

EDB/DBCP/TCP SAMPLING

This sample uses TWO clear vials which have sodium thiosulfate pre-added to them.

Fill out the sample labels and apply it to the sample vials. Remove any connections (hoses, etc..) from the sample tap. Flush the tap for at least 2-3 minutes and then fill both of the clear vials to the rim (forming a meniscus) with your water sample.

Place the caps on both vials being sure that the septa is teflon-lined side down (towards the sample). Avoid trapping air bubbles within the vials.

Check to ensure that there are no air bubbles trapped in the vials.
