.

Yes, gravity is a law. Mess with it at your own risk.

Subject: I strongly oppose 11-157 proposed rules

Aloha,

I strongly oppose 11-157 proposed rules.

I am a licensed Naturopathic Doctor as well as a mother and grandmother. In my family practice as a primary care doctor in Vermont and Hawaii for 24 years, I have had many vaccine injured babies, children, and adults come to me for treatment.

There are many reasons that I oppose the 11-157 proposed rules. I will mention a few of the important reasons due to time.

It is unlawful to require more vaccinations, especially for a child to be able to enter schools and preschools.

Unfortunately, vaccines are not safe and many children and adults have been injured and often debilitated. Reported vaccine injuries can be seen on the VAERS database.

There have never been proper scientific, double-blind studies done to determine the safety and efficacy of individual vaccines, and no studies have been conducted to evaluate the safety of combining multiple vaccinations in one shot or in one office visit, or the cumulative affects of 48 vaccinations starting from birth through early childhood on the current recommended vaccine schedule (before the added proposed vaccines)!

It is absolutely unlawful to require medical interventions that have a history of causing harm and death, and that have not been studied adequately individually, combined, or cumulative over time.

The vaccines are manufactured with many chemicals and adjuvants that are neurotoxic and

toxic to living beings in general like aluminum, mercury compounds, formaldehyde, phenol, polysorbate 80, to name a few. Some contain material from aborted human fetuses, dog kidneys, genetically modified insects and viruses. How do these interact with a baby or adult's DNA? Do you know? No studies have been done. Animal and aborted human cells can easily be contaminated by other unknown viruses, which may lead to the recipient developing cancer, autoimmune and other conditions. Has this been studied? No.

Gardasil, an hpv vaccine, that is being proposed for requirement, has been shown to have many terrible side effects and reactions, yet hpv is a very slow growing cancer that is easily treated and screamed for.

Due to time I must end here,

Mahalo,

Dr. Donna Caplan, ND

Subject: HAR 11-157
Date: Wednesday, December 26, 2018 8:37:18 AM

I strongly oppose the new mandatory vaccine schedule for Hawaii.

HAR 11-157 requires influenza vaccines, a good friend of mine, Albert Salsedo, acquired Guillain- Barre syndrome after receiving the influenza vaccine. Making this a requirement for all children will increase the incidence of this horrible, paralyzing disease.

Fifty-eight thousand adverse reactions—including *four hundred twenty-seven deaths*—have been reported after HPV vaccine injections in the U.S. alone. (Search the U.S. Government's VAERS Data) <http://www.medalerts.org/>) Insisting that young healthy boys and girls receive this vaccine, when the rates of cervical cancer and penile cancer deaths are so low, and the adverse reactions are so high, is unconscionable.

Thank you for all that you do for the health of this amazing state,
Sammee Albano RN

Aloha,

I am writing to oppose HAR 11-157 for mandatory vaccines. I think there should always be an option of what we are putting into our bodies and our children's bodies.

My father had an adverse reaction from the flu shot 3 years ago where he developed Guillain Barre Syndrome (GBS). He hadn't had a flu shot in almost 20 years and due to traveling for work thought it might be a good idea. The same day he said he felt odd and knew something was not right. The next day he felt really sick and weak, and by the end of the day had double vision, weakness, severe headache and body aches. He went to the ER and when they were doing the routine check in his blood pressure was abnormally high. They initially thought he had a stroke. When the neurologist was involved and did all of the test it was obvious that it was a direct linked to the flu vaccine and not a stroke. The Dr. said my dad was one of the lucky ones all of his other patients at that time would not be walking out of the hospital like he was. For 6 months he had intensive rehabilitation and detoxing of his system to regain strength in his body. He had to wear special glasses to help his eyes correct the severe double vision he was experiencing. Chiropractic and acupuncture appointment after appointment and after a year he was starting to feel like himself again and three years later I feel so blessed that he is fully back to himself.

They cannot pinpoint why it happened to him, if its genetic or not. What I know is I never want anyone I know to go through any of that. I am so grateful that my father has access to the absolute best Dr.'s at the Mayo clinic who gave him the best treatment plan possible.

The 3 vaccines that you are talking about have just awful track records in other countries where they have already stopped requiring them. They are not properly tested and to force that upon people is just wrong. The medical repercussions that they may have in the future are unknown, but why is that even a risk we want to take with our future generations.

Mahalo,

Kimberley Nagel

Dear Department of Health. I am 10 years old and my name is Lily Sky. I OPPOSE Har11-157. I have friends who vaccinate and I dont want the HPV vaccine to be mandated, as I dont want my friends to get this vaccine. There are dangerous side effects from this vaccine you are trying to mandate for thousands of children. Kids do not have sex in school, theres no reason for kids to get this vaccine if theyre not going to have sex. Kids should be taught about safe sex and be able to decide if this is a vaccine they want or need. They should be able to make this choice.

Thankyou, Sincerely Lily Sky

Hawaii Midwifery Council
Rachel Curnel Struempf, President

In opposition

Aloha,

Thank you for the opportunity to submit testimony. The Hawaii Midwifery Council strongly opposes the increase in required immunizations for the children of Hawaii. We feel this is not in the best interest of the children who would be subject to this

New policy. Furthermore, we feel the DOH does

Not have the authority to unilaterally make this decision and it should require legislation to be implemented.

Thank you for your time.

Sent: Thursday, December 27, 2018 5:40 PM
To: DOH webmaster [REDACTED]
Cc: Momi Fernandez [REDACTED]
Subject: HAR-11-157 Immunization & Examination Proposed Rule Change

Aloha: This email is submitted as testimony in opposition to the proposed HAR-11-157 immunization and examination rule change by making immunizations mandatory for children. This is especially dangerous for a child/children with (a) compromised immune system(s) and children born with organ disfunction or not fully developed and newborns with spina bifida. Side effects experienced by children too young to communicate their pain and discomfort are especially at risk of being misdiagnosed or their violent reactions minimized.

I am against mandatory immunization for the following reasons:

1. I believe **human rights are violated** when immunizations are mandatory. Human rights to health and health care afford the opportunity to make individual decisions regarding health decisions and to participate in decisions that affect health ... (National Economic & Social Rights Initiative [NESRI], subtitle Participation). At times that means that **we may choose NOT to participate in health initiatives/mandates when we believe our health can be compromised or lessened in any way.**
2. "Health is a fundamental human right", Human Rights Day 2017, one of the World Health Organization (WHO) guiding principles and equal to another WHO guiding principle: "Good health is also clearly determined by other basic human rights including access to safe drinking water and sanitation, nutritious foods, adequate housing, education and safe working conditions." Source: <https://www.who.int/mediacentre/news/statements/fundamental-human-right/en/>.
3. Personal experience with my daughter who suffered **violent reactions to being immunized** on Maui during the

early to mid-1980s. Even half-doses did not alleviate the reactions she suffered for more than a week after being immunized. I am against putting any other child through that misery.

4. After reviewing studies from the US., WHO, UK, Europe, several conclusions are in common. That **there is no vaccine against resistance or refusals that are rooted in social-cultural, religious and political contexts.** That **certain vaccines are promoted more than others based on pharmaceutical companies applying pressure on doctors, hospitals and medical clinics.** In other words, vaccines are promoted because the process allows for pharmaceutical companies to get rich and doctors and hospitals are rewarded for selling the product widely. Source: Dr. Patrick Gentempo research and documentary series: "Vaccines Revealed". The same source shared evidence that vaccines are especially dangerous to people (not just children) diagnosed with autism and in some cases have caused autistic symptoms in children and adults that last for years. It is also dangerous if one has the HIV virus. The quality of life diminishes drastically in those patients.

It is very disappointing that the Department of Health (DOH) doesn't look toward traditional medicine, homeopathic methods that boost the immune system to better protect against disease, whether viral or bacterial infections. Sources and resources are available, however, I don't know of any effort that the DOH has made to bring these valuable and knowledgeable practitioners to the table and within the conversation to listen to viable preventative measures and treatment therapies. These therapies are not expensive and promote health at the highest level by addressing the health of mind, body and spirit.

Instead of immunizing newborns, **babies have a natural protection by leaving the vernix caseosa on their bodies after birth** and allowing it to be absorbed into the skin. This **is the first natural defense babies are born with that protects their immune system.** There are Native Hawaiian la'au lapa'au practices that enhance baby's immune system that have proven to be effective for hundreds of years before and after western contact. I utilize those remedies for my children and grandchildren and teach other mothers upon request. Other native cultures know the same truth and pass down those traditions.

DOH should be promoting more breast feeding. Breast feeding transfers natural defenses that help to nurture a newborn and provide additional defenses that can benefit a child for years to come.

It is interesting that acute flaccid myelitis (AFM) has surfaced during a time when the U.S. suffers from division, unstable stock market, vivid and cruel racism and the worst addiction problems in society supported by doctors and pharmaceutical companies. National leaders demonstrate the lack of respect toward immigrants and homosexuals/trans-gender people, while the middle class is disappearing all while the "national tribe" is losing faith and hope in the political system. The same was true prior to the Great Depression of 1929. Caroline Myss, "Anatomy of the Spirit" (Harmony Books, NY, copyright 1996, 2017) writes of the common "crippling effects" prior to the epidemic of polio in the 1930s. "What adults suffer, children also suffer by becoming weak and susceptible to viral disease similar to the economic dis-ease and social illnesses we are experiencing today. The "tribe", as a nation, took on both physical weakness and resilience by electing Franklin D. Roosevelt as President, as an aligning symbol of much needed hope. Polio and AFM both represent a weakness in the first energy center as it represents tribal power that embraces the "All Is One" tribal energy. Otherwise, what we experience as a nation; both positive and negative. The polio epidemic is viewed as a result of the Great Depression, affecting the entire nation or "tribal energy". It took a physical tribal event and experience of physical strength to "heal" the "tribal spirit". "A sense of heroism and tribal unity, supported by increased jobs, restored pride, power, and honor to each tribal member."

In the United Kingdom, European countries, India and Pakistan where mandatory vaccinations have been proposed, the process has met with protests, marches and resistance. Distrust in government process, policies and processes that diminish the voices of those who demand collaboration and open communication with inclusion rather than exclusion by limiting input and opportunities to decide and express the "tribes" health concerns, remedies, and quality of life that effects life expectancy. "A 2016 ASSET analysis published by Science in Society ... once again did not find evidence of a relationship between national mandatory vaccination policies and increased vaccine uptake in European countries ... "Countries where a vaccination is mandatory do not usually reach better coverage than neighbor or similar countries where there is no legal obligation." Furthermore, a 2015 study revealed "a growing vaccine hesitancy and concern about vaccine safety among healthcare workers and their patients in Europe. Researchers reported healthcare workers had "significant mistrust of pharmaceutical companies who not only had financial interests but also did not communicate sufficient information about side

effects ...”

Respectfully submitted,

Momi Lovell

Subject: I oppose HAR 11-157

Dear DOH officials,

I am writing to express my staunch opposition to HAR 11-157. I was in attendance at the teleconference meeting held in the state building on Maui and I was denied the opportunity to give testimony. I am opposed to the new rules that DOH plans to implement on the grounds of religious freedom, physical sovereignty, and submission to force under duress. You simply cannot tell your constituents that you are going to force them to pay taxes for education and deny their children an education unless they submit to injections which have been proven to be harmful in many events. It's not hard to find the evidence of youth being harmed and even dying as a result of the hpv vaccine.

I have three children who range from full vaccination to partial vaccination that have been harmed in different ways from vaccines. My oldest daughter is 13 and after receiving her latest vaccination has suffered multiple bouts of angioedema that cause her to miss school. My second daughter is 6 and has permanent nerve damage in her legs. My youngest almost died from fever and dehydration the week of her last vaccination. Please, I am begging you not to mandate me to further harm them so that they can attend school.

Not only would this be a clear violation of our rights, it is legalized theft to take my tax dollars for something that I would be denied access to. Further, this is the equivalent of taxation without representation. If I am forced to take this to court then I suppose I will do what I must to ensure my children are not denied their right to an education. I am willing to defend them and all of the other children you plan to inject with harmful toxins if I must.

I appreciate you at the Department of Health taking the time to understand the reasons why I am not willing to follow the proposed guidelines of HAR 11-157. I humbly ask you to please reconsider the use of force and coercion in reaching your objectives.

Sincerely, Brandi Chanthathep

Dear Health Department officials,

It is please imperative that we continue to vaccinate children according to our current public health standards. The opposition to this bill is not thinking on a scientific basis and it will adversely affect our community as these diseases can be lethal.

We need to continue to vaccinate and prevent a medical and moral travesty. Measles almost wiped out the Hawaiian population in the past when an unvaccinated population was exposed by sailors bringing in the virus. History should not repeat itself due to ignorance nor should we drop our standards.

Sincerely,

Bridget S. Bongaard MD, FACP, HCMD

December 28, 2018

RE: STRONG OPPOSITION TO HAR 11-157 PROPOSED RULE CHANGES

Dear Disease Outbreak Control Division:

Hawaii for Informed Consent (HFIC) is a non-partisan group of ordinary people with over 1600 members whose mission is to defend the basic human right of freedom to make informed, voluntary, healthcare choices for ourselves and our minor children. We advocate for a more accurate and complete informed consent for vaccine consumers through continued research, education, and empowerment of our citizens, legislators, and health care professionals. Our legislative goals aim to preserve flexible medical, religious, and conscientious vaccine exemptions for all human beings, free from coercion, harassment, or penalty, as we bring respect, compassion, and awareness to the fact that vaccine injury is real and becoming more prevalent every day.

The Hawai'i Department of Health (DOH) is proposing an amendment and compilation of Hawai'i Administrative Rules (HAR) Title 11, Chapter 157, "Examination and Immunization." The proposed rule changes seek to:

- ▶ increase the vaccine *requirements* for Hawai'i's children ([Exhibit A](#)) by adding multiple doses of seven recommended vaccines by the Advisory Committee on Immunization Practices (ACIP) of the Department of Health and Human Services .
- ▶ update and clarify the immunization and examination procedures for school, post-secondary school, and child care facility attendance in Hawai'i by adopting as *requirements* ACIP's "General Best Practice Guidelines for Immunization" ([Exhibit B: page 3](#)).

HAWAII FOR INFORMED CONSENT

[Redacted signature block]

[Redacted footer text]

First do no harm

HFIC opposes the DOH-proposed rule changes for the following reasons:

1. The vaccine **recommendations** and administration **guidelines** put forth by ACIP are not intended to be **requirements**, or blanket state mandates for school entry.

The ACIP develops recommendations on how to use vaccines to control disease in the United States. The Committee's recommendations are forwarded to CDC's Director for approval," who then publishes and creates "the final and official CDC recommendations for immunization of the U.S. population."

<https://www.cdc.gov/vaccines/acip/recommendations.html>

In its online document, "General Best Practice Guidelines for Immunization," the ACIP clarifies its advisory function "for clinicians and other health care providers who vaccinate patients" to "help vaccination providers to assess vaccine benefits and risks." These **general recommendations and guidelines** are intended to **guide** providers' discussions and decision-making process with unique, individual patients. <https://www.cdc.gov/vaccines/hcp/acip-recs/general-recs/intro.html>

ACIP members publicly have demonstrated questionable judgment and negligence to protect Americans from harm; watch [this video \[hyperlinked here\]](#) as they unanimously approve a new vaccine and **subsequently** discuss the myocardial infarction "signal" discovered in preliminary and incomplete testing of that vaccine. They resolve to track future occurrences of myocardial infarction in the **post-marketing** period for a few years, rendering the people who receive the vaccine as **human guinea-pigs**. ACIP members' also demonstrated remarkable unresponsiveness to public testimony presented, including personal vaccine injuries, professional experiences in the healthcare environment, as can be observed [here](#).

Vaccination is a **medical procedure** that carries risk of serious injury, death, and risk of failure to prevent infection and transmission for some individuals. Physicians must be free to utilize their best judgment and intimate patient knowledge in weighing the genetic, biological, and environmental risk factors which could render some patients more susceptible to vaccine reactions than others.

Physicians must consider the four core universal values defined in medical ethics:

- **Autonomy: The rights of the individual to self-determination**
- **Beneficence: Taking actions that serve the best interest of the patient**
- **Non-maleficence: "First Do No Harm"**
- **Respect for Human Rights: The inalienable, fundamental rights to which a person is inherently entitled simply because she or he is a human being**

https://en.wikipedia.org/wiki/Medical_ethics

Neither ACIP nor the CDC has any regulatory authority to force vaccines onto the public by law. Furthermore, unelected, career individuals of an administrative agency such as the DOH should not have any statutory authority to promulgate federal vaccine recommendations and individual practitioner use guidelines into state law as a one-size fits all requirement for entry into Hawaii schools and daycare facilities.

HAR 11-157 has not been updated since July 2002, therefore the DOH's desire to have Hawaii's vaccine policy conform with national recommendations and recognized standard medical practices is understandable. Most physicians in the state of Hawai'i already consider CDC recommendations and guidelines. *There is a significant difference, however, between vaccine recommendations and vaccine requirements.* Currently, Rhode Island is the only state to require the entire list of ACIP-recommended children's vaccines for school eligibility. Rhode Island's exemptions to vaccination, notably, are more broad than Hawaii's. ***Therefore, if these rules were to be adopted, Hawaii would have the most stringent childhood vaccination requirements for school eligibility in the US.***

HFIC respectfully urges the Hawai'i Department of Health to modify its language in the proposed amendment to replace the word "requirements" with the word "recommendations," in accordance with the verbiage of the US Department of Health and Human Services' Centers For Disease Control and Prevention (CDC).

- 2.** HFIC discourages the DOH from expanding the list of vaccines required for school entry, since the current requirements *already* conform with the national standard.

Please consider the following statements of fact:

- Congress passed *The National Childhood Vaccine Injury Act of 1986* to shield vaccine manufacturers from civil product liability

lawsuits for all harm caused by vaccines, including permanent disability and death (Public Law 99-660).

<https://www.ncbi.nlm.nih.gov/books/NBK220067/>

- Since the 1986 Act sheltered vaccine manufacturers from liability, the recommended childhood vaccination schedule has exploded to a current **74 doses of 17 different vaccines** (commencing in pregnancy, on the first day of birth, and continuing until 18 years old). See the CDC normal childhood schedule [here](#) (as well as the recommended CDC schedule for the immunocompromised....whom, contrary to what we are lead to believe, also receive most vaccinations.
- Both Tdap and Influenza vaccine package inserts state that neither safety nor effectiveness have been established in pregnant women; yet both vaccines are routinely recommended by ACIP for this specific population. Doctors are merely “encouraged to register [their patients] in a pregnancy registry” which later, without patient consent, becomes the manufacturer’s post-marketing data or “research.”—a [violation of the spirit of the Nuremberg Code](#) that individuals must expressly and voluntarily offer their informed consent to participate in medical research. <https://www.fda.gov/downloads/biologicsbloodvaccines/vaccines/approvedproducts/ucm142764.pdf> [Please refer to section 8.1 in this link]
- The US administers 2-3 times more childhood vaccines than any other developed nation, and yet we have the highest infant mortality rate in that category. <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3170075/?tool=pubmed>
- According to CDC statistics, we now have the *sickest generation* of children in the history of mankind: <https://www.ncbi.nlm.nih.gov/pubmed/21570014>
 - 54% of children suffer from chronic illness such as autoimmune and/or neurological disease, allergies, and asthma
 - 1 in 6 are diagnosed with neurodevelopmental disorders such as ADHD/ADD, autistic spectrum disorder, tics, speech delays
 - 1 in 36 have autism <https://www.cdc.gov/mmwr/volumes/67/ss/ss6706a1.htm>
 - 13-25% of children require special education learning environments
- The HPV vaccine (Gardasil) is supposed to counter the effects of a sexually transmitted disease which is not communicable in the school setting. It is a highly controversial vaccine that has proven to be neither safe nor effective. (Please see both the detailed and heavily referenced article recently published in the [Maui Independent](#) and [Mary Holland’s book, The HPV Vaccine On Trial](#)).
- *The potentially dangerous, synergistic and long-term effects of the ever-growing childhood vaccination schedule has NEVER been evaluated for safety.*
 - A 2013 study by the prestigious Institute of Medicine (IOM)

concluded that:

"The key elements of the entire [childhood vaccine] schedule: the number, frequency, timing, order, and age of administration of vaccination have not been systematically examined in research studies."

- In May 2017, Robert F. Kennedy, Jr. (childrenshealthdefense.org) & Del Bigtree (icandecide.org) filed a lawsuit against the US Department of Health and Human Services, suspecting it was not fulfilling its critical vaccine safety obligations.

DHHS is required by Congress as per the NCVIA of 1986 to assure "improvements in the licensing, manufacturing, adverse reaction reporting, research, safety and efficacy testing of vaccines in order to reduce the risk of adverse vaccine reactions". ***The lawsuit revealed that DHHS had never—not even once—submitted a single biennial report to Congress detailing any improvements in vaccine safety.***

<http://icandecide.org/government/ICAN-HHS-Stipulated-Order-July-2018.pdf>

It is evident that increasing vaccination requirements via rule changes is supported by neither the public nor the Legislature. In 2016 the Hawai'i State Legislature, with checks and balances of the full complement of legislators and formal public input, opted not to proceed with vaccine mandates such as: HPV for all seventh graders (SB2316/HB1910), Influenza vaccine for all healthcare workers (SB2394/HB1945), and a bill for Hawai'i to automatically adopt ACIP guidelines and recommendations *without* this public hearings process (SB2393/HB1946); each bill failed when submitted through the rightful legislative process.

3. Requiring Healthcare Providers to adhere to the ACIP's Best Practices Guidelines for Immunization (Exhibit B) may interfere with the sacred doctor-patient relationship on many levels, but especially as it pertains to writing **medical exemptions**. It is worth stating again that the proposed practice guidelines should remain just that: guidelines— not requirements.

The proposed amendment requires medical exemptions to vaccination to be written "in a form or format specified by the department,"... "due to a stated cause, in conformance with recognized medical practices."... "Issuing physicians [shall] forward a copy of the

form to the department.” This language is too vague and too restrictive at the same time, and there are three inherent problems with this proposed change:

- A. If requiring a medical exemption to vaccination were to be based solely on ACIP’s (“recognized medical practices”) table of contraindications, *this would be a deliberate act denying individual rights to informed consent to medical risk-taking, as well as a breach of Medical Ethics by the physician. ACIP’s Guidelines and CDC handouts, Vaccine Information Statements (VISs), do not contain the same detailed adverse events (possible side effects) as the vaccine manufacturer’s package inserts.* In fact, the primary condition that qualifies as a contraindication to most vaccines according to ACIP (exhibit B , Table 4-2) is “severe allergic reaction (e.g., anaphylaxis) after a previous dose”. Most autoimmune and neurological disorders, as well as collapse or shock-like state, seizure ≤ 3 days, family history of seizures, or even Sudden Infant Death Syndrome (SIDS) are not considered contraindications by ACIP for giving vaccines. We contend that physicians ought to consider these conditions as contraindications, based on the body of independent peer reviewed medical literature linking acknowledged vaccine components to neurological system effects. [see [here](#), [here](#), [here](#)]
- B. Physicians who otherwise might be uncertain of the safety of vaccination might feel more compelled to recommend vaccines versus not recommend vaccines if vaccines were required by law (HRS 302A-1162 Rules) to follow ACIP guidelines, since all providers are also indemnified under the 1986 NCVIA—protecting providers from vaccine injury lawsuits. This potentially would not be in the best interest of those individual patients’ well-being.
- C. The proposed rule changes would require physicians to submit copies of medical exemptions directly to the DOH. This opens the door for the health department to scrutinize those medical exemptions, try to deny them and harass physicians who are writing them (which has been ongoing in California since SB277 passed there).

Physicians’ best professional judgements, utilizing their intimate patient-specific, as well as family history knowledge, should be the sole determining factor in whether a medical exemption is warranted....period. The “Precautionary Principle of Medicine” must be upheld and not be restricted by bureaucratic over-reach. No children should be forced to risk their lives, supposedly to protect others.

- **The recognized alternative treatments or procedures, including the option of not providing these treatments or procedures;**
 - **The recognized material risks of serious complications or mortality associated with:**
 - a. **The proposed treatment or procedure;**
 - b. **The recognized alternative treatments or procedures; and**
 - c. **Not undergoing any treatment or procedure;...and**
 - **The recognized benefits of the recognized alternative treatments or procedures**
- https://www.capitol.hawaii.gov/hrscurrent/Vol13_Ch0601-0676/HRS0671/HRS_0671-0003.htm

4. Finally, HFIC opposes the existing AND the proposed rules which violate both Federal privacy law [Family Educational Rights and Privacy Act (FERPA)], as well as Hawaii's HAR 8-34 [pertaining to the Department of Education (DOE)] by requiring schools to report the names of children with medical and religious exemptions to the DOH.

<https://www2.ed.gov/policy/gen/guid/fpco/ferpa/index.html>
<http://boe.hawaii.gov/policies/AdminRules/Pages/Admin-Rule34.aspx>

The DOH may gather and report aggregate numbers of students in non-compliance with vaccine requirements, but should not be allowed to report personally identifiable information (PII). Current

- QUESTIONS HFIC WOULD LIKE TO SUBMIT FOR THE RECORD:**
1. How will these new requirements financially impact schools, private daycare centers, and private healthcare practitioners?

- state law* does not require schools to violate federal privacy laws.
2. Has there been a detailed cost/benefit analysis on exactly what costs to DOH to put out the training materials for educating public to implement this mandate? What would be the costs to taxpayers to purchase Vaccines For Children (VFC) for DOH's new requirements? What would be the costs to DOE to implement the administrative and operational requirements of this mandate? Have costs been analyzed for small businesses to implement this new mandate?
 3. If healthcare providers were not to strictly adhere to the ACIP's Best Practice Guidelines for Immunization procedures and/or abide by the list of vaccines in Exhibit A, Table 1, would there be fines and penalties? If so, how would compliance be enforced? Who will determine and how would penalties and fines be determined and assessed? For whom--doctors? Parents? Schools? Principals?
 4. There are almost 300 vaccines currently in development. How many will ACIP approve and is there any limit to the number and nature of vaccine recommendations DOH will convert to requirements for the people of Hawai'i?
 5. What would be the process for medical exemption approval, and who will be in charge of approvals/rejections?
 6. The members of HFIC *were shocked to learn* that PII regarding our children's religious and medical vaccination exemptions were being reported to the DOH by the DOE, *without* our express consent. How will the DOH handle multiple lawsuits in regard to this violation of privacy laws? Will these intentional violations of FERPA jeopardize Federal funds to Hawai'i's public schools, as well as funding for special education from the Office of Special Education Programs? If not, what kind of assurances have been secured?
 7. Does the DOH take adequate action to safeguard privacy of the records it currently maintains, and can people reasonably expect that private medical information will remain private? Where is the database of student vaccination records being stored and to whom distributed once the DOH has acquired this information?
 8. ***Are the current proposed rules in violation of Hawai'i Revised Statute 671-3 re: Informed Consent?*** Is information

regarding the following required to be discussed, in an accurate and complete fashion, with each patient, in regards to each vaccine?

HFIC appreciates the mission statement of the Hawai'i Department of Health as stated to "protect and improve the health and environment for all people of Hawai'i", yet we are concerned that the proposed amendments to HAR 11-157 may present unforeseen individual-, family-, and society-wide health, financial and legal burdens on our ohana. Preventing the spread of infectious disease is important; however, establishing *true health*, in both individuals and the community, is incumbent upon so many factors beyond simply increasing antibody levels to just 17 of the hundreds of known and unknown infectious agents.

We are experiencing an *absolute epidemic of chronic childhood neurological and autoimmune illnesses*. If we are to protect and improve the health and environment of *all people—not just immunocompromised people for whom mass vaccination policies are nominally intended to protect*—then every health department, including Hawai'i State DOH and federal health agencies, *MUST* begin focusing on this alarming crisis, which will have grave impact on us socially and economically. Public health agencies cannot myopically focus merely on increasing vaccine uptake, "thereby" eradicating infectious diseases—a notion which independent scientific studies have and continue to challenge. The ***ever-unsettled***, larger body of industry-independent scientific research is pointing more and more toward vaccination and [*acknowledged vaccine components and contaminants*](#) as possible culprits in neurological and autoimmune disorders (see [here](#) and [here](#)).

We thank you for your time and consideration of this critical issue regarding children's health.

Hawaii For Informed Consent

Governor Ige
DOH Director Anderson

From: [REDACTED]
To: [REDACTED]
Subject: Testimony in Favor of HAR 11-157
Date: Monday, December 31, 2018 2:12:34 PM

Thank you for this opportunity to provide testimony. As a community member and public health advocate, I am writing to strongly support the HAR 11-157 proposed rules update.

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

No vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and those with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, vulnerable groups will stay protected. Immunized students are protected from vaccine-preventable diseases and protect those who cannot be immunized.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you for your consideration.

From: [REDACTED]
To: [REDACTED]
Subject: Endorsement of updated Hawaii Administrative Rules, Chapter 157
Date: Tuesday, January 01, 2019 8:30:49 AM
Importance: High

Thank you for this opportunity to provide testimony. I am writing to strongly support the proposed update to the Chapter 11-157 administrative rules as a community member and strong advocate for public health and safety in Hawaii. The proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP), the officially accepted professional organization that makes recommendations regarding immunizations. ACIP voting members have professional expertise in vaccinology, immunology, pediatrics, internal medicine, nursing, family medicine, virology, public health, infectious diseases, and preventive medicine. A consumer representative also provides perspectives on the social and community aspects of vaccination. ACIP provides evidence-base recommendations that take into account disease epidemiology and burden of disease, vaccine efficacy and effectiveness, vaccine safety, the quality of evidence reviewed, economic analyses, and implementation issues. ACIP has consistently made prudent recommendations that take into consideration possible adverse effects, costs, and other concerns.

Public health research clearly shows that communities with more vaccine exemptions have a greater risk for vaccine-preventable disease outbreaks. Ideally, limiting exemptions to those that are medically indicated, improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders. Without vaccinations, ongoing cases and outbreaks of measles, mumps, rubella, diphtheria, pertussis (whooping cough), tetanus, meningococcal meningitis, and *Hemophilus influenza* septicemia and meningitis would continue as they had 100 years ago, causing death, disability and severe illness that affected the lives of individuals and communities. These micro-organisms still exist. Within the past few years alone, we have had mumps, measles, rubella, pertussis and hepatitis A outbreaks in Hawaii as well as ongoing cases of hepatitis B, and cancers caused by human papilloma virus (HPV). Vaccines today are as important as law enforcement is to crime. They are an essential part of a morally responsible society.

I wholeheartedly endorse, and respectfully request that the proposed changes to Hawaii Administrative Rules, Chapter 11-157 be passed for the ongoing protection of the health and safety of the people and community in Hawaii.

Thank you for your consideration.

Glenn M. Wasserman, MD, MPH
Chief, Communicable Disease and

Public Health Nursing Division
State of Hawaii Department of Health

Testimony of
Hawaii Immunization Coalition (HIC)

Before:
Department of Health
State of Hawaii

Re: Hawaii Administrative Rules (HAR) Title 11, Chapter 157, “Examination and Immunization”

Dr. Bruce Anderson, thank you for this opportunity to provide testimony on the proposed rules.

The Hawaii Immunization Coalition (HIC) **strongly supports the HAR11-157 proposed rules.** This update of the Administrative Rules would establish immunization and requirements for school, post-secondary school, and child care facility attendance in Hawaii and to provide for the immunization of indigents and other high-risk individuals. Mandatory vaccination required set by the State of Hawaii, and specifically the Department of Health, are selected to protect those most vulnerable.

- More than 732,000 American lives were saved by childhood vaccination in the past 20 years.
- School health requirements for attendance/registration that include vaccination are a valuable strategy for keeping our schools safe for children who **can** get vaccinated and for those who **cannot** because of medical reasons.
- School immunization regulations rely on **herd immunity** – that at least 93% of the school population is vaccinated - to protect students.

These immunization updates will bring much needed, up-to-date Advisory Committee on Immunization Practices (ACIP) requirements to our current rules. This update is especially important to require students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels, especially for the HPV vaccine.

The reality is that no vaccine is 100% effective for everyone and not everyone can be vaccinated. Newborns and persons with compromised immune systems – such as those experiencing chemotherapy or with autoimmune conditions – cannot be immunized. If approximately 93% of the population is vaccinated, these vulnerable groups will stay protected. The vaccinated students protect those who cannot be immunized.

The Centers for Disease Control and Prevention (CDC) clearly states:

- State and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases (VPDs).
- Studies have shown that vaccine exemptions tend to cluster geographically, making communities with more vaccine exemptions at greater risk for disease outbreaks.

The Hawaii Immunization Coalition (HIC) is a state-wide, community-based non-profit 501(c) 3 coalition of public and private organizations and concerned individuals whose mission is to promote effective strategies to ensure that all of Hawaii’s families are appropriately vaccinated against vaccine-preventable diseases. Focus: Immunizations across the lifespan. The coalition has been active in Hawaii since 1979 and has more than four hundred immunization supporters.

We respectfully request that the Hawaii Administrative Rule 11-157 be supported and passed for the reasons noted above.

Thank you for your consideration.

The Hawaii Immunization Coalition (HIC) is a statewide, community-based 501C (3) non-profit organization working to ensure all of Hawaii’s families are appropriately vaccinated against vaccine-preventable diseases

Tax ID

Dear Sir or Madam,

I am appalled that the Hawaii Department of Health is considering mandatory vaccinations for children for the human papilloma virus. How can anyone who oversees the health of Hawaii's children seek to force a vaccination which may potential have serious side effects. Is the department so in bed with the pharmaceutical industry that it is ignoring safety issues?

While U.S. citizens are prohibited from suing vaccine manufacturers, lawsuits have been launched in Japan, France, Ireland, Spain, and Columbia claiming HPV vaccine harm.

It is beyond question that some children are permanently disabled or die from their vaccine exposures. A broad spectrum of suspected and confirmed adverse vaccine events has grown in the decades from the beginning of mass vaccination. (U.S. Dep't of Health Res. & Human Servs. Admin., National Vaccine Injury Compensation Program Monthly Statistics Report (2017)).

In the U.S. the NVICP has paid affected families approximately \$3.7 billion since it began taking claims in 1989. <http://law.emory.edu/elj/content/volume-67/issue-3/articles/liability-vaccine-injury-united-european-world.html>.

The Vigibase database of the World Health Organization has compiled more than 86,000 serious adverse event reports for Merck's HPV vaccine. They include nervous system disorders (39,092), respiratory, thoracic and mediastinal disorders (6060), vascular disorders (5766), nervous system disorders (39,092), reproductive system and breast disorders (3267), cardiac disorders (2604), and blood and lymphatic system disorders (2035). <http://www.vigiaccess.org/>

Among 12 - 17 year olds, 45,000 adverse events have been reported.

The number of AE's reported for HPV vaccines, in each country, are overwhelmingly higher than that for other vaccines. But national health authorities and medical professionals continue to deny any causal relationship between HPV vaccines and AE's.

Under the Freedom of Information Act, in 2013 Judicial Watch received documents from the Department of Health and Human Services (HHS) revealing that its National Vaccine Injury Compensation Program has awarded more than \$5 million to 49 victims in claims made against the HPV vaccine. <https://www.judicialwatch.org/press-room/press-releases/hpv-vaccine-injuries-and-deaths-is-the-government-compensating/>

Judicial Watch also received documents, under the Freedom of Information Act, from the U.S. Food and Drug Administration (FDA) detailing reports of adverse reactions to Gardasil. The adverse reaction reports detail 26 deaths reported between September 1, 2010 and September 15, 2011 as well as incidents of seizures, paralysis, blindness, pancreatitis, speech problems, short term memory loss and Guillain-Barré Syndrome.

The conservative watchdog points out, "Merck has waged an aggressive lobbying campaign with state governments to mandate this HPV vaccine for young girls."

It's fascinating that Dr. Julie Gerberding, who approved Gardasil when she was director of the C.D.C., was subsequently hired by Merck in 2010 as president of Merck Vaccines. In 2015 she made more than \$2 million selling Merck shares.

https://en.wikipedia.org/wiki/Julie_Gerberding

While the CDC and international government bodies promote the vaccine's safety, there is compelling evidence that Merck conducted shoddy, questionable clinical trials; and that a number of individuals around the world have suffered drastic health consequences post vaccination.

According to a 2015 Atlantic magazine article, Merck's top selling vaccine is Gardasil, which brings in \$1.7 billion in sales. With such massive sales is it any wonder any attempts to raise safety issues are routinely dismissed, contrary to evidence.

<https://www.theatlantic.com/business/archive/2015/02/vaccines-are-profitable-so-what/385214/>

There is widespread concern about adverse effects caused by the Gardasil vaccination. They include paralysis, narcolepsy, respiratory dysfunction, cognitive impairment, involuntary movements, blood clots, and a rapid heartbeat.

A 2016 Canadian study looked at over 195,000 girls who had received HPV vaccines. Within forty-two days of HPV vaccination, the girls experienced over 20,000 emergency room visits or hospitalizations. But only 198 adverse events were reported. Liu XC, Bell CA, Simmonds KA, Svenson LW, Russell ML. Adverse events following HPV vaccination, Alberta 2006–2014. Vaccine 2016;34(15):1800-1805.

In 2012 Canadian researchers looked at whether or not some serious autoimmune and neurological ADRs followed HPV vaccinations are causal or merely coincidental. They analyzed post-mortem brain tissue specimens from two young women who suffered from cerebral vasculitistype symptoms following vaccination with Gardasil. They conceded “our study suggests that HPV vaccines containing HPV-16L1 antigens pose an inherent risk for triggering potentially fatal autoimmune vasculopathies.”

“The fact that many of the symptoms reported to vaccine safety surveillance databases following HPV vaccination are indicative of cerebral vasculitis, but are unrecognized as such (i.e., intense persistent migraines, syncope, seizures, tremors and tingling, myalgia, locomotor abnormalities, psychotic symptoms and cognitive deficits), is a serious concern.”

“It thus appears that in some cases vaccination may be the triggering factor of fatal autoimmune/neurological events.” <https://www.omicsonline.org/open-access/death-after-quadrivalent-human-papillomavirus-hpv-vaccination-causal-or-coincidental-2167-7689.S12-001.php?aid=9036>

The basis for HPV vaccination is its ability to prevent precancerous lesions related to HPV type 16 and 18 infections and the idea that preventing those lesions would prevent cervical cancer. According to University of Louisville researcher Dr. Diane Harper who led clinical trials of HPV vaccination, HPV infection can take years to result in cervical cancer. That leaves plenty of time for screening, treatment and prevention. Furthermore, 90% of HPV infections are removed from the body by its own immune system and related processes

without medical or other consequences within three years. Only a tiny minority leads to cancer.

The FDA licensed Merck's vaccine as a result of trials that were just three years long.

Dr. Kelly Brogan notes: “In the marketing and licensure of the HPV vaccine, changes to cervical cells have been equated with death. This is called using a “surrogate marker” and in vaccine research, this is considered acceptable because we can’t otherwise prove a non-event is attributable to an intervention. There are leaps in logic and in science inherent in this practice that render conclusions nothing more than false marketing.”

<https://kellybroganmd.com/new-gardasil/>

Former neurosurgeon Dr. Russell Blaylock claimed in 2013: “It has never been proven that the HPV vaccine prevents cervical cancer.”

A study by researchers at the University of Texas looked at HPV vaccination data from 2007–2012. The results showed that young women 20 to 26 years of age who received the four-strain Gardasil vaccine were actually more likely than non-HPV-vaccinated women to be infected with high-risk nonvaccine strains of HPV ten years later. Guo F, Hirth JM, Berenson AB. Comparison of HPV prevalence between HPV-vaccinated and non-vaccinated young adult women (20-26 years). *Hum Vaccin Immunother* 2015;11(10):2337-2344.

A review published in 2014 in *Autoimmunity Reviews*, “On the relationship between human papilloma virus vaccine and autoimmune disease,” pointed out: “Along with the introduction of the HPV vaccines, several cases of onset or exacerbations of autoimmune diseases following the vaccine shot have been reported in the literature and pharmacovigilance databases, triggering concerns about its safety.”

The authors caution that, “the decision to vaccinate with HPV vaccine is a personal decision, not one that must be made for public health. HPV is not a lethal disease in 95% of the infections; and the other 5% are detectable and treatable in the precancerous stage.” <http://www.ncbi.nlm.nih.gov/pubmed/24468416>

In a July 2016 lawsuit against Gardasil’s manufacture Merck, in the Superior Court of the State of California, Los Angeles County, evidence was presented questioning the safety of adjuvantes in vaccines that can produce autoimmune disorders, such as the addition of aluminum salts. <http://www.greenmedinfo.com/blog/merck-accused-fraud-deceit-and-negligence-us-gardasil-case>

“It is medically and scientifically accepted that aluminum salts are toxic to and damage the human cells at the injection site. In addition, the aluminum salts cause inflammation at the site. These aluminum salts may bind with the free DNA released from the damaged and dying cells at the injection site. The combination of the Aluminum salt bound by the human DNA is effective in activating Toll Like Receptors (“TLR”), whose function in the immune system is highly complex.”

Lawsuits internationally include one against the French manufacturer of Gardasil in 2013, where the court found 50% of the blame for a teenager’s subsequent multiple sclerosis on

Gardasil. Two weeks after the first injection, she experienced sensory and motor problems in the upper limbs. Three months after the second injection she was hospitalized.

<https://www.reuters.com/article/us-sanofi-lawsuit/sanofi-sued-in-france-over-gardasil-vaccine-idUSBRE9AN0FX20131124>

In Japan, an injury lawsuit in 2017 against the state and the HPV vaccine drug makers prompted the Japanese health ministry to withdraw their official recommendation for the HPV vaccination.

Twenty eight girls and women suffering what they say are side effects from cervical cancer vaccines that were recommended by the government, demanded compensation from the state and drug makers at the Tokyo District Court.

<https://www.japantimes.co.jp/news/2017/02/13/national/crime-legal/suit-opens-tokyo-court-cervical-cancer-vaccine-side-effects/#.XBg7OCx7ILM>

The plaintiffs, ranging in age from 15 to 22, said they have experienced a wide range of health problems, including pain all over their bodies and impaired mobility, after receiving HPV vaccines between 2010 and 2013.

Erina Sonoda, a 20-year-old college student, reported she started to suffer strong menstrual pain after receiving the second of three recommended shots of the Cervarix vaccine, and the pain spread to other parts of her body after the third vaccination. Due to agonizing pain, Sonoda said she has difficulty walking without a cane and often must use a wheelchair.

According to the health ministry, 2,945 people out of the 3.39 million women who had received the shots by the end of April 2017 reported side effects.

In Columbia anthropological researcher Mario Lamo-Jiménez, has raised concerns about the side effects of Gardasil, and is assisting attorneys prosecuting the collective action lawsuit filed by 700 women in that country demanding some \$160 million in compensation from Merck. <https://hetq.am/en/article/84400>

She reported Columbian girls suffering from ASIA syndrome after vaccination, as well as onset of early menopause, where there is a premature ovarian failure and they become sterile, as well as Guillain Barré Syndrome.

In Ireland around 650 girls reported requiring medical intervention or treatment after receiving the HPV vaccine, according to data collected by the State's medicines watchdog. Ireland accounts for one in five of all reports of suspected adverse reactions against Gardasil in Europe. At this time there are eight cases filed in Ireland's High Court that relate to the HPV vaccine.

At least 6 Danish women have report they developed chronic health problems during an HPV clinical trial. At Aalborg University Hospital, one of the trial sites in Denmark, Miam Donslund began to experience persistent flu-like symptoms as well as two infections, one of which required hospitalization, shortly after immunization. Stine Sørensen began to experience general discomfort, headaches, and a profound fatigue that often made her miss

school after she got her first shot of Gardasil. All the women have one or more agonistic autoantibodies in their bodies.

German scientist Gerd Wallukat noted about the autoantibodies, they reveal “the classical pattern I’ve seen in patients after vaccination.”

In Spain in 2017, the High Court of Justice of Asturias condemned the Asturian Health System for the death of Andrea, a young Spanish girl who died in September 2012 after getting the second shot of the HPV vaccine. The Court admonished the hospitals of Jove and Cabueñes, since they did not diagnose the patient’s pathology before the second shot of the vaccine was supplied which caused the death of the young woman.

<https://healthimpactnews.com/2017/spain-high-court-rules-hpv-vaccine-caused-death-of-young-woman/>

When she got the first shot of the HPV vaccine on July 23, 2012, the woman had a headache and breathing difficulty. Although, she suffered from severe asthmatic exacerbation, she got the second shot on August 23, 2012, and worsened. As a result she suffered severe dyspnea and seizures only 12 hours after receiving the vaccine, and died.

This year India’s Ministry of Health and Family Welfare indicated that it was unlikely to include HPV vaccines in the national immunization program.

In 2009, an HPV vaccine trial in the Indian states of Gujarat and Andhra Pradesh conducted by the Program for Appropriate Technology in Health, came under scrutiny for endangering the lives of participants. The study involved vaccinating 13,000 girls in Andhra Pradesh and 10,000 girls in Gujarat aged 10–14. The government halted the trial in March 2010 after seven girls who had received the vaccines reportedly died during the trial. Though a government inquiry later concluded that the deaths were unrelated to the vaccines.

Last year an empirical study confirmed that the inability to sue vaccine manufacturers in U.S. civil courts since 1986 is associated with a decrease in vaccine safety in FDA-approved vaccines after 1986. Gayle DeLong, Is “Delitigation” Associated with a Change in Product Safety? The Case of Vaccines, Rev. Ind. Org. (June 14, 2017),

<https://link.springer.com/article/10.1007/s11151-017-9579-7>.

DeLong found that vaccines licensed after 1986 are associated with approximately 5.2 more reported adverse events per 100,000 vaccine doses than the vaccines that were licensed before the passage of Vaccine Act.

A 2017 investigation by Slate revealed problems with the clinical trials for Gardasil, which was supposed to establish the vaccine’s efficacy and safety before it was approved. The article raises questions about why regulators knowingly accepted the company’s flawed data. <https://slate.com/health-and-science/2017/12/flaws-in-the-clinical-trials-for-gardasil-made-it-harder-to-properly-assess-safety.html>

“Interviews with five clinical trial study participants and more than 2,300 pages of documents obtained through freedom-of-information requests from hospitals and health authorities suggest inadequacies built into Merck’s major clinical tests of Gardasil.”

“European health regulators worried about Merck’s methods during a review of the company’s marketing application for Gardasil 9, the latest version of the vaccine, but have not made their concerns public. In an internal 2014 EMA report about Gardasil 9 obtained through a freedom-of-information request, senior experts called the company’s approach “unconventional and suboptimal” and said it left some “uncertainty” about the safety results.

“If I were a research subject, I would feel betrayed,” said Trudo Lemmens, a bioethicist and professor of health law and policy at the University of Toronto.

It’s worth remembering that former Merck virologists Stephen A. Krahling and Joan A. Wlochowski, filed a lawsuit against Merck in 2010. The scientists alleged that the efficacy tests for the measles, mumps, rubella vaccine (MMR) were faked. They claimed that over the years the effectiveness of the mumps vaccine declined. In 2014 a federal judge rejected Merck’s motion to dismiss. The lawsuit is still active with the court ruling class certification is due by 2/15/2019. <http://ahrp.org/former-merck-scientists-sue-merck-alleging-mmr-vaccine-efficacy-fraud/>

Slate reported when Dr. Rebecca Chandler, at Läkemedelsverket, the Swedish Medical Products Agency began analyzing Merck’s safety data for Gardasil 9, three girls vaccinated with Gardasil 9 had been diagnosed with POTS (postural orthostatic tachycardia syndrome), and one with CRPS (Complex regional pain syndrome). There were also several cases of neurological disorders. But none of them had been reported by the company as adverse events.

The suspicion that postural orthostatic tachycardia syndrome is related the HPV vaccine comes from a 2015 study by Danish researchers who provided some observational evidence about POTS occurrence after HPV vaccines. The authors stated that they “found a close chronologic association to the vaccination. The study found that the average number of days between vaccination and diagnosing POTS was around 11 days.

POTS normally occurs in approximately 1% of adolescents.

The Norwegian press has reported on the case of a 12 years old Norwegian girl, Maria Lysaker Wenersberg, who received the HPV vaccine at school. In April 2015 she was diagnosed with Postural Orthostatic Tachycardia Syndrome which is suspected to be a serious side effect from the vaccine. Most of the time she is now bedridden. Sometimes she faints daily. She has not been able to attend school for the past four and a half years. She has to be pushed in a wheelchair from her bed into the living room. <http://www.vg.no/nyheter/innenriks/maria-18-har-vaert-alvorlig-syk-i-fem-aar/a/23517356/>

In May 2016, Professor Peter C. Gøtzsche and Cochran Nordic Deputy Director Karsten Juhl Jørgensen, along with others, filed an official complaint about how the European Medicines Agency (EMA) handled the HPV safety issue.

In 2014, Australian doctors published in the Journal of Investigative Medicine a case study of a series of teens who had entered premature menopause after vaccination - a phenomenon Dr. Little and Dr. Ward described as ordinarily “so rare as to be also unknown.”

They noted – “Long-term follow-up data after HPV vaccination has not surveyed ovarian function, recorded, measured, or analyzed symptoms or signs of dysfunction. Principles of informed consent, population health, and vaccine confidence require careful, rigorous and independent research to establish ovarian safety following HPV vaccination.”

In a public forum Dr. Little spoke about the poor quality of research being performed on HPV vaccines. She noted a September 2018 article published in Paediatrics which found that women in the USA who received Gardasil were no more likely than those who did not receive Gardasil to have premature ovarian insufficiency meaning that their ovaries were no longer functioning. Little suggest the effect of HPV vaccines on the female ovary needs further study.

The American College of Pediatricians in 2016 released a health warning about the HPV vaccine – “It has recently come to the attention of the College that one of the recommended vaccines could possibly be associated with the very rare but serious condition of premature ovarian failure (POF), also known as premature menopause.”

In January 2016, pathologist Dr. Sin Hang Lee, MD, Director of Milford Medical Laboratory, sent an open letter of complaint to the Director-General of the World Health Organization (WHO), Dr. Margaret Chan, in which he challenged the integrity of the GACVS (Global Advisory Committee on Vaccine Safety) Statement on the Continued Safety of HPV Vaccination.

He wrote: “A series of emails recently uncovered via a Freedom of Information request submitted in New Zealand revealed evidence that Dr. Robert Pless, the chairperson of the Global Advisory Committee on Vaccine Safety (GACVS), Dr. Nabae Koji of the Ministry of Health of Japan, Dr. Melinda Wharton of the CDC, Dr. Helen Petousis-Harris of Auckland University, New Zealand, and others may have been actively involved in a scheme to deliberately mislead the Japanese Expert Inquiry on human papillomavirus (HPV) vaccine safety.” <https://sanevax.org/wp-content/uploads/2016/01/Allegations-of-Scientific-Misconduct-by-GACVS.pdf>

In 2011, Dr. Lee found that every one of the 13 Gardasil samples that he examined contained HPV L1 gene DNA fragments. He also found that the HPV DNA fragments were not only bound to Merck’s proprietary aluminum adjuvant but also adopted a non-B conformation, thereby creating a new chemical compound of unknown toxicity.

This non-B conformation, Dr. Lee believes, is responsible for the array of autoimmune illnesses experienced by children and young women following vaccination with Gardasil.

In 2012, he testified at a coroner’s inquest of the death of a New Zealand teenager, 6 months after receiving 3 Gardasil vaccine injections.

During the inquest neuroscientist Professor Christopher Shaw of the University of Columbia in Vancouver told the New Zealand inquest that he was sent the teenager’s brain tissue to test. He said there was aluminium in all the samples he tested and there were some abnormalities in the samples. The human papillomavirus (HPV16) was found in her brain, which could have only got there through the vaccine, Prof Shaw said. He said there was a

"biological plausibility" that vaccine likely caused her death. He could not say conclusively that was the cause of her death.

Finally, a new study, published in the Journal of Toxicology and Environmental Health, suggests a link between the HPV vaccine and declining fertility. It examined the childbearing capacity of women who received the HPV vaccine – compared to those who didn't, and discovered an alarming correlation. Approximately 60% of women who did not receive the HPV vaccine had been pregnant at least once compared to 35% of women who had had an HPV shot had ever conceived. For married women, 75% who did not receive the shot were found to have conceived, while only 50% who received the vaccine had ever been pregnant.

Considering all this relevant information I would hope that that the Department of Health in all good conscience would not try to force the HPV vaccine on Hawaii's children, when it is known that harm might occur in those more susceptible to injury.

Any decision to vaccinate or not to vaccinate against the sexually transmitted HPV virus is a private medical matter, and not the responsibility of the state.

Jon Woodhouse, M.Ed.

Michelle Kwik R.N., B.S.N., P.H.N, M.Ed. School Nurse

I Strongly Oppose HAR 11-157 (Mandatory Vaccines throughout Hawaii)

I began working as a Neonatal Intensive Care Nurse in the late 1980's; I worked with many premature infants as well as infants that were born with anomalies, infections, and addiction. From there I worked as a Public Health Nurse for mothers and their children ages newborn to 5 years. I was also a Triage Nurse in a Pediatric Office for six Pediatricians. My most recent job was working as a Certified School Nurse in Southern California caring for more than 9,000, 3-13 year olds over a course of 13 years.

Over the past 30 years I have seen the significant increase in children with autism, allergies, mental health illness, learning disabilities, and other chronic illnesses such as asthma. This increase has been dramatic. As a school nurse I kept logs in Southern California which included all health concerns noted by parents and physicians; I also wrote up more than 200 yearly health and developmentals for children receiving Special Education Services. For example, reviewing records our district went from 13 children with epipens for life threatening allergies to over 200 children in a course of 15 years. The cases of children on the Autism Spectrum has risen immensely in the same time period and has put a strain on society especially the families who have minimal coping resources as well as the educational system who must pay for special services.

It does not take a professional, to see so many insults to the welfare of our children is directly related to the toxins in our environment and what we put in our children's bodies. Each child is a unique individual with a genetically diverse make-up. As a School Nurse, Neonatal Nurse, Pediatric Nurse, Childhood Triage Nurse, Public Health Nurse, I can tell you a parent is their child's first line of defense and they know their child and their child's health more than anyone else. They are their child's first and foremost advocate. When it comes to their child's health, no physician can know a child like a parent does. As a nurse, I have always been a patient advocate, when it comes to children I advocate for them and their parents because I know they know their child and Pediatricians do not always have time, energy, and accessibility to follow through with a patient's critical needs and it is up to the parent to pursue their child's wellness.

Immunizations were first introduced in recorded history as early on as 1500's. There is some evidence the first immunizations were actually done as early on as 200 BC. Immunizations were originally created to prevent the spread of a specific disease that was deemed detrimental to society and the well-being of life. As like many things, money has taken place of what is best for our world and its children. The immunizations today are laden with so many chemicals that make them an insult to immature bodies struggling in a toxic environment already. For example the aluminum in each vaccination today is 1.47 to 49 times higher than the U.S. Food and Drug Administration safety limits allow. Aluminum is added to potentiate the effects of the inoculation so less virus can be used and it is cheaper. In the HPV inoculation there has been no evidence that the Aluminum helps to potentiate the virus and it is questionable if it is the cause of the aversive reactions including death that has been seen after giving this shot (Please review Dr. Mercola under immunizations benefits and detriments).

Each child is a unique individual. I have first handedly seen young healthy children given the MMR, have

seizures, go into a coma and loose language and be diagnosed with Severe Autism. Dr. Sears, one of the most highly regarded Pediatricians in America was the Pediatrician in one case. He directly linked this case to the immunization. He has two sons, both are now Pediatricians. One is pro vaccine the other is opposed due to what they have learned and seen. On the other side of the debate, I had a child who at one years old, contracted chicken pox. During this time his body attacked his pancreas causing him to require insulin for the rest of his life with a diagnosis of Type I Diabetese. It is unknown if a cold or flu could have done the same thing his body attacked itself in response to an illness (This is not uncommon in children who acquire type 1 Diabetes). It could of happened after a vaccination, if his body attacked itself in response to the vaccination. I knew a 23 year old healthy, vital, young man who had a flu shot in my district; within 48 hours of the flu shot his body attacked itself and his vital organs bled out and he died. Another child who was severly allergic to many things, had severe asthma and given a flu shot to prevent a bad flu, this boy ended up getting petechiae which is a severe reaction and one of the first signs of the body attacking itself before it fully attacks the organs. This child was not allergic to eggs. He survived but will never be immunized again. Each person, each body is unique in its response to viruses as well as vaccinations . I have had numerous friends children have seizures from immunizations because their bodies reacted violently to the vaccine. Unless they do more studies to find a genetic link and this can be tested prior to an immunization no one knows how a child will react until they are given the vaccination. Many parents are waiting to vaccinate until their children are 3 when there language is intact and there bodies are stronger than the infant stage in case they were to have a reaction, or they vaccinate 3 months prior to daycare.

Children who are born today are at a greater risk of developing a reaction to an immunization because their bodies and genetic make up is being altered by all of the contaminants in our environment. Adding the huge load of aluminum and other perservatives to an already sensitive system, is detremental and dangerous. My son at one years old was given the MMR, one week later he got Rotovirus was hospitalized, lost 5 lbs., and ended up with double pneumoniae. His body was not immunologically strong enough for the MMR and it made him vulnerable. When I got an MMR vaccine at 28 years old, I got the measles. I got a rash covering my entire body and I got arthritis in all of my joints lasting two weeks. My nursing supervisor at the time did not believe me and told me to go to my clinical which was working with children with Cystic Fibrosis in the hospital. I was wise enough to stay home knowing if they came in physical contact with my rash they could have acquired measles if their titers were not high enough (titers meaning their immune response measured in a blood test). The same adverse reactions happened when I got a DPT and a flu shot. With both I acquired bronchitis and asthma for close to 6 months. Myself and my son were/are genetically sensitive.

There are rules in a school district, if their is an outbreak and your child is not vaccinated they must stay home. If a parent wants to they can immunize at that time. If your child contracted the illness previously and has immunity their blood test (i.e. titer will show an adequate level), this counts as an immunization. When we had children from other countries, especially children adopted from overseas, who came to school without records, we had parents acquire their titers to show immunity so the children did not need the vaccination again and if they had the disease it would show as immunity. Some people actually do not acquire immunity from certain vaccines even if the vaccine is given

numerous times. It is unknown why this happens.

I can not say children with autism are autistic because of mercury in their vaccines, I can say I do know some children who are, and I can definitely say most children with autism have an increased sensitivity to food allergens and environmental toxins and immunizing them is not wise unless the risk of getting the disease out weighs the benefits of the immunization. Thus, if there is an outbreak parents must keep their unimmunized children home and they can immunize at that time if they feel it is important.

I can probably write you a thesis on the importance of allowing parents to make a judgement call on their own child's health. Parents are there to decide what is best for their own child; I have seen children die when parents did not listen to their own instincts or the signs and symptoms of their child when pediatricians were left to solely diagnosis their children with a short office visit and phone calls. I believe immunizations save many lives and also take some lives. I have seen them weaken further an already weakened system. Who are we to decide for a parent. It is best if we as citizens and health care workers advocate for more efficient and healthy vaccines that do not have preservatives and activators that are toxic and we advocate for more blood titers (if a specific titer is reached with one dose a child does not need more; titers can be checked every few years easily and as needed for at risk children). We also need to advocate for a clean environment with safe food and drinking water since this is where many of the insults have started. If you pay attention the same companies who make weed killer, insecticides, etc. are the companies making the preservatives and compounds added to the vaccines. This is where we need to put up boundaries. The health of our children is more important than the profits of some companies. Even if vaccines are like they were in 200 BC or 1500's without added chemicals, our environment is much different now. If there is an outbreak we can immunize and check titers before a child returns to school or the family can home school until there is no evidence of illness. We can not take away parents rights. We can educate and encourage families in options such as immunizing in summer when children tend to be healthier so their immune system does not get an extra load during flu season, or get titers so you can see if your child has enough immunity rather than over immunizing. Maybe they can make an expensive brand of immunization for children more at risk to the preservatives, which are all children really but those with autism, asthma, mental illness etc..

My sister is a nurse practitioner who gives the HPV vaccine often, she stated she gives about 1000 doses a year, has had one anaphylactic reaction requiring resuscitation, and otherwise she believes the problems associated with HPV far outweigh the risk of the vaccine. That saying, we need to educate parents, not in a doctor's office there is never time. If anything could be mandated it could be a class discussing immunizations for people opting out and this, I believe, should be in a school setting with actual facts including the pros and cons. The amount of aluminum, the chemicals, children's reactions to the vaccines, cases involving no vaccines and what has happened due to contracting measles and other illnesses. People must make their own choices and people should be fully educated.

I will never be immunized again due to my sensitivities. My children were given the least immunizations required to reach normal titers. They were not given immunizations which were not necessary due to their sexual activities such as Hep B, which is a blood born contaminant until they were teens and they opted for them. They were educated on Blood and Body Fluid precautions. I only immunized in the

summer due to my sons vulnerabilities to seasonal illness, he still got pneumonia even in the summer but less often. I spread out the immunizations since there was no active illness at the time and due to my sons vulnerabilities. I do believe in social responsibility and if my child had an illness another child contracted and that child had a severe reaction to that illness I would feel at fault. That is why I ended up immunizing, also because I was in the Pediatric field and I was in contact with illnesses of every kind. Which actually most do not have a vaccine for like Epstein Barr Virus, Toxoplasmosis, Cytomegalovirus, to name a few. We need more research and parents need more education. If we do not let parents know the ugly truth about immunizations when they find it out on their own they are even more inclined to say no because we hid the truth. We need to tell them the whole truth so they can decide for themselves. They need videos, power point presentations, other parents comments from both sides, naturopathic doctor responses as well as pediatricians. Honestly if vaccines were a less contaminated and people were better educated I believe that would increase the declining vaccination rate by about 25% but until that happens people will put their children in home school programs whatever it takes to prevent them from being immunized. I know I worked in California and I have talked to thousands of parents and I know why they refuse to vaccinate. Sometimes it is the lazy secretaries at the schools who try to make it easy on their book keeping so they can just not follow through on children who need updated immunizations, they have the parents decline all of them, this gives a sense of people not immunizing. I have been audited numerous times at one or more of the schools I looked after in California and we had to document why parents did not complete the vaccinations. Most of them actually do complete the vaccinations just not on the schedule the documentation requires.

I have covered why people do not vaccinate and I have given options in to what can be done to increase the vaccination rates and why I strongly oppose the mandate that requires vaccination. Like I said I would mandate a two sided debate and educational review on the pros and cons of immunizations at each grade level K, 6, 9 for those parents who wish to opt out of immunizations. That way if the levels of chemical additives decreases in the immunizations or the level of illness increases in the community, or if the immunizations have caused more fatalities people know and they can change their minds. Parents whose children have contracted an illness who were not immunized can speak, mothers who were pregnant and contracted an illness that caused a birth defect can talk, the person who has cancer from HPV can talk, parents whose children got violently ill or passed away from a vaccine can talk. That's what a health care provider does they give facts and let the public decide that way it is informed consent and a person can choose.

Mahalo for Your Time and attention to this matter, Michelle Kwik

Please contact me if you need further information [REDACTED]

My name is Jennifer Bonifacio, a mother, teacher, Permaculturist, farmer, entrepreneur, and an advocate for the 'aina and the people's rights. I strongly oppose the changes to HAR 11-157, especially those in HAR 11-157-3 a and b. Where there is risk, there must be choice. Everyone has the right to informed consent. We should know everything about a drug, vaccination, or procedure so that we can make a good decision on what is best for us and our families. I do not appreciate being made to feel like I am stupid for even asking to see a vaccine insert or asking for a second opinion.

The recommended requirements in table 3-1 in Exhibit A List of Required Vaccines (July 1, 2020) is ridiculous. How can anyone believe that injecting a child with all those vaccines with all the various ingredients be safe especially at birth? The list of ingredients can be found on the CDC's website.

<https://www.cdc.gov/vaccines/pubs/pinkbook/downloads/appendices/B/excipient-table-2.pdf>

A good number of those ingredients can be harmful to the human body. Please take a look at the list. There are three pages of it. Do you want even a small dose of formaldehyde in your system? The CDC provides a VIS or Vaccine Information Statement and these are what doctors or immunization clinics provide the patients. VIS do NOT list the ingredients as a vaccine package insert does.

I once (Oct 2013) calculated the amount of mercury in a flu vaccine and it was more than the number the EPA reported as safe for consumption. My calculation compared the EPA's recommendation for a 130lbs woman. For a child, the amount of mercury is even more than that which is considered safe by the EPA.

Here is my calculations:

According to NRDC who used the EPA's recommendation for a 130 lbs woman, more than 0.5 ppm of mercury in fish is considered highest and should be avoided. High mercury in fish is considered to be 0.3 to 0.49 ppm and recommendation is at most eating three times a month or less. According to one of the flu vaccine's website: "Multidose vial, 5-mL. Contains thimerosal, a mercury derivative (25 mcg mercury per 0.5-mL dose). Thimerosal is added as a preservative."

$1\text{mcg/ml} = 1\text{ppm}$

Converting to ppm, this vial contains 50 ppm of thimerosal.

"Prefilled syringe, 0.5-mL. Thimerosal, a mercury derivative used during manufacture, is removed by subsequent purification steps to a trace amount (≤ 1 mcg mercury per 0.5-mL dose)."

So basically it's ≤ 2 ppm in the prefilled syringe.

But this is Thimerosal, organomercury compound, a compound that contains mercury.

From the FDA's website:

"A vaccine containing 0.01% thimerosal as a preservative contains 50 micrograms of thimerosal per 0.5 mL dose or approximately 25 micrograms of mercury per 0.5 mL dose."

So basically it's saying that the amount of mercury is half that of thimerosal. So in this case, the multidose vial contains 25 ppm of mercury and the prefilled syringe contains ≤ 1 ppm of mercury. Isn't that still a lot?

According to the EPA's Fact Sheet Mercury Update: Impact on Fish Advisories, the multidose vial of this flu vaccine company contains more mercury than some of the fish sampled in their report at the highest range.

Now let's think logically. Does this make sense?

Hep B at birth. That infant will not be engaging in sex or use drug needles. If the mom may have Hep B, shouldn't her physician have determined that during pregnancy? Not only that, the brain of a child is undergoing continual development until about the age of 12. How can anyone think it's safe to inject all those ingredients in a child from birth? How can anyone think that this is safe?!

HPV around middle school. The act of sex is NOT a class in school so why is it recommended? The message in school should be abstinence and not just safe sex.

Flu every year. A healthy body does not need to have a flu vaccine. Nature has made the body perfect and able to fight off disease as long as one has enough nutrients. Working with plants, I observed this perfectly. When the plant is sick or being attacked by pests, I just give it more nutrients such as worm casting tea (compost tea) or inputs from Korean Natural Farming practices. A few days later, the plant has shown significant improvement or is better as it's stronger to fight off even pests like aphids. I do not use synthetic fertilizers nor do I use synthetic herbicides or pesticides like Roundup.

It's the same with my child. When my child is sick, all I do is give my child extra nutrients in the form of very good natural supplements and is better in usually 24 hours while my child's friends are still out a week or two.

Vaccines have never been proven safe as many of my friends who've submitted testimonials have brought up and provided links to. There have been NO studies between vaccinated or unvaccinated populations. All sides should be allowed to be heard without the witch hunt that the medical community or media advertises.

The chances of vaccine injury over the chances of a complication from a childhood disease are too high. We cannot and should not compare ourselves (the United States) to places like Africa and India where sanitation is pretty non-existent. Polio, for example can be spread by fecal matter. It is not common practice anymore in the US to use the bathroom in the river upstream from where children are playing. Yes, complication can and do occur when someone gets a disease but the chances of that are minimal in the US today. The media will report a case where someone's child died over not getting a shot but will not report how many have died from

receiving that shot. The Vaccine Adverse Event Reporting System (VAERS) have reports on death but only a very small fraction of reactions are reported so the true numbers are basically unknown.

We have the best doctors and medicine in the world and I believe they can help a person who develops a complication from a disease. Vaccine injury however is first of all discounted/dismissed.

Why is it that the government of Japan actually stopped recommending the HPV vaccine and called for research because of the high reporting of adverse reactions where the US government just calls for more vaccination? Here is a paper done on the lessons learned in Japan. Read especially III. Structural flaws: an ethics viewpoint

<http://ijme.in/articles/lessons-learnt-in-japan-from-adverse-reactions-to-the-hpv-vaccine-a-medical-ethics-perspective/?galley=html>

Why is it in the US, the government is actively trying to keep us clueless about these. Where is the ethics of the American Medical community and Department of Health?

I am a mother and I will not stand for this. My child was vaccine injured and sickly for the first four and a half years of her life. Thankfully I found a doctor who figured it out. He wasn't her pediatrician, dermatologist, or allergist, all of whom kept prescribing more drugs (that she'd have to be on 24 hours a day) and steroids. This doctor was able to determine the cause and clear her. She has been healthy ever since and as mentioned above, if she gets sick, only for max 48 hours.

The Department of Health is so focused on immunizing the population with vaccines instead of preventive health measures such as exercising and eating organic and non-genetically modified nutritious foods. The focus should be on working with the Department on Agriculture to make sure everyone has access to good foods. Instead, the focus is making sure everyone is vaccinated against diseases that a person can fight off with the right nutrients.

I strongly oppose the changes in HAR 11-157-3 a and b.

TESTIMONY IN SUPPORT OF HAR 11-157 RULES UPDATE

Thank you for this opportunity to provide testimony. As a community member and public health advocate, I am writing to strongly support the HAR 11-157 proposed rules update.

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents up to six HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you for your consideration.

TESTIMONY IN SUPPORT OF HAR 11-157 RULES UPDATE

Thank you for this opportunity to provide testimony. As a community member and public health advocate, I am writing to strongly support the HAR 11-157 proposed rules update.

These proposed changes will bring Hawaii’s rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents up to six HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you for your consideration.

I am writing to strongly support the HAR 11-157 proposed rules update.

Across the country and within the state there has been an increase in vaccine preventable disease. The proposed rules update would bring the state rules into compliance with the recommendations of the Advisory Committee on Immunization Practices (ACIP). It is important that students receive HPV, MCV, and Tdap shots because they have the ability to protect individuals against life threatening illness and can provide protection against cancer.

Certain segments of the population including newborns and individuals with suppressed immune systems are not able to receive immunizations, however they are protected from these life threatening diseases when around 93% of the population is immunized. Research has shown that communities with low vaccination rates are most at risk for outbreaks of vaccine preventable diseases. Vaccine exemptions should be limited to individuals who are medically unable to receive immunizations, so these members of the community will still remain protected by herd immunity.

In recent years, Hawaii has been hit with outbreaks of preventable diseases. Last year nearly a thousand people in Hawaii were infected with Mumps, a disease that usually affects less than ten people in the state. This was a case of an outbreak of a vaccine preventable disease spread through the school system by infected students. HAR 11-157 would help prevent events like that from occurring in the future.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed to help ensure that all segments of the population remain healthy.

Thank you for your consideration,

Sienna Ogawa

Subject: HAR 11-157, I OPPOSE
Date: Monday, November 19, 2018 9:57:31 AM

Aloha Hawaii Department of Health,

Thank you for this opportunity to provide testimony.

I STRONGLY OPPOSE THE HAR 11-157 PROPOSED RULES UPDATE!

I OPPOSE INCREASING VACCINE REQUIREMENTS. The risks of adverse reactions include autism, infertility, autoimmune disorders, seizures, paralysis, and death. Over 59,000 adverse effects from the HPV vaccine have been reported to VAERS, including 425 deaths.

I OPPOSE INCREASING REQUIREMENTS FOR MEDICAL AND RELIGIOUS EXEMPTION. Complicating the exemption process would contribute to more allergic reactions and adverse reactions for susceptible genetic types. We must be allowed to refuse the injections of toxic metals, harmful chemicals, allergens, and xeno-biological agents such as animal and fetal derived DNA.

I OPPOSE ADOPTING THE ADVISORY COMMITTEE ON IMMUNIZATION PRACTICES (ACIP) RECOMENDATIONS. These recommendations have not been proven safe and pose risks of severe adverse reactions. The FDA admits that only 1-10% of adverse reactions are even reported.

The HAR 11-157 proposed rule changes increase vaccine requirements and complicate the acquiring of vaccine exemptions, which would cause an increase in adverse reactions.

HEALTH FREEDOM AND INFORMED CONSENT ARE BASIC HUMAN RIGHTS! Everybody must be allowed the right to chose or refuse what is put into the body. Vaccination is a medical intervention that carries a risk of injury or death. The right to informed consent to any medical intervention that can kill or injure you or your child is a human right.

Please consider the health concerns of everyone susceptible to adverse reactions to immunizations.

Thank you again for the opportunity to provide testimony opposing the HAR 11-157 proposed rules update and the adverse consequences it would cause.

Mahalo,
JANELLE MARTIN and TALLY WINTER

[REDACTED]

From: [REDACTED]
To: [DOH.Immunization](#); [REDACTED]
Subject: HAR 11-157 Testimony
Date: Tuesday, October 30, 2018 8:03:23 PM

Aloha,

Thank you for this opportunity to provide testimony. We live on the island of [REDACTED] and we strongly OPPOSE the HAR 11-157 proposed rules update. We oppose the proposed rule changes for the following reasons:

1. It takes away our civil rights, our freedom, the whole point of being American. Please stop encroaching on our civil liberties. The idea that you believe you have the right to mandate anything being injected into our bloodstreams without consent is appalling/uncivil/tyrannous, what right and liberty will you be taking away next? I am literally terrified of living in a country who thinks it is ok to inject whatever they deem necessary into their civilian's bloodstreams. No government body or health department should have this kind of power, ever.
2. The safety obligations from the 1986 National Childhood Vaccine Injury Act are supposed to be in place to protect our children. However, as I am sure you have heard, that those safety obligations have never been upheld. We cannot trust the government/system to follow through with their promises when it comes to the health and safety of our children—so parents must. The GOVERNMENT/SYSTEM HAS FAILED US REPEATEDLY even with the supposed checks and balances in place, except this time the lives of our children are on the line. Stop making it harder for us to protect our children. Do not take my right to protect my child/children away from me. Common sense knows that where there are humans completing anything there is human error. There is a margin of human error in these vaccines hence the list of side effects, but common sense would know it is not just limited to side effects. There have been no studies showing the effects of the suggested vaccine schedule as a whole, let alone as how they are currently dosed, NOR detailed enough studies on people with different genetics in this incredibly diverse country and state. Attempting to mandate a medical procedure when there are no adequate safety studies in place is a BLATANT DISREGARD FOR PUBLIC SAFETY. There are no check and balances in the vaccine program, as vaccines are classified differently than any other medications and are not subject to the rigorous scrutiny or the liability that comes along with putting new drugs on the market. And as common sense would have it, I do not trust the "goodwill" of a company who has no repercussions to any of the vaccine products administered to the public since the vaccine companies can not be sued for any damage caused by the vaccines and as the Supreme Court ruled the are unavoidably unsafe. I am not sure how you can trust the "goodwill" of a company or person with your childs' life on the line when there are billions of dollars that could be theres instead.
3. Where there is risk, there MUST be a choice. Vaccines carry risk. Read the vaccine insert/prescribing information ---the actual, lengthy, detailed insert that comes in the vaccine box. Each vaccine administered to children was never evaluated for its ability to cause cancer, genetic mutation, or infertility. The studies lack important details that are needed, THAT ARE NECESSARY, in order for them to make claims that the vaccines are for everyone. A simple example of their lack of detail for genetic differences for a injection directly into the bloodstream, which can have incredibly serious consequences if there is anything harmful--- there have never been studies regarding the effectiveness and safety for use of vaccines for people with autoimmune issues and/or MFTHR gene. We have an incredibly diverse genetic country and state. This lack of detail or care for the population as a whole matters when making this decision. Vaccines are not safe for everyone and children should be given the chance to lead a normal life before our society makes the decision without their consent to take that from them before we even know for EXACT certainty that they will not have an adverse reaction, which is humanly impossible with the margin of human error. It is wrong to mandate a medical procedure that is known to cause harm and carries risk, without informed consent. Just an example, the MMR vaccine insert contains 42 paragraphs of warnings and adverse reactions, including seizures, encephalitis, pneumonia, deafness, and death. DTaP lists SIDS as a side effect. The inserts on live virus vaccines state that recipients should avoid close contact with susceptible high-risk individuals for up to 6-weeks following vaccination. <- Common sense again, would have you

wondering if the outbreaks are from the vaccines themselves, which is hardly ever reported with honesty. Also, the government does not know and can not control which individuals would be included in this group and would be forcing individuals that fall into those categories (immunocompromised, pregnant women, new infants, etc.) who work and attend the schools to exposure to those illnesses. Will the schools be accepting doctor's notes with paid leave for up to 6-week post vaccine absences? And, how come when the break outs of these diseases occur the vaccines are never investigated for possibly being the contaminate?

4. I disagree with the HPV vaccine being a requirement for every child to attend school. There have been numerous lawsuits across the world, including Spain, France, Japan, Colombia, India and right here in the US. Why are you recommending a vaccine that has never been proven effective at the prevention of cancer? Because as all vaccines go, the studies are inadequate for suggesting them for the whole public. The HPV vaccine has been linked to including but not limited to: lesion development, ovarian failure, autoimmune disease, pancreatitis, infertility, silent seizures and disseminated encephalomyelitis, and death following vaccination. The median age for cervical cancer diagnosis is age 49. Why are we taking away or damaging young children's lives before they have even started? Not all children fall under this blanket, there are still more people without HPV than with HPV that this vaccine would be harming. How about responsibility for your own sexual conduct and when of age making the choice to take on the risks of the HPV vaccine if you believe you are at higher risk of contracting the disease?<---- this is called informed consent and having rights and liberties as a citizen.

5. Requiring the flu vaccine is inappropriate. Again, taking away our rights and liberties. I am literally terrified of living in a country who thinks it is ok to inject whatever they deem necessary into their civilian's bloodstreams. No government body or health department should have this kind of power.

6. According to the CDC's publication "Vaccine Excipient & Media Summary", "In addition to weakened or killed disease antigens (viruses or bacteria), vaccines contain very small amounts of other ingredients – excipients or media." These excipients include thimerosal (a form of mercury), aluminum (as amorphous aluminum hydroxyphosphate sulfate p/k/a aluminum hydroxide), aborted fetal cells (injecting fetal cells has shown to permanently change our DNA), bovine extract, formaldehyde, monkey kidney cells, calf serum, chicken cells and polysorbate80 (breaks down the blood brain barrier). This is disgusting, we should have the right to decide if these items are put into our bodies or our children's especially with the different side effects that each of these substances can cause. Our children should have the right to decide if this is put into their bodies. How is rape not ok, but you making the decision to inject your civilians bodies with these disgusting substances against our will is ok? Again, the decision should not be the government's, but the individual and when it comes to minors, their parents' decision, till they are of age.

6. I also question why the state epidemiologist, Dr. Park, who used to work for the CDC, isn't being investigated for the conflict of interest. She has stated that "giving parents full informed consent would hurt her flu shot program in the schools." How about the harm her program inflicts on the families that have adverse reactions?

I ALSO REQUEST FOR THE DOH TO HOST PUBLIC HEARINGS STATEWIDE.

Thank you & Sincerely,
Tanner & Matt Brittan

TESTIMONY IN SUPPORT OF HAR 11-157 RULES UPDATE

Thank you for this opportunity to provide testimony. As a community member and public health advocate, I am writing to strongly support the HAR 11-157 proposed rules update.

These proposed changes will bring Hawaii's rules into compliance with the most current recommendations of the Advisory Committee on Immunization Practices (ACIP).

The proposed rules update is especially important for students first entering 7th grade or higher to receive the HPV, MCV, and Tdap shots because of low uptake levels. This is especially true for the HPV vaccine which prevents up to six HPV-related cancers that might otherwise occur later in life.

The Centers for Disease Control and Prevention (CDC) advises that state and local vaccination requirements for daycare and school entry are important tools for maintaining high vaccination coverage rates, and in turn, lower rates of vaccine-preventable diseases.

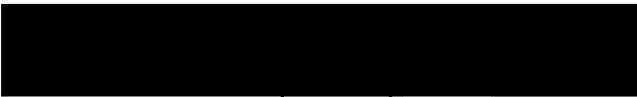

Research demonstrates that communities with more vaccine exemptions are at greater risk for vaccine-preventable disease outbreaks. Limiting exemptions to those that are medically indicated improves protection for our entire community, including those who are particularly vulnerable, the very young and our elders.

I respectfully request that the proposed changes to HAR 11-157 be supported and passed for the health of all of our communities.

Thank you for your consideration.

To Legislators and Administrators Granted Power to Make Decisions Affecting Public Health:

I vehemently OPPOSE HAR 11-157 and any legislation that would prevent me from exercising my human and civil right to freedom of thought, speech, and belief under the Constitution of the United States to make informed voluntary choices regarding my health and the health of those whom God has entrusted into my care.

Nobody should be forced to use pharmaceuticals that carry the risk of harm or failure, especially those made with toxic substances or derived from unethical sources such as aborted human fetuses.

It is religious discrimination to accept exemptions from specific religious organizations and not others. Every individual has the right to exercise their religious beliefs as they so chose. It is my belief that God created our bodies with the power and ability to build and maintain a strong immune system by making healthy choices. Compromising the immune system from birth through the administration of vaccines alters natural immunity for life and is contrary to God's design for the body.

As consumers of anything, we are voting for whatever we put into or on our bodies. Forced vaccinations denies us our "right to vote" against drug and chemical companies, immune from accountability and liability, whose interest is in profit and not our health and well-being.

I strongly encourage you to educate yourself by watching the Youtube video with Del Bigtree called THE IRREFUTABLE ARGUMENT AGAINST VACCINE SAFETY before you attempt to make any more mistakes regarding mandatory vaccinations.

I will pray for each of you to have wisdom to do what is right and for God's mercy when you stand before him accountable for the damage and death that may result from the decisions you make.

Sincerely and respectfully,

Sue Pantano-Saldana

██████████

██████████████████

Kamala Galletes

Aloha, my name is Kamala Galletes. I am a parent, and have been a DOE educator for over ten years. Thank you for your CAREFUL review of this, and ANY vaccination issue! NO vaccinations should be mandatory, let alone for the entrance into school.

I oppose HAR 11-157, and cannot believe I need to defend children against proposed mandatory vaccines!

YES, defend children from vaccinations that are a RISK to them, can HURT them, and can even KILL them! In all actuality, I need to defend children against pharmaceutical companies that intentionally poison our children for a profit! These companies DO NOT care about the welfare of our children, and if injured from a vaccine parents are stuck dealing with much more than the Vaccine Injury Compensation Program (VICP). Injury compensation; I believe many parents DENY the scheduled vaccines because there is INJURY/RISKS involved.

In 1986 the vaccine-manufacturing pharmaceutical companies were freed from all liability related to vaccine injuries and death via the National Childhood Vaccine Injury Act (NCVIA). Clearing the way for these companies to mass produce poison and make a profit off of children.

Vaccines contain TOXIC chemicals that DO NOT belong in anyone's body! For example, aluminum is KNOWN to cause brain and developmental damage even in small amounts. Formaldehyde is KNOWN to cause cancer in humans. These ingredients and several others are documented in vaccines.

Parents who DO NOT vaccinate ARE making sound, conscious choices for THEIR children. We feel strongly against poisoning them, and do understand that this poison is made for a PROFIT! There is RISK that can result in injury, that IS documented by many cases around the world!

Parents will choose to keep their children safe verses sending them to school if a mandatory vaccine schedule is forced on them! How with the state handle those circumstances?

Mahalo nui loa,

Kamala Galletes

Aloha DOH,

These references were in my talks and this is a written documentation of them and the topics that embraced them. It is essential that mandatory vaccines do not happen in Kona or any part of Hawaii for a multiple of reasons, some of which are stated below and part of my testimony.

Clare Loprinzi, Traditional Midwife, MCH (Maternal/Child Healthcare, CPM

1. **Premature birth weight Primary immunization of premature infants with gestational age <35 weeks: cardiorespiratory complications and C-reactive protein responses associated with administration of single and multiple separate vaccines simultaneously. CRP level is expected to be elevated in the 48 hours following immunization. In a minority of infants immunized, cardiorespiratory events were associated with presumed need for intervention. Underlying medical conditions and possibly multiple injections are associated with cardiorespiratory events. Precautionary monitoring following immunizations is warranted multiple separate vaccines simultaneously.**
<https://www.ncbi.nlm.nih.gov/pubmed/17643770>

2. **premature birth weight. We evaluated the tolerance to immunization of 64 very low birth weight preterm infants. Thirty-three of the infants experienced a cardiorespiratory event after the first vaccination, and 6 of these 33 (18%) had a recurrence after the second vaccination, including 2 infants previously discharged to home. A cardiorespiratory event associated with the first vaccination was the sole risk factor for recurrence identified.**
<https://www.ncbi.nlm.nih.gov/pubmed/17643770>

3. CHANGING DNA

To assess the public health consequences of fetal cell line manufactured vaccines that contain residual human fetal DNA fragments utilizing laboratory and ecological approaches including statistics, molecular biology and genomics. Vaccines manufactured in human fetal cell lines contain unacceptably high levels of fetal DNA fragment contaminants. The human genome naturally contains regions that are susceptible to double strand break formation and DNA insertional mutagenesis. The "Wakefield Scare" created a natural experiment that may demonstrate a causal relationship between fetal cell-line manufactured vaccines and ASD prevalence. Kingdom of Hawaii and Indigenous Rights are being violated.

<https://www.ncbi.nlm.nih.gov/pubmed/26103708>

2. Cancer and Immune systems

Fever are important to build the immune system. Herd immunity will never happen as the vaccines do not last forever and many consequences from them with no studies. Building resistance is a natural healthy process. Epidemiological research into the connection between fever and protection against cancer Other interesting studies describe the same connection between the growing number of cancer cases and the decrease of febrile childhood diseases as a result of vaccinations (!), antibiotics and antipyretics over the last few decades importance of febrile disease in preventing cancer.
https://www.wanttoknow.info/health/cancer_link_vaccination_fever_research.pdf

6. Autism in our children

<https://www.ncbi.nlm.nih.gov/pubmed/23609067>

<https://www.ncbi.nlm.nih.gov/pubmed/25428645>

Epidemiologic and Molecular Relationship Between Vaccine Manufacture and Autism Spectrum Disorder Prevalence. [Deisher TA](#), [Doan NV](#), [Koyama K](#), [Bwabye S](#).

5. Informed Choice is already mandated by the State of Hawaii and is failing to be abided by many healthcare practitioners.

Healthcare Practitioners must give an informed choice, that includes speaking about the alternatives to the procedure that they are using. Vaccines need to by law show both sides.

Hawaii Revised Statutes 671-3 – Informed consent

6. FERPA Family Educational Rights and Privacy Act (FERPA)

DOH violation of demanding at a DOE school for the list of students not vaccinated for the Flu Vaccine in 2018.

FERPA Family Educational Rights and Privacy Act (FERPA)

7. VAERS While the Vaccine Adverse Events Reporting System [VAERS]

may be lauded as the “front line” of vaccine safety, the lack of enforcement provisions and effective monitoring of reporting practices preclude accurate assessments of the extent to which adverse events are actually reported. Former FDA Commissioner David A. Kessler has estimated that VAERS reports currently represent only a fraction of the serious adverse events. The quality of VAERS data has been questioned. Because reports are submitted from a variety of sources, some inexperienced in completing data forms for medical studies, many reports omit important data and contain obvious errors. Assessment is further complicated by the administration of multiple vaccines at the same time, following currently recommended vaccine schedules, because there may be no conclusive way to determine which vaccine or combination of vaccines caused the specific adverse event.

Pediatr Infect Dis J 28:943, 2009

8. Blood Money

The taking of STEM Cells from cord blood is a war crime in Hawaii under occupation as the baby needs them and they contain DNA.

Violation of Hawaii Revised Statutes 671-3 – Informed consent*

To Department of Health- Disease Outbreak Control Division,

I am writing to oppose the proposed rule changes to Hawai'i's vaccine requirement for children. It is a human right to have access to informed consent regarding any medical procedure that may have adverse affects on our children.

Deciding whether to vaccinate, like any medical procedure with inherent risks, is a choice that each individual should have the right to make. Vaccination is a medical procedure performed on otherwise healthy individuals that carries inherent risks, such as seizures and for some vaccines death. As parents, we have a responsibility and a right to examine the advantages and risks of a procedure before having it performed on our children.

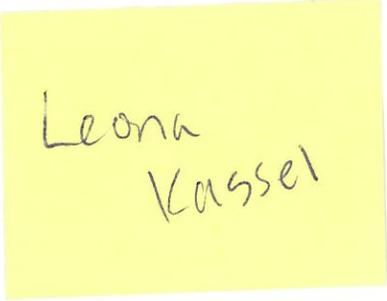

I ask you to consider your stance on informed consent. Specifically:

- Do you acknowledge that there are inherent risks associated with vaccinations?
- Do you affirm that informed consent is a basic human right?
- Do you endorse an informed consent for vaccinations?

We do not want to be forced to give our children all vaccines. Many of us parents believe that certain vaccines have risks that outweigh their benefit, such as the HPV and influenza vaccines. I strongly urge you to affirm our basic human right to informed consent regarding all medical procedures that may have adverse affects, including vaccines.

Thank you,

Leona Kassel

Testimony of Dr. Joseph Kassel N.D., L.Ac.

I am testifying against the expansion of the mandatory vaccine schedule put forth by the DOH. The 1986 vaccine injury act protects the Pharmaceutical industry from lawsuits for vaccine injury. The U.S. government was played by the pharmaceutical industry to protect and now enhance their profits.

They now are promoting what will be a never ending expansion of vaccine mandates with impunity and inadequate supportive research on safety. I must note that this violates the favorite principal of the colonial occupying power that the free market will sort everything out. In point of fact the U.S. government has betrayed this principal as it has become a corporate oligarchy, a revolving door of conflicts of interest, the handmaiden to Pharmaceutical fossil fuel, tech and other interests. The interests of the people, colonized and otherwise will go unrecognized until they refuse to cooperate. The Hawaii state DOH marches in lockstep (or should I say goosetstep) serving these corporate interests under the guise of protecting human health. The aforementioned 1986 vaccine injury act also created VAERS to sort out reports of vaccine injury, however the vast majority of vaccine injuries go unreported, one calculation printed in the BMJ, estimated underreporting for one condition to be less than 1 report per 200 cases.

Autoimmune disease secondary to vaccination adjuvants now have their own acronym, ASIA Auto Immune Syndrome Induced by Adjuvants

The most commonly used adjuvant, Aluminum is a heavy metal with known neurotoxic effects on human and animal nervous systems. It can be found in the following childhood vaccines – DTaP, Pediarix (DTaP-Hepatitis B-Polio combination), Pentacel (DTaP-HIB-Polio combination), Hepatitis A, Hepatitis B, Haemophilus influenzae B (HIB), Human Papilloma Virus (HPV), and Pneumococcal vaccines.[2]

In 1996, the American Academy of Pediatrics issued a position paper on Aluminum Toxicity in Infants and Children which stated in the first paragraph, "Aluminum is now being implicated as interfering with a variety of cellular and metabolic processes in the nervous system and in other tissues.[3]

Many current vaccines including the Gardasil HPV vaccine utilize the most toxic aluminum adjuvant, the same form used in the notorious DPT vaccine that gave rise to the 1986 vaccine injury act.

My primary concerns about current vaccination protocols relate to disruption of normal immune function and likely potential for neurotoxicity from adjuvants preservatives and other components of vaccines.

It's important for those impacted to know that the hallmark of a healthy, mature immune system in children is demonstrated by an equal and balanced TH1, TH2 and TH3 immune response to the natural environment. TH1, TH2 & TH3 do not work independently, and require a very important synergistic relationship to function properly in our bodies. As soon as one or more of these three arms begins to over or under work in relation to the other, chronic illness begins to express itself.

More on Aluminum

Aluminum is placed in the vaccines to selectively target the up-regulation of the humoral arm (TH2 cells) of children's immune systems, to drive the production of antibodies. The medical community leads us to believe that this production of antibodies is what imparts for children a protective nature against vaccine-preventable illnesses. Yet, this outcome may come at a cost. I want to raise a concern that I haven't heard mentioned yet, I want to present the fact that a number of studies have shown that experiencing febrile illnesses both in childhood and adulthood, results in reduced cancer rates, an association recognized by Hippocrates, who admonished us as Physicians to first do no harm.

It is becoming quite evident to those of us looking at all available evidence, that modern science's mercenary tunnel vision is failing to explore the total impacts of vaccinations on human health thereby disrupting the natural development and balance between the 3 main arms of the immune system, it is increasing rates of atopic diseases such as asthma eczema, allergic rhinitis, and autoimmune diseases, while reducing the ability of naturally acquired illnesses to cultivate a vigorous healthy and balanced immune system. Modern vaccination schedules are doing harm, in violation of the hippocratic oath.

5 Hawaii Revised Statutes 671-3

Hawaii Board of Medical Examiners requires a thorough informed consent

- (1) The condition to be treated;
- (2) A description of the proposed treatment or procedure;
- (3) The intended and anticipated results of the proposed treatment or procedure;
- (4) The recognized alternative treatments or procedures, including the option of not providing these treatments or procedures;
- (5) The recognized material risks of serious complications or mortality associated with:
 - (A) The proposed treatment or procedure;
 - (B) The recognized alternative treatments or procedures; and
 - (C) Not undergoing any treatment or procedure; and
- (6) The recognized benefits of the recognized alternative treatments or procedures.

Are Medical Doctors associated with the DOH advocating for adherence or violation of this statute?

The Childhood IMMUNIZATION SCHEDULE and Safety

STAKEHOLDER CONCERNS, SCIENTIFIC EVIDENCE, AND FUTURE STUDIES

Committee on the Assessment of Studies of Health Outcomes Related to the Recommended Childhood Immunization Schedule

Board on Population Health and Public Health Practice

INSTITUTE OF MEDICINE

OF THE NATIONAL ACADEMIES. 2013 this is a seriously cautious and conservative institution

In summary, few studies have comprehensively assessed the association between the entire immunization schedule or variations in the overall schedule and categories of health outcomes, and no study has directly examined health outcomes and stakeholder concerns in precisely the way that the committee was charged to address in its statement of task. No studies have compared the differences in health outcomes that some stakeholders questioned between entirely unimmunized populations of children and fully immunized children. Experts who addressed the committee pointed not to a body of evidence that had been overlooked but rather to the fact that existing research has not been designed to test the entire immunization schedule.

In summary, to consider whether and how to study the safety and health outcomes of the entire childhood immunization schedule, the field needs valid and accepted metrics of the entire schedule (the "exposure") and clearer definitions of health outcomes linked to stakeholder concerns (the "outcomes") in rigorous research that will ensure validity and generalizability.

Is this acknowledgement of the unknown impacts of vaccination schedules shared in DOH recommended informed consents for vaccination?

Does the DOH have examples of vaccination informed consents that the DOH endorses?

Do they meet the requirements set forth in HRS 671-3?

Is the DOH encouraging Health Care Providers to share these conclusions with Vaccine recipients?

Please provide the examples of unbiased balanced informed consents for vaccinations provided by M.D.'s associated with the DOH or the DOH itself.

Is the DOH expected to or required to support/adhere to HRS 671-3?

Is the acknowledgement of the unknown impacts of vaccination schedules shared in DOH recommended informed consents for vaccination?

Are or would the vaccines cultured in fetal tissue cell lines and containing residual fetal DNA (Varicella, Rubella, Hepatitis A, Rabies and Shingles) identified in DOH endorsed informed consent?

Are or would the various animal cell lines, antibiotics, adjuvants including known toxicities, additives, history and possibility of viral contamination of vaccines be included in vaccine informed consents?

Where does the leap from ACIP recommendations to DOH/DOE mandates come from?

Has it resulted in alterations to DOH endorsed informed consent for vaccination schedules?

Does the DOH support informing parents/patients that vaccination creates an imperfect immune response that can predispose to the vaccinated to becoming carriers when exposed to the illness, as well as becoming vulnerable to illness or asymptomatic carrier later in life?

Will the DOH agree to the formation of a committee including skilled members (both advocates and opponents of universal vaccination) to write comprehensive informed consents for affected individuals and parents?

Several years ago I had a 4th year medical student observe in my clinic. She noted how healthy the children were. I shared that those were the sick ones, but they were born at home, breast fed and unvaccinated. Later I pointed out that many of the parents I work with follow my suggestion to give the children moderate amounts of vitamin c, which has been used for 7 decades to treat virtually all of the childhood illnesses which are now vaccinated for including 100% successful treatment of polio by Dr Klenner. I.V. vitamin c is finally beginning to be recognized as a crucial treatment increasing survival in sepsis significantly. So that will probably trigger multiple alarm bells of conventional dogma, and my intention today is not to convince you of anything, but I do want to state the following

1 There is significant scientific evidence of negative impacts of vaccination and a paucity of data supporting multiple vaccination schedule safety, failure to use genuine placebos in most safety studies and therefore there is a basis for a scientific as well as religious exemptions to vaccination schedules. That scientific exemptions are not recognized is a violation of civil rights and the bodily integrity of all those impacted by these rules.

2 unlike what is promulgated by the advocates of current expanding vaccination regimes, the science supporting vaccine safety is not conclusive, in fact there are not only significant volumes of contradictory research, but much of the requisite research to confirm safety has not been done.

3 People in positions of influence such as the DOH, are violating a sacred public trust by turning CDC recommendations into mandates and failing to honestly convey to parents what is known and unknown about vaccine effectiveness and safety.

4 the mandatory vaccination policy may well reduce vaccination rates by forcing parents who would have opted for selective vaccination to choose none on religious grounds since they are left no other option.

5 There is some serious cynicism afoot with some of the required vaccines in this expansion of the vaccine schedule. The annual flu vaccine is worse than a bad joke.

Over 75% of annual flu like illnesses are not influenza, the vaccination will not protect against these illnesses, yet the cdc will include morbidity and mortality from these illnesses in their scare tactics. One annual study showed 19% of flu like illnesses were in fact the flu and 57% of those with the flu were vaccinated. Meanwhile adults receiving the flu vaccine 5 years in a row demonstrate a 10 fold increase in Alzheimers disease. The HPV vaccines are another nightmare with limited if any advantage over routine screening in impacting cervical cancer and extremely serious neurological and reproductive consequences.

6The inclusion of Naturopathic Physicians as providers capable of assessing Medical exemptions, while imposing stringent adherence to an alien allopathic Medical paradigm for making such assessments is a hollow and patronizing inclusion.

7 finally, Imposing vaccination schedules originating from the Federal agency of the occupying power, the CDC, is in fact a War Crime, since no such vaccination schedule exists for the occupied Hawaiian Kingdom

Hi my name is Nayeva Pajot Gendron.
I oppose HR 11 157

And Specifically Point 6 Enhanced reporting requirements for medical and religious exemptions

We currently have exemptions for medical and religious and we don't want that to change at all.
And I feel that we should also add philosophical exemptions to the state of Hawaii.

I would like to submit Exhibit a.

"President Trump promised the American people that his administration would vigorously uphold the rights of conscience and religious freedom. That promise is being kept today. The Founding Fathers knew that a nation that respects conscience rights is more diverse and more free, and OCR's new division will help make that vision a reality."

<https://www.hhs.gov/about/news/2018/01/18/hhs-ocr-announces-new-conscience-and-religious-freedom-division.html?language=en>

also President Trump commissioned Robert Kennedy to investigate the pharmaceutical immunizations.

It is against our constitutional rights to force American citizens to inject poisons with unknown side effects into our bodies against our will or without the right to choose.

The Universal Declaration of Human Rights adopted in 1948 after World War II states that, "Everyone has the right to freedom of thought, conscience and religion; this right includes freedom to change his religion or belief, and freedom, either alone or in community with others and in public or private, to manifest his religion or belief in teaching, practice, worship and observance."

U.S. Supreme Court: Vaccines are "Unavoidably Unsafe"

In 2011, the U.S. Supreme Court agreed with what Congress said in 1986, and that is: government licensed vaccines are "unavoidably unsafe" and pharmaceutical corporations should not be liable for vaccine injuries and deaths. 30 31 Today, when your child dies or is permanently brain injured after vaccination or the vaccine fails to protect your child, you cannot hold the vaccine manufacturer or the doctor who gave the vaccine accountable in court in front of a jury of your peers.

With this free pass, in 2011 and 2012 the multi-billion dollar vaccine machine powered by medical trade, industry and government rolled into the legislatures of Washington, Vermont and other states with the goal of eliminating religious and conscience vaccine exemptions that have been in place in the U.S. for more than half a century. 32 NVIC has worked with families and other grassroots organizations to protect vaccine exemptions in 15 states but, in 2015, Vermont lost the conscience exemption and California lost the personal belief exemption protecting both exercise of conscience and religious beliefs. 33

There are three general statements about vaccination in the U.S. that cannot be disputed, which are:

1. Like prescription drugs, vaccines are pharmaceutical products that carry a risk of injury, death and failure. 46 47 48 49
2. There are genetic, biological and environmental high risk factors that make some individuals more susceptible to vaccine reactions, but doctors cannot predict who will be harmed. 50
3. The U.S. Congress and Supreme Court have declared government licensed and mandated vaccines to be “unavoidably unsafe” and more than \$3 billion dollars in federal vaccine injury compensation has been awarded to children and adults under the National Childhood Vaccine Injury Act of 1986.

These three basic facts about vaccination affect your human right to exercise freedom of thought, conscience and religious belief:

Because vaccines can injure or kill and doctors cannot predict who will be harmed, and the U.S. government has acknowledged that fact and indemnified pharmaceutical corporations and doctors, while awarding financial compensation to children and adults who have been injured or died from government licensed vaccines, 52 you have the human right to exercise informed consent, freedom of conscience and religious belief when making a decision about vaccination for yourself or your minor. Whatever your sincere religious beliefs, you do not have to be a member of an organized religion or church to hold them and defend your human right to exercise freedom of conscience. In America, you should not have to live in fear that you will be judged and punished for exercising freedom of thought, conscience and religious belief.

Thank you for doing the right thing and protecting our right to choose.

~ Nayeva Pajot Gendron

HHS Announces New Conscience and Religious Freedom Division

Today, the U.S. Department of Health and Human Services (HHS) is pleased to announce the formation of a new Conscience and Religious Freedom Division in the HHS Office for Civil Rights (OCR). The announcement will take place at an event at HHS headquarters from 10:30 a.m. to noon. It will be livestreamed [here](#). Speakers will include Acting Secretary Eric D. Hargan, House Majority Leader Kevin McCarthy, Representative Vicky Hartzler, Senator James Lankford, OCR Director Roger Severino, and special guests.

The Conscience and Religious Freedom Division has been established to restore federal enforcement of our nation's laws that protect the fundamental and unalienable rights of conscience and religious freedom. OCR is the law enforcement agency within HHS that enforces federal laws protecting civil rights and conscience in health and human services, and the security and privacy of people's health information. The creation of the new division will provide HHS with the focus it needs to more vigorously and effectively enforce existing laws protecting the rights of conscience and religious freedom, the first freedom protected in the Bill of Rights.

OCR already has enforcement authority over federal conscience protection statutes, such as the Church, Coats-Snowe, and Weldon Amendments; Section 1553 of the Affordable Care Act (on assisted suicide); and certain federal nondiscrimination laws that prohibit discrimination on the basis of religion in a variety of HHS programs.

OCR Director Severino said, "Laws protecting religious freedom and conscience rights are just empty words on paper if they aren't enforced. No one should be forced to choose between helping sick people and living by one's deepest moral or religious convictions, and the new division will help guarantee that victims of unlawful discrimination find justice. For too long, governments big and small have treated conscience claims with hostility instead of protection, but change is coming and it begins here and now."

Acting HHS Secretary Hargan said, "President Trump promised the American people that his administration would vigorously uphold the rights of conscience and religious freedom. That promise is being kept today. The Founding Fathers knew that a nation that respects conscience rights is more diverse and more free, and OCR's new division will help make that vision a reality."

To learn more about the new Conscience and Religious Freedom Division, visit us at www.hhs.gov/conscience.

To file a complaint with OCR based on a violation of civil rights, conscience or religious freedom, or health information privacy, visit us at <https://www.hhs.gov/ocr/complaints>.

VACCINATION EXEMPTION PURSUANT TO THE
Hawaii Administrative Rules §11-157-5 & OFFICIAL CODE OF Haw. Rev. Stat. § 325-34

§11-157-5 Exemptions. (b) *A religious exemption shall be granted to a student whose parent, custodian, guardian, or other person in loco parentis certifies that the person's religious beliefs prohibit the practice of immunization. Requests for religious exemptions based on objections to specific immunizing agents will not be granted. Students who have reached the age of majority shall apply on their own behalf. The certification shall be retained in the student's health record. Reports of such exemptions shall be submitted to the department by each school.*

§ 325-34 *No person shall be subjected to vaccination, revaccination or immunization, who shall in writing object thereto on the grounds that the requirements are not in accordance with the religious tenets of an established church of which the person is a member or adherent, or, if the person is a minor or under guardianship, whose parent or guardian shall in writing object thereto on such grounds, but no objection shall be recognized when, in the opinion of the director of health, there is danger of an epidemic from any communicable disease.*

VACCINE EXEMPTION FORM

I, _____, as the parent, guardian or person in
(insert your name)
loco parentis of the child _____, hereby certify that the
(insert your child's name)
administration of any vaccine or other immunizing agents is contrary to our personal
religious beliefs.

Making Informed Decisions

Your decision to vaccinate or not should be an informed decision. Vaccines can cause severe injuries such as seizures, death, anaphylaxis, brain damage and other reactions. The type and severity of reactions may vary from vaccine to vaccine and child to child. The effects of a vaccine injury may be temporary or permanent. If you notice any changes in your child's condition after receiving a vaccine, you should contact your doctor immediately or go to a hospital. Vaccines have never been proven to be safe or effective and your child may contract the disease even if he is vaccinated. What has been proven is that you can get the disease from the vaccine or from coming into contact with a recently vaccinated person. The polio vaccine is just one example. It is a known fact that most healthcare providers do not fully inform patients of the side effects a vaccine can have on the body, brain and immune system. Because of the highly toxic ingredients all vaccines contain, you should thoroughly research vaccines for yourself before making such an important decision. DO NOT allow someone else, even your healthcare provider, scare or force you into making this decision without being fully informed. Many healthcare providers have not researched vaccine history or toxicology and are not fully informed.

Always provide a detailed history of your child's health to your doctor. Make sure they know of allergies, neurological problems, nutritional deficiencies, any immune system disorder and skin diseases such as eczema. Most physicians and nurses do not warn parents that if their child's health is compromised in any way, such as having a common cold or previous reaction to a vaccine, they should not receive vaccines.

Benefits of Non-Vaccination

When you choose to not vaccinate your child, you have the responsibility to educate yourself on how to maintain the well-being of not only their body but also their mind and spirit as well. Childhood diseases can result in minor symptoms to severe complication or death depending on the child's immune system and treatment protocols followed. The stronger the immune system, the less severe are the symptoms of the disease. A child that goes through the full expression of the disease (i.e. fever and skin eruptions, without suppressing any of these symptoms) usually acquires immunity from that disease for life. Good nutrition and cleanliness play a major role. The risk of contracting various diseases can vary over time or locality. Symptoms or complications of these diseases may be treatable by alternative methods or may resolve without treatment. Educate yourself on childhood diseases from informed alternative sources. Fear of these diseases comes from not being properly informed.

For More Information

To make a truly informed decision there are numerous sources of information on the risks of vaccines and the risks and benefits of childhood diseases. Sources of information to determine if the risks associated with vaccines outweigh any perceived benefits include: vaccine package inserts, the Physicians Desk Reference, the U.S. Center for Disease Control and Prevention, public and medical libraries or state and local health agencies. (NOTE: These sources do not give complete and total information on vaccine ingredients and their toxicity, nor do they provide accurate statistics.)
Vaccination Liberation – www.vaclib.org or (888) 249-1421
National Vaccine Information Center – www.909shot.com or (800) 909-SHOT / (703) 938-0324
(NOTE: The two websites above, Vaccination Liberation and the National Vaccine Information Center, have proven to be excellent sources for extensive vaccine information.)

Reporting Reactions

If you do decide to vaccinate, report vaccine reactions to the Vaccine Adverse Event Reporting System (800) 822-7969. Always get the vaccine name, vaccine manufacturer and lot number. Keep records of day to day reactions from the time of vaccination for at least 6 months to 2 years, no matter how slight the reactions. Long-term effects of vaccines have not been well documented by the allopathic community and are just now being researched. If your child has been injured by a vaccine, he may be eligible for compensation under the National Vaccine Injury Compensation Program.

Vaccingate: Initial results on Infanrix Hexa chemical composition

When we started these analysis, from the metagenomics to the chemical ones, we had a lot of questions and we were only looking for answers...
After these first results, more questions have arisen and so did the concerns!

The quali-quantitative analysis of organic compound is of great importance in the pharmacological field, as potential safety problems arise from the new production processes of biological drugs and from the complex structural and biological characteristics of these products.

In Infanrix Hexa we found

- chemical contamination from the manufacturing process or cross-contamination with other manufacturing lines;
- chemical toxins;
- bacterial peptide toxins;
- insoluble and indigestible macromolecule that reacts to the protein assay, but cannot be recognized by any protein databases.

We have not found:

- Protein antigens of diphtheria toxoids, tetanus, pertussis, hepatitis B, haemophilus influenzae B, Poliomyelitis 1-2-3;
- Formaldehyde and glutaraldehyde, phenoxyethanol, antibiotic residues indicated in the composition;

In Infanrix Hexa there are six antigens

Tetanus, diphtheria and pertussis toxoids, D antigens of Poliomyelitis 1-2-3, hepatitis B proteins obtained with genetic engineering and Haemophilus polysaccharides chemically linked to tetanus toxoid as carrier. Toxoids are created by treatments with formaldehyde and glutaraldehyde that should remove toxicity keeping intact their ability to stimulate protective antibodies against original toxins.

We were expecting to find the three toxoids and the other antigens not modified by treatment with formaldehyde and glutaraldehyde, to separate the antigens from each other and to be digestible by the enzyme specific for proteins (trypsin). **We have found instead a real polymer, insoluble and indigestible, that we supposed to be the set of antigens chemically bound together (has to be defined if this is present as an aggregate of the individual antigens or a single macromolecule), on which we can find in literature partial information regarding the single antigens.**

This macromolecule could not be recognized in any way by the protein databases, and in fact it turned out to be a solid compound of an unknown chemical structure.

Proteins solubility and their digestion (i.e. the capacity to divide them into small peptide fragments) are two typical proteins characteristics that not only makes it possible to study them through some specific analysis methods **but are also fundamental for the interaction with the immune system to create protective antibodies**, because if the protein structure is heavily altered from the original one, the new antibodies result completely different from those that are able to attack the original antibodies causing illnesses.】

Since this polymer we have encountered, derived from the antigenic mix, is not only different for its spatial conformation but it's chemically different, so **we can state that we are not facing antigens similar to the original ones but in the form of a compound with an unknown and unpredictable toxicity and efficacy.**

Not only vaccine antigens have been not detected, there were also 65 signs of chemical contaminants of which only 35% is known, there are among these various processing residues and cross-contaminations from other manufacturing lines, and their identification will be checked during the second level of the analytical study (i.e. with standard controls).

7 chemical toxins among these signals have also been identified, probably deriving from chemical contaminants of the manufacturing process or other manufacturing lines at the vaccine manufacturing site; these toxins have a structure that could probably be partially derived from the formaldehyde, glutaraldehyde and cyanogen bromide reaction with other chemical contaminants in the vaccine. We'd like to point out that the toxicity of many of these toxins have been confirmed and published in Pubchem or Toxnet and this poses important safety problems, issues and concerns.

From the protein and peptide fraction study, various free peptides of bacterial origin have been obtained probably coming from the bacterial culture cells used for the antigen extraction. Literature reports bacterial peptides as potential allergens ⁵ and also as capable of inducing autoimmune reactions ⁶ and these too put a safety issue that needs to be further clarified with the regulatory bodies.

Coming back to the two basic principles that have been our topic on this analysis path, we reaffirm what we have said in the recent interview on the scientific journal Nature: we are inquiring the vaccines efficacy and safety and we can't quite understand how it is possible to claim that this vaccine is even able to generate the 6 protective antibodies - reason why it is designed for - and furthermore to understand how this cluster made of 6 neurotoxic antigens bound together can be claimed as not toxic for newborns.

Infanrix Hexa hexavalent, as for the method we have commissioned, casts major doubts on both its effectiveness and on its safety...

One thing is for sure: we will not stop to proceed.

Study on the chemical composition profile of Infanrix Hexa

Introduction and description of the need

The quali-quantitative analysis of organic compounds is of great importance in the pharmacological field¹, as potential safety problems arise from the new production processes of biological drugs and from the complex structural and biological characteristics of these products.²

The review of the registration dossiers for military vaccines that we find in the final report³ of the Parliamentary Commission of Inquiry "Depleted Uranium"⁴ revealed the presence of protein-chemical contaminants and impurities, which required further analytical study. Our association has decided to take charge of it, as far as possible.

This project is part of the above-mentioned insights. It has been therefore necessary to develop a technology capable of analyzing a wide spectrum of molecules of chemical, metabolic and protein origin in order to evaluate the quality of the obtained results.

A method has been therefore developed, based on SANIST technology to test vaccines for purity and safety (further information below).

Results and Discussion

1. Analysis of the composition declared in the vaccine leaflet

Compound	Presence	Ionic species
Amino acids	YES	[M+H] ⁺
Formaldehyde ⁵	Not detected	-
Lactose anhydrous	YES	[M+H-H ₂ O] ⁺
Vitamins	Not detectable	-

2. Protein fraction analysis

According to the manufacturer, Infanrix Hexa vaccine contains some proteins. The sample has been analyzed for the identification of these proteins. At a visual analysis, the sample appears milky.

Different analysis have been conducted on the sample:

2.1 - 1st analysis: Digestion as it is

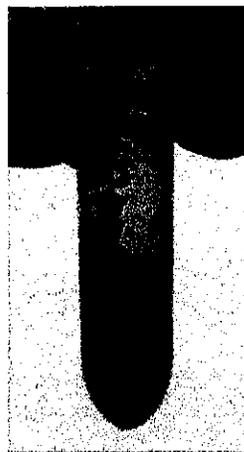

To start with, the sample has been subjected to an enzymatic digestion process: 10 μL of a raw sample has been treated with 50 μL Trypsin, left overnight in thermoblock at 37 ° C. A 1 mg / mL hemoglobin control has been prepared and treated as the sample. **This analysis revealed the absence of any proteins in the sample.**

2.2 - 2nd Analysis: Digestion of Precipitate

The sample has been then subjected to further analysis by separating, by centrifugation, the liquid part from the solid part of the milky suspension. All the supernatant has been taken. The remaining precipitate has been treated with 30 μL Trypsin and left overnight in thermoblock at 37 ° C. A 1 mg / mL hemoglobin control has been prepared and treated as the sample. After digestion, the sample and the control have been centrifuged. The supernatant has been taken and placed in vials for analysis. 20 μL osmotized H_2O have been added in order to give enough volume for injection. **This analysis revealed the absence of any proteins in the sample.**

2.3 - 3rd analysis: Bradford assay

To identify the actual presence of proteins, Infanrix Hexa vaccine has been subjected to the Bradford assay. 200 μL of the raw sample has been treated with 300 μL osmotic H_2O to obtain volume. Then 500 μL of Bradford reagent have been added. After a visual analysis, we can confirm the presence of proteins or peptide sequences given by the blue color (see Figure below):

Based on the calibration line, a protein concentration of 1.099 mg/mL was detected.

2.4 - 4th analysis: Digestion as it is at 57 ° C

After Bradford's assay, 20 μL of the raw sample has been treated with 80 μL of Trypsin. A 1 mg / mL hemoglobin control has been prepared and treated as the sample. They have been left in thermoblock at 37 ° C for 4 hours and then at 57 ° C for 30 minutes. The sample and the control have

then been subjected to centrifugation and the supernatant has been taken and placed in vial for analysis.

In order to process the data thus obtained, the Mascot¹¹ database has been initially used but **nothing has been found**. Therefore, the GMP has been used but also in this case **no protein sequences have been detected**. By the DeNovo research, the following peptide sequences that do not meet the trypsin cutting criteria and therefore potentially belong to free peptides have been identified. Below is the detected sequences list:

YLSA	YLSA	SLGS	HNLPT
QLYTCC	CHFAHD	WRASST	SYLPFT
SAGE	HLLNMT	YSDDQC	NMAWW
DEV	CHPPYL	TDTENW	GPFRVW
AEYHW	TLAPRF	ALAPWF	RWGPH
DEV	GSAAG	MNFHR	DSYWH
VLYACPP	DEV	NSNWW	WGC
	SNCGYY	VFHRE	

These sequences have been filed into the MS-BLAST¹² search engine obtaining the characterizations reported in Table 1. As can be seen, they have been potentially attributed by structural similarity to proteins of the bacterial world. **The proteins relating to the antigens present in the vaccine have not been detected**. This may be due to its extensive structural modification, introduced by formaldehyde and glutaraldehyde. In fact, the database research has been carried out Without considering the m/z variation introduced by the above-mentioned compounds

It is important to verify whether these changes have led to cross-linked macromolecular complexes shaping. In this regard, we will ask for further analysis using MALDI-TOF-MS¹³ technology widely acknowledged in clinical practice for the study of high weight macromolecules,

Table 1 - Batch #1 (A21CD072D)

Name of Protein	Organism	Total Score
Hypothetical protein CALCODRAFT_501505	Calocera cornea HHB 12733	159

Hypothetical protein FIBSPDRAFT_917685	Bulborhizoctonia sp. CBS 109695	107
Uncharacterized protein	Blastocystis hominis	104
Unnamed protein product	Blastocystis hominis	104
Hypothetical protein J132_09024	Termitomyces ssp. J132	104

3. Metabolic fraction Analysis

¹¹ http://www.matrixscience.com/help/seq_db_setup_db_gui.html

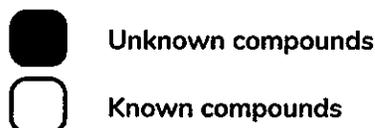

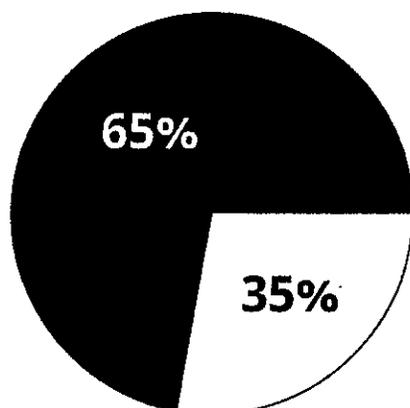

¹² <http://genetics.bwh.harvard.edu/msblast/>

¹³ <https://it.wikipedia.org/wiki/MALDI>

It should be emphasized that this screening study provides a semi-quantitative data which correspond to a range from nanograms to micrograms as an indicative order of magnitude. To obtain accurate quantitative data, it will be necessary to proceed using certified analytical standards of known strength.

Below, we report the identification screening results obtained in the two batches under examination:

Batch #1 (A21CD072D)

In Batch # 1 we have 65 signals of which only 35% are known

It has not been possible to carry out the analyzes on different batches because since all the Infanrix Hexa we have purchased for more than a year on the national territory, in different regions and in different periods, belong to batch A21CD072D.

NOTES FOR UNDERSTANDING: this is a first level analysis, that is an identification based on molecular weight. If the result is univocal, (ie at a measured molecular weight only one compound is associated as a structure) it is more likely the right one, but absolute certainty is not possible in this phase. As you will notice, as far as a certain number of compounds is concerned, different substances correspond to a particular molecular weight.

3.1. Infanrix Hexa Vaccine - Batch # 1 (A21CD072D)

65 signals were detected, among which only the 35% gave a potential classification (Table 2).

It must be specified that compound identity is not certain and it should be confirmed by a second level screening carried out with certified analytical standards.

In fact, during screening level, the device measures a particular data by its accurate molecular weight (measurement error <10 ppm). The empirical formula is calculated on the basis of these measures. Some formulas might correspond to several compounds having the same molecular weight but different chemical identity.

NOTES FOR UNDERSTANDING: in essence, the certain data is that we have 65 chemically different substances among which only 35% is known.

Molecules potentially belonging to toxin category have been researched. They have been suggested on the basis of accurate m / z mode research (error <10 ppm) using the toxic compounds database in the Metlin search engine. Table 3 shows the candidates obtained.

It is emphasized that different detected compounds have a candidate empirical formula containing sulfur compounds or sulfur in the form of various functional groups. Furthermore, the presence of formic acid in the form of sodium salt and a polymer deriving from contaminations of Poly Ethylene Glycol (PEG)¹⁴ with an average molecular weight equal to 1340 Da have been detected.

¹⁴ <https://www.sciencedirect.com/topics/materials-science/polyethylene-glycol>

5. Final considerations

Most of the contaminants and impurities detected were not characterized using the metabolic and protein reference databases (KEGG, NCBI-Protein SwissProt).⁸⁻⁹

There is a critical issue in the contamination of various compounds potentially or definitely harmful to human health.

In short, the first questions we asked ourselves, and the relative answers obtained, are the following:

- | | |
|--|---|
| 1. Are the chemical substances listed in the data sheet present? | in part |
| 2. Are there any chemical and protein contaminations? | YES |
| 3. How many contaminating compounds are there? | From 65 |
| 4. What are they? | Chemical toxins, chemical compounds, peptides |

Next analysis

1. First of all, it is necessary to identify with certainty the most interesting probable compounds
2. Then to determine the exact amount of each contaminant
3. Finally to determine the structure of the macromolecule constituted by the set of antigens

6. Future research developments

Confirmation and identity analysis will be performed using the "Tandem Mass Spectrometry (MS / MS)" technique associated with the aid of certified analytical standards. The analysis will be performed in compliance with the European directives (EU directive 2002/657 / EC) useful for the identification of compounds.

In particular, the investigation will have the objective of confirming those substances whose toxicity and allergenicity is known and the 7 toxins identified will be an element of careful study.

7. Description of the SANIST technology

The innovative internationally renowned SANIST platform, through publications in peer-reviewed scientific journals¹⁵⁻¹⁶ - was used to perform a first identification screening on the vaccines of interest.

8. Details related to the analytical method

SANIST technology consists of:

- a) a kit for the extraction of analytes (the unknown substances to be determined);
- b) the LC-SACI / ESI-MS analysis system which allows to reduce the chemical noise of mass spectrometers and obtain a better detection of instrumental signals;

¹⁵ Albinì A. et al., Rapid Commun Mass Spectrom. 2015 Oct 15;29(19):1703-10. doi: 20.1002/rcm.7270. (<https://onlinelibrary.wiley.com/doi/full/10.1002/rcm.7270>)

¹⁶ Cristoni S. et al., J Mass Spectrom. 2017 Jan;52(1):16-21. doi:10.1002/jms.3895. (<https://www.ncbi.nlm.nih.gov/pubmed/27776380>)

- c) the **SANIST data processing system** consisting of a local bioinformatics and network platform capable of processing data using dedicated databases and customized algorithms. It is specified that, during the screening phase, the recognition is made in the context of scientific research and through research in official banks (KEGG, NCBI-Prot and SwissProt)^{17,18} without the aid of certified analytical standards. It is therefore necessary to perform a second level analysis with certified analytical standards to confirm their identity.

9. Areas of application of SANIST technology

To date, the **SANIST platform** is applicable in the following fields:

- In **clinical research** of disease markers and their direct application in the diagnostic field.
- Food services**, food traceability. Comparative studies to determine the quality of products based on their complex molecular composition. Control of food counterfeiting.
- Nutraceutical sector**, development of the nutritional value of a food supplement based on its molecular composition. Forged search (for example: added drugs).
- Pharmaceutical sector**, drug control and research of active biomolecules.
- Cosmetic industry**: the molecular composition of cosmetic products can be carefully monitored and correlated with the quality of the product.

10. How to read the tables

This is a screening phase; the instrument measures a particular data by its accurate molecular weight (measurement error <10 ppm). On the basis of these measures a brute formula is calculated. Some formulas can correspond to several compounds having the same molecular weight but different chemical identity.

Example of a single associated component:

Atovaquone Medication for the treatment of malaria

In this example, the instrument detected a signal with a certain molecular weight. By inserting the brute formula in the databases, it was possible to associate a **probable component**.

Example of a number of associated components:

Tetracenomycin F2
 Decaketide tricyclic intermediate
 1-hydroxyversicolorone
 Monocarboxylic hydroxy acid
 Member of the anthracenes
 Antrafuran

In this example, the instrument detected a signal with a certain molecular weight. By inserting the brute formula in the databases, it was possible to associate **three probable components**.

11. Tables of contaminants

Table 2 - Batch #1 (A21CD072D)

Tungsten carbide
 Inorganic carbide industrially used to synthesize cemented carbides.

New Quality-Control Investigations on Vaccines: Micro- and Nanocontamination

Research Article

Abstract

Vaccines are being under investigation for the possible side effects they can cause. In order to supply new information, an electron-microscopy investigation method was applied to the study of vaccines, aimed at verifying the presence of solid contaminants by means of an Environmental Scanning Electron Microscope equipped with an X-ray microprobe. The results of this new investigation show the presence of micro- and nanosized particulate matter composed of inorganic elements in vaccines' samples which is not declared among the components and whose unduly presence is, for the time being, inexplicable. A considerable part of those particulate contaminants have already been verified in other matrices and reported in literature as non biodegradable and non biocompatible. The evidence collected is suggestive of some hypotheses correlated to diseases that are mentioned and briefly discussed.

Introduction

Vaccines are one of the most notable inventions meant to protect people from infectious diseases. The practice of variolation is century-old and is mentioned in Chinese and Indian documents dated around 1000 A.D. Over time, variolation has been replaced by vaccination, vaccines have been enhanced as to technology, and the vaccination practice is now standardized worldwide.

Side effects have always been reported but in the latest years it seems that they have increased in number and seriousness, particularly in children as the American Academy of pediatrics reports [1,2]. For instance, the diphtheria-tetanus-pertussis (DTaP) vaccine was linked to cases of sudden infant death syndrome (SIDS) [3]; measles-mumps-rubella vaccine with autism [4,5]; multiple immunizations with immune disorders [6]; hepatitis B vaccines with multiple sclerosis, etc.

The notice of Tripedia DTaP by Sanofi Pasteur reports "Adverse events reported during post-approval use of Tripedia vaccine include idiopathic thrombocytopenic purpura, SIDS, anaphylactic reaction, cellulitis, autism, convulsion/grand mal convulsion, encephalopathy, hypotonia, neuropathy, somnolence and apnea". The epidemiological studies carried out did not show a clear evidence of those associations, even if in 2011 the National Academy of Medicine (formerly, IOM) admitted: "Vaccines are not free from side effects, or adverse effects" [7].

Specific researches on components of the vaccines like adjuvants (in most instances, Aluminum salts) are already indicated as possible responsible of neurological symptoms [8-10] and in some cases, in-vivo tests and epidemiological studies demonstrated a possible correlation with neurological

diseases [10,11]. Neurological damages induced in patients under hemodialysis treated with water containing Aluminum are reported in literature [12].

Recently, with the worldwide-adopted vaccines against Human Papillomavirus (HPV), the debate was reawaken due to some adverse effects reported by some young subjects.

Specific studies communicated the existence of symptoms related to never-described-before syndromes developed after the vaccine was administered. For instance, Complex Regional Pain Syndrome (CRPS), Postural Orthostatic Tachycardia Syndrome (POTS), and Chronic Fatigue Syndrome (CFS) [13]. The side-effects that can arise within a relatively short time can be local or systemic.

Pain at the site of injection, swelling and uncontrollable movement of the hands (though this last symptom can also be considered systemic) are described. Among the systemic effects, fever, headache, irritability, epileptic seizures, temporary speech loss, lower limbs dysaesthesia and paresis, hot flashes, sleep disorders, hypersensitivity reactions, muscle pain, recurrent syncope, constant hunger, significant gait impairment, incapacity to maintain the orthostatic posture are reported [14].

It is a matter of fact that every day millions of vaccine doses are administered and nothing notable happens, but it is also irrefutable that, regardless of the amount of side effects that are not recorded and the percentage of which remains in fact unknown, in a limited number cases something wrong occurs. No satisfactory explanation or, in many cases, no explanation at all has been given and it seems that those adverse effects happen on a random and stochastic basis.

Those situations induced us to verify the safety of vaccines from a point of view which was never adopted before: not a biological, but a physical approach. So, we developed a new analysis method based on the use of a Field Emission Gun Environmental Scanning Electron Microscope investigations to detect possible physical contamination in those products.

Materials and Methods

44 types of vaccines coming from 2 countries (Italy and France) were analyzed. Table 1 groups them in terms of name, brand and purpose.

Table 1: List of vaccines analyzed, according to their purpose.

N	Name	Brand Name, Country of Distribution	Description	Production Batch, Expiry Date
1	Vivotif Berna	Berna Biotech SA, Italy	Anti-Thyphoid Vaccine (Live), group Ty21a	3000336 [2004]
2	Typhim Vi	Aventis Pasteur MSD, Italy	Anti-Salmonella typhi Vaccine	U1510-2 [2004]
3	Typherix	GlaxoSmithKline S.p.a., Italy	Anti-Thyphoid Vaccine (polysaccharide Vi)	ATYPB061BB [2009]
4	Anatetall	Chiron (now Novartis) Italy	Adsorbed anti-Tetanus Vaccine	030106 [2004]
5	Anatetall	Novartis Vaccines and Diagnostics, Italy	Adsorbed anti-Tetanus Vaccine	060510 [2009]
6	Tetabulin	Baxter AG, Italy	Adsorbed anti-Tetanus Vaccine	VNG2G006A [2009]
7	Dif-Tet-All	Novartis Vaccines and Diagnostics, Italy	Adsorbed anti-Tetanus and diphtheria Vaccine	070501 [2009]
8	Infanrix	GlaxoSmithKline S.p.a., Italy	Anti-Diphtheria, tetanus and pertussis vaccine	AC14B071A] [2009]
9	Infanrix hexa	GlaxoSmithKline Biologicals s, Italy	Anti-diphtheria, tetanus, pertussis, hepatitis B, poliomyelitis and disease caused by Haemophilus influenzae type b	A21CC512A [2017]
10	Infanrix hexa	GlaxoSmithKline Biologicals s. a. France	Anti-diphtheria, tetanus, pertussis, hepatitis B, poliomyelitis and disease caused by Haemophilus influenzae type b	A21CC421A [2017]
11	M-M-R vaxPro	Sanofi Pasteur MSD, Italy	M-M-R vaxPro (measles, mumps, and rubella) analyzed in Cambridge	L012437 [2017]

42	Gardasil	Sanofi Pasteur MSD, Italy	Anti-HPV (types 6,11,16,18) vaccine	K023804 [2016]
43	Cervarix	GlaxoSmithKline Biological, Italy	Anti-HPV (type 16,18)	AHPVA238AX [2017]
44	Feligen CRP	Virbac S.A. - Carros - Italy	anti-panleucopenia, infectious rhinotracheitis and infections by Calciavirus, veterinary Vaccine for cats	3R4R [2013]

Some vaccines, in fact a minority, are meant to deal with a single bacterium or virus, while others are multi-valent. The list of vaccines we analyzed may contain repeated names, because we considered different batches and years of production of the same vaccine: the ones against influenza in particular.

The study was aimed at verifying a possible physical contamination. To do that, we performed a new kind of investigation based on observations under a Field Emission Gun Environmental Electron Scanning Microscope (FEG-ESEM, Quanta 200, FEI, The Netherlands) equipped with the X-ray microprobe of an Energy Dispersive Spectroscopy (EDS, EDAX, Mahwah, NJ, USA) to detect the possible presence of inorganic, particulate contaminants and identify their chemical composition.

A drop of about 20 microliter of vaccine is released from the syringe on a 25-mm-diameter cellulose filter (Millipore, USA), inside a flow cabinet. The filter is then deposited on an Aluminum stub covered with an adhesive carbon disc. The sample is immediately put inside a clean box in order to avoid any contamination and the box is re-opened only for the sample to be inserted inside the FEG-ESEM chamber. We selected that particular type of microscope as it allows to analyse watery and oily samples in low vacuum (from 10 to 130 Pa) at a high sensitivity.

When the water and saline the vaccine contains are evaporated, the biological/physical components emerge on the filter and it is then possible to observe them. This type of microscope

(low-vacuum observations) prevents the possible sample contamination and the creation of artefacts. The observations are made with different sensors (SE: secondary-electron sensor and BSE: backscattered-electron sensor), and are performed at a pressure of 8.9×10^{-1} mbar, at energies ranging from 10 to 30kV to detect the particulate matter's size, morphology and its elemental composition. The method identifies clearly inorganic bodies with a higher atomic density (looking whiter) than the biological substrate. So, organic entities are visible and easy to distinguish from inorganic ones. The method cannot distinguish between proteins and organic adjuvants (e.g. squalene, glutamate, proteins, etc.) or viruses, bacteria, bacteria's DNA, endo-toxins and bacteria's waste, but their comparatively low atomic density allows us to identify these entities as organic matter. In some vaccines, the organic matter contains white-looking debris named aggregates, while a high concentration of inorganic debris is called a cluster.

Single inorganic particles or organic-inorganic aggregates are identified, evaluated and counted. The counting procedure is repeated three times by three different operators, with an error lower than 10%. When a layer of salts (Sodium chloride or Aluminum) is detected, we record the situation but we do not do body count.

Results

The investigations verified the physical-chemical composition of the vaccines considered according to the inorganic component as declared by the Producer. In detail, we verified the presence of saline and Aluminum salts, but further presence of micro-, sub-micro- and nanosized, inorganic, foreign bodies (ranging from 100nm to about ten microns) was identified in all cases, whose presence was not declared in the leaflets delivered in the package of the product (Table 2).

Table 2: List of the vaccines according to their manufacturers with the chemical composition of the debris identified in each sample. The elements most represented are reported.

N	Company	Name	Alluminum	Elements Identified
1	Allergopharma - Germany	Allergoid	yes	Al
2	Aventis Pasteur MSD Lyon - France	Typhim Vi	no	BrKP, PbSi, FeCr, PbCISiTi
3	Baxter AG	Tetabulin	no	SiMg, Fe, SiTiAl, Sba, Zn
4	Berna Biotech	Vivotif Berna	no	FeAl, ZrAlHf, SrAl, BiAlCl
5	Berna Biotech	Inflexal V	no	CuSnPbZn, Fe, CaSiAl, SiAl, NaPZn, ZnP, AlSiTi

44	Virbac S.A. - Carros - France	Feligen CRP	no	Ca, SiAl

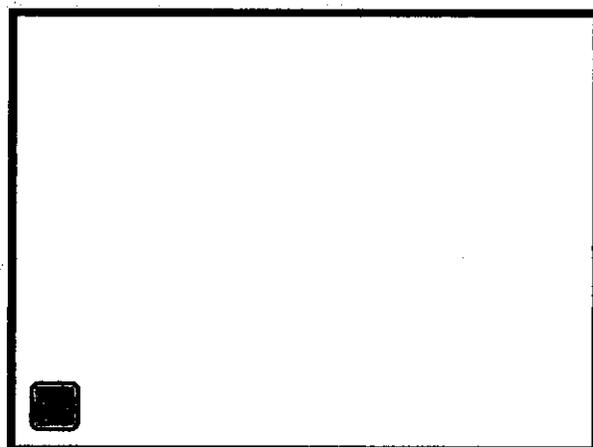

Figure 1a shows a layer of crystals of Sodium chloride (NaCl) embedding salts of Aluminum phosphate ($AlPO_4$) in a drop of Gardasil (anti-HPV vaccine by Merck) as the EDS spectrum (Figure 1b) shows. Saline is the fluid base to any vaccine preparation and Aluminum salts or Aluminum hydroxide [$Al(OH)_3$] are the adjuvants which are usually added.

Looking at the area outside these precipitates but inside the liquid drop, we identified other things: single particles, clusters of particles and aggregates (organic-inorganic composites) that are due to an interaction of the inorganic particulate matter with the organic part of the vaccine.

Figure 2a-2f shows the different typology of entities identified in the vaccines (Repevax, Prevenar and Gardasil); single particles, cluster of micro- and nanoparticles (<100nm) and aggregates with their EDS spectra (Figure 2d-2f). The images (Figure 2a & 2d) show debris of Aluminum, Silicon, Magnesium and Titanium; of Iron, Chromium, Silicon and Calcium particles (Figure 2b & 2e) arranged in a cluster, and Aluminum -Copper debris (Figure 2c & 2f) in an aggregate.

As can be seen, the particles are surrounded and embedded in a biological substrate. In all the samples analyzed, we identified particles containing: Lead (Typhym, Cervarix, Agrippal S1, Meningitec, Gardasil) or stainless steel (Mencevax, Infarix Hexa, Cervarix, Anateall, Focetria, Agrippal S1, Menveo, Prevenar 13, Meningitec, Vaxigrip, Stamaril Pasteur, Repevax and MMRvaxPro).

Figure 3a-3d show particles of Tungsten identified in drops of Prevenar and Infarix (Aluminum, Tungsten, Calcium chloride).

Figure 4a-4d present singular debris found in Repevax (Silicon, Gold, Silver) and Gardasil (Zirconium).

Some metallic particles made of Tungsten or stainless steel were also identified. Other particles containing Zirconium, Hafnium, Strontium and Aluminum (Vivotif, Meningetec); Tungsten, Nickel, Iron (Priorix, Meningetec); Antimony (Menjugate kit); Chromium (Meningetec); Gold or Zinc (Infarix Hexa, Repevax), or Platinum, Silver, Bismuth, Iron, Chromium (MMRvaxPro) or Lead, Bismuth (Gardasil) or Cerium (Agrippal S1) were also found. The only Tungsten appears in 8/44 vaccines, while Chromium (alone or in alloy with Iron and Nickel) in 25/44. The investigations revealed that some particles are embedded in a biological substrate, probably proteins, endo-toxins and residues of bacteria. As soon as a particle comes in contact with proteic

fluids, a nano-bio-interaction [6] occurs and a "protein corona" is formed [7-10]. The nano-bio-interaction generates a bigger-sized compound that is not biodegradable and can induce adverse effects, since it is not recognized as self by the body.

Figure 5a-5f show examples of these nano-bio-interactions. Aggregates can be seen (stable composite entities) containing particles of Lead in Meningitec, (Figure 5a & 5b) of stainless steel (Iron, Chromium and Nickel, Figure 5c & 5d) and of Copper, Zinc and Lead in Cervarix (Figure 5e & 5f). Similar aggregates, though in different situations (patients suffering from leukemia or cryoglobulinemia), have already been described in literature.

The link between these two entities generates an unfolding of the proteins that can induce an autoimmune effect once those proteins are injected into humans.

Figure 6a & 6b show one of the foreign bodies identified in Agrippal. The particle is composed of Cerium, Iron, Titanium and Nickel. (Figure 7a & 7b) present an area of Repevax where the morphology of red cells - we cannot tell whether they are human or animal- is clearly visible.

Table 3 summarizes the number and morphology of the debris identified, in term of single particles, clusters of particles or aggregates (organic-inorganic compounds), while Figure 8 shows the graph obtained calculating the total number of particles (particles plus clusters plus aggregates) identified for 20 microl of every vaccine.

Similar aggregates were already described by other scientists who identified them in the blood e.g. in leukemic patients [15] and in subjects affected by cryoglobulinemia [16].

Not all the vaccines analyzed contain the same contamination, though the same vaccine belonging to different batches and, in some cases, coming from different countries can contain a similar contamination (e.g. the vaccines by Glaxo Infarix, Typherix and Priorix contain Tungsten. Tungsten was also identified in Menjugate kit by Novartis, and Prevenar, Meningitec by Pfizer and Meningitec by Wyeth.)

Feligen, the only veterinary vaccine tested, proved to be the only sample free from inorganic contamination, while Allergoid generates a layer of inorganic salts so thick that it does not allow to detect other particulate contaminants.

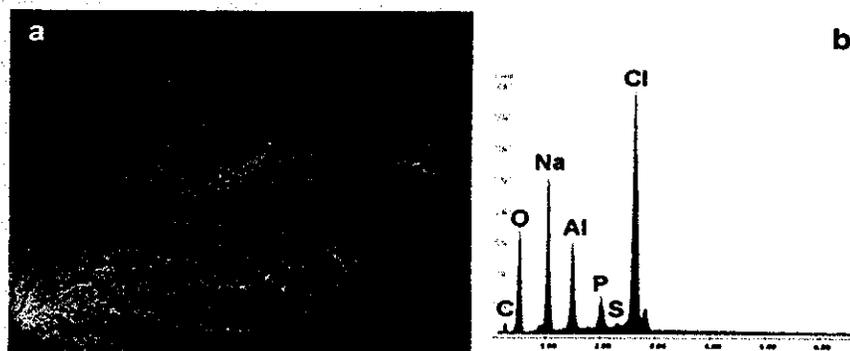

Figure 1: Crystals of saline solution and Aluminum Phosphate and corresponding EDS spectra.

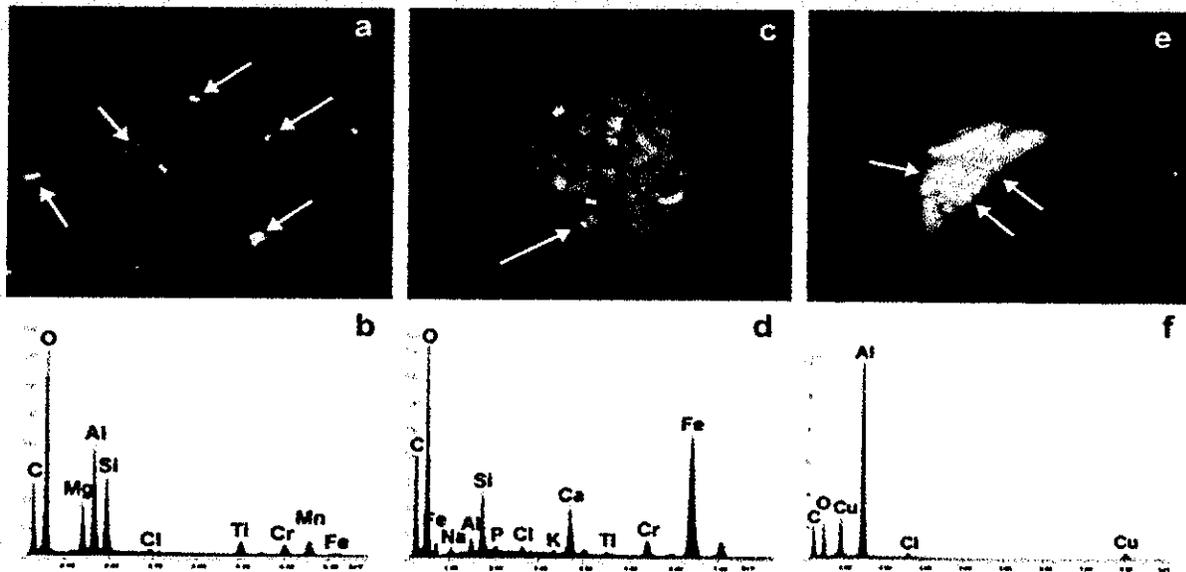

Figure 2: Images of single particles, cluster of micro- and nanoparticles (<100nm) and aggregates with their EDS spectra. They are respectively composed of (a,b) Aluminum, Silicon, Magnesium, Titanium, Chromium, Manganese, Iron, (c,d) Iron, Silicon, Calcium Titanium, Chromium, (e,f) Aluminum, Copper. The arrows show the points where EDS spectra were taken.

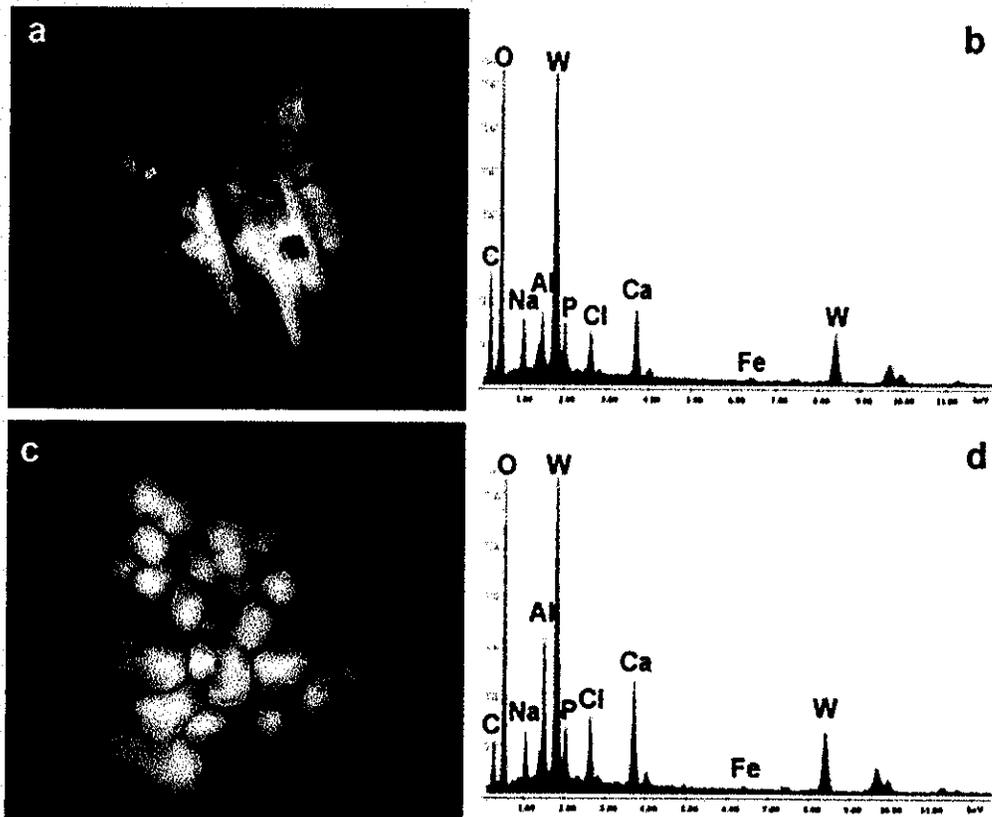

Figure 3: Images of Tungsten particles identified in drops of Prevenar and Infarix. They are composed respectively of Tungsten, Aluminum, Iron but in different concentrations. The arrows show the points where EDS spectra were taken.

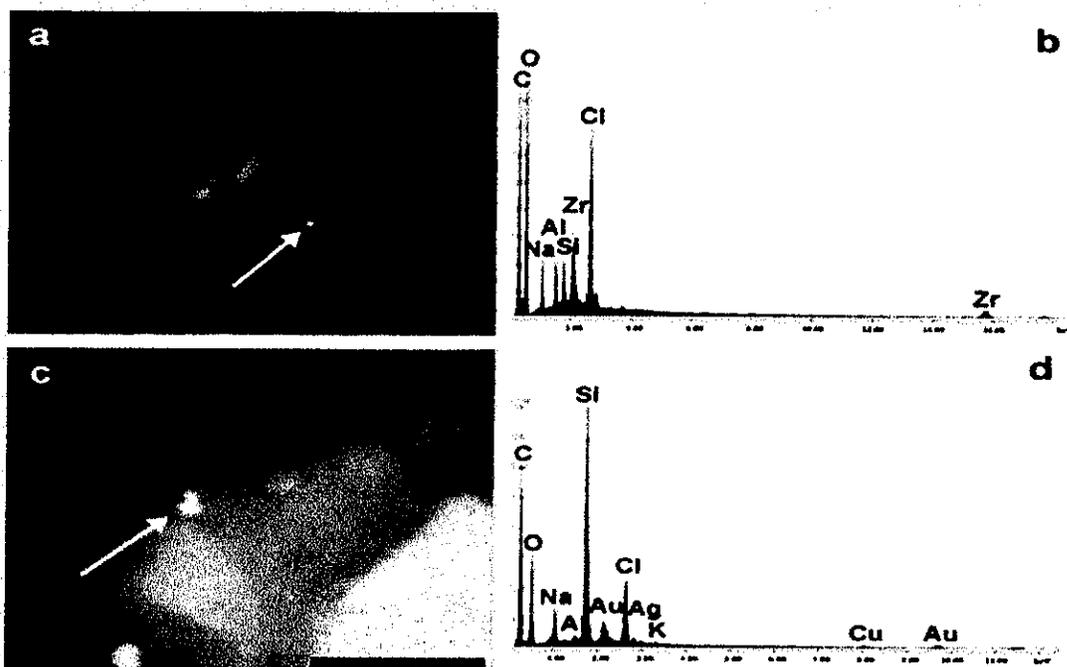

Figure 4: Images show examples of nano biointeraction. The aggregate (a,b) identified in Gardasil contains nanoparticles of Chlorine, Silicon, Aluminum, Zirconium, while the debris found in Repevax contains Silicon, Gold, Silver (c,d). The arrows show the points where EDS spectra were taken.

Table 3: List of the debris' number identified in each vaccine as single particle, clusters and aggregates. Characterization is made by shape, size range and variability of the number of particles counted in each aggregate [in brackets].

Name	Total Debris n.	Size Range in μm	Cluster n.	Size Range in μm	Aggregate n.(Range of Particles)	Size Range μm

Discussion

The quantity of foreign bodies detected and, in some cases, their unusual chemical compositions baffled us. The inorganic particles identified are neither biocompatible nor biodegradable, that means that they are biopersistent and can induce effects that can become evident either immediately close to injection time or after a certain time from administration. It is important to remember that particles (crystals and not molecules) are bodies foreign to the organism and they behave as such. More in particular, their toxicity is in some respects different from that of the chemical elements composing them, adding to that toxicity which, in any case, is still there, that typical of foreign bodies. For that reason, they induce an inflammatory reaction.

After being injected, those microparticles, nanoparticles and

aggregates can stay around the injection site forming swellings and granulomas [17]. But they can also be carried by the blood circulation, escaping any attempt to guess what will be their final destination. We believe that in many cases they get distributed throughout the body without causing any visible reaction, but it is also likely that, in some circumstances, they reach some organ, none excluded and including the microbiota, in a fair quantity. As happens with all foreign bodies, particularly that small, they induce an inflammatory reaction that is chronic because most of those particles cannot be degraded. Furthermore, the protein-corona effect (due to a nano-bio-interaction [18]) can produce organic/inorganic composite particles capable of stimulating the immune system in an undesirable way [19-22]. It is impossible not to add that particles the size often observed in vaccines can enter cell nuclei and interact with the DNA [23].

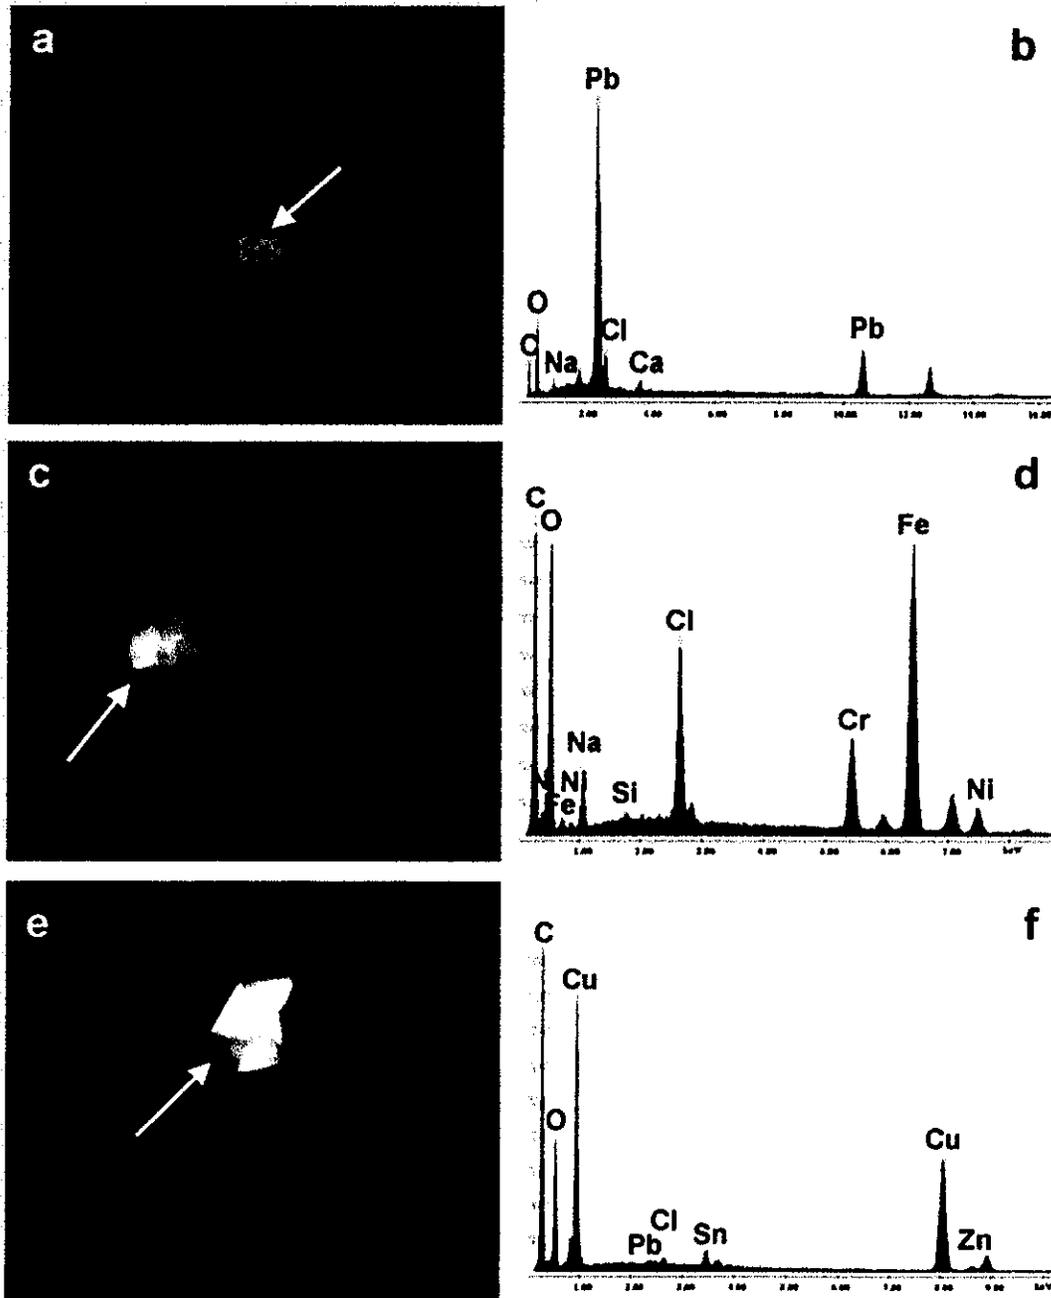

Figure 5: show particles surrounded by an organic compound. They are composed of Lead (a,b), Iron, Chromium, Nickel (stainless steel; c,d), Copper, Tin, Lead (e,f). The arrows show the points where EDS spectra were taken.

In some cases, e.g. as occurs with Iron and some Iron alloys, they can corrode and the corrosion products exert a toxicity affecting the tissues [24-26].

The detection of presence of Aluminum and NaCl salts is obvious as they are substances used by the Producers and declared as components, but other materials are not supposed to be in the vaccine or in any other injectable drug, at that, and, in any case, Aluminum has already been linked with neurological diseases [27-29].

Given the contaminations we observed in all samples of human-use vaccines, adverse effects after the injection of those vaccines are possible and credible and have the character of randomness, since they depend on where the contaminants are carried by the blood circulation. It is only obvious that similar quantities of these foreign bodies can have a more serious impact on very small organisms like those of children. Their presence in the muscles, due an extravasation from the blood, could heavily impair the muscle functionality [30,31].

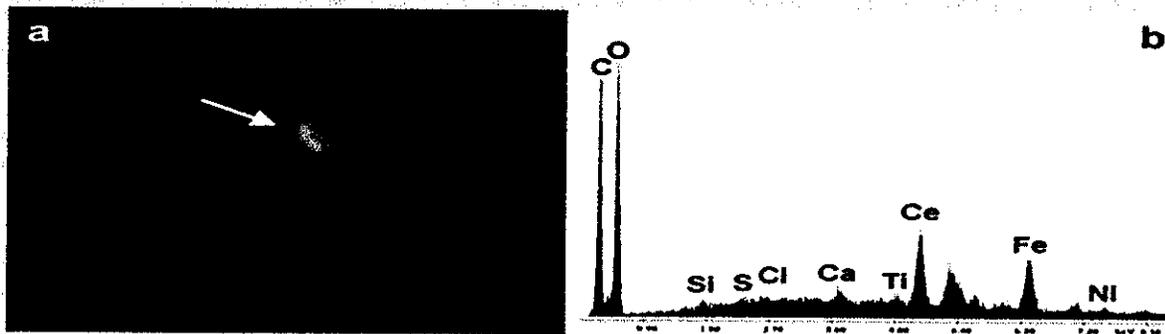

Figure 6: show an organic aggregate containing a debris made of Cerium, Iron, Nickel, Titanium. The red arrow indicates the organic layer (less atomically dense) that covers the Cerium particle.

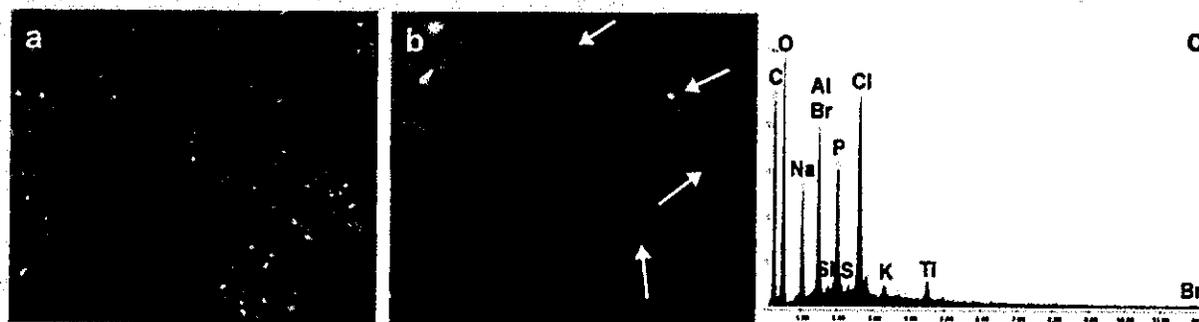

Figure 7: Image of an area in a Repevax drop where the morphology of red cells (red arrows) were identified. It is impossible to know whether they are human or animal origin. Among the debris of saline and Aluminum phosphate, there is the presence of debris (white arrows) composed of Aluminum, Bromine, Silicon, Potassium, Titanium.

We come across particles with chemical compositions, similar to those found in the vaccines we analyzed, when we study cases of environmental contamination caused by different pollution sources. In most circumstances, the combinations detected are very odd as they have no technical use, cannot be found in any material handbook and look like the result of the random formation occurring, for example, when waste is burnt. In any case, whatever their origin, they should not be present in any injectable medicament, let alone in vaccines, more in particular those meant for infants.

Other forms of so-far unknown contaminations have recently been observed and, in any case, vaccines contain components that could themselves be the cause of adverse effects. It is a well-known fact in toxicology that contaminants exert a mutual, synergic effect, and as the number of contaminants increases, the effects grow less and less predictable. The more so when some substances are unknown.

As a matter of fact, no exhaustive and reliable official data exist on the side-effects induced by vaccines. The episodic evidence reported by people allegedly damaged by vaccines is twofold: some say the damage occurred and became visible within a few hours from administration, and some maintain that it was a matter of some weeks. Though we have no indisputable evidence as to the reliability of those attestations, we can put forward a hypothesis to explain the different phenomena. In the former

case, the pollutants contained in the drug have reached the brain and, depending on the anatomical site interested, have induced a reaction. If that is the case, the whole phenomenon is very rapid. In the latter circumstance, the pollutants reached the microbiota, thus interfering with the production of enzymes necessary to carry out neurological functions [32-35]. That possibility takes time, as it involves the production of chemical compounds in a sufficient quantity, and an elapse of some weeks between injection and clinical evidence is reasonable. Of course, ours is no more than a hypothesis open to discussion and in need of proof, hoping that a chance of further investigation is allowed.

Conclusion

The analyses carried out show that in all samples checked vaccines contain non biocompatible and bio-persistent foreign bodies which are not declared by the Producers, against which the body reacts in any case. This new investigation represents a new quality control that can be adopted to assess the safety of a vaccine. Our hypothesis is that this contamination is unintentional, since it is probably due to polluted components or procedures of industrial processes (e.g. filtrations) used to produce vaccines, not investigated and not detected by the Producers. If our hypothesis is actually the case, a close inspection of the working places and the full knowledge of the whole procedure of vaccine preparation would probably allow to eliminate the problem.

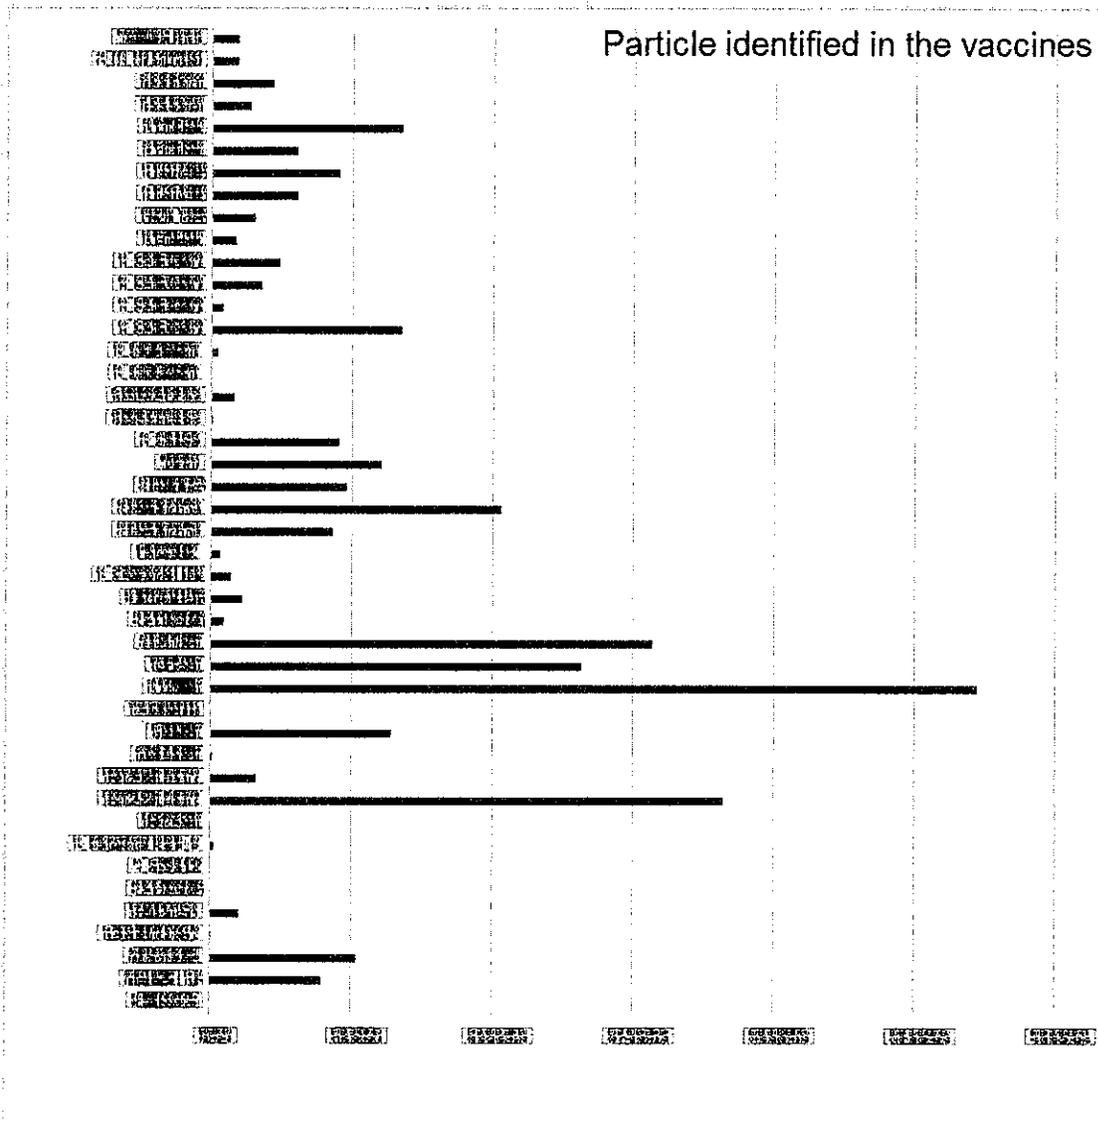

Figure 8: Graph of the debris' quantities identified in a 20 microl drop of every vaccine.

A further purification of the vaccines could improve their quality and could probably decrease the number and seriousness of the adverse incidental effects.

Acknowledgment

The Authors are indebted to Dr. Federico Capitani, Dr. Laura Valentini and Ms. Lavinia Nitu for their technical assistance. The opinions and conclusions are not necessarily those of the Institution.

HPV testimony to DOH

I would like to start off my testimony with questions for the decision makers at the Dept of Health as well as any State Legislators that may read or hear this testimony regarding the potential addition of the HPV vaccine to the mandatory list of vaccines needed for children to go to public school

Why is the HPV vaccine so heavily marketed for starters? Why make a vaccine for a disease that afflicts way less than 1% of people in their lifetime? Why include ingredients that are toxic, especially high doses of ingredients that scientists have objected to, and with documented toxicity to reproductive organs? Why use "placebos" in the testing that has been done by Pharmaceutical companies that contained both the high doses of aluminium as well as polysorbate 80 ? These are serious questions and need thoughtful deliberation.

When the U.S. introduced the human papilloma virus (HPV) vaccine in 2006, cervical cancer rates had been steadily declining for several decades This was due largely to successful and routine cervical cancer screening. HPV is an illness women have a lifetime risk of being diagnosed with 0.6%. Usually diagnosed most frequently at age 47 yrs old in the US, it is now targeting girls aged 11 to 26. Since then it is being marketed to boys as young as nine to prevent very rare anal and penile cancers — a disease that afflicts 0.2 % of men in their lifetime.

. Recent letters published in the *British Medical Journal* (BMJ) have brought forward some stark numbers that illustrate the vaccine's **appalling** record:

- A serious adverse event rate of 1 in 15 (7%) and a death rate among the vaccinated (14 per 10,000) that far exceeds the risk of dying from cervical cancer (.23 per 10,000) (*BMJ letter*, May 2018).
- Reports to the World Health Organization's global adverse drug reactions database—conservatively estimated to represent 10% of actual reactions—of over 305,000 adverse reactions where the HPV vaccine "is believed to have been the cause," including 445 deaths (23 of which were sudden) and over 1,000 cancerous tumors (including 168 cervical cancers), among other serious reactions (*BMJ letter*, December 2017).

HPV vaccines have a high number of reported adverse events: 45,277 in the US alone from its introduction in 2006 to May, 2018 (and these are considered to be vastly under-reported).

These hundreds of thousands of reported and unreported case reports can no longer be discarded simply as 'anecdotes' or 'coincidence,'. OUR CHILDREN AND GRANDCHILDREN ARE NOT ANECDOTES TO US !

It is argued that a healthy 16-year-old is at zero immediate risk of dying from cervical cancer but is faced with a small but real risk of death or serious disability from this vaccine. Cervical screening will always detect more pre-cancers and cancers than vaccination can prevent.

There is now reason to believe that there is a lowered probability of pregnancy in females in the US between 25 and 29 who received the HPV vaccine. The HPV vaccine may just be the common denominator behind the growing infertility link. I submit a link to a study, published in the current Journal of Toxicology and Environmental Health, which examines the childbearing capacity of women who received the human papilloma virus (HPV) vaccine – compared to those who didn't.

Both HPV vaccines contain aluminum, a toxic metal with documented potential to induce autoimmune self-attack, including on reproductive organs. HPV vaccines are loaded with aluminum: Merck's original Gardasil vaccine contained 225 micrograms of aluminum in each of three shots; the "new improved" Gardasil 9 shots contain a total of 1500 micrograms – a tremendous stimulant for the immune system that might just be "a tipping point" for youths who have had so many previous injections of aluminum in the schedule of 50 vaccines before school age.

Vaccine believers must accept that, like all drugs, vaccines can and do have thousands of documented long-term adverse reactions. Because these responses are mediated by the individual's unique immune system, they are diverse, unpredictable and profound.

Why does the CDC, and our Dept of Health brush off 45,277 reports of adverse events – including neurological and reproductive symptoms — among young women of childbearing age?

More studies must be done. The precautionary rule must apply so that our children do not needlessly suffer from the mistake by the CDC, and our own Dept of Health of making HPV a MANDATORY VACCINE !

Journal of Toxicology & Environmental Health -

<https://www.tandfonline.com/doi/full/10.1080/15287394.2018.1477640>

Aloha, my name is Stasia Estep and I am in opposition to HAR 11-157. Thank you everyone who rearranged their schedule to get here. Your voices matter. I know everyone here is striving for the same end which is keeping our keiki as healthy and safe as possible.

Before I begin I want to ask that everyone here as a medical professional consider a few questions. Has history ever shown the medical establishment to be wrong about a medical procedure, drug or therapy? True science is willing to question methodical dogma, even when the majority scoff at the idea. I have no doubt most of you are deeply caring individuals who have a desire to heal and protect. That's why you do what you do. That's also why I urge you to reflect on the education you received regarding vaccines. It being the one of the most routine treatments in any pediatrician's office, did you spend countless hours learning all of the ingredients, the adverse reactions, and how to identify them? Or was it mostly about the benefits? Did you learn how to give true fully informed consent? Where are you required by federal law to report reactions (that hopefully you know how to identify)? What is the history of each disease and the huge mortality and incidence decrease in the 20th century prior to the introductions of the vaccines? Brave and learned medical professionals have stepped forward, admitting they didn't learn much about vaccines in school, and now, after reading the literature from both sides for themselves are standing up, concerned about the safety of vaccines. Have you heard what your contemporaries have to say?

A fact I trust you will not lose sight of is that safety testing for vaccines fails the golden standard of every other pharmaceutical drug. Among the failings in vaccine safety studies are adjuvant safety testing individually and when combined as administered on the schedule.

Listed in the Vaccine Excipient & Media Summary (1) some *known* adjuvants include: formaldehyde, blood-brain opening polysorbate 80, phenoxyethanol, ammonium sulfate, human serum albumen, human-diploid fibroblast cell cultures WI-38, human diploid cells MRC-5. Fun fact: vaccine-creator Stanley Plotkin admitted in a deposition earlier 2018 that during said vaccine development, it took 76 aborted fetuses to get the right tissues needed for the culture (2). Also included is fetal bovine serum, monkey kidney cells, african green monkey (VERO) cells, porcine derived gelatin (and porcine circoviruses in Rotarix) as well as egg and yeast proteins. There are 60 or so more metal, chemical, human and animal organisms as adjuvants, including the controversial thimerosal still in multi-dose flu vials. (3) This is what's being mandated into our keiki's muscle tissue.

If that isn't alarming, I trust the *unlisted* contaminants discovered in vaccines in these studies (4, 5) from Italy in 2017 & 2018 will be a surprise. Contaminants found include: Barium, lead, stainless steel, tungsten, gold-zinc, platinum, silver, bismuth, iron, chromium, lead particles, morphologies of red cells (human or animal origin is unknown), and "debris" composed of aluminum, bromine, silicon, potassium and titanium. In some they also could not find the protein antigens that the vaccines were supposed to have. Other independent tests have found glyphosate. (6)

Now for Aluminum. Many childhood vaccines contain it. Aluminum is a known neurotoxin. After learning that many "placebos" used in "safety studies" [including HPV(7)] are either other vaccines or aluminum adjuvant, I was surprised, and I would hope it surprises you too. Placebos are supposed to be inert. Saline is a great placebo. If IA (injected aluminum) placebos were themselves shown to cause damage, would that nullify the study since the control contained this harmful substance?

You may be surprised to hear that they do cause harm. There is one study, known as the Mitkus study that vaccine advocates reference when questioned about the safety of IA. (8) It came under severe scrutiny this year from leading experts in the world on the neurotoxicity of Al. In the paper criticizing the methods of the Mitkus study, the authors also mention other countries who have studies implicating aluminum-containing vaccines in chronic illness: "The occurrence of *myalgia* and *arthralgia*, *chronic fatigue* and *neurological disorders* following multiple injections of aluminum-containing vaccines against hepatitis B, tetanus and human papilloma virus (HPV) has been reported in many countries: Australia, Canada, Denmark, France, United Kingdom, Italy, Israel, Japan, Mexico, Portugal, and USA." (9)

Recent studies have regarded IA as "poorly biodegradable", with the potential to become "*insidiously unsafe*, especially in the case of *over-immunization* and immature/altered blood brain barrier..." as well as having potential for neurotoxic effects after long-term accumulation. (10, 11, 12, 13, 14)

To summarize the cited works, here is a summary of what a decade of emerging science on IA toxicity is saying. It can:

- 1) impair brain development,
- 2) remain in the brain much longer than thought,
- 3) is brought into the brain by macrophages that grab the IA from the vaccine injection site and recirculate it,
- 4) may actually be worse when injected in small doses repeatedly (like in vaccination) and,
- 5) remarkably high levels of aluminum have been found in brains of people diagnosed with autism. (15, 16, 17, 19, 20, 21)

HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all the information needed to use GARDASIL safely and effectively. See full prescribing information for GARDASIL.

GARDASIL[®]

[Human Papillomavirus Quadrivalent (Types 16, 18, 6, and 11) Vaccine, Recombinant]

Suspension for intramuscular injection

Initial U.S. Approval: 2006

INDICATIONS AND USAGE

GARDASIL is a vaccine indicated in girls and women 9 through 26 years of age for the prevention of the following diseases caused by Human Papillomavirus (HPV) types included in the vaccine:

- Cervical, vulvar, vaginal, and anal cancer caused by HPV types 16 and 18 (1.1)
- Genital warts (condyloma acuminata) caused by HPV types 6 and 11 (1.1)

And the following precancerous or dysplastic lesions caused by HPV types 6, 11, 16, and 18:

- Cervical intraepithelial neoplasia (CIN) grade 2/3 and Cervical adenocarcinoma *in situ* (AIS) (1.1)
- Cervical intraepithelial neoplasia (CIN) grade 1 (1.1)
- Vulvar intraepithelial neoplasia (VIN) grade 2 and grade 3 (1.1)
- Vaginal intraepithelial neoplasia (VaIN) grade 2 and grade 3 (1.1)
- Anal intraepithelial neoplasia (AIN) grades 1, 2, and 3 (1.1)

GARDASIL is indicated in boys and men 9 through 26 years of age for the prevention of the following diseases caused by HPV types included in the vaccine:

- Anal cancer caused by HPV types 16 and 18 (1.2)
- Genital warts (condyloma acuminata) caused by HPV types 6 and 11 (1.2)

And the following precancerous or dysplastic lesions caused by HPV types 6, 11, 16, and 18:

- Anal intraepithelial neoplasia (AIN) grades 1, 2, and 3. (1.2)

Limitations of GARDASIL Use and Effectiveness:

- GARDASIL does not eliminate the necessity for women to continue to undergo recommended cervical cancer screening. (1.3, 17)
- Recipients of GARDASIL should not discontinue anal cancer screening if it has been recommended by a health care provider. (1.3, 17)
- GARDASIL has not been demonstrated to provide protection against disease from vaccine and non-vaccine HPV types to which a person has previously been exposed through sexual activity. (1.3, 14.4, 14.5)
- GARDASIL is not intended to be used for treatment of active external genital lesions; cervical, vulvar, vaginal, and anal cancers; CIN; VIN; VaIN, or AIN. (1.3)
- GARDASIL has not been demonstrated to protect against diseases due to HPV types not contained in the vaccine. (1.3, 14.4, 14.5)

- Not all vulvar, vaginal, and anal cancers are caused by HPV, and GARDASIL protects only against those vulvar, vaginal, and anal cancers caused by HPV 16 and 18. (1.3)
- GARDASIL does not protect against genital diseases not caused by HPV. (1.3)
- Vaccination with GARDASIL may not result in protection in all vaccine recipients. (1.3)
- GARDASIL has not been demonstrated to prevent HPV-related CIN 2/3 or worse in women older than 26 years of age. (14.7)

DOSAGE AND ADMINISTRATION

0.5-mL suspension for intramuscular injection at the following schedule: 0, 2 months, 6 months. (2.1)

DOSAGE FORMS AND STRENGTHS

- 0.5-mL suspension for injection as a single-dose vial and prefilled syringe. (3, 11)

CONTRAINDICATIONS

- Hypersensitivity, including severe allergic reactions to yeast (a vaccine component), or after a previous dose of GARDASIL. (4, 11)

WARNINGS AND PRECAUTIONS

- Because vaccinees may develop syncope, sometimes resulting in falling with injury, observation for 15 minutes after administration is recommended. Syncope, sometimes associated with tonic-clonic movements and other seizure-like activity, has been reported following vaccination with GARDASIL. When syncope is associated with tonic-clonic movements, the activity is usually transient and typically responds to restoring cerebral perfusion by maintaining a supine or Trendelenburg position. (5.1)

ADVERSE REACTIONS

The most common adverse reaction was headache. Common adverse reactions (frequency of at least 1.0% and greater than AAHS control or saline placebo) are fever, nausea, dizziness; and injection-site pain, swelling, erythema, pruritus, and bruising. (6.1)

To report SUSPECTED ADVERSE REACTIONS, contact Merck Sharp & Dohme Corp., a subsidiary of Merck & Co., Inc., at 1-877-888-4231 or VAERS at 1-800-822-7967 or www.vaers.hhs.gov.

DRUG INTERACTIONS

GARDASIL may be administered concomitantly with RECOMBIVAX HB[®] (7.1) or with MenaCTra and Adacel. (7.2)

USE IN SPECIFIC POPULATIONS

Safety and effectiveness of GARDASIL have not been established in the following populations:

- Pregnant women. Women who receive GARDASIL during pregnancy are encouraged to contact Merck Sharp & Dohme Corp., a subsidiary of Merck & Co., Inc., at 1-877-888-4231. (8.1)
- Children below the age of 9 years. (8.4)
- Immunocompromised individuals. Response to GARDASIL may be diminished. (8.6)

See 17 for PATIENT COUNSELING INFORMATION and FDA-approved patient labeling.

Revised: 04/2015

FULL PRESCRIBING INFORMATION

1 INDICATIONS AND USAGE

1.1 Girls and Women

GARDASIL® is a vaccine indicated in girls and women 9 through 26 years of age for the prevention of the following diseases caused by Human Papillomavirus (HPV) types included in the vaccine:

- Cervical, vulvar, vaginal, and anal cancer caused by HPV types 16 and 18
- Genital warts (condyloma acuminata) caused by HPV types 6 and 11

And the following precancerous or dysplastic lesions caused by HPV types 6, 11, 16, and 18:

- Cervical intraepithelial neoplasia (CIN) grade 2/3 and Cervical adenocarcinoma *in situ* (AIS)
- Cervical intraepithelial neoplasia (CIN) grade 1
- Vulvar intraepithelial neoplasia (VIN) grade 2 and grade 3
- Vaginal intraepithelial neoplasia (VaIN) grade 2 and grade 3
- Anal intraepithelial neoplasia (AIN) grades 1, 2, and 3

1.2 Boys and Men

GARDASIL is indicated in boys and men 9 through 26 years of age for the prevention of the following diseases caused by HPV types included in the vaccine:

- Anal cancer caused by HPV types 16 and 18
- Genital warts (condyloma acuminata) caused by HPV types 6 and 11

And the following precancerous or dysplastic lesions caused by HPV types 6, 11, 16, and 18:

- Anal intraepithelial neoplasia (AIN) grades 1, 2, and 3

1.3 Limitations of GARDASIL Use and Effectiveness

The health care provider should inform the patient, parent, or guardian that vaccination does not eliminate the necessity for women to continue to undergo recommended cervical cancer screening. Women who receive GARDASIL should continue to undergo cervical cancer screening per standard of care. [See Patient Counseling Information (17).]

Recipients of GARDASIL should not discontinue anal cancer screening if it has been recommended by a health care provider. [See Patient Counseling Information (17).]

GARDASIL has not been demonstrated to provide protection against disease from vaccine and non-vaccine HPV types to which a person has previously been exposed through sexual activity. [See Clinical Studies (14.4, 14.5).]

GARDASIL is not intended to be used for treatment of active external genital lesions; cervical, vulvar, vaginal, and anal cancers; CIN; VIN; VaIN; or AIN.

GARDASIL has not been demonstrated to protect against diseases due to HPV types not contained in the vaccine. [See Clinical Studies (14.4, 14.5).]

Not all vulvar, vaginal, and anal cancers are caused by HPV, and GARDASIL protects only against those vulvar, vaginal, and anal cancers caused by HPV 16 and 18.

GARDASIL does not protect against genital diseases not caused by HPV.

Vaccination with GARDASIL may not result in protection in all vaccine recipients.

GARDASIL has not been demonstrated to prevent HPV-related CIN 2/3 or worse in women older than 26 years of age. [See Clinical Studies (14.7).]

2 DOSAGE AND ADMINISTRATION

2.1 Dosage

GARDASIL should be administered intramuscularly as a 0.5-mL dose at the following schedule: 0, 2 months, 6 months. [See *Clinical Studies (14.8).*]

2.2 Method of Administration

For intramuscular use only.

Shake well before use. Thorough agitation immediately before administration is necessary to maintain suspension of the vaccine. GARDASIL should not be diluted or mixed with other vaccines. After thorough agitation, GARDASIL is a white, cloudy liquid. Parenteral drug products should be inspected visually for particulate matter and discoloration prior to administration. Do not use the product if particulates are present or if it appears discolored.

GARDASIL should be administered intramuscularly in the deltoid region of the upper arm or in the higher anterolateral area of the thigh.

Syncope has been reported following vaccination with GARDASIL and may result in falling with injury; observation for 15 minutes after administration is recommended. [See *Warnings and Precautions (5.1).*]

Single-Dose Vial Use

Withdraw the 0.5-mL dose of vaccine from the single-dose vial using a sterile needle and syringe and use promptly.

Prefilled Syringe Use

This package does not contain a needle. Shake well before use. Attach the needle by twisting in a clockwise direction until the needle fits securely on the syringe. Administer the entire dose as per standard protocol.

3 DOSAGE FORMS AND STRENGTHS

GARDASIL is a suspension for intramuscular administration available in 0.5-mL single dose vials and prefilled syringes. See *Description (11)* for the complete listing of ingredients.

4 CONTRAINDICATIONS

Hypersensitivity, including severe allergic reactions to yeast (a vaccine component), or after a previous dose of GARDASIL. [See *Description (11).*]

5 WARNINGS AND PRECAUTIONS

5.1 Syncope

Because vaccinees may develop syncope, sometimes resulting in falling with injury, observation for 15 minutes after administration is recommended. Syncope, sometimes associated with tonic-clonic movements and other seizure-like activity, has been reported following vaccination with GARDASIL. When syncope is associated with tonic-clonic movements, the activity is usually transient and typically responds to restoring cerebral perfusion by maintaining a supine or Trendelenburg position.

5.2 Managing Allergic Reactions

Appropriate medical treatment and supervision must be readily available in case of anaphylactic reactions following the administration of GARDASIL.

6 ADVERSE REACTIONS

Overall Summary of Adverse Reactions

Headache, fever, nausea, and dizziness; and local injection site reactions (pain, swelling, erythema, pruritus, and bruising) occurred after administration with GARDASIL.

Syncope, sometimes associated with tonic-clonic movements and other seizure-like activity, has been reported following vaccination with GARDASIL and may result in falling with injury; observation for 15 minutes after administration is recommended. [See *Warnings and Precautions (5.1).*]

Anaphylaxis has been reported following vaccination with GARDASIL.

6.1 Clinical Trials Experience

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a vaccine cannot be directly compared to rates in the clinical trials of another vaccine and may not reflect the rates observed in practice.

Studies in Girls and Women (9 Through 45 Years of Age) and Boys and Men (9 Through 26 Years of Age)

In 7 clinical trials (5 Amorphous Aluminum Hydroxyphosphate Sulfate [AAHS]-controlled, 1 saline placebo-controlled, and 1 uncontrolled), 18,083 individuals were administered GARDASIL or AAHS control or saline placebo on the day of enrollment, and approximately 2 and 6 months thereafter, and safety was evaluated using vaccination report cards (VRC)-aided surveillance for 14 days after each injection of GARDASIL or AAHS control or saline placebo in these individuals. The individuals who were monitored using VRC-aided surveillance included 10,088 individuals 9 through 45 years of age at enrollment who received GARDASIL and 7,995 individuals who received AAHS control or saline placebo. Few individuals (0.2%) discontinued due to adverse reactions. The race distribution of the 9- through 26-year-old girls and women in the safety population was as follows: 62.3% White; 17.6% Hispanic (Black and White); 6.8% Asian; 6.7% Other; 6.4% Black; and 0.3% American Indian. The race distribution of the 24- through 45-year-old women in the safety population of Study 6 was as follows: 20.6% White; 43.2% Hispanic (Black and White); 0.2% Other; 4.8% Black; 31.2% Asian; and 0.1% American Indian. The race distribution of the 9- through 26-year-old boys and men in the safety population was as follows: 42.0% White; 19.7% Hispanic (Black and White); 11.0% Asian; 11.2% Other; 15.9% Black; and 0.1% American Indian.

Common Injection-Site Adverse Reactions in Girls and Women 9 Through 26 Years of Age

The injection site adverse reactions that were observed among recipients of GARDASIL at a frequency of at least 1.0% and also at a greater frequency than that observed among AAHS control or saline placebo recipients are shown in Table 1.

Table 1: Injection-Site Adverse Reactions in Girls and Women 9 Through 26 Years of Age*

Adverse Reaction (1 to 5 Days Postvaccination)	GARDASIL (N = 5088) %	AAHS Control[†] (N = 3470) %	Saline Placebo (N = 320) %
<i>Injection Site</i>			
Pain	83.9	75.4	48.6

Hematoma	1.0	0.3	3.3

*The injection-site adverse reactions that were observed among recipients of GARDASIL were at a frequency of at least 1.0% and also at a greater frequency than that observed among AAHS control or saline placebo recipients.

†AAHS Control = Amorphous Aluminum Hydroxyphosphate Sulfate

Evaluation of Injection-Site Adverse Reactions by Dose in Girls and Women 9 Through 26 Years of Age

An analysis of injection-site adverse reactions in girls and women by dose is shown in Table 3. Of those girls and women who reported an injection-site reaction, 94.3% judged their injection-site adverse reaction to be mild or moderate in intensity.

Table 3: Postdose Evaluation of Injection-Site Adverse Reactions in Girls and Women 9 Through 26 Years of Age (1 to 5 Days Postvaccination)

Adverse Reaction	GARDASIL (% occurrence)			AAHS Control* (% occurrence)			Saline Placebo (% occurrence)		
	Post-dose 1 N [†] = 5011	Post-dose 2 N = 4924	Post-dose 3 N = 4818	Post-dose 1 N = 3410	Post-dose 2 N = 3351	Post-dose 3 N = 3295	Post-dose 1 N = 315	Post-dose 2 N = 301	Post-dose 3 N = 300
Pain	63.4	60.7	62.7	57.0	47.8	49.6	33.7	20.3	27.3

Common Systemic Adverse Reactions in Girls and Women 9 Through 26 Years of Age

Headache was the most commonly reported systemic adverse reaction in both treatment groups (GARDASIL = 28.2% and AAHS control or saline placebo = 28.4%). Fever was the next most commonly

reported systemic adverse reaction in both treatment groups (GARDASIL = 13.0% and AAHS control or saline placebo = 11.2%).

Adverse reactions that were observed among recipients of GARDASIL, at a frequency of greater than or equal to 1.0% where the incidence in the GARDASIL group was greater than or equal to the incidence in the AAHS control or saline placebo group, are shown in Table 5.

Table 5: Common Systemic Adverse Reactions in Girls and Women 9 Through 26 Years of Age (GARDASIL ≥Control)*

Adverse Reactions (1 to 15 Days Postvaccination)	GARDASIL (N = 5088) %	AAHS Control [†] or Saline Placebo (N = 3790) %
Pyrexia	13.0	11.2
Nausea	6.7	6.5
Dizziness	4.0	3.7
Diarrhea	3.6	3.5
Vomiting	2.4	1.9
Cough	2.0	1.5
Toothache	1.5	1.4

Serious Adverse Reactions in the Entire Study Population

Across the clinical studies, 26 serious adverse reactions (GARDASIL N = 128 or 0.8%; placebo N = 130 or 1.0%) out of 29,323 (GARDASIL N = 15,706; AAHS control N = 13,023; or saline placebo N = 594) individuals (9- through 45-year-old girls and women; and 9- through 26-year-old boys and men) reported a serious systemic adverse reaction.

Of the entire study population (29,323 individuals), 0.04% of the reported serious systemic adverse reactions were judged to be vaccine related by the study investigator. The most frequently (frequency of 4 cases or greater with either GARDASIL, AAHS control, saline placebo, or the total of all three) reported serious systemic adverse reactions, regardless of causality, were:

- Headache [0.02% GARDASIL (3 cases) vs. 0.02% AAHS control (2 cases)],
- Gastroenteritis [0.02% GARDASIL (3 cases) vs. 0.02% AAHS control (2 cases)],
- Appendicitis [0.03% GARDASIL (5 cases) vs. 0.01% AAHS control (1 case)],
- Pelvic inflammatory disease [0.02% GARDASIL (3 cases) vs. 0.03% AAHS control (4 cases)],
- Urinary tract infection [0.01% GARDASIL (2 cases) vs. 0.02% AAHS control (2 cases)],
- Pneumonia [0.01% GARDASIL (2 cases) vs. 0.02% AAHS control (2 cases)],
- Pyelonephritis [0.01% GARDASIL (2 cases) vs. 0.02% AAHS control (3 cases)],
- Pulmonary embolism [0.01% GARDASIL (2 cases) vs. 0.02% AAHS control (2 cases)].

One case (0.006% GARDASIL; 0.0% AAHS control or saline placebo) of bronchospasm; and 2 cases (0.01% GARDASIL; 0.0% AAHS control or saline placebo) of asthma were reported as serious systemic adverse reactions that occurred following any vaccination visit.

In addition, there was 1 individual in the clinical trials, in the group that received GARDASIL, who reported two injection-site serious adverse reactions (injection-site pain and injection-site joint movement impairment).

Deaths in the Entire Study Population

Across the clinical studies, 40 deaths (GARDASIL N = 21 or 0.1%; placebo N = 19 or 0.1%) were reported in 29,323 (GARDASIL N = 15,706; AAHS control N = 13,023, saline placebo N = 594) individuals (9- through 45-year-old girls and women; and 9- through 26-year-old boys and men). The events reported were consistent with events expected in healthy adolescent and adult populations. The most common cause of death was motor vehicle accident (5 individuals who received GARDASIL and 4 individuals who received AAHS control), followed by drug overdose/suicide (2 individuals who received GARDASIL and 6 individuals who received AAHS control), gunshot wound (1 individual who received GARDASIL and 3 individuals who received AAHS control), and pulmonary embolus/deep vein thrombosis (1 individual who

received GARDASIL and 1 individual who received AAHS control). In addition, there were 2 cases of sepsis, 1 case of pancreatic cancer, 1 case of arrhythmia, 1 case of pulmonary tuberculosis, 1 case of hyperthyroidism, 1 case of post-operative pulmonary embolism and acute renal failure, 1 case of traumatic brain injury/cardiac arrest, 1 case of systemic lupus erythematosus, 1 case of cerebrovascular accident, 1 case of breast cancer, and 1 case of nasopharyngeal cancer in the group that received GARDASIL; 1 case of asphyxia, 1 case of acute lymphocytic leukemia, 1 case of chemical poisoning, and 1 case of myocardial ischemia in the AAHS control group; and 1 case of medulloblastoma in the saline placebo group.

Systemic Autoimmune Disorders in Girls and Women 9 Through 26 Years of Age

In the clinical studies, 9- through 26-year-old girls and women were evaluated for new medical conditions that occurred over the course of follow-up. New medical conditions potentially indicative of a systemic autoimmune disorder seen in the group that received GARDASIL or AAHS control or saline placebo are shown in Table 9. This population includes all girls and women who received at least one dose of GARDASIL or AAHS control or saline placebo, and had safety data available.

¹Arthralgia/Arthritis/Arthropathy includes the following terms: Arthralgia, Arthritis, Arthritis reactive, and Arthropathy

³Hyperthyroidism includes the following terms: Basedow's disease, Goiter, Toxic nodular goiter, and Hyperthyroidism

⁵Hypothyroidism includes the following terms: Hypothyroidism and thyroiditis

⁴Inflammatory bowel disease includes the following terms: Colitis ulcerative, Crohn's disease, and Inflammatory bowel disease

⁶Nephritis includes the following terms: Nephritis, Glomerulonephritis minimal lesion, Glomerulonephritis proliferative

⁷Pigmentation disorder includes the following terms: Pigmentation disorder, Skin depigmentation, and Vitiligo

⁸Psoriasis includes the following terms: Psoriasis, Pustular psoriasis, and Psoriatic arthropathy

⁹Rheumatoid arthritis includes juvenile rheumatoid arthritis. One woman counted in the rheumatoid arthritis group reported rheumatoid arthritis as an adverse experience at Day 130.

N = Number of individuals enrolled

n = Number of individuals with specific new Medical Conditions

NOTE: Although an individual may have had two or more new Medical Conditions, the individual is counted only once within a category. The same individual may appear in different categories.

Systemic Autoimmune Disorders in Boys and Men 9 Through 26 Years of Age

In the clinical studies, 9- through 26-year-old boys and men were evaluated for new medical conditions that occurred over the course of follow-up. New medical conditions potentially indicative of a systemic autoimmune disorder seen in the group that received GARDASIL or AAHS control or saline placebo are

shown in Table 10. This population includes all boys and men who received at least one dose of GARDASIL or AAHS control or saline placebo, and had safety data available.

Table 10: Summary of Boys and Men 9 Through 26 Years of Age Who Reported an Incident Condition Potentially Indicative of a Systemic Autoimmune Disorder After Enrollment in Clinical Trials of GARDASIL, Regardless of Causality

Conditions	GARDASIL (N = 3093)	AAHS Control* or Saline Placebo (N = 2303)
	n (%)	n (%)
Alopecia Areata	2 (0.1)	0 (0.0)
Ankylosing Spondylitis	1 (0.0)	2 (0.1)
Arthralgia/Arthritis/Reactive Arthritis	30 (1.0)	17 (0.7)
Autoimmune Thrombocytopenia	1 (0.0)	0 (0.0)
Diabetes Mellitus Type 1	3 (0.1)	2 (0.1)
Hyperthyroidism	0 (0.0)	1 (0.0)
Hypothyroidism [†]	3 (0.1)	0 (0.0)
Inflammatory Bowel Disease [‡]	1 (0.0)	2 (0.1)
Myocarditis	1 (0.0)	1 (0.0)
Proteinuria	1 (0.0)	0 (0.0)
Psoriasis	0 (0.0)	4 (0.2)
Skin Depigmentation	1 (0.0)	0 (0.0)
Vitiligo	2 (0.1)	5 (0.2)
All Conditions	46 (1.5)	34 (1.5)

*AAHS Control = Amorphous Aluminum Hydroxyphosphate Sulfate

[†]Hypothyroidism includes the following terms: Hypothyroidism and Autoimmune thyroiditis

[‡]Inflammatory bowel disease includes the following terms: Colitis ulcerative and Crohn's disease

N = Number of individuals who received at least one dose of either vaccine or placebo

n = Number of individuals with specific new Medical Conditions

NOTE: Although an individual may have had two or more new Medical Conditions, the individual is counted only once within a category. The same individual may appear in different categories.

Safety in Concomitant Use with RECOMBIVAX HB[®] [hepatitis B vaccine (recombinant)] in Girls and Women 16 Through 23 Years of Age

The safety of GARDASIL when administered concomitantly with RECOMBIVAX HB[®] [hepatitis B vaccine (recombinant)] was evaluated in an AAHS-controlled study of 1871 girls and women with a mean age of 20.4 years [see *Clinical Studies (14.10)*]. The race distribution of the study individuals was as follows: 61.6% White; 23.8% Other; 11.9% Black; 1.6% Hispanic (Black and White); 0.8% Asian; and 0.3% American Indian. The rates of systemic and injection-site adverse reactions were similar among girls and women who received concomitant vaccination as compared with those who received GARDASIL or RECOMBIVAX HB [hepatitis B vaccine (recombinant)].

Safety in Concomitant Use with Menactra [Meningococcal (Groups A, C, Y and W-135) Polysaccharide Diphtheria Toxoid Conjugate Vaccine] and Adacel [Tetanus Toxoid, Reduced Diphtheria Toxoid and Acellular Pertussis Vaccine Adsorbed (Tdap)]

The safety of GARDASIL when administered concomitantly with Menactra [Meningococcal (Groups A, C, Y and W-135) Polysaccharide Diphtheria Toxoid Conjugate Vaccine] and Adacel [Tetanus Toxoid, Reduced Diphtheria Toxoid and Acellular Pertussis Vaccine Adsorbed (Tdap)] was evaluated in a randomized study of 1040 boys and girls with a mean age of 12.6 years [see *Clinical Studies (14.11)*]. The race distribution of the study subjects was as follows: 77.7% White; 1.4% Multi-racial; 12.3% Black; 6.8% Hispanic (Black and White); 1.2% Asian; 0.4% American Indian, and 0.2% Indian.

There was an increase in injection-site swelling reported at the injection site for GARDASIL (concomitant = 10.9%, non-concomitant = 6.9%) when GARDASIL was administered concomitantly with Menactra and Adacel as compared to non-concomitant (separated by 1 month) vaccination. The majority of injection-site swelling adverse experiences were reported as being mild to moderate in intensity.

Safety in Women 27 Through 45 Years of Age

The adverse reaction profile in women 27 through 45 years of age was comparable to the profile seen in girls and women 9 through 26 years of age.

6.2 Postmarketing Experience

The following adverse events have been spontaneously reported during post-approval use of GARDASIL. Because these events were reported voluntarily from a population of uncertain size, it is not possible to reliably estimate their frequency or to establish a causal relationship to vaccine exposure.

Blood and lymphatic system disorders: Autoimmune hemolytic anemia, idiopathic thrombocytopenic purpura, lymphadenopathy.

Respiratory, thoracic and mediastinal disorders: Pulmonary embolus.

Gastrointestinal disorders: Nausea, pancreatitis, vomiting.

General disorders and administration site conditions: Asthenia, chills, death, fatigue, malaise.

Immune system disorders: Autoimmune diseases, hypersensitivity reactions including anaphylactic/anaphylactoid reactions, bronchospasm, and urticaria.

Musculoskeletal and connective tissue disorders: Arthralgia, myalgia.

Nervous system disorders: Acute disseminated encephalomyelitis, dizziness, Guillain-Barré syndrome, headache, motor neuron disease, paralysis, seizures, syncope (including syncope associated with tonic-clonic movements and other seizure-like activity) sometimes resulting in falling with injury, transverse myelitis.

Infections and infestations: cellulitis.

Vascular disorders: Deep venous thrombosis.

7 DRUG INTERACTIONS

7.1 Use with RECOMBIVAX HB

Results from clinical studies indicate that GARDASIL may be administered concomitantly (at a separate injection site) with RECOMBIVAX HB [hepatitis B vaccine (recombinant)] [see *Clinical Studies (14.10)*].

7.2 Use with Menactra and Adacel

Results from clinical studies indicate that GARDASIL may be administered concomitantly (at a separate injection site) with Menactra [Meningococcal (Groups A, C, Y and W-135) Polysaccharide Diphtheria Toxoid Conjugate Vaccine] and Adacel [Tetanus Toxoid, Reduced Diphtheria Toxoid and Acellular Pertussis Vaccine Adsorbed (Tdap)] [see *Clinical Studies (14.11)*].

7.3 Use with Hormonal Contraceptives

In clinical studies of 16- through 26-year-old women, 13,912 (GARDASIL N = 6952; AAHS control or saline placebo N = 6960) who had post-Month 7 follow-up used hormonal contraceptives for a total of 33,859 person-years (65.8% of the total follow-up time in the studies).

In one clinical study of 24- through 45-year-old women, 1357 (GARDASIL N = 690; AAHS control N = 667) who had post-Month 7 follow-up used hormonal contraceptives for a total of 3400 person-years (31.5% of the total follow-up time in the study). Use of hormonal contraceptives or lack of use of hormonal contraceptives among study participants did not impair the immune response in the per protocol immunogenicity (PPI) population.

7.4 Use with Systemic Immunosuppressive Medications

Immunosuppressive therapies, including irradiation, antimetabolites, alkylating agents, cytotoxic drugs, and corticosteroids (used in greater than physiologic doses), may reduce the immune responses to vaccines [see *Use in Specific Populations (8.6)*].

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Pregnancy Category B:

Reproduction studies have been performed in female rats at doses equivalent to the recommended human dose and have revealed no evidence of impaired female fertility or harm to the fetus due to GARDASIL. There are, however, no adequate and well-controlled studies in pregnant women. Because

animal reproduction studies are not always predictive of human responses, GARDASIL should be used during pregnancy only if clearly needed.

An evaluation of the effect of GARDASIL on embryo-fetal, pre- and postweaning development was conducted using rats. One group of rats was administered GARDASIL twice prior to gestation, during the period of organogenesis (gestation Day 6) and on lactation Day 7. A second group of pregnant rats was administered GARDASIL during the period of organogenesis (gestation Day 6) and on lactation Day 7 only. GARDASIL was administered at 0.5 mL/rat/occasion (120 mcg total protein which is equivalent to the recommended human dose) by intramuscular injection. No adverse effects on mating, fertility, pregnancy, parturition, lactation, embryo-fetal or pre- and postweaning development were observed. There were no vaccine-related fetal malformations or other evidence of teratogenesis noted in this study. In addition, there were no treatment-related effects on developmental signs, behavior, reproductive performance, or fertility of the offspring.

Clinical Studies in Humans

In clinical studies, women underwent urine pregnancy testing prior to administration of each dose of GARDASIL. Women who were found to be pregnant before completion of a 3-dose regimen of GARDASIL were instructed to defer completion of their vaccination regimen until resolution of the pregnancy.

GARDASIL is not indicated for women 27 years of age or older. However, safety data in women 16 through 45 years of age was collected, and 3819 women (GARDASIL N = 1894 vs. AAHS control or saline placebo N = 1925) reported at least 1 pregnancy each.

The overall proportions of pregnancies that resulted in an adverse outcome, defined as the combined numbers of spontaneous abortion, late fetal death, and congenital anomaly cases out of the total number of pregnancy outcomes for which an outcome was known (and excluding elective terminations), were 22.6% (446/1973) in women who received GARDASIL and 23.1% (460/1994) in women who received AAHS control or saline placebo.

Overall, 55 and 65 women in the group that received GARDASIL or AAHS control or saline placebo, respectively (2.9% and 3.4% of all women who reported a pregnancy in the respective vaccination groups), experienced a serious adverse reaction during pregnancy. The most common events reported were conditions that can result in Caesarean section (e.g., failure of labor, malpresentation, cephalopelvic disproportion), premature onset of labor (e.g., threatened abortions, premature rupture of membranes), and pregnancy-related medical problems (e.g., pre-eclampsia, hyperemesis). The proportions of pregnant women who experienced such events were comparable between the groups receiving GARDASIL and AAHS control or saline placebo.

There were 45 cases of congenital anomaly in pregnancies that occurred in women who received GARDASIL and 34 cases of congenital anomaly in pregnancies that occurred in women who received AAHS control or saline placebo.

Further sub-analyses were conducted to evaluate pregnancies with estimated onset within 30 days or more than 30 days from administration of a dose of GARDASIL or AAHS control or saline placebo. For pregnancies with estimated onset within 30 days of vaccination, 5 cases of congenital anomaly were observed in the group that received GARDASIL compared to 1 case of congenital anomaly in the group that received AAHS control or saline placebo. The congenital anomalies seen in pregnancies with estimated onset within 30 days of vaccination included pyloric stenosis, congenital megacolon, congenital hydronephrosis, hip dysplasia, and club foot. Conversely, in pregnancies with onset more than 30 days following vaccination, 40 cases of congenital anomaly were observed in the group that received GARDASIL compared with 33 cases of congenital anomaly in the group that received AAHS control or saline placebo.

Women who receive GARDASIL during pregnancy are encouraged to contact Merck Sharp & Dohme Corp., a subsidiary of Merck & Co., Inc., at 1-877-888-4231 or VAERS at 1-800-822-7967 or www.vaers.hhs.gov.

8.3 Nursing Mothers

Women 16 Through 45 Years of Age

It is not known whether GARDASIL is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when GARDASIL is administered to a nursing woman.

GARDASIL or AAHS control were given to a total of 1133 women (vaccine N = 582, AAHS control N = 551) during the relevant Phase 3 clinical studies.

Overall, 27 and 13 infants of women who received GARDASIL or AAHS control, respectively (representing 4.6% and 2.4% of the total number of women who were breast-feeding during the period in which they received GARDASIL or AAHS control, respectively), experienced a serious adverse reaction.

In a post-hoc analysis of clinical studies, a higher number of breast-feeding infants (n = 7) whose mothers received GARDASIL had acute respiratory illnesses within 30 days post vaccination of the mother as compared to infants (n = 2) whose mothers received AAHS control.

8.4 Pediatric Use

Safety and effectiveness have not been established in pediatric patients below 9 years of age.

8.5 Geriatric Use

The safety and effectiveness of GARDASIL have not been evaluated in a geriatric population, defined as individuals aged 65 years and over.

8.6 Immunocompromised Individuals

The immunologic response to GARDASIL may be diminished in immunocompromised individuals [see *Drug Interactions (7.4)*].

10 OVERDOSAGE

There have been reports of administration of higher than recommended doses of GARDASIL.

In general, the adverse event profile reported with overdose was comparable to recommended single doses of GARDASIL.

11 DESCRIPTION

GARDASIL, Human Papillomavirus Quadrivalent (Types 6, 11, 16, and 18) Vaccine, Recombinant, is a non-infectious recombinant quadrivalent vaccine prepared from the purified virus-like particles (VLPs) of the major capsid (L1) protein of HPV Types 6, 11, 16, and 18. The L1 proteins are produced by separate fermentations in recombinant *Saccharomyces cerevisiae* and self-assembled into VLPs. The fermentation process involves growth of *S. cerevisiae* on chemically-defined fermentation media which include vitamins, amino acids, mineral salts, and carbohydrates. The VLPs are released from the yeast cells by cell disruption and purified by a series of chemical and physical methods. The purified VLPs are adsorbed on preformed aluminum-containing adjuvant (Amorphous Aluminum Hydroxyphosphate Sulfate). The quadrivalent HPV VLP vaccine is a sterile liquid suspension that is prepared by combining the adsorbed VLPs of each HPV type and additional amounts of the aluminum-containing adjuvant and the final purification buffer.

GARDASIL is a sterile suspension for intramuscular administration. Each 0.5-mL dose contains approximately 20 mcg of HPV 6 L1 protein, 40 mcg of HPV 11 L1 protein, 40 mcg of HPV 16 L1 protein, and 20 mcg of HPV 18 L1 protein.

Each 0.5-mL dose of the vaccine contains approximately 225 mcg of aluminum (as Amorphous Aluminum Hydroxyphosphate Sulfate adjuvant), 9.56 mg of sodium chloride, 0.78 mg of L-histidine, 50 mcg of polysorbate 80, 35 mcg of sodium borate, <7 mcg yeast protein/dose, and water for injection. The product does not contain a preservative or antibiotics.

After thorough agitation, GARDASIL is a white, cloudy liquid.

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

HPV only infects human beings. Animal studies with analogous animal papillomaviruses suggest that the efficacy of L1 VLP vaccines may involve the development of humoral immune responses. Human beings develop a humoral immune response to the vaccine, although the exact mechanism of protection is unknown.

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

GARDASIL has not been evaluated for the potential to cause carcinogenicity or genotoxicity.

GARDASIL administered to female rats at a dose of 120 mcg total protein, which is equivalent to the recommended human dose, had no effects on mating performance, fertility, or embryonic/fetal survival.

The effect of GARDASIL on male fertility has been studied in male rats at an intramuscular dose of 0.5 mL/rat/occasion (120 mcg total protein which is equivalent to the recommended human dose). One group of male rats was administered GARDASIL once, 3 days prior to cohabitation, and a second group of male rats was administered GARDASIL three times, at 6 weeks, 3 weeks, and 3 days prior to cohabitation. There were no treatment-related effects on reproductive performance including fertility, sperm count, and sperm motility. There were no treatment-related gross or histomorphologic and weight changes on the testes.

14 CLINICAL STUDIES

CIN 2/3 and AIS are the immediate and necessary precursors of squamous cell carcinoma and adenocarcinoma of the cervix, respectively. Their detection and removal has been shown to prevent cancer; thus, they serve as surrogate markers for prevention of cervical cancer. In the clinical studies in girls and women aged 16 through 26 years, cases of CIN 2/3 and AIS were the efficacy endpoints to assess prevention of cervical cancer. In addition, cases of VIN 2/3 and VaIN 2/3 were the efficacy endpoints to assess prevention of HPV-related vulvar and vaginal cancers, and observations of external genital lesions were the efficacy endpoints for the prevention of genital warts.

In clinical studies in boys and men aged 16 through 26 years, efficacy was evaluated using the following endpoints: external genital warts and penile/perineal/perianal intraepithelial neoplasia (PIN) grades 1/2/3 or penile/perineal/perianal cancer. In addition, cases of AIN grades 1/2/3 and anal cancer made up the composite efficacy endpoint used to assess prevention of HPV-related anal cancer.

Anal HPV infection, AIN, and anal cancer were not endpoints in the studies conducted in women. The similarity of HPV-related anal disease in men and women supports bridging the indication of prevention of AIN and anal cancer to women.

Efficacy was assessed in 6 AAHS-controlled, double-blind, randomized Phase 2 and 3 clinical studies. The first Phase 2 study evaluated the HPV 16 component of GARDASIL (Study 1, N = 2391 16- through 26-year-old girls and women) and the second evaluated all components of GARDASIL (Study 2, N = 551 16- through 26-year-old girls and women). Two Phase 3 studies evaluated GARDASIL in 5442 (Study 3) and 12,157 (Study 4) 16- through 26-year-old girls and women. A third Phase 3 study, Study 5, evaluated GARDASIL in 4055 16- through 26-year-old boys and men, including a subset of 598 (GARDASIL = 299; placebo = 299) men who self-identified as having sex with men (MSM population). A fourth Phase 3 study, Study 6, evaluated GARDASIL in 3817 24- through 45-year-old women. Together, these six studies evaluated 28,413 individuals (20,541 girls and women 16 through 26 years of age at enrollment with a mean age of 20.0 years, 4055 boys and men 16 through 26 years of age at enrollment with a mean age of 20.5 years, and 3817 women 24 through 45 years of age at enrollment with a mean age of 34.3 years). The race distribution of the 16- through 26-year-old girls and women in the clinical trials was as follows: 70.4% White; 12.2% Hispanic (Black and White); 8.8% Other; 4.6% Black; 3.8% Asian; and 0.2% American Indian. The race distribution of the 16- through 26-year-old boys and men in the clinical trials was as follows: 35.2% White; 20.5% Hispanic (Black and White); 14.4% Other; 19.8% Black; 10.0% Asian; and 0.1% American Indian. The race distribution of the 24- through 45-year-old women in the clinical trials was as follows: 20.6% White; 43.2% Hispanic (Black and White); 0.2% Other; 4.8% Black; 31.2% Asian; and 0.1% American Indian.

The median duration of follow-up was 4.0, 3.0, 3.0, 3.0, 2.3, and 4.0 years for Study 1, Study 2, Study 3, Study 4, Study 5, and Study 6, respectively. Individuals received vaccine or AAHS control on the day of enrollment and 2 and 6 months thereafter. Efficacy was analyzed for each study individually and for all studies in girls and women combined according to a prospective clinical plan.

Overall, 73% of 16- through 26-year-old girls and women, 67% of 24- through 45-year-old women, and 83% of 16- through 26-year-old boys and men were naïve (i.e., PCR [Polymerase Chain Reaction] negative and seronegative for all 4 vaccine HPV types) to all 4 vaccine HPV types at enrollment.

A total of 27% of 16- through 26-year-old girls and women, 33% of 24- through 45-year-old women, and 17% of 16- through 26-year-old boys and men had evidence of prior exposure to or ongoing infection with at least 1 of the 4 vaccine HPV types. Among these individuals, 74% of 16- through 26-year-old girls and women, 71% of 24- through 45-year-old women, and 78% of 16- through 26-year-old boys and men had evidence of prior exposure to or ongoing infection with only 1 of the 4 vaccine HPV types and were naïve (PCR negative and seronegative) to the remaining 3 types.

In 24- through 45-year-old individuals, 0.4% had been exposed to all 4 vaccine HPV types.

In individuals who were naïve (PCR negative and seronegative) to all 4 vaccine HPV types, CIN, genital warts, VIN, VaIN, PIN, and persistent infection caused by any of the 4 vaccine HPV types were counted as endpoints.

Among individuals who were positive (PCR positive and/or seropositive) for a vaccine HPV type at Day 1, endpoints related to that type were not included in the analyses of prophylactic efficacy. Endpoints related to the remaining types for which the individual was naïve (PCR negative and seronegative) were counted.

For example, in individuals who were HPV 18 positive (PCR positive and/or seropositive) at Day 1, lesions caused by HPV 18 were not counted in the prophylactic efficacy evaluations. Lesions caused by HPV 6, 11, and 16 were included in the prophylactic efficacy evaluations. The same approach was used for the other types.

14.1 Prophylactic Efficacy – HPV Types 6, 11, 16, and 18 in Girls and Women 16 through 26 Years of Age

GARDASIL was administered without prescreening for presence of HPV infection and the efficacy trials allowed enrollment of girls and women regardless of baseline HPV status (i.e., PCR status or serostatus). Girls and women with current or prior HPV infection with an HPV type contained in the vaccine were not eligible for prophylactic efficacy evaluations for that type.

The primary analyses of efficacy with respect to HPV types 6, 11, 16, and 18 were conducted in the per-protocol efficacy (PPE) population, consisting of girls and women who received all 3 vaccinations within 1 year of enrollment, did not have major deviations from the study protocol, and were naïve (PCR negative in cervicovaginal specimens and seronegative) to the relevant HPV type(s) (Types 6, 11, 16, and 18) prior to dose 1 and through 1 month Postdose 3 (Month 7). Efficacy was measured starting after the Month 7 visit.

GARDASIL was efficacious in reducing the incidence of CIN (any grade including CIN 2/3); AIS; genital warts; VIN (any grade); and VaIN (any grade) related to vaccine HPV types 6, 11, 16, or 18 in those who were PCR negative and seronegative at baseline (Table 11).

In addition, girls and women who were already infected with 1 or more vaccine-related HPV types prior to vaccination were protected from precancerous cervical lesions and external genital lesions caused by the other vaccine HPV types.

Table 11: Analysis of Efficacy of GARDASIL in the PPE* Population¹ of 16- Through 26-Year-Old Girls and Women for Vaccine HPV Types

Population	GARDASIL		AAHS Control		% Efficacy (95% CI)
	N	Number of cases	N	Number of cases	
HPV 16- or 18-related CIN 2/3 or AIS					
Study 1 [†]	755	0	750	12	100.0 (65.1, 100.0)
Study 2	231	0	230	1	100.0 (-3744.9, 100.0)

HPV 6- and 11-related Genital Warts					
Combined Protocols [§]	6932	2	6856	189	99.0 (96.2, 99.9)

*The PPE population consisted of individuals who received all 3 vaccinations within 1 year of enrollment, did not have major deviations from the study protocol, and were naïve (PCR negative and seronegative) to the relevant HPV type(s) (Types 6, 11, 16, and 18) prior to dose 1 and through 1 month postdose 3 (Month 7).

[†]See Table 14 for analysis of vaccine impact in the general population.

[‡]Evaluated only the HPV 16 L1 VLP vaccine component of GARDASIL

[§]Analyses of the combined trials were prospectively planned and included the use of similar study entry criteria.

N = Number of individuals with at least 1 follow-up visit after Month 7

CI = Confidence Interval

Note 1: Point estimates and confidence intervals are adjusted for person-time of follow-up.

Note 2: The first analysis in the table (i.e., HPV 16- or 18-related CIN 2/3, AIS or worse) was the primary endpoint of the vaccine development plan.

Note 3: Table 11 does not include cases due to non-vaccine HPV types.

AAHS Control = Amorphous Aluminum Hydroxyphosphate Sulfate

Prophylactic efficacy against overall cervical and genital disease related to HPV 6, 11, 16, and 18 in an extension phase of Study 2, that included data through Month 60, was noted to be 100% (95% CI: 12.3%, 100.0%) among girls and women in the per protocol population naïve to the relevant HPV types.

GARDASIL was efficacious against HPV disease caused by HPV types 6, 11, 16, and 18 in girls and women who were naïve for those specific HPV types at baseline.

14.2 Prophylactic Efficacy – HPV Types 6, 11, 16, and 18 in Boys and Men 16 through 26 Years of Age

The primary analyses of efficacy were conducted in the per-protocol efficacy (PPE) population. This population consisted of boys and men who received all 3 vaccinations within 1 year of enrollment, did not have major deviations from the study protocol, and were naïve (PCR negative and seronegative) to the

relevant HPV type(s) (Types 6, 11, 16, and 18) prior to dose 1 and through 1 month postdose 3 (Month 7). Efficacy was measured starting after the Month 7 visit.

GARDASIL was efficacious in reducing the incidence of genital warts related to vaccine HPV types 6 and 11 in those boys and men who were PCR negative and seronegative at baseline (Table 12). Efficacy against penile/perineal/perianal intraepithelial neoplasia (PIN) grades 1/2/3 or penile/perineal/perianal cancer was not demonstrated as the number of cases was too limited to reach statistical significance.

Table 12: Analysis of Efficacy of GARDASIL in the PPE* Population of 16- Through 26-Year-Old Boys and Men for Vaccine HPV Types

Endpoint	GARDASIL		AAHS Control		% Efficacy (95% CI)
	N [†]	Number of cases	N	Number of cases	
External Genital Lesions HPV 6-, 11-, 16-, or 18- related					
External Genital Lesions	1394	3	1404	32	90.6 (70.1, 98.2)
Condyloma	1394	3	1404	28	89.3 (65.3, 97.9)
PIN 1/2/3	1394	0	1404	4	100.0 (-52.1, 100.0)

*The PPE population consisted of individuals who received all 3 vaccinations within 1 year of enrollment, did not have major deviations from the study protocol, and were naïve (PCR negative and seronegative) to the relevant HPV type(s) (Types 6, 11, 16, and 18) prior to dose 1 and through 1 month postdose 3 (Month 7).

[†]N = Number of individuals with at least 1 follow-up visit after Month 7

14.3 Prophylactic Efficacy – Anal Disease Caused by HPV Types 6, 11, 16, and 18 in Boys and Men 16 through 26 Years of Age in the MSM Sub-study

A sub-study of Study 5 evaluated the efficacy of GARDASIL against anal disease (anal intraepithelial neoplasia and anal cancer) in a population of 598 MSM. The primary analyses of efficacy were conducted in the per-protocol efficacy (PPE) population of Study 5.

GARDASIL was efficacious in reducing the incidence of anal intraepithelial neoplasia (AIN) grades 1 (both condyloma and non-acuminate), 2, and 3 related to vaccine HPV types 6, 11, 16, and 18 in those boys and men who were PCR negative and seronegative at baseline (Table 13).

Table 13: Analysis of Efficacy of GARDASIL for Anal Disease in the PPE* Population of 16- Through 26-Year-Old Boys and Men in the MSM Sub-study for Vaccine HPV Types

HPV 6-, 11-, 16-, or 18- related Endpoint	GARDASIL		AAHS Control		% Efficacy (95% CI)
	N [†]	Number of cases	N	Number of cases	
AIN 1/2/3	194	5	208	24	77.5 (39.6, 93.3)
AIN 2/3	194	3	208	13	74.9 (8.8, 95.4)
AIN 1	194	4	208	16	73.0 (16.3, 93.4)
Condyloma Acuminatum	194	0	208	6	100.0 (8.2, 100.0)
Non-acuminate	194	4	208	11	60.4 (-33.5, 90.8)

*The PPE population consisted of individuals who received all 3 vaccinations within 1 year of enrollment, did not have major deviations from the study protocol, and were naïve (PCR negative and seronegative) to the relevant HPV type(s) (Types 6, 11, 16, and 18) prior to dose 1 and through 1 month postdose 3 (month 7).

14.4 Population Impact in Girls and Women 16 through 26 Years of Age

Effectiveness of GARDASIL in Prevention of HPV Types 6-, 11-, 16-, or 18-Related Genital Disease in Girls and Women 16 Through 26 Years of Age, Regardless of Current or Prior Exposure to Vaccine HPV Types

The clinical trials included girls and women regardless of current or prior exposure to vaccine HPV types, and additional analyses were conducted to evaluate the impact of GARDASIL with respect to HPV 6-, 11-, 16-, and 18-related cervical and genital disease in these girls and women. Here, analyses included events arising among girls and women regardless of baseline PCR status and serostatus, including HPV infections that were present at the start of vaccination as well as events that arose from infections that were acquired after the start of vaccination.

The impact of GARDASIL in girls and women regardless of current or prior exposure to a vaccine HPV type is shown in Table 14. Impact was measured starting 1 month Postdose 1. Prophylactic efficacy denotes the vaccine's efficacy in girls and women who are naïve (PCR negative and seronegative) to the relevant HPV types at Day 1. Vaccine impact in girls and women who were positive for vaccine HPV infection, as well as vaccine impact among girls and women regardless of baseline vaccine HPV PCR status and serostatus are also presented. The majority of CIN and genital warts, VIN, and VaIN related to a vaccine HPV type detected in the group that received GARDASIL occurred as a consequence of HPV infection with the relevant HPV type that was already present at Day 1.

There was no clear evidence of protection from disease caused by HPV types for which girls and women were PCR positive regardless of serostatus at baseline.

Table 14: Effectiveness of GARDASIL in Prevention of HPV 6, 11, 16, or 18-Related Genital Disease in Girls and Women 16 Through 26 Years of Age, Regardless of Current or Prior Exposure to Vaccine HPV Types

*Includes all individuals who received at least 1 vaccination and who were HPV-naïve (i.e., seronegative and PCR negative) at Day 1 to the vaccine HPV type being analyzed. Case counting started at 1 month postdose 1.

[†]Includes all individuals who received at least 1 vaccination and who were HPV positive or had unknown HPV status at Day 1, to at least one vaccine HPV type. Case counting started at Day 1.

[‡]Out of the 148 AAHS control cases of 16/18 CIN 2/3, 2 women were missing serology or PCR results for Day 1.

[§]There is no expected efficacy since GARDASIL has not been demonstrated to provide protection against disease from vaccine HPV types to which a person has previously been exposed through sexual activity.

[¶]Includes all individuals who received at least 1 vaccination (regardless of baseline HPV status at Day 1). Case counting started at 1 month postdose 1.

[¶]Includes 2 AAHS control women with missing serology/PCR data at Day 1.

[¶]Includes 1 woman with missing serology/PCR data at Day 1.

CI = Confidence Interval

N = Number of individuals who have at least one follow-up visit after Day 1

Note 1: The 16- and 18-related CIN 2/3 or AIS composite endpoint included data from studies 1, 2, 3, and 4. All other endpoints only included data from studies 2, 3, and 4.

Note 2: Positive status at Day 1 denotes PCR positive and/or seropositive for the respective type at Day 1.

Note 3: Table 14 does not include disease due to non-vaccine HPV types.

AAHS Control = Amorphous Aluminum Hydroxyphosphate Sulfate

Effectiveness of GARDASIL in Prevention of Any HPV Type Related Genital Disease in Girls and Women 16 Through 26 Years of Age, Regardless of Current or Prior Infection with Vaccine or Non-Vaccine HPV Types

The impact of GARDASIL against the overall burden of dysplastic or papillomatous cervical, vulvar, and vaginal disease regardless of HPV detection, results from a combination of prophylactic efficacy

against vaccine HPV types, disease contribution from vaccine HPV types present at time of vaccination, the disease contribution from HPV types not contained in the vaccine, and disease in which HPV was not detected.

Additional efficacy analyses were conducted in 2 populations: (1) a generally HPV-naïve population (negative to 14 common HPV types and had a Pap test that was negative for SIL [Squamous Intraepithelial Lesion] at Day 1), approximating a population of sexually-naïve girls and women and (2) the general study population of girls and women regardless of baseline HPV status, some of whom had HPV-related disease at Day 1.

Among generally HPV-naïve girls and women and among all girls and women in the study population (including girls and women with HPV infection at Day 1), GARDASIL reduced the overall incidence of CIN 2/3 or AIS; of VIN 2/3 or VaIN 2/3; of CIN (any grade) or AIS; and of Genital Warts (Table 15). These reductions were primarily due to reductions in lesions caused by HPV types 6, 11, 16, and 18 in girls and women naïve (seronegative and PCR negative) for the specific relevant vaccine HPV type. Infected girls and women may already have CIN 2/3 or AIS at Day 1 and some will develop CIN 2/3 or AIS during follow-up, either related to a vaccine or non-vaccine HPV type present at the time of vaccination or related to a non-vaccine HPV type not present at the time of vaccination.

Table 15: Effectiveness of GARDASIL in Prevention of Any HPV Type Related Genital Disease in Girls and Women 16 Through 26 Years of Age, Regardless of Current or Prior Infection with Vaccine or Non-Vaccine HPV Types

14.5 Population Impact in Boys and Men 16 through 26 Years of Age

Effectiveness of GARDASIL in Prevention of HPV Types 6-, 11-, 16-, or 18-Related Anogenital Disease in Boys and Men 16 Through 26 Years of Age, Regardless of Current or Prior Exposure to Vaccine HPV Types

Study 5 included boys and men regardless of current or prior exposure to vaccine HPV types, and additional analyses were conducted to evaluate the impact of GARDASIL with respect to HPV 6-, 11-, 16-,

and 18-related anogenital disease in these boys and men. Here, analyses included events arising among boys and men regardless of baseline PCR status and serostatus, including HPV infections that were present at the start of vaccination as well as events that arose from infections that were acquired after the start of vaccination.

The impact of GARDASIL in boys and men regardless of current or prior exposure to a vaccine HPV type is shown in Table 16. Impact was measured starting at Day 1. Prophylactic efficacy denotes the vaccine's efficacy in boys and men who are naive (PCR negative and seronegative) to the relevant HPV types at Day 1. Vaccine impact in boys and men who were positive for vaccine HPV infection, as well as vaccine impact among boys and men regardless of baseline vaccine HPV PCR status and serostatus are also presented. The majority of anogenital disease related to a vaccine HPV type detected in the group that received GARDASIL occurred as a consequence of HPV infection with the relevant HPV type that was already present at Day 1.

There was no clear evidence of protection from disease caused by HPV types for which boys and men were PCR positive regardless of serostatus at baseline.

AAHS Control = Amorphous Aluminum Hydroxyphosphate Sulfate

Effectiveness of GARDASIL in Prevention of Any HPV Type Related Anogenital Disease in Boys and Men 16 Through 26 Years of Age, Regardless of Current or Prior Infection with Vaccine or Non-Vaccine HPV Types

The impact of GARDASIL against the overall burden of dysplastic or papillomatous anogenital disease regardless of HPV detection, results from a combination of prophylactic efficacy against vaccine HPV types, disease contribution from vaccine HPV types present at time of vaccination, the disease contribution from HPV types not contained in the vaccine, and disease in which HPV was not detected.

Additional efficacy analyses from Study 5 were conducted in 2 populations: (1) a generally HPV-naïve population that consisted of boys and men who are seronegative and PCR negative to HPV 6, 11, 16, and 18 and PCR negative to HPV 31, 33, 35, 39, 45, 51, 52, 56, 58 and 59 at Day 1, approximating a population of sexually-naïve boys and men and (2) the general study population of boys and men regardless of baseline HPV status, some of whom had HPV-related disease at Day 1.

Among generally HPV-naïve boys and men and among all boys and men in Study 5 (including boys and men with HPV infection at Day 1), GARDASIL reduced the overall incidence of anogenital disease (Table 17). These reductions were primarily due to reductions in lesions caused by HPV types 6, 11, 16, and 18 in boys and men naïve (seronegative and PCR negative) for the specific relevant vaccine HPV type. Infected boys and men may already have anogenital disease at Day 1 and some will develop anogenital disease during follow-up, either related to a vaccine or non-vaccine HPV type present at the time of vaccination or related to a non-vaccine HPV type not present at the time of vaccination.

AAHS Control = Amorphous Aluminum Hydroxyphosphate Sulfate

14.6 Overall Population Impact

The subject characteristics (e.g. lifetime sex partners, geographic distribution of the subjects) influence the HPV prevalence of the population and therefore the population benefit can vary widely.

The overall efficacy of GARDASIL will vary with the baseline prevalence of HPV infection and disease, the incidence of infections against which GARDASIL has shown protection, and those infections against which GARDASIL has not been shown to protect.

The efficacy of GARDASIL for HPV types not included in the vaccine (i.e., cross-protective efficacy) is a component of the overall impact of the vaccine on rates of disease caused by HPV. Cross-protective efficacy was not demonstrated against disease caused by non-vaccine HPV types in the combined database of the Study 3 and Study 4 trials.

GARDASIL does not protect against genital disease not related to HPV. One woman who received GARDASIL in Study 3 developed an external genital well-differentiated squamous cell carcinoma at Month 24. No HPV DNA was detected in the lesion or in any other samples taken throughout the study.

In 18,150 girls and women enrolled in Study 2, Study 3, and Study 4, GARDASIL reduced definitive cervical therapy procedures by 23.9% (95% CI: 15.2%, 31.7%).

14.7 Studies in Women 27 through 45 Years of Age

Study 6 evaluated efficacy in 3253 women 27 through 45 years of age based on a combined endpoint of HPV 6-, 11-, 16- or 18-related persistent infection, genital warts, vulvar and vaginal dysplastic lesions of any grade, CIN of any grade, AIS, and cervical cancer. These women were randomized 1:1 to receive either GARDASIL or AAHS control. The efficacy for the combined endpoint was driven primarily by prevention of persistent infection. There was no statistically significant efficacy demonstrated for CIN 2/3, AIS, or cervical cancer. In post hoc analyses conducted to assess the impact of GARDASIL on the individual components of the combined endpoint, the results in the population of women naïve to the relevant HPV type at baseline were as follows: prevention of HPV 6-, 11-, 16- or 18-related persistent infection (80.5% [95% CI: 68.3, 88.6]), prevention of HPV 6-, 11-, 16- or 18-related CIN (any grade) (85.8% [95% CI: 52.4, 97.3]), and prevention of HPV 6-, 11-, 16- or 18-related genital warts (87.6% [95% CI: 7.3, 99.7]).

Efficacy for disease endpoints was diminished in a population impact assessment of women who were vaccinated regardless of baseline HPV status (full analysis set). In the full analysis set (FAS), efficacy was not demonstrated for the following endpoints: prevention of HPV 16- and 18-related CIN 2/3, AIS, or cervical cancer and prevention of HPV 6- and 11-related condyloma. No efficacy was demonstrated against CIN 2/3, AIS, or cervical cancer in the general population irrespective of HPV type (FAS any type analysis).

14.8 Immunogenicity

Assays to Measure Immune Response

The minimum anti-HPV titer that confers protective efficacy has not been determined.

Because there were few disease cases in individuals naïve (PCR negative and seronegative) to vaccine HPV types at baseline in the group that received GARDASIL, it has not been possible to establish minimum anti-HPV 6, anti-HPV 11, anti-HPV 16, and anti-HPV 18 antibody levels that protect against clinical disease caused by HPV 6, 11, 16, and/or 18.

The immunogenicity of GARDASIL was assessed in 23,951 9- through 45-year-old girls and women (GARDASIL N = 12,634; AAHS control or saline placebo N = 11,317) and 5417 9- through 26-year-old boys and men (GARDASIL N = 3109; AAHS control or saline placebo N = 2308).

Type-specific immunoassays with type-specific standards were used to assess immunogenicity to each vaccine HPV type. These assays measured antibodies against neutralizing epitopes for each HPV type. The scales for these assays are unique to each HPV type; thus, comparisons across types and to other assays are not appropriate.

Immune Response to GARDASIL

The primary immunogenicity analyses were conducted in a per-protocol immunogenicity (PPI) population. This population consisted of individuals who were seronegative and PCR negative to the relevant HPV type(s) at enrollment, remained HPV PCR negative to the relevant HPV type(s) through 1 month postdose 3 (Month 7), received all 3 vaccinations, and did not deviate from the study protocol in ways that could interfere with the effects of the vaccine.

Immunogenicity was measured by (1) the percentage of individuals who were seropositive for antibodies against the relevant vaccine HPV type, and (2) the Geometric Mean Titer (GMT).

In clinical studies in 16- through 26-year-old girls and women, 99.8%, 99.8%, 99.8%, and 99.4% who received GARDASIL became anti-HPV 6, anti-HPV 11, anti-HPV 16, and anti-HPV 18 seropositive, respectively, by 1 month postdose 3 across all age groups tested.

In clinical studies in 27- through 45-year-old women, 98.2%, 97.9%, 98.6%, and 97.1% who received GARDASIL became anti-HPV 6, anti-HPV 11, anti-HPV 16, and anti-HPV 18 seropositive, respectively, by 1 month postdose 3 across all age groups tested.

In clinical studies in 16- through 26-year-old boys and men, 98.9%, 99.2%, 98.8%, and 97.4% who received GARDASIL became anti-HPV 6, anti-HPV 11, anti-HPV 16, and anti-HPV 18 seropositive, respectively, by 1 month postdose 3 across all age groups tested.

Across all populations, anti-HPV 6, anti-HPV 11, anti-HPV 16, and anti-HPV 18 GMTs peaked at Month 7 (Table 18 and Table 19). GMTs declined through Month 24 and then stabilized through Month 36 at levels above baseline. Tables 20 and 21 display the persistence of anti-HPV cLIA geometric mean titers by gender and age group. The duration of immunity following a complete schedule of immunization with GARDASIL has not been established.

Table 18: Summary of Month 7 Anti-HPV cLIA Geometric Mean Titers in the PPI* Population of Girls and Women

Population	N [†]	n [‡]	% Seropositive (95% CI)	GMT (95% CI) mMU [§] /mL
Anti-HPV 6				
9- through 15-year-old girls	1122	917	99.9 (99.4, 100.0)	929.2 (874.6, 987.3)
16- through 26-year-old girls and women	9859	3329	99.8 (99.6, 99.9)	545.0 (530.1, 560.4)
27- through 34-year-old women	667	439	98.4 (96.7, 99.4)	435.6 (393.4, 482.4)

Tables 18 and 19 display the Month 7 immunogenicity data for girls and women and boys and men. Anti-HPV responses 1 month postdose 3 among 9- through 15-year-old adolescent girls were non-inferior to anti-HPV responses in 16- through 26-year-old girls and women in the combined database of immunogenicity studies for GARDASIL. Anti-HPV responses 1 month postdose 3 among 9- through 15-year-old adolescent boys were non-inferior to anti-HPV responses in 16- through 26-year-old boys and men in Study 5.

On the basis of this immunogenicity bridging, the efficacy of GARDASIL in 9- through 15-year-old adolescent girls and boys is inferred.

GMT Response to Variation in Dosing Regimen in 18- Through 26-Year-Old Women

Girls and women evaluated in the PPE population of clinical studies received all 3 vaccinations within 1 year of enrollment. An analysis of immune response data suggests that flexibility of ± 1 month for Dose 2 (i.e., Month 1 to Month 3 in the vaccination regimen) and flexibility of ± 2 months for Dose 3 (i.e., Month 4 to Month 8 in the vaccination regimen) do not impact the immune responses to GARDASIL.

Duration of the Immune Response to GARDASIL

The duration of immunity following a complete schedule of immunization with GARDASIL has not been established. The peak anti-HPV GMTs for HPV types 6, 11, 16, and 18 occurred at Month 7. Anti-HPV GMTs for HPV types 6, 11, 16, and 18 were similar between measurements at Month 24 and Month 60 in Study 2.

14.9 Long-Term Follow-Up Studies

The protection of GARDASIL against HPV-related disease continues to be studied over time in populations including adolescents (boys and girls) and women who were enrolled in the Phase 3 studies.

Persistence of Effectiveness

An extension of Study 4 used national healthcare registries in Denmark, Iceland, Norway, and Sweden to monitor endpoint cases of HPV 6-, 11-, 16-, or 18-related CIN (any grade), AIS, cervical cancer, vulvar cancer, or vaginal cancer among 2,650 girls and women 16 through 23 years of age at enrollment who were randomized to vaccination with GARDASIL and consented to be followed in the extension study. An interim analysis of the per-protocol effectiveness population included 1,902 subjects who completed the GARDASIL vaccination series within one year, were naïve to the relevant HPV type through 1 month postdose 3, had no protocol violations, and had follow-up data available. The median follow-up from initial vaccination was 6.7 years with a range of 2.8 to 8.4 years. No cases of HPV 6-, 11-, 16-, or 18-related CIN (any grade), AIS, cervical cancer, vulvar cancer, or vaginal cancer were observed over a total of 5,765 person-years at risk.

An extension of a Phase 3 study (Study 7) in which 614 girls and 565 boys 9 through 15 years of age at enrollment were randomized to vaccination with GARDASIL actively followed subjects for endpoint cases of HPV 6-, 11-, 16-, or 18-related persistent infection, CIN (any grade), AIS, VIN, VaIN, cervical cancer, vulvar cancer, vaginal cancer, and genital lesions from the initiation of sexual activity or age 16 onwards. An interim analysis of the per-protocol effectiveness population included 246 girls and 168 boys who completed the GARDASIL vaccination series within one year, were seronegative to the relevant HPV type at initiation of the vaccination series, and had not initiated sexual activity prior to receiving the third dose of GARDASIL. The median follow-up, from the first dose of vaccine, was 7.2 years with a range of 0.5 to 8.5 years. No cases of persistent infection of at least 12 months' duration and no cases of HPV 6-, 11-, 16-, or 18-related CIN (any grade), AIS, VIN, VaIN, cervical cancer, vulvar cancer, vaginal cancer, or genital lesions were observed over a total 1,105 person-years at risk. There were 4 cases of HPV 6-, 11-, 16-, or 18-related persistent infection of at least 6 months' duration, including 3 cases related to HPV 16 and 1 case related to HPV 6, none of which persisted to 12 months' duration.

Persistence of the Immune Response

The interim reports of the two extension studies described above included analyses of type-specific anti-HPV antibody titers at 9 years postdose 1 for girls and women 16 through 23 years of age at enrollment (range of 1,178 to 1,331 subjects with evaluable data across HPV types) and at 8 years postdose 1 for boys and girls 9 through 15 years of age at enrollment (range of 436 to 440 subjects with evaluable data across HPV types). Anti-HPV 6, 11, 16, and 18 GMTs as measured by cLIA were decreased compared with corresponding values at earlier time points, but the proportions of seropositive subjects ranged from 88.4% to 94.4% for anti-HPV 6, from 89.1% to 95.5% for anti-HPV 11, from 96.8% to 99.1% for anti-HPV 16, and from 60.0% to 64.1% for anti-HPV 18.

14.10 Studies with RECOMBIVAX HB [hepatitis B vaccine (recombinant)]

The safety and immunogenicity of co-administration of GARDASIL with RECOMBIVAX HB [hepatitis B vaccine (recombinant)] (same visit, injections at separate sites) were evaluated in a randomized, double-blind, study of 1871 women aged 16 through 24 years at enrollment. The race distribution of the girls and women in the clinical trial was as follows: 61.6% White; 1.6% Hispanic (Black and White); 23.8% Other; 11.9% Black; 0.8% Asian; and 0.3% American Indian.

Subjects either received GARDASIL and RECOMBIVAX HB (n = 466), GARDASIL and RECOMBIVAX HB-matched placebo (n = 468), RECOMBIVAX HB and GARDASIL-matched placebo (n = 467) or RECOMBIVAX-matched placebo and GARDASIL-matched placebo (n = 470) at Day 1, Month 2 and Month 6. Immunogenicity was assessed for all vaccines 1 month post completion of the vaccination series.

Concomitant administration of GARDASIL with RECOMBIVAX HB [hepatitis B vaccine (recombinant)] did not interfere with the antibody response to any of the vaccine antigens when GARDASIL was given concomitantly with RECOMBIVAX HB or separately.

14.11 Studies with Menactra [Meningococcal (Groups A, C, Y and W-135) Polysaccharide Diphtheria Toxoid Conjugate Vaccine] and Adacel [Tetanus Toxoid, Reduced Diphtheria Toxoid and Acellular Pertussis Vaccine Adsorbed (Tdap)]

The safety and immunogenicity of co-administration of GARDASIL with Menactra [Meningococcal (Groups A, C, Y and W-135) Polysaccharide Diphtheria Toxoid Conjugate Vaccine] and Adacel [Tetanus Toxoid, Reduced Diphtheria Toxoid and Acellular Pertussis Vaccine Adsorbed (Tdap)] (same visit, injections at separate sites) were evaluated in an open-labeled, randomized, controlled study of 1040 boys and girls 11 through 17 years of age at enrollment. The race distribution of the subjects in the clinical trial was as follows: 77.7% White; 6.8% Hispanic (Black and White); 1.4% Multi-racial; 12.3% Black; 1.2% Asian; 0.2% Indian; and 0.4% American Indian.

One group received GARDASIL in one limb and both Menactra and Adacel, as separate injections, in the opposite limb concomitantly on Day 1 (n = 517). The second group received the first dose of GARDASIL on Day 1 in one limb then Menactra and Adacel, as separate injections, at Month 1 in the opposite limb (n = 523). Subjects in both vaccination groups received the second dose of GARDASIL at Month 2 and the third dose at Month 6. Immunogenicity was assessed for all vaccines 1 month post completion of the vaccination series (1 dose for Menactra and Adacel and 3 doses for GARDASIL).

Concomitant administration of GARDASIL with Menactra [Meningococcal (Groups A, C, Y and W-135) Polysaccharide Diphtheria Toxoid Conjugate Vaccine] and Adacel [Tetanus Toxoid, Reduced Diphtheria Toxoid and Acellular Pertussis Vaccine Adsorbed (Tdap)] did not interfere with the antibody response to any of the vaccine antigens when GARDASIL was given concomitantly with Menactra and Adacel or separately.

16 HOW SUPPLIED/STORAGE AND HANDLING

All presentations for GARDASIL contain a suspension of 120 mcg L1 protein from HPV types 6, 11, 16, and 18 in a 0.5-mL dose. GARDASIL is supplied in vials and syringes.

Carton of one 0.5-mL single-dose vial. **NDC 0006-4045-00.**

Carton of ten 0.5-mL single-dose vials. **NDC 0006-4045-41.**

Carton of six 0.5-mL single-dose prefilled Luer-Lok[®] syringes with tip caps. **NDC 0006-4109-09.**

Carton of ten 0.5-mL single-dose prefilled Luer-Lok[®] syringes with tip caps. **NDC 0006-4109-02.**

Store refrigerated at 2 to 8°C (36 to 46°F). Do not freeze. Protect from light.

GARDASIL should be administered as soon as possible after being removed from refrigeration.

GARDASIL can be out of refrigeration (at temperatures at or below 25°C/77°F), for a total time of not more than 72 hours.

17 PATIENT COUNSELING INFORMATION

Advise the patient to read the FDA-approved patient labeling (Patient Information).

Inform the patient, parent, or guardian:

- Vaccination does not eliminate the necessity for women to continue to undergo recommended cervical cancer screening. Women who receive GARDASIL should continue to undergo cervical cancer screening per standard of care.
- Recipients of GARDASIL should not discontinue anal cancer screening if it has been recommended by a health care provider.
- GARDASIL has not been demonstrated to provide protection against disease from vaccine and non-vaccine HPV types to which a person has previously been exposed through sexual activity.
- Since syncope has been reported following vaccination sometimes resulting in falling with injury, observation for 15 minutes after administration is recommended.
- Vaccine information is required to be given with each vaccination to the patient, parent, or guardian.
- Information regarding benefits and risks associated with vaccination.

- GARDASIL is not recommended for use in pregnant women.
 - Importance of completing the immunization series unless contraindicated.
 - Report any adverse reactions to their health care provider.
-

Lessons learnt in Japan from adverse reactions to the HPV vaccine: a medical ethics perspective

HIROKUNI BEPPU, MASUMI MINAGUCHI, KIYOSHI UCHIDE, KUNIHIKO KUMAMOTO, MASATO SEKIGUCHI, YUKARI YAJU

Abstract

The human papillomavirus (HPV) vaccine has been linked to a number of serious adverse reactions. The range of symptoms is diverse and they develop in a multi-layered manner over an extended period of time. The argument for the safety and effectiveness of the HPV vaccine overlooks the following flaws: (i) no consideration is given to the genetic basis of autoimmune diseases, and arguments that do not take this into account cannot assure the safety of the vaccine; (ii) the immune evasion mechanisms of HPV, which require the HPV vaccine to maintain an extraordinarily high antibody level for a long period of time for it to be effective, are disregarded; and (iii) the limitations of effectiveness of the vaccine. We also discuss various issues that came up in the course of developing, promoting and distributing the vaccine, as well as the pitfalls encountered in monitoring adverse events and epidemiological verification.

Introduction

In this paper, we review the adverse reactions following human papilloma virus (HPV) vaccination in Japan, and the measures taken by the Ministry of Health, Labour and Welfare (MHLW) (1) to withdraw active recommendation of the vaccine. These measures triggered domestic and international controversy. We also discuss various problems that occurred while developing, promoting and distributing the vaccine; the pitfalls encountered in monitoring adverse events and epidemiological verification; and the influence of big pharma on healthcare policy and research.

I. Overview of the HPV vaccine issue in Japan

HPV vaccines were approved later in Japan than in the western countries (October 2009 for Cervarix, and July 2011 for Gardasil). The vaccination rate was initially low. However, after a campaign for the promotion of the vaccine, which led to government subsidisation of the cost of the vaccine in November 2010, the vaccination rate increased exponentially. This was followed by an unexpected increase in reports of adverse events (AEs). Importantly, these vaccines gave rise to a large number of serious AEs. Table 1 shows the number of reports of serious AEs/adverse drug reactions (ADRs), defined according to the ICH E2A guidelines (2), submitted with respect to HPV vaccines by vaccine manufacturers and medical professionals at the end of February 2016 (3). These numbers far exceed those for other vaccines, even if one allows for the probability that vigilance would be higher for a newly introduced vaccine than an older, time-tested one (4,5) (Fig. 1). As these data have been compiled from voluntary reports, the actual incidence of AEs may well be far higher (6,7).

Table 1
Reports of serious AEs/ADRs of HPV vaccines in Japan (3)

Vaccines	Total dose*	Total number of inoculated persons*	Serious AE/ADR reports	
			From MAH	From medical institutes
Cervarix	6,998,266	2,590,000	835	448
Gardasil	1,924,121	800,000	124	165

*Estimated from sales data

Note: AE: adverse event; ADR: adverse drug reaction; MAH: marketing authorisation holder

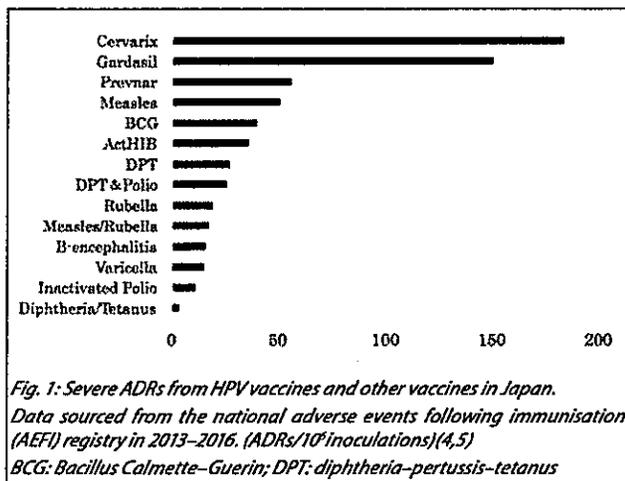

Observation period: December 2009–February 2016 (Cervarix), August 2011–February 2016 (Gardasil)

Other key features of the ADRs reported with HPV vaccines are the diversity of the symptoms and their development in a multi-layered manner over an extended period of time. The ADRs include complex, multi-system symptoms, such as seizures; disturbance of consciousness; systemic pain, including headache, myalgia, arthralgia, back pain and other pain; motor dysfunction, such as paralysis, muscular weakness, exhaustion and involuntary movements; numbness and sensory disturbances; autonomic symptoms, including dizziness, hypotension, tachycardia, nausea, vomiting and diarrhoea; respiratory dysfunction, including dyspnoea and

asthma; endocrine disorders, such as menstrual disorder and hypermenorrhoea; hypersensitivity to light and sound; psychological symptoms, such as anxiety, frustration, hallucinations and overeating; higher brain dysfunction and cognitive impairments, including memory impairment, disorientation and loss of concentration; and sleep disorders, including hypersomnia and sudden sleep attacks. In some cases, these symptoms impair learning and result in extreme fatigue and decreased motivation, having a negative impact on everyday life (8–11). The situation in Japan is similar to that in other countries which have also reported a specific cluster of serious and complex symptoms that develop across multiple body systems over an extended period of time (12,13).

The reason why HPV vaccines cause these characteristic adverse effects remains to be studied in the future, but one of the most plausible explanations is that these vaccines are designed to maintain an extremely high antibody titre over a long period of time. Since prolonged inflammatory reactions associated with infection are known to cause autoimmune diseases and worsening of autoimmune reactions (14), long-time antigen stimulation with HPV vaccines might also induce complex autoimmune reactions via a mechanism similar to that seen with prolonged infection.

Individuals who experienced ADRs following HPV vaccination established a voluntary liaison organisation to facilitate communication with others who also experienced ADRs in Japan. When these ADRs were reported in the mass media, HPV vaccination became a major social issue. In response to the negative press surrounding HPV vaccination, the MHLW withdrew its active recommendation in June 2013 on the grounds of “an undeniable causal relationship between persistent pain and the vaccination”(1). As a result, the inoculation rate for the vaccine decreased rapidly [from 80% at its peak to less than 1% at present (15)]. In response to this change, proponents of the HPV vaccine initiated a push-back campaign and began actively lobbying the government.

On January 20, 2014, the expert advisory committee established by the MHLW (16) presented the view that the

diverse pain and motor dysfunctions experienced by many individuals after HPV vaccination comprised psychosomatic reactions to anxiety or stimulatory pain caused by needle injection, and were not due to any components of the vaccine itself. However, doctors and researchers who examined patients with post-vaccination symptoms arrived at a completely different conclusion, highlighting both the characteristic symptoms and course, which are difficult to explain as psychosomatic reactions (9–11).

Thus, the safety of the HPV vaccine remains far from certain in Japan, justifying the public's strong distrust. Recognising the potentially negative influence of these events on public opinion in other countries, pharmaceutical companies initiated a counter-intervention strategy through public and private organisations, such as the World Health Organisation (WHO). The Global Advisory Committee on Vaccine Safety (GACVS), one of the WHO's advisory committees, claimed it had “not found any safety issue that would alter its recommendations for the use of the vaccine” and criticised the MHLW's decision to withdraw active recommendation (17).

Despite these obstacles, in July 2016, a victims' group filed a multi-plaintiff lawsuit in the district courts of Tokyo, Nagoya, Osaka and Fukuoka against the Japanese government and the two pharmaceutical companies that had produced these vaccines. Furthermore, in December of the same year, additional victims joined the multi-plaintiff lawsuit, bringing the total number of plaintiffs to 119 (18).

So far, we have reviewed the adverse reactions to HPV vaccines and the measures taken by the MHLW in Japan that provoked controversy both in Japan and abroad. In the next section, we discuss the safety and efficacy of the HPV vaccines promoted by the WHO and other organisations, and identify a flaw in the basis of their arguments in favour of the vaccines.

II. The problem with the HPV vaccine: refuting the GACVS statement (19)

a. Safety issues

Investigation by the MHLW

Regarding Japan, the GACVS statement (17) says that “review of clinical data by the national expert committee led to a conclusion that symptoms were not related to the vaccine”. However, there are major problems with the expert committee's investigation (16).

The most serious problem is that very few members of the committee actually examined patients with post-vaccination symptoms. The committee's investigation focused exclusively on pain and motor dysfunction, and ignored many other diverse symptoms that have been observed. Further, cases in which adverse events occurred more than a month after vaccination were excluded from consideration on the ground that most adverse effects of vaccines occur within one month of vaccination. However, subsequent studies have clarified that symptoms commonly appear even after a considerable period of time has elapsed since vaccination (9–11).

The methods used for determining psychosomatic reactions to be the cause of symptoms are also open to question (16). The expert advisory committee proposed four hypotheses regarding the pathophysiology of post-vaccination symptoms: (i) neurological disorder, (ii) intoxication, (iii) immunological reaction, and (iv) psychosomatic reaction. Those cases which do not conform to the committee's criteria for (i)–(iii) were regarded as having no causal relationship with the HPV vaccine. However, since the definition of the psychosomatic response is ambiguous and the diagnosis is exclusively made by the subjective judgement of the doctor, many cases are diagnosed as psychosomatic reactions.

Support for the expert advisory committee's conclusion is far from universal. Doctors and researchers who actually examined patients with post-vaccination symptoms pointed out that it is difficult to explain all symptoms as psychosomatic reactions on the basis of the results of experiments and case reports (8–11, 20–22). Prior to investigating HPV vaccine-associated neuro-immunopathy (HANS), a new disease concept proposed by Nishioka (22), Yokota et al excluded from their survey all individuals who exhibited any physical/psychological abnormality before the vaccination (9). Thus, the survey design further strengthened the conclusion that the psychosomatic response could not account for the majority of the AEs of the HPV vaccine, as claimed by the committee.

Further, as 11 of the 15 members of the expert advisory committee have conflicts of interest with vaccine manufacturers, the public is justified in requesting that a more diverse range of scientists reviews the relevant data (23). Thus, the safety of the HPV vaccine remains far from certain in Japan, justifying the public's strong concerns. Outside Japan, Jefferson et al (24) and Gøtzsche et al (25) also expressed concern about the nature and quality of regulation of the HPV vaccine by the European Medicine Agency.

Criticism of the evidence for safety mentioned in the GACVS statement

Regarding the safety of the HPV vaccine, the GACVS claimed in its statement that it had not found any safety issues warranting an alteration in its recommendations for the use of the vaccine, and criticised Japan for stopping the active promotion of HPV vaccination (17). However, the studies (26–31) cited by the GACVS as evidence for the vaccine's safety raise the following fundamental questions.

i) Genetic basis of autoimmunity

Among the pathophysiological mechanisms related to adverse reactions after vaccination, the involvement of autoimmunity is one of the most probable. The various mechanisms suggested with regard to autoimmune diseases include: molecular mimicry (32), in which a foreign antigen shares structural similarities with self-antigen; the disruption of essential mechanisms in central and peripheral immune tolerance (33); and human endogenous retroviruses genes producing functional proteins or developing antibodies against the individual's own proteins (34).

Although the aetiology has not been fully elucidated, most autoimmune diseases are complex polygenic conditions, in which the affected individual inherits multiple genetic polymorphisms that contribute to disease susceptibility, and these genes interact with environmental factors to cause the disease. It is a well-known fact that some human leucocyte antigen alleles occur at a higher frequency in patients with certain autoimmune diseases than in the general population (35).

At present, what is claimed to be the primary evidence for the safety of the HPV vaccine is that there is no statistically significant difference in the incidence of autoimmune diseases among vaccinated females and unvaccinated females or the general population. However, since the proportion of genetically susceptible people in the general population is very small and limited, simple comparisons of the incidence of autoimmune diseases between those who have been vaccinated and a control (unvaccinated) group are likely to show no significant difference. Arguments that do not take this into account cannot assure the safety of the vaccine. The baseline prevalence of many autoimmune diseases is relatively low. Thus, careful large-scale post-marketing surveillance that takes into account the immunological characteristics of individual patients is required to scientifically verify the relationship between vaccination and autoimmune diseases (36).

ii) Coding and the loss of important information

In drug regulatory agencies and the pharmaceutical industry, all AEs in a patient's medical record are coded for computer processing and thus, details contained in the raw data are "lost". As a result, the clinical significance and extent of drug risk are masked (37,38). This process results in a kind of circular reasoning, in which post-vaccination symptoms are isolated and analysed retrospectively within the framework of the existing disease concepts, instead of being viewed comprehensively.

iii) Paradigm shift

HPV is equipped with various immune evasion mechanisms, which could cause the immune system to become more tolerant to the infection, creating a microenvironment susceptible to further infection and facilitating the progression of cervical intraepithelial neoplasia (CIN). To counteract these immune evasion mechanisms, the HPV vaccine is designed to maintain an extraordinarily high level of antibodies for more than a decade (39, 40). This moves the HPV vaccine out of the paradigm of "vaccine" as it is conventionally understood. These unique characteristics of the HPV vaccine make it essential to conduct a more thorough evaluation of its safety.

b. Effectiveness

While the GACVS statement claims that "the impact of HPV vaccines on HPV-related clinical outcomes, including pre-cancerous lesions, is well established", in actuality, the effectiveness of the HPV vaccine is quite limited, as discussed below.

First, the only verified effect of the HPV vaccine is a preventive effect on pre-cancerous lesions (specifically CIN); the preventive effect on cervical cancer itself has not been established. The effects of the vaccines currently approved in Japan (Cervarix and Gardasil) on pre-cancerous lesions have been demonstrated only in the cases of HPV 16 and 18, which, according to the most reliable studies, represent only 50% of cervical cancer cases in Japan (41).

Further, 10% or fewer cases of high-risk HPV infection result in persistent infection that can cause cancer, while the large majority of any pre-cancerous lesions (CIN) that do develop resolve before becoming cancerous (42, 43). Therefore, only 0.15% of individuals infected with high-risk HPV develop (invasive) cancer (44, 45). Even if cancer develops, regular check-ups can help to detect it at an early stage and appropriate treatment (surgery, radiation and drug therapy) saves many lives. On the basis of these facts, the promotion of educational activity that emphasises the importance of screening and early detection, as well as the creation of an environment in which women feel more comfortable undergoing Pap testing, would be far more effective at preventing cervical cancer than would pressuring teenage girls to receive the existing HPV vaccination, with all its problems.

The proponents of the HPV vaccines claim that they are 98%–100% effective in preventing cervical cancer. In reality, however, the absolute risk reduction (ARR) provided by HPV vaccines is, at most, 0.1%–0.7%, on the basis of calculations using the existing data (46). Further, this indicates only the reduction in the risk of developing pre-cancerous lesions, while the risk of developing cervical cancer remains unknown.

The promotion of screening for cervical cancer is another important measure against cervical cancer. For a long time now, attention has been drawn to the low screening rate for cervical cancer in Japan compared to the western countries. In particular, young women with no experience of pregnancy are reluctant to undergo gynaecological examinations in Japan. Access to examinations by female doctors and an acceptance of self-sampling would undoubtedly increase the screening rates. In fact, the promotion of screening for cervical cancer significantly reduced the age-adjusted incidence of invasive cervical cancer in the UK (47).

III. Structural flaws: an ethics viewpoint

In the previous sections, we discussed various issues regarding the safety and effectiveness of the HPV vaccine. It is now appropriate to ask how such questionable vaccines have come into widespread use. The answer, at least with respect to Japan, can be found in a structural flaw, combined specifically with the following factors: (i) aggressive promotion by the pharmaceutical industry, (ii) trade negotiations by economic superpowers, and (iii) contemporary medicine, which is characterised by overconfidence in technology and a lack of humility with respect to listening to patients' complaints.

a. Immunisation Act and HPV vaccine promotion by manufacturers

Following the enactment of the Immunisation Act in Japan in 1948, numerous lawsuits were filed in response to vaccine-related injuries. This resulted in the establishment of a compensation system for victims and the amendment of the relevant laws and regulations. At present, vaccines are divided into three categories, as shown in Table 2(48).

According to the definitions in the Act, a vaccine for individual protection, such as the HPV vaccine, should be classified as an "optional" vaccination, which is solely the individual's choice. However, due to lobbying activities, the HPV vaccine was approved as a vaccine to be administered at public expense, and was included in the category "Routine vaccination A". Since it was recommended by the government, individuals felt obligated to receive the HPV vaccine.

The Japanese Expert Board for the Eradication of Cervical Cancer (49), one of the most powerful lobbying organisations in Japan, was founded in November 2008, around the time the HPV vaccine was being reviewed for approval. The executive members of various medical academic societies joined this group and exerted considerable influence on the legislative process, as well as on public administration and the shaping of public opinion.

Category	Responsibility of individual	Vaccination
Routine vaccination A	Duty to make effort to receive vaccination	Hib, pneumococcal, BCG, diphtheria, pertussis, tetanus, polio, measles, rubella, varicella, HPV, HB, Japanese Encephalitis
Routine vaccination B	No particular social duty	Influenza (for elderly), pneumococcal
Optional vaccination	Discretion of individual	Pneumococcal (for adults), rotavirus, etc.

According to information obtained by Medwatcher Japan(50) under the *Transparency Guideline for the Relation between Corporate Activities and Medical Institutions* (51) of the Japan Pharmaceutical Manufacturers Association, the funds received by the Expert Board from vaccine manufacturers amounted to ¥73,500,000 (¥35,000,000 in 2012 and ¥38,500,000 in 2013). In addition, the secretary of the Expert Board was found to have been working at GlaxoSmithKline Co. as the Director of Marketing for vaccines for up to eight months prior to the launch of Cervarix. These facts strongly suggest that the activity of the Expert Board was not altruistic, but was actually disguised promotion(52).

b. Pressure from outside Japan

The promotion of the HPV vaccine during Japan–US trade negotiations has also created pressure on Japan to adopt the vaccine. For many years, the promotion of vaccination has been

one of the most pressing requirements in trade negotiations with the US, Japan's most important trading partner (53, 54). The Center for Strategic and International Studies, a civilian think tank that is part of the US military-industrial complex, criticised the indecisiveness of Japan's government in reports issued in May 2014 and April 2015, reflecting the irritation of US industries (55,56).

c. Medical professionals forgetting their role

Basic defects inherent in the medical community underlie the issue of the HPV vaccine. In 2004, Sheldon Krinsky pointed out the increasing influence of commercialism in academic science and biomedical research in his book, *Science in the private interest* (57). He wrote, "...the mix of science and commerce continues to erode the ethical standards of research and diminish public confidence in its results. "In the 13 years since the publication of the book, his warning has become a reality everywhere in the world, not only in the USA. Originally, public health and pharmaco-epidemiology were the scientific fields that aimed to protect the health of individual patients and the public. However, the current reality is very far from the ideal.

Science is now misused to protect the interests of the pharmaceutical industry, and has been used to deny the causal relationship between the drug and its adverse reactions. Many researchers and experts are attempting to exclude inconvenient truths from consideration. "The taxonomy of diseases represents the nearest science has got to nature, but it remains a theoretical construct. It is the theory that should be discounted when the patient's symptoms refuse to fit, not the patient's account of the reality of their experience."(58, 59) This means that doctors must be more humble and scientifically honest. Today's diagnostics and therapeutics were created by listening to patients' voices and conducting careful examinations. It is irresponsible to dismiss a patient's complaint as a psychogenic reaction or a general phenomenon among young women without conducting a thorough examination.

IV. Considerations for solving problems

As described in section III, the introduction of HPV vaccination in Japan was promoted with an emphasis on commercial interests rather than as a public health need. This situation is not unique to Japan and has also been observed in other countries. In Australia, for example, despite the considerable doubts of the Pharmaceutical Benefits Advisory Committee about the Gardasil vaccine, the committee's decision to reject the addition of Gardasil to the national vaccination schedule was hurriedly overturned, following political interference and lobbying by other vested interests (60). In the USA, Merck & Co, Inc promoted legislation to mandate HPV vaccination for school attendance by serving as an information resource, lobbying legislators, drafting legislation, mobilising female legislators and physicians' organisations, conducting consumer marketing campaigns, and filling gaps in access to the vaccine. Legislators relied heavily on Merck for scientific information (61). The responsibility to prove the efficacy and safety of a vaccine lies with the pharmaceutical companies, and the

government is expected to monitor and guide these efforts. The current situation in which commercial interests drive government policy must be corrected from a medical ethics perspective.

At present, Japan is one of the few countries in which the active recommendation of HPV vaccination has been temporarily stopped; the regulatory authorities in other countries have not changed their policies. Although various groups of victims of vaccination have collaborated on wide-ranging activities in these countries, the regulatory authorities have not yet admitted the causal relationship between the vaccines and the victims' health injuries.

The Japanese government's decision to stop actively recommending HPV vaccination has, to an extent, encouraged regulators and patients in other countries to question the value of HPV vaccination. Japan's efforts to stop active recommendation might have been successful because of its historical background of cases of environmental pollution and drug-induced suffering (Minamata disease, thalidomide, SMON, dura mater graft-associated Creutzfeldt-Jakob disease, HIV transmitted by contaminated blood products, etc), which occurred during the post-war period of rapid economic growth. In the multi-plaintiff suits that followed the instances of environmental pollution and drug-induced suffering, the plaintiff groups sought not only compensation for damages, but also institutional reform and revisions to the law to prevent the repetition of the same mistakes (62).

This historical background has created a situation in which the mass media and regulators cannot easily ignore the victims' complaints about the side-effects of new vaccines. It is here that we may find a clue on how to solve this problem. It is necessary to enhance transparency at every step of the approval process for pharmaceutical products, from new-drug development to post-marketing surveillance. At the same time, it is crucial to strengthen the management of conflicts of interest, and develop a system by which citizens can participate directly and have a voice in the planning of public health policy(63-65).

Conflict of interest

All the authors are members of Medwatcher Japan. Masumi Minaguchi and Masato Sekiguchi are Lawyers for the plaintiffs in the HPV vaccination lawsuits.
