EXECUTIVE SUMMARY

This groundwater monitoring report presents the results of the First Quarter 2021 groundwater monitoring event conducted on January 18 through January 27, 2021, at the Red Hill Bulk Fuel Storage Facility (Facility), Joint Base Pearl Harbor-Hickam, Hawai‘i. The Facility is located in the south-central portion of the island of O‘ahu, Hawai‘i and currently contains 14 active and 6 inactive underground fuel storage tanks. The State of Hawai‘i Department of Health (DOH) Facility identification number is 9-102271. The DOH Release identification numbers are 990051, 010011, 020028, and 140010.

The groundwater sampling was conducted as part of the Red Hill groundwater long-term monitoring (LTM) program pursuant to the *Groundwater Protection Plan* (DON 2014) and performed under the Comprehensive Long-Term Environmental Action Navy V, contract task order N6274218F0126. Data collected for this groundwater monitoring event also support Sections 6 and 7 of the *Administrative Order on Consent* [AOC] *in the Matter of Red Hill Bulk Fuel Storage Facility, EPA Docket No: RCRA 7003-R9-2015-01 and DOH Docket No: 15-UST-EA-01*, Attachment A, Statement of Work (EPA Region 9 and DOH 2015). The purpose of the sampling is to assess the condition of groundwater beneath the Facility and to ensure that the United States Department of the Navy remains in compliance with DOH Underground Storage Tank release response requirements as described in Hawai‘i Administrative Rules Chapter 11-280.1, Subchapter 6, Release Response Action. The sampling was conducted in accordance with the Naval Facilities Engineering Systems Command, Pacific Environmental Restoration Program *Project Procedures Manual* (DON 2015b), the DOH *Technical Guidance Manual for the Implementation of the Hawaii State Contingency Plan* (DOH 2018), and the AOC Statement of Work Sections 6 and 7 *Work Plan/Scope of Work* (DON 2017a). A *Sampling and Analysis Plan* and addenda (DON 2017b; 2017c; 2017d; 2021b) were also prepared for AOC Statement of Work Sections 6 and 7 that contain updated information related to the groundwater sampling.

During the First Quarter 2021 groundwater monitoring event, AECOM Technical Services, Inc. personnel collected groundwater samples from 18 monitoring locations within the Red Hill groundwater monitoring network in accordance with the *Sampling and Analysis Plan* and addenda (DON 2017b; 2017c; 2017d; 2021b). These included:

- The sampling point at Red Hill Shaft (RHMW2254-01)
- Twelve single-screen monitoring wells located within the Facility boundary (RHMW01 through RHMW10, RHMW19, and OWDFMW01)
- One deep monitor well located outside the Facility boundary at the Hālawa Correctional Facility (Hālawa Deep Monitor Well [HDMW2253-03])
- One sampling zone each at two multilevel monitoring wells (RHMW11 and RHMW14) located at the Hālawa Correctional Facility
- One sampling zone each at two multilevel monitoring wells (RHMW13 and RHMW15) located within the Facility boundary

Of the multilevel monitoring wells listed above, the following zones were sampled during this event, based on either the zone’s proximity to the approximate elevation of the piezometric surface of the regional basal aquifer, or the zone being the topmost zone within the high-hydraulic-conductivity portions of unweathered basalt in that monitoring location:

- RHMW11 Zone 5
- RHMW13 Zone 5

- RHMW14 Zone 3
- RHMW15 Zone 5

The following multilevel monitoring zones were not sampled in this sampling event in accordance with the *Sampling and Analysis Plan* and addenda (DON 2017b; 2017c; 2017d; 2021b):

- RHMW11 Zones 1 to 4
- RHMW14 Zones 1 to 2
- RHMW13 Zones 1 to 4
- RHMW15 Zones 1 to 4

The following multilevel monitoring zones were not sampled in this sampling event due to low hydraulic conductivity at these zones:

- RHMW11 Zones 6 to 8
- RHMW14 Zones 4 to 8

Of the monitoring locations sampled during the First Quarter 2021 groundwater monitoring event, primary and field duplicate samples were collected from sampling point RHMW2254-01, monitoring well RHMW02, and multilevel monitoring well RHMW13 Zone 5 (RHMW13-05).

Analytical results from the sampling event were compared to the current LTM screening criteria. The LTM screening criteria were agreed upon by the AOC Parties and were presented in the February 4, 2016, AOC Statement of Work Sections 6 and 7 scoping completion letter (EPA Region 9 and DOH 2016). The LTM screening criteria were updated (as applicable) with the most current (Fall 2017) DOH Tier 1 groundwater environmental action levels for sites where groundwater is a potential or current drinking water resource and the nearest surface water body is greater than 150 meters from the release site (DOH 2017).

The analytical results for groundwater samples collected from RHMW01, RHMW02, and RHMW03 were also compared to the Site-Specific Risk-Based Levels (SSRBLs) for total petroleum hydrocarbons (TPH)-diesel range organics (TPH-d) (4,500 micrograms per liter [µg/L]) and benzene (750 µg/L). The use of these screening SSRBLs was described in the Red Hill *Groundwater Protection Plan* (DON 2014) and later presented in the February 4, 2016, AOC Statement of Work Sections 6 and 7 scoping completion letter (EPA Region 9 and DOH 2016).

No detectable amounts of nonaqueous-phase liquid (NAPL) or sheen were present in groundwater from any monitoring well during First Quarter 2021 groundwater monitoring event. A slight brown color was observed in the groundwater collected from HDMW2253-03, similar to observations made in previous events. Other than the slight brown color, no odors, sheen, or NAPL were noted at HDMW2253-03.

No odors were noted in any of the groundwater samples. Chemical of potential concern (COPC) concentrations exceeded LTM screening criteria only for samples collected from RHMW02. No SSRBL exceedances were reported.

Analytical results for the groundwater monitoring event are summarized as follows:

- *RHMW2254-01 (primary and duplicate), RHMW01, RHMW04, RHMW05, RHMW06, RHMW07, RHMW08, RHMW09, RHMW10, RHMW19, RHMW11-05, RHMW13-05 (primary and duplicate), RHMW14-03, RHMW15-05, HDMW2253-03,* and *OWDFMW01:* No COPCs were detected.
- *RHMW02 (primary and duplicate):* TPH-d (1,500 and 1,600 µg/L), 1-methylnaphthalene (25 and 23 µg/L), 2-methylnaphthalene (17 and 16 µg/L), and naphthalene (44 and 41 µg/L) were detected at concentrations exceeding their respective screening criteria (400, 10, 10, and 17 µg/L). TPH-d with silica gel cleanup (SGC) analysis was detected at significantly lower concentrations than the non-SGC analysis, suggesting that the majority of the non-SGC TPH-d results were biodegradation by-products. The concentrations of TPH-d did not exceed the SSRBL of 4,500 µg/L. TPH-d with SGC analysis (390 and 380 µg/L) and TPH-residual range organics (TPH-o) (180 J and 330 µg/L) were detected at concentrations below their respective LTM screening criteria (400 and 500 µg/L). No other COPCs were detected.
- *RHMW03:* TPH-d (180 J µg/L) and TPH-o (220 J µg/L) were detected at estimated concentrations below their respective LTM screening criteria (400 and 500 µg/L). The TPH-d and TPH-o with SGC analysis results were non-detect, suggesting that the non-SGC TPH-d result consisted entirely of biodegradation by-products. No other COPCs were detected.

Analytical results of natural attenuation parameters (NAPs) suggest that biodegradation is occurring in the vicinity of RHMW02, based on depleted dissolved oxygen (DO), nitrate, and sulfate concentrations and elevated dissolved methane concentrations. Likewise, the concentrations of SGC TPH-d and polynuclear aromatic hydrocarbons found at RHMW02 further underscore that biodegradation is occurring at the site. Even though RHMW01 was non-detect for TPH-d and TPH-o, the depleted DO, dissolved methane, depleted nitrate, and reduced sulfate concentrations at this well suggest biodegradation is occurring, which is consistent with historical observations at this location. Depleted DO and COPC detections at RHMW03 indicate that biodegradation is likely occurring there. Evaluation of COPC results and NAP concentrations at all other monitoring locations does not indicate biodegradation in those locations.

Lead scavengers were not detected at RHMW13 during the First Quarter 2021 monitoring event, which completes 1 year of sampling with no detections at all sampled RHMW13 multilevel monitoring well zones. Based on no detections of lead scavengers at all sampled RHMW13 multilevel monitoring well zones for 1 year of sampling, it is recommended that testing for lead scavengers be discontinued for RHMW13.

Based on the groundwater monitoring results, pursuant to the Red Hill *Groundwater Protection Plan* (DON 2014) and in accordance with AOC Statement of Work Sections 6 and 7 (EPA Region 9 and DOH 2015), groundwater monitoring at locations within the Red Hill groundwater monitoring network will continue. It is also recommended that the Red Hill groundwater LTM program continue testing for NAPs at each monitoring event and continue SGC TPH-d and TPH-o analysis for all locations with non-SGC TPH-d or TPH-o detections.

1. Introduction

This groundwater monitoring report presents the results of the First Quarter 2021 groundwater monitoring event conducted on January 18 through January 27, 2021, at the Red Hill Bulk Fuel Storage Facility (Facility), Joint Base Pearl Harbor-Hickam (JBPHH), O'ahu, Hawai'i (Figure 1). In accordance with the *Groundwater Protection Plan* (DON 2014), the purpose of the sampling is to (1) assess the condition of groundwater beneath the Facility with respect to chemical constituents associated with Jet Fuel Propellant and Marine Diesel Fuel (F-76), and (2) ensure that the United States (U.S.) Department of the Navy (Navy) remains in compliance with the State of Hawai'i Department of Health (DOH) Underground Storage Tank release response requirements codified in Hawai'i Administrative Rules Chapter 11-280.1, Subchapter 6, Release Response Action. The DOH Facility identification number (no.) for the Facility is 9-102271. The DOH Release identification nos. are 990051, 010011, 020028, and 140010.

The groundwater sampling was conducted under Naval Facilities Engineering Systems Command (NAVFAC) Pacific Contract No. N62742-17-D-1800 as part of the long-term groundwater and soil vapor monitoring program at the Facility for Naval Supply Systems Command Fleet Logistics Center Pearl Harbor. Soil vapor monitoring at Red Hill is conducted under another contract and reported separately. The groundwater sampling was conducted in accordance with the NAVFAC Pacific Environmental Restoration Program *Project Procedures Manual* (DON 2015b); the DOH *Technical Guidance Manual for the Implementation of the Hawaii State Contingency Plan* (TGM) (DOH 2018); and the Administrative Order on Consent (AOC) Statement of Work Sections 6 and 7, *Work Plan/Scope of Work* (WP/SOW) (DON 2017a). A *Sampling and Analysis Plan* (SAP) and addenda (DON 2017b; 2017c; 2017d; 2021b) containing updated information for the groundwater sampling were also prepared for AOC Statement of Work Sections 6 and 7 (EPA Region 9 and DOH 2015).

This report presents the results for sampling activities conducted at groundwater monitoring locations both within and outside of the Facility boundaries. Cumulative historical monitoring results for the Red Hill groundwater monitoring network are presented in tables and charts in Appendix A. Field activity and analytical documentation for the monitoring event are presented in Appendix B and Appendix C, respectively.

1.1 SITE DESCRIPTION

The Facility is located on Federal Government land (on land zoned by the City and County of Honolulu as a mix of F-1 Federal and Military and P-1 Restricted Preservation districts) in south-central O'ahu, approximately 2.5 miles northeast of Pearl Harbor (Figure 1). It is located on a low ridge on the western edge of the Ko'olau Mountain Range that divides Hālawa Valley and Moanalua Valley. The Facility occupies 144 acres of land, and the majority of the ground surface of the site lies at an elevation of approximately 200–500 feet above mean sea level. Proximate to the Facility lie Hālawa Industrial Park and Hālawa Correctional Facility to the north, preservation land to the northeast, residential neighborhoods in Moanalua Valley to the southeast, and additional residential neighborhoods and the U.S. Coast Guard reservation to the southwest. A quarry is located less than one-quarter mile to the northwest.

The Facility currently contains 14 active and 6 inactive underground fuel storage tanks that are operated by Naval Supply Systems Command Fleet Logistics Center Pearl Harbor. Each tank has a capacity of approximately 12 million gallons. The bottoms of the Facility's tanks are located a minimum of approximately 100 feet above the basal aquifer. The fuel storage tanks currently contain Jet Fuel Propellant No. 5 (JP-5), North Atlantic Treaty Organization-grade F-24 jet fuel (F-24), and F-76. The current status of each tank is summarized in Table 1-1.

Table 1-1: Current Status of the Facility's Fuel Storage Tanks as of January 2021

Tank ID	Fuel Type	Status [a]	Capacity (million gallons) [b]
F-1	Empty	Inactive	12.0
F-2	F-24	Active	12.0
F-3	F-24	Active	12.0
F-4	F-24	Active	12.0
F-5	F-24	Active	12.7
F-6	F-24	Active	12.7
F-7	JP-5	Active	12.7
F-8	JP-5	Active	12.7
F-9	JP-5	Active	12.7
F-10	JP-5	Active	12.7
F-11	JP-5	Active	12.7
F-12	JP-5	Active	12.7
F-13	Empty	Inactive (CIR)	12.7
F-14	Empty	Inactive (CIR)	12.7
F-15	F-76	Active	12.7
F-16	F-76	Active	12.7
F-17	Empty	Inactive (CIR)	12.7
F-18	Empty	Inactive (CIR)	12.7
F-19	Empty	Inactive	12.7
F-20	JP-5	Active	12.7

ID identification
CIR clean, inspect, and repair
[a] Active status indicates that a tank is currently available for use. Inactive status indicates that a tank is currently not available for use. CIR status indicates a tank is currently scheduled for cleaning, inspection, and repair activities.
[b] Tank capacity in this table is approximate and is not necessarily the tank-rated capacity or maximum allowable fill volume.

One sampling point at Red Hill Shaft (RHMW2254-01), 12 single-screen monitoring wells (RHMW01 to RHMW10, RHMW19, and OWDFMW01), and two multilevel monitoring wells (RHMW13 and RHMW15) are located within the Facility boundary. One deep monitor well (HDMW2253-03) and two multilevel monitoring wells (RHMW11 and RHMW14) are located outside the Facility boundary.

Of the non-multilevel monitoring locations, RHMW01 to RHMW10, RHMW19, and OWDFMW01 are conventional monitoring wells with single screens typically installed across or near the water table. Sampling point RHMW2254-01 is located inside the shaft of Navy Supply Well 2254-01. HDMW2253-03 is a deep monitor well installed by the State of Hawai'i Department of Land and Natural Resources at the Hālawa Correctional Facility and has a solid casing installed to approximately 50 feet below the water table.

This page intentionally left blank

RHMW11, RHMW13, RHMW14, and RHMW15 are multilevel monitoring wells that are screened at the piezometric surface of the regional basal aquifer and at other depths above and below the piezometric surface.

- RHMW11 has eight monitoring zones: one zone (Zone 8) near the groundwater table, two zones (Zones 6 and 7) below the groundwater table with sampling ports within the saprolite layer (the layer of heavily weathered and altered clay-rich basalts), and five zones (Zones 1 to 5) below the groundwater table with sampling ports within the basalt layer.
- RHMW13 has five monitoring zones all located within high-hydraulic-conductivity portions of unweathered basalt: one monitoring zone (Zone 5) near the approximate elevation of the piezometric surface of the regional basal aquifer, and four zones (Zones 1 to 4) below the elevation of the regional basal aquifer.
- RHMW14 has eight monitoring zones: one monitoring zone (Zone 8) near the approximate elevation of the piezometric surface of the regional basal aquifer, four zones (Zones 4 to 7) below the approximate elevation of the piezometric surface of the regional basal aquifer with sampling ports within basalt with relatively lower hydraulic conductivity, and three zones (Zones 1 to 3) below the elevation of the piezometric surface of the regional basal aquifer with sampling ports within the relatively higher-hydraulic-conductivity portions of the unweathered basalt of the regional basal aquifer.
- RHMW15 has five monitoring zones, all located within high-hydraulic-conductivity portions of unweathered basalt: one monitoring zone (Zone 5) near the approximate elevation of the piezometric surface of the regional basal aquifer, and four zones (Zones 1 to 4) below the elevation of the regional basal aquifer.

1.2 PHYSICAL SETTING

The Facility is situated on the southwest flank of the Koʻolau shield volcano and is primarily underlain by Koʻolau volcanic series basalts. Climatological conditions in the area of the Facility consist of warm to moderate temperatures and low to moderate rainfall. The average annual precipitation is approximately 40 inches, which occurs mainly between November and April (Giambelluca, Nullet, and Schroeder 1986). Average temperatures range from the low 60s to high 80s (degrees Fahrenheit) (Juvik and Juvik 1998).

The Facility is located at the administrative boundary between the Waimalu Aquifer System of the Pearl Harbor Aquifer Sector and the Moanalua Aquifer System of the Honolulu Aquifer Sector. The underlying aquifer is classified as a basal, unconfined, flank-type and is currently used as a drinking water source. The aquifer is considered fresh, with less than 250 milligrams per liter (mg/L) of chloride, and is considered an irreplaceable resource with a high vulnerability to contamination (Mink and Lau 1990).

The nearest drinking water supply well is Navy Supply Well 2254-01 (also known as Red Hill Shaft), located within the Facility's lower access tunnel. Navy Supply Well 2254-01 is located approximately 2,600 feet topographically downgradient of the fuel storage tanks (Figure 1) and provides potable water to the JBPHH Water System, which serves approximately 65,200 military customers. NAVFAC Hawaii Utilities Energy Management Division operates Navy Supply Well 2254-01 and its associated water development tunnel.

The nearest surface water body is South Hālawa Stream, which is an ephemeral stream present along the north side of the Facility. Wells RHMW01 through RHMW03, RHMW05, RHMW09, RHMW10,

RHMW15, and RHMW19 are located greater than 150 meters from any portion of South Hālawa Stream. Sampling point RHMW2254-01 and wells RHMW04, RHMW06 through RHMW08, RHMW11, RHMW13, RHMW14, HDMW2253-03, and OWDFMW01 are located within 150 meters of a portion of Hālawa Stream. The approximate distance from each well and sampling point to Hālawa Stream is presented in Table 1-2.

Table 1-2: Distance of Sampling Locations to South Hālawa Stream

Sampling Location	Approximate Closest Distance to South Hālawa Stream (meters)
RHMW2254-01	85
RHMW01	232
RHMW02	299
RHMW03	271
RHMW04	81
RHMW05	225
RHMW06	104
RHMW07	81
RHMW08	64
RHMW09	376
RHMW10	452
RHMW11	3 [a]
RHMW13	47
RHMW14	10 [a]
RHMW15	153
RHMW19	441
HDMW2253-03	20
OWDFMW01	143

[a] RHMW11 and RHMW14 are located alongside the concrete-lined portion of South Hālawa Stream.

Despite some wells being located within 150 meters of surface water (South Hālawa Stream), there are no indications of any complete pathways to nearby surface water bodies. Both South Hālawa Stream and Moanalua Stream (located in Moanalua Valley east of the Facility) are intermittent streams (USGS 2017) located approximately 100 feet or more above the water table of the basal aquifer. Moreover, the bottoms of the fuel tanks are located at least 50 feet below the bottom of the streams, and the segment of South Hālawa Stream between Red Hill and Hālawa Correctional Facility is concrete-lined. Thus, groundwater conditions do not affect the nearby stream, and analytical results for the long-term monitoring (LTM) program are therefore compared to the screening criteria based on DOH environmental action levels (EALs) Table D-1b (i.e., groundwater EALs for sites where "groundwater is a current or potential drinking water resource" and the nearest "surface water body is not located within 150 meters of release site") (DOH 2017).

1.3 BACKGROUND

The U.S. Government constructed the Facility in the early 1940s. Twenty tanks were constructed of reinforced concrete lined with steel. The fueling system is a self-contained underground unit that was installed into native rock composed primarily of basalt with some interbedded tuffs and breccias (DON 2010). Each tank measures approximately 250 feet in height and 100 feet in diameter. The upper domes of the tanks lie at depths varying between 100 and 200 feet below ground surface. The tanks currently

contain JP-5, F-24, and F-76. In the past, the tanks also stored Navy special fuel oil, Navy distillate, aviation gasoline, and motor gasoline (DON 2010).

1.3.1 Previous Groundwater Monitoring Results

Groundwater samples for the Red Hill groundwater LTM program have been analyzed by the various offsite laboratories listed in Table 1-3. The Red Hill groundwater LTM program results spanning from 2005 onward are summarized in Table 1-4.

Table 1-3: Red Hill Groundwater LTM Program Analytical Laboratories

Groundwater Monitoring Event	Analytical Laboratory
1st Qtr 2020 – 1st Qtr 2021	APPL
4th Qtr 2019	APPL (all COPCs and NAPs except TOC and DOC for select samples) ARI (TOC and DOC for select samples)
2nd Qtr 2019 – 3rd Qtr 2019	APPL
1st Qtr 2019	APPL (all COPCs and NAPs except TOC during the December 2018 event) ARI (TOC during the December 2018 event only)

[a] Groundwater LTM samples were not collected during the First and Second Quarters 2006 due to Phase I and Phase II site investigation activities (DON 2007) occurring at that time.
[b] Groundwater LTM samples were not collected during the Fourth Quarter 2007.

Groundwater sampling locations are depicted on Figure 1. Detailed cumulative results of historical groundwater monitoring are tabulated in Appendix A.1, and concentration graphs of chemicals of potential concern (COPCs) over time are presented in Appendix A.2. All historical data are compared to the most recently updated (Fall 2017) DOH EALs (DOH 2017). Total petroleum hydrocarbons (TPH)-diesel range organics (TPH-d) and benzene are also compared to the Site-Specific Risk-Based Levels (SSRBLs), as discussed in the Red Hill *Groundwater Protection Plan* (DON 2014), as supplemented by the February 4, 2016, AOC Statement of Work Sections 6 and 7 scoping completion letter (EPA Region 9 and DOH 2016). Historical results indicate that most, and generally the highest, detected concentrations of COPCs occur in monitoring well RHMW02.

Notes:
Bold and shaded text indicates analyte detected above DOH EAL.
RHMW2254-01 is the sampling point located inside the shaft of the Navy Supply Well 2254-01.
Inside Wells: RHMW01, RHMW02, RHMW03, RHMW05.
Outside Wells: RHMW04, RHMW06, RHMW07, RHMW08, RHMW09, RHMW10, RHMW19, RHMW11, RHMW13, RHMW14, RHMW15, HDMW2253-03, OWDFMW01.
As of the Third Quarter 2018 Groundwater Monitoring Report, the "No. of Detects" and "No. of Non-detects" includes all primary and replicate results; versions of this table previous to the Third Quarter 2018 report included only the maximum detected concentration between primary and replicate samples.
As of the Second Quarter 2019 Groundwater Monitoring Report, the "No. of Detects" and "No. of Non-detects" includes EPA Region 9 Laboratory split sampling data; versions of this table previous to the Second Quarter 2019 report included only data from Navy-contracted laboratories.
TPH-d and TPH-o results at wells other than RHMW01, RHMW02, and RHMW03 from the Second Quarter 2020 onwards are partially or wholly due to laboratory solvent contamination. See Fourth Quarter 2020 report narrative for additional discussion.
— = no data
% = percent
µg/L = microgram per liter
DOH = Department of Health, State of Hawai'i
EAL = Environmental Action Level
EPA = Environmental Protection Agency, United States
no. = number
TPH-d = total petroleum hydrocarbons-diesel range organics
TPH-g = total petroleum hydrocarbons-gasoline range organics
TPH-o = total petroleum hydrocarbons-residual range organics (i.e., TPH-oil)

This page intentionally left blank

No measurable amount of nonaqueous-phase liquid (NAPL) has ever been detected in any Red Hill monitoring well. Of the 35 previously sampled monitoring locations (including both non-multilevel wells and multilevel well monitoring zones) from 2005 to 2020, five monitoring locations have had COPCs in concentrations exceeding the screening criteria (i.e., RHMW01, RHMW02, RHMW05, HDWMW2253-03, and OWDFMW01). No detections of COPCs have ever exceeded screening criteria at the sampling point (RHMW2254-01) in Red Hill Shaft. Of the three monitoring wells that the SSRBLs apply to (RHMW01, RHMW02, and RHMW03), only TPH-d in RHMW02 has ever exceeded the SSRBL. Sampling results analyzed by Navy-contracted laboratories from 2005 to 2020 are summarized below:

- *RHMW2254-01* is a sampling point located inside the shaft of Navy Supply Well 2254-01. Detections of TPH-gasoline range organics (TPH-g), TPH-d, TPH-residual range organics (TPH-o), and polynuclear aromatic hydrocarbons (PAHs) occurred occasionally during monitoring events between 2005 and October 2017, but no COPCs were detected above the screening criteria. Ethylbenzene, toluene, and total xylenes were detected below screening criteria during the Fourth Quarter (October) 2018 groundwater monitoring event, but were non-detect during the subsequent monthly (November and December 2018) monitoring events; thus, the Fourth Quarter 2018 detections could not be verified and have not occurred since. TPH-d detections below screening criterion were reported during First and Second Quarters 2020 monitoring events. Evaluations of TPH chromatograms suggested that the reported TPH detections were not related to the release of petroleum fuels. TPH chromatograms of the First through Fourth Quarter 2020 groundwater samples, field quality control (QC), and laboratory QC showed similar chromatographic profiles of discrete peaks not indicative of petroleum hydrocarbons; therefore, the RHMW2254-01 2020 monitoring events TPH detections were attributable to contamination during sample extraction and were not related to the release of petroleum fuels. No COPCs have been detected since Second Quarter 2020.
- *RHMW01*, located immediately southwest of Tank 1, was installed in 2001 (DON 2002). TPH-d has consistently been detected at RHMW01 but has not exceeded the DOH screening criterion (400 micrograms per liter [µg/L]) since the First Quarter (January) 2016 monitoring event. TPH-d has never exceeded the SSRBL (4,500 µg/L). The TPH-d detections during the 2020 quarterly monitoring events were mostly or wholly due to petroleum biodegradation by-products, as indicated by TPH chromatograms and TPH with silica gel cleanup (SGC) results. PAHs were periodically detected below the screening criteria. Sporadic detections of benzene and toluene below their respective screening criteria occurred in 2005, 2014, and 2017. Other than those noted above, no other COPCs have been detected.
- *RHMW02,* located next to Tank 6, was installed in 2005 (DON 2007). TPH-g was detected and exceeded the screening criterion (300 µg/L) during Fourth Quarter 2012 and First Quarter 2013 monitoring events. TPH-d has consistently been detected; concentrations exceeded the screening criterion (400 µg/L) in all monitoring events and exceeded the SSRBL in 2008, 2014, 2015, and 2016. TPH-o was detected below the screening criterion (500 µg/L) in most monitoring events from 2015 onward. SGC TPH-d and TPH-o results showed reduced or non-detect concentrations compared to non-SGC TPH-d and TPH-o results, indicating that the majority of the reported non-SGC TPH mass has likely been biodegradation by-products. PAHs regularly exceeded their screening criteria during monitoring events from 2005 onward. Ethylbenzene and total xylenes were also detected in most events between 2005 and 2018 at trace concentrations below the screening criteria. Benzene and toluene were also detected at trace concentrations below the screening criteria between 2008 and 2016, although less frequently than ethylbenzene and total xylenes. No other COPCs have been detected.
- *RHMW03*, located next to Tank 14, was installed in 2005 (DON 2007). TPH-d and TPH-o were frequently detected but at concentrations below the screening criteria. SGC TPH-d and

TPH-o results were frequently non-detect. TPH-g, toluene, and PAHs were occasionally detected at trace concentrations below screening criteria between 2005 and 2016. No COPCs have been detected above the screening criteria.

- *RHMW04*, located northeast of the tank farm, was installed in 2005 as a background monitoring location (DON 2007). TPH-d, TPH-o, benzene, total xylenes, and PAHs were sporadically detected below screening criteria. TPH-d and TPH-o detections below screening criteria were reported during First through Third Quarter 2020 monitoring events. Evaluation of the chromatograms of the groundwater samples, field QC, and laboratory QC showed similar chromatographic signatures, indicating that during the 2020 quarterly monitoring events TPH-d and TPH-o detections were mostly or wholly due to non-petroleum-related contamination during sample extraction. No other COPCs have been detected.
- *RHMW05*, located southwest of the tank farm and east of sampling point RHMW2254-01, was installed in 2009. TPH-d exceeded the screening criterion during monitoring events in 2009 and 2010, but subsequent TPH-d detections were below the screening criterion; evaluations of historical TPH chromatograms suggested non-petroleum chemical signatures. TPH-o, toluene, and PAHs were occasionally detected below screening criteria. TPH-d and TPH-o detections below screening criteria were reported during First and Third Quarter 2020 monitoring events. Evaluation of the chromatograms of the First through Fourth Quarter 2020 groundwater samples, field QC, and laboratory QC showed similar chromatographic signatures, indicating that the TPH-d and TPH-o detections during the First and Third Quarter 2020 monitoring events were mostly or wholly due to non-petroleum-related contamination during sample extraction. No COPCs were detected during the Second Quarter 2020 monitoring event. TPH-d and TPH-o were not detected during the Fourth Quarter 2020 monitoring event.
- *RHMW06 & RHMW07*, located north of the tank farm, were installed in 2014 in response to the January 2014 release (DON 2015a). TPH-d, TPH-o, and PAHs were occasionally detected below screening criteria. No COPCs have ever been detected above screening criteria. TPH-d was detected below its screening criterion in RHMW07 during the First and Second Quarter 2020 groundwater monitoring events. TPH-o was detected below its screening criterion at RHMW06 during the Third Quarter 2020 groundwater monitoring event; evaluation of the chromatograms of the samples, field QC, and laboratory QC showed similar chromatographic signatures, indicating that the 2020 quarterly monitoring events detections at RHMW06 and RHMW07 were due to non-petroleum-related contamination during sample extraction. TPH-d and TPH-o were not detected during the Fourth Quarter 2020 monitoring event.
- *RHMW08 & RHMW09*, located respectively west and south of Tank 1, were installed in 2016 as part of the AOC Statement of Work Sections 6 and 7 investigation (DON 2017a). Naphthalene was detected below the screening criterion by U.S. Environmental Protection Agency (EPA) Region 9 during the February 2017 split sampling event at RHMW09. TPH-d and/or TPH-o were detected below the screening criteria at RHMW08 from November 2016 to March 2017 and during the First through Third Quarter 2020 events. TPH-d was detected at RHMW09 during the Third Quarter 2020 event. After evaluation of the chromatograms of the samples, field QC, and laboratory QC showed similar chromatographic signatures, the 2020 quarterly monitoring event detections were found to be mostly or wholly attributable to non-petroleum contamination during sample extraction.
- *RHMW10*, located south of Tank 14, was installed in April 2017 as part of the AOC Statement of Work Sections 6 and 7 investigation (DON 2017a). TPH-d and TPH-o were sporadically detected at concentrations below the screening criteria. No other COPCs have been detected.
- *RHMW11*, located at the Hālawa Correctional Facility north of the tank farm, was installed in November 2017 as part of the AOC Statement of Work Sections 6 and 7 investigation (DON

2017a). Five of the eight multilevel monitoring zones (RHMW11 Zones 1 to 5) were sampled during the First, Second, and Third Quarter 2018 events. Sampling was discontinued for RHMW11 Zones 1 to 4 due to lack of COPC detections in groundwater samples collected from all five zones during the First Quarter 2018 through Third Quarter 2018 events. Groundwater samples continued to be collected from RHMW11 Zone 5 thereafter, which is the topmost zone within the high-hydraulic-conductivity portions of unweathered basalt at RHMW11. RHMW11 Zone 7 (one of three zones located in the saprolite formation with low hydraulic conductivity) was sampled during the Third Quarter 2019 monitoring event to collect general chemistry data from formation water within the saprolite. TPH-o was detected during the Second Quarter 2020 event and TPH-d was detected during the Third Quarter event at RHMW11 Zone 5; however, evaluation of the chromatograms of the sample, field QC, and laboratory QC showed similar chromatographic signatures, indicating that the Second and Third Quarter 2020 monitoring event detections were due to non-petroleum-related contamination during sample extraction. TPH-g was detected during the Third Quarter 2020 event; yet, no PAHs or other COPCs were detected at RHMW11-05. During the Third Quarter 2020 event xylenes were detected in the trip blank, suggesting that volatile organic compound (VOC) contamination may have been present prior to analysis. No COPCs have been detected in any other of the RHMW11 multilevel monitoring zones that have been sampled (RHMW11 Zones 1 to 4 and Zone 7).

- *RHMW12,* located at the Hālawa Correctional Facility north of the tank farm, was installed in January 2020. The well is screened in the geologic units overlying the regional aquifer; thus, the well does not reach down to and is not screened in the regional basal aquifer, and has not been integrated into the LTM program.
- *RHMW13*, located northeast of the tank farm, was installed in December 2019 as part of the AOC Statement of Work Sections 6 and 7 investigation (DON 2017a). RHMW13 has five monitoring zones all located within high-hydraulic-conductivity portions of unweathered basalt. Groundwater samples have been collected from all multilevel monitoring zones. TPH-d and TPH-o were detected at RHMW13 Zone 4 and RHMW13 Zone 5 during the Second Quarter 2020 monitoring event; however, evaluation of the chromatograms of the samples, field QC, and laboratory QC showed similar chromatographic signatures, indicating that the detections were due to non-petroleum contamination during sample extraction. No COPCs have been detected in any other RHMW13 multilevel monitoring zones (RHMW13 Zones 1 to 3).
- *RHMW14,* located at the Hālawa Correctional Facility northwest of Tank 1, was installed in March 2019 as part of the AOC Statement of Work Sections 6 and 7 investigation (DON 2017a). RHMW14 has eight multilevel monitoring zones. Three of the eight zones (RHMW14 Zones 1 to 3) are within relatively higher-hydraulic-conductivity portions of the unweathered basalt formation, while the other five zones (RHMW14 Zones 4 to 8) are within relatively lower-hydraulic-conductivity portions of the basalt. Groundwater samples have been collected from six of eight multilevel monitoring zones (RHMW14 Zones 1 to 5 and Zone 7). TPH-o was detected at RHMW14 Zone 3 during the Second Quarter 2020 monitoring event, and TPH-d was detected during the Third Quarter 2020 monitoring event. Evaluation of the sample, field QC, and laboratory QC chromatograms showed similar TPH chromatographic profiles of discrete peaks not indicative of petroleum hydrocarbons, thus the detections were mostly or wholly due to non-petroleum contamination during sample extraction. No COPCs have been detected in any other RHMW14 multilevel monitoring zones that have been sampled (RHMW14 Zones 1 to 2, 4 to 5, and 7).
- *RHMW15*, located between RHMW2254-01 and RHMW05 within the Facility boundaries, was installed in July 2019 as part of the AOC Statement of Work Sections 6 and 7 investigation (DON 2017a). RHMW15 has five multilevel monitoring zones located within relatively higher-hydraulic-conductivity portions of the unweathered basalt formation, with RHMW15

Zone 5 located near the piezometric surface of the regional basal aquifer. All monitoring zones of RHMW15 were initially sampled during the Third Quarter 2019 monitoring event. No COPCs have been detected in any of the RHMW15 multilevel monitoring zones.

- *RHMW19*, located south of tank 8, was installed in June 2020 as part of the AOC Statement of Work Sections 6 and 7 investigation (DON 2017a). TPH-o (150 J) was detected at an estimated concentration below the screening criterion during the Third Quarter 2020 monitoring event; however, TPH-d was detected in laboratory method blank at the same concentration (150 J). Therefore, the sample result was qualified as non-detect (U) due to laboratory method blank contamination. Evaluation of the samples, field QC, and laboratory QC chromatograms showed similar TPH chromatographic profiles of discrete peaks not indicative of petroleum hydrocarbons, suggesting that the TPH-o detection was also due to non-petroleum contamination during sample extraction. No other COPCs have been detected at RHMW19.
- *HDMW2253-03*, located north of the tank farm at the Hālawa Correctional Facility, was installed in 2000 by the State of Hawaiʻi Department of Land and Natural Resources below the groundwater table without a well screen. The well was installed with the intent of monitoring water supply parameters, not potential presence of contamination from nearby facilities. TPH-d was detected above the screening criterion during the First Quarter 2013 quarterly monitoring event. HDMW2253-03 was not sampled during quarterly and monthly monitoring events from April to July 2017 due to experimental testing conducted by the State of Hawaiʻi Department of Land and Natural Resources Commission on Water Resource Management and the University of Hawaiʻi. During the Second Quarter 2020 monitoring event, TPH-d was detected; however, evaluation of TPH chromatograms suggested that the reported TPH detections were due to non-petroleum contamination during sample extraction and were not related to the release of petroleum fuels. No other COPCs have exceeded screening criteria. No COPCs were detected since the Second Quarter 2020 monitoring event.
- *OWDFMW01*, located at the former Oily Waste Disposal Facility west of Navy Supply Well 2254-01, was installed in 1998 (DON 2000). TPH-d exceeded the screening criterion during quarterly monitoring events in 2010, 2012, 2013, 2015, and 2020. Evaluations of historical TPH chromatograms suggested that the reported TPH detections were not related to the release of petroleum fuels. Even though the Second Quarter 2020 TPH-d result exceeded its screening criterion, evaluation of TPH chromatograms (original analysis and re-extract analysis) and laboratory QC showed similar chromatographic profiles of discrete peaks not indicative of petroleum hydrocarbons; therefore, the TPH detections were attributable to contamination during sample extraction. Third Quarter 2020 TPH-d and TPH-o detections were below screening criterion. Evaluation of the sample, field QC, and laboratory QC chromatograms showed similar TPH chromatographic profiles of discrete peaks not indicative of petroleum hydrocarbons, thus the Third Quarter 2020 detections were due to laboratory solvent contamination. No other COPCs have ever exceeded screening criteria.

1.3.2 TPH Analysis Concerns

As discussed in previous quarterly monitoring reports, the TPH and PAH concentrations for the Second Quarter 2018 through Fourth Quarter 2018 monitoring events were higher than the reported results from the Fourth Quarter 2016 through First Quarter 2018 monitoring events. The increase in concentrations starting from the Fourth Quarter 2017 through Third Quarter 2018 is attributable to changes made to the Navy-contracted laboratory's extraction and analysis protocols to optimize the laboratory's EPA Method 8015 and EPA Method 8270 selected ion monitoring (SIM) standard operating procedures. The changes were prompted by the January–March 2017 split sampling and October 2017 TPH-d performance testing results conducted by the EPA Region 9 laboratory in Richmond, California, and the Navy-contracted laboratory (EPA Region 9 and DOH 2018; DON

2017e). The split sampling and performance testing results showed that although both laboratories' processes and protocols were in accordance with the EPA Method 8015, the EPA Region 9 laboratory had higher TPH-d and PAH recoveries than the Navy-contracted laboratory for analytes present in groundwater samples at high concentrations (EPA Region 9 and DOH 2017a, 2018; DON 2018b). The differences in recoveries were due to the EPA Region 9 laboratory protocols being more effective at recovering higher TPH-d and PAH concentrations, especially for samples with higher concentrations of polar hydrocarbons and metabolites. Changes made to the Navy-contracted laboratory's protocols included: using calibration standards identical to those used by the EPA Region 9 laboratory, sample acidification to pH less than 5 prior to extraction, switching extraction methodologies from EPA Method 3510C (separatory funnel liquid-liquid extraction) to EPA Method 3520C (continuous liquid-liquid extraction), using a rotary evaporator for extract condensation, and reducing the field-collected sample volume for optimal extraction within the liquid-liquid extractor vessel. The Third Quarter 2018 split sampling event results indicated that TPH-d and PAH data generated by the Navy-contracted laboratory were approximately 12–37 percent lower than results reported by the EPA Region 9 laboratory (DON 2018a). The Navy-contracted laboratory's recoveries have increased since the First Quarter 2017 split sampling event, during which recoveries were approximately 65 percent lower than the EPA Region 9 laboratory's results. After the method optimizations, there were no apparent increases in the TPH and PAH concentration trends. Evaluation of the split sampling data was presented in detail in the *Third Quarter 2018 Groundwater Monitoring Report* (DON 2018a).

Starting from the First Quarter 2020 monitoring event, increasing concentrations of non-petroleum-related impurities were observed in recent batches of reagent-grade solvent used in the extraction of groundwater samples for EPA Method 8015 analysis. Extraction of samples for EPA Method 8015 uses a relatively large amount of solvent (300 milliliters [mL]) that is concentrated (5 mL or less) prior to analysis. Thus, the trace impurities are magnified in the final extract for TPH analysis. The solvent contamination is evident in samples from the Second, Third, and Fourth Quarter 2020 monitoring events. Additional EPA Method 8270 analysis of the RHMW13-05 March 2020 sample tentatively identified three compounds (i.e., 2-ethyl-1-hexanol, cis-1-butyl-2-methylcyclopropane, and octadecanoic acid) used in polymeric materials and plasticizers; no other compounds associated with the solvent contamination could be positively identified using the method in the *Fourth Quarter 2020 Groundwater Monitoring Report* (DON 2021a).

EPA Method 8015 TPH detections due to laboratory contamination were previously flagged with an asterisk (*) but as of the Third Quarter 2020 report have been flagged by the letter "A" to facilitate recognition among other qualifiers. Additionally, the cumulative groundwater COPC graphs (Appendix A.2) and Figure 2 (COPC detections) differentiate TPH detections due to laboratory contamination.

1.3.3 Previous Reports

The Red Hill groundwater LTM reports listed in Table 1-5 were prepared and submitted to DOH. Starting from the Fourth Quarter 2016 groundwater monitoring event, information for both the inside-tunnel and outside-tunnel monitoring locations has been combined into one report.

Table 1-5: Previous Groundwater Monitoring Reports

Combined Reports for Inside- and Outside-Tunnel Wells					
Year	Title	Sampling Period		Submittal Date

Qtr quarter
Rpt report

2. Groundwater Monitoring Activities

During the First Quarter 2021 groundwater monitoring event, AECOM Technical Services, Inc. personnel collected groundwater samples from 18 monitoring locations within the Red Hill groundwater monitoring network in accordance with the SAP and addenda (DON 2017b; 2017c; 2017d; 2021b):

- The sampling point at Red Hill Shaft (RHMW2254-01)
- Twelve single-screen monitoring wells located within the Facility boundary (RHMW01 through RHMW10, RHMW19, and OWDFMW01)
- One deep monitor well located outside the Facility boundary at the Hālawa Correctional Facility (Hālawa Deep Monitor Well [HDMW2253-03])
- One sampling zone each at two multilevel monitoring wells (RHMW11 and RHMW14) located at the Hālawa Correctional Facility
  - RHMW11 Zone 5
  - RHMW14 Zone 3
- One sampling zone each at multilevel monitoring wells (RHMW13 and RHMW15) located within the Facility boundary
  - RHMW13 Zone 5
  - RHMW15 Zone 5

In addition, field duplicate samples were collected from:

- Sampling point RHMW2254-01
- Monitoring well RHMW02
- Multilevel monitoring well RHMW13 Zone 5 (RHMW13-05)

The following multilevel monitoring zones were not sampled in this sampling event due to lack of detections of COPCs in previous monitoring events:

- RHMW11 Zones 1 to 4
- RHMW14 Zones 1 to 2
- RHMW13 Zones 1 to 4
- RHMW15 Zones 1 to 4

The following multilevel monitoring zones were not sampled in this sampling event due to low hydraulic conductivity at these zones:

- RHMW11 Zones 6 to 8
- RHMW14 Zones 4 to 8

All samples were collected in accordance with the AOC Statement of Work Sections 6 and 7 WP/SOW (DON 2017a), SAP (DON 2017b; 2017c), SAP Addendum 01 (DON 2017d), and SAP Addendum 03 (DON 2021b). The WP/SOW and SAP are consistent with DOH underground storage tank release response requirements (Hawai'i Administrative Rules, Chapter 11-280.1), NAVFAC Pacific Environmental Restoration Program Project Procedure I-C-3, *Monitoring Well Sampling* (DON 2015b), and the Red Hill *Groundwater Protection Plan* (DON 2014). Prior to purging and sampling, ambient and headspace vapor readings (VOCs, oxygen, hydrogen sulfide, carbon monoxide, and lower explosive levels of vapors) were measured using a MultiRAE multi-gas monitor at all inside-tunnel sampling locations, RHMW09, and OWDFMW01. VOCs were measured using a MiniRAE 3000 photoionization detector (PID) at all other outside-tunnel sampling locations. The depth to groundwater was measured using Solinst oil/water interface probes and calibrated Solinst water level measuring tapes for inside tunnel wells (see Appendix B.2 for tape correction factors). The depth to groundwater was measured using Solinst oil/water interface probes and calibrated Heron water level measuring tapes for outside wells (see Appendix B.2 for tape correction factors). No NAPL or sheen was observed in any well. PID detections were observed in the monitoring well headspace at RHMW06, RHMW09, RHMW11 Zone 5, RHMW13 Zone 5, and RHMW14 Zone 5, with PID measurements ranging from 0.1 parts per million (ppm) to 4.2 ppm (Table 3-1). Field measurements and observations are presented in the groundwater purge logs in Appendix B.1.

2.1 GROUNDWATER SAMPLING

2.1.1 Single-Screen (Non-Multilevel) Monitoring Well Sampling

Prior to collecting groundwater samples, the non-multilevel monitoring wells were purged of standing water in the well casings. These monitoring locations each contain a dedicated bladder pump, which was used to purge the well and collect samples. The groundwater wells were purged using low-flow sampling methodology at flow rates of approximately 0.10–0.30 liter per minute to minimize VOC loss and drawdown.

To operate the pump, a portable air compressor with an in-line filter was connected to a QED Environmental Systems MicroPurge MP10 Controller, which was then connected to the pump. The compressor was turned on to power the pump, and the controller was used to adjust the pumping rate to less than 1 liter of water per minute. Compressed nitrogen gas was used to purge and sample these non-multilevel monitoring wells.

Water quality parameters were monitored on a periodic basis during well purging using an In-Situ Inc. smarTROLL multiparameter handheld water quality meter. Parameters measured included total dissolved solids, pH, temperature, specific conductivity, dissolved oxygen (DO), turbidity, oxidation-reduction potential (ORP), and salinity. The water quality parameters were used to evaluate whether the natural characteristics of the aquifer formation water were present within the monitoring wells before the samples were collected. A minimum of six readings were collected at each well during the purging process. When feasible depending on the well's inside diameter allowing space for both the bladder pump tubing and calibrated tape, water level measurements were collected and recorded during purging to detect indications of drawdown; if drawdown approaching 0.2 foot was detected, the rate of low-flow purging was reduced. Purging was considered complete when at least three consecutive water quality measurements stabilized within the specified range for each parameter noted in groundwater sampling logs (Appendix B.1) and in accordance with NAVFAC Pacific Environmental Restoration Program Project Procedure I-C-3, *Monitoring Well Sampling* (DON 2015b). The readings were recorded in the groundwater sampling logs (Appendix B.1).

Once water quality parameters stabilized, groundwater samples were immediately collected from the wells using the bladder pumps. Groundwater samples from these non-multilevel monitoring wells were

collected no more than 2.5 hours after purging was completed. Groundwater samples were collected in sample containers that were pre-preserved (as necessary) and provided by the analytical laboratory. Samples collected for ferrous iron analysis were filtered in the field using new, individual 0.45-micron filters attached at the end of the pump/probe discharge tubing.

2.1.2 Multilevel Monitoring Well Sampling

Due to the multilevel design of monitoring wells RHMW11, RHMW13, RHMW14, and RHMW15, purging was not required immediately prior to collecting groundwater from the sampled monitoring zone, since the measurement ports allow groundwater to flow directly from the surrounding formation and there is no filter pack.

Groundwater was collected using sampling probes from the following multilevel monitoring zones: RHMW11 Zone 5, RHMW13 Zone 5, RHMW14 Zone 3, and RHMW15 Zone 5.

A string of four sealed 250-mL sample containers was connected to the sampling probe, which was lowered to each monitoring zone, and the containers filled with groundwater from the formation through a sampling port in the central casing of the well. Once sampling containers were filled, the sampling port was closed, and the probe and container string were brought to the surface. The groundwater was then transferred to the appropriate laboratory-supplied containers. For collection of groundwater quality parameters, the sample containers were flushed with nitrogen to remove air from within the containers prior to collection of groundwater. The nitrogen flush was performed to minimize DO enrichment due to high water pressure in the formation, which would otherwise have forced air in the sample containers to mix into the groundwater collected. Groundwater quality parameters were collected at least three times during the sampling of each multilevel monitoring well zone and recorded in the groundwater sampling logs (Appendix B.1). Additionally, cumulative data on water pressure, temperature, and elevation from multilevel monitoring well sampling is presented in Appendix D of the *Fourth Quarter 2020 Groundwater Monitoring Report* (DON 2021a). Observations and additional discussion of groundwater DO enrichment were presented in the *First Quarter 2018 Groundwater Monitoring Report* (DON 2018f).

Groundwater samples were collected in sample containers that were pre-preserved (as necessary) and provided by the analytical laboratory. Samples collected for ferrous iron were filtered in the field using new, individual 0.45-micron filters attached at the end of the pump/probe discharge tubing.

Groundwater sampling at multilevel monitoring well zones requires a few hours for each zone due to the limited volume (1 liter) collected from each deployment of the sample container string. During the Second Quarter 2019 monitoring event, a one-time evaluation was conducted to evaluate whether the groundwater geochemistry changes during the sampling duration. Three additional aliquots of groundwater (from run #2, run #7, and run #13) were collected from RHMW11-05 and analyzed for anions and alkalinity. The results indicated that the groundwater geochemistry is consistent during the 4-hour sampling duration at RHMW11-05. Data related to these samples were presented in the *Second Quarter 2019 Groundwater Monitoring Report* (DON 2019c).

The analytical program for the First Quarter 2021 groundwater monitoring event is shown in Table 2-1.

Table 2-1: Groundwater Sampling Program for the First Quarter 2021 Quarterly Monitoring Event

— not analyzed
✓ analyzed

[a] COPCs and associated screening criteria were provided in the February 4, 2016, AOC Statement of Work Sections 6 and 7 scoping completion letter from the Regulatory Agencies (EPA Region 9 and DOH 2016) and updated with the most current DOH Tier 1 EALs in Table D-1b (DOH 2017) where appropriate.
[b] Screening criterion is from EPA Tap Water Regional Screening Levels, target hazard quotient = 1.0, November 2020 (EPA 2020).
[c] TPH-d and TPH-o with SGC were analyzed only in samples with positive detections of TPH-d and TPH-o without SGC.
[d] Lead scavengers are collected only from newly installed monitoring wells for at least 1 year of sampling, and may be discontinued if sample results are below the Groundwater Action Levels established in the February 4, 2016, scoping completion letter (EPA Region 9 and DOH 2016). Lead scavenger analysis was performed during the First Quarter 2021 monitoring event for RHMW19 and RHMW13-05, which have not yet completed the minimum 1 year of sampling. The lead scavenger requirement has been completed for all other monitoring locations.

2.2 FIELD QUALITY ASSURANCE/QUALITY CONTROL

A quality assurance (QA)/QC program was implemented in the field in accordance with the NAVFAC Pacific *Project Procedures Manual* (DON 2015b), DOH TGM (DOH 2018), the project WP/SOW (DON 2015c), AOC Statement of Work Sections 6 and 7 WP/SOW (DON 2017a), SAP (DON 2017b; 2017c), SAP Addendum 01 (DON 2017d), and SAP Addendum 03 (DON 2021b) to support generating data of known and defensible quality. The QA/QC program was designed to minimize error, provide early identification and correction of potential problems, and evaluate the performance of the sampling program.

Field instruments were calibrated each morning prior to starting field activities. The PID was calibrated with 100 ppm isobutylene calibration gas. The multi-gas monitor was calibrated with 100 ppm isobutylene calibration gas and a multi-gas monitor calibration gas composed of 50 ppm carbon monoxide, 25 ppm dihydrogen sulfide, 19 percent oxygen, and 50 percent of the lower explosive limit of methane. The water quality meter was calibrated with an auto-calibration solution prior to recording measurements.

To assess the effectiveness of the equipment decontamination process, one equipment blank sample was collected from the reusable sample container used during the multilevel monitoring well zone sampling. The equipment blank sample was collected on site by pouring distilled water onto the decontaminated multilevel monitoring well sample container string and then into the sample containers. A field blank sample was also collected to assess the quality of the locally sourced Menehune Water Company distilled water used to collect the equipment blank. The field blank was collected by pouring distilled water directly into sample containers. The field blank and equipment blank samples were analyzed for the same COPCs as the groundwater samples.

As all non-multilevel monitoring locations have dedicated bladder pumps installed, no field and equipment blanks were collected from non-multilevel monitoring locations.

To help assess the precision of the data collection activity, including sampling and analysis, field duplicates were collected at the same approximate time as their respective primary samples. During the First Quarter 2021 monitoring event, one field duplicate each was collected from RHMW2254-01, RHMW02, and RHMW13 Zone 5.

One trip blank was used at each sampling location to accurately represent the condition of the samples in each shipment. The hermetically sealed trip blank samples were supplied pre-filled by the analytical laboratory and remained with the associated groundwater sample in the cooler during the field event and transported to and from the site.

2.3 SAMPLE HANDLING AND ANALYSIS

The samples were labeled and logged in accordance with NAVFAC Pacific Environmental Restoration Program Project Procedure III-E, *Record Keeping, Sample Labeling, and Chain-of-Custody Procedures* (DON 2015b). Immediately after collection, all samples were labeled, logged in the field logbooks, custody-sealed, sealed with tape, and placed in a resealable plastic bag. To meet the recommended holding time for nitrate analysis, efforts were made to ship samples to the laboratory on the day of collection. Samples not shipped on the day of collection were stored in secure and controlled cold storage overnight and shipped the following day.

Prior to shipping, the samples were logged in a chain-of-custody form and loaded into a cooler with double-bagged wet ice. Packed coolers were sent by field personnel via express-courier overnight shipping in custody-sealed coolers to Agriculture & Priority Pollutants Laboratories, Inc. in Clovis, California. Sample transport and custody details are provided in the chain-of-custody records in the laboratory reports in Appendix C.1.

2.4 DECONTAMINATION

Decontamination activities were performed in accordance with NAVFAC Pacific Environmental Restoration Program Project Procedure I-F, *Equipment Decontamination* (DON 2015b). A staging and decontamination area was established near each well location. Non-disposable sampling equipment (e.g., water level meter, oil/water interface probe, and multilevel monitoring well sample container string) was decontaminated at the beginning of each day and after purging and sampling each well. The decontamination process included washing and scrubbing the equipment with stiff-bristled nylon brushes and a non-phosphate detergent (e.g., Alconox) solution, followed by rinsing once with isopropyl alcohol and twice with distilled water. Liquid wastes generated during decontamination activities were captured and containerized in properly labeled, U.S. Department of Transportation-approved 55-gallon drums or other suitable temporary containers and managed as investigation-derived waste (IDW).

2.5 INVESTIGATION-DERIVED WASTE MANAGEMENT

IDW generated during the monitoring events consisted of purged groundwater from the monitoring wells and decontamination water. The IDW was handled, stored, and labeled in accordance with NAVFAC Pacific Environmental Restoration Program Project Procedure I-A-6, *Investigation-Derived Waste Management* (DON 2015b). Approximately 150 gallons of fluid from all wells were containerized in three clearly labeled, 55-gallon-capacity drums, covered with a tarp, and stored on site in an area designated by the Navy, pending disposal. Disposable personal protective equipment and sampling equipment and supplies were collected in plastic trash bags and disposed of as municipal waste.

3. Data Evaluation and Quality Assessment

Field observations and measurements and laboratory groundwater analytical results collected during the First Quarter 2021 groundwater monitoring event were evaluated along with available correction factors and historical groundwater concentrations. A data quality assessment consisting of a review of the overall groundwater sample collection and analysis process was performed to determine whether the analytical data generated met the quality objectives for the project. The data quality assessment was performed in accordance with the AOC Statement of Work Sections 6 and 7 WP/SOW (DON 2017a) and the SAP and addenda (DON 2017b; 2017c; 2017d; 2021b). The field QC program consisted of standardized sample collection and management procedures and the collection of field duplicate samples, matrix spike (MS) samples, and trip blank samples. The laboratory QA program consisted of the use of standard analytical methods and the preparation and analyses of MS/MS duplicate (MSD) samples, surrogate spikes, blanks, and laboratory control samples (LCSs)/LCS duplicates (LCSDs).

3.1 GROUNDWATER LEVEL MEASUREMENTS

Depths to groundwater were gauged from the notched and surveyed top of casing using calibrated water level measuring tapes at non-multilevel monitoring well locations prior to sampling (Table 3-1). Additionally, a Heron or Solinst oil/water interface probe was used to detect NAPL, which was measured if present.

The oil/water interface probe and water level measuring tapes were decontaminated between well measurements by washing with a non-phosphate detergent solution and rinsing with isopropyl alcohol and distilled water to prevent cross-contamination. Measuring points for all non-multilevel monitoring wells are detailed in three well elevation survey reports (DON 2018c; 2018e; 2019a) and presented in Table 3-1.

Table 3-1: Groundwater Elevations

Monitoring Well No.	Sampling Date	PID Reading at Wellhead (ppm)	Depth to Water (ft btoc) [a]	Measuring Tape Correction Factor [Tape ID] (ft) [b]	Well Horizontal Displacement Correction Factor (ft) [c]	Corrected Depth to Water (ft btoc)	Measuring Point Elevation (ft msl) [d]	Groundwater Elevation (ft msl)

msl mean sea level
N-1 500-foot calibrated water level tape (Appendix B.2)
N-2 1000-foot calibrated water level tape (Appendix B.2)

[a] Depth to water readings were taken using the calibrated water level measuring tapes.
[b] Water level measuring tape calibration information and correction factors are presented in Appendix B.2.
[c] Well horizontal displacement correction factor based on gyroscopic survey of the monitoring well's vertical plumbness. Correction factors are presented in the *Technical Memorandum, Gyroscopic Survey Results and Calculated Correction Factors for Groundwater Monitoring Network Wells at the Red Hill Bulk Fuel Storage Facility* (DON 2018d).
[d] Well Elevation Survey Reports: (DON 2018c; 2018e; 2019a).
[e] Ambient PID measurements were recorded at 0.1 ppm for RHMW06; all other ambient PID measurements were 0.0 ppm.
[f] Depth to water is measured from the top of the gray plate at monitoring wells RHMW06, RHMW07, RHMW08, RHMW09, RHMW10, and RHMW19.
[g] Depth to water measurements cannot be measured in multilevel monitoring wells RHMW11, RHMW13, RHMW14, and RHMW15.
[h] Depth to water at the Red Hill Shaft sampling point was not measured due to safety concerns related to entering the shaft access manhole.
[i] The horizontal displacement correction factor for RHMW19 and the zones in multilevel wells RHMW13, RHMW14, and RHMW15 are currently unavailable but will be published in a forthcoming deliverable.

Groundwater elevations beneath and near the site ranged from 18.10 to 22.54 feet above mean sea level during the First Quarter 2021 groundwater monitoring event. Graphs of cumulative historical depth to water readings are presented in Appendix A.4.

PID readings at the wellheads ranged from 0.0 to 4.2 ppm, with PID detections at RHMW06, RHMW09, RHMW11-05, RHMW13-05, and RHMW14-03. The highest PID detection at the wellhead was 4.2 ppm at RHMW14-03. The ambient PID reading at RHMW06 was 0.1 ppm. PID measurements of ambient conditions for all other monitoring locations was 0.0 ppm, indicating that wellhead VOCs detections at RHMW09, RHMW11-05, RHMW13-05, and RHMW14-03 were likely not caused by field conditions, such as vehicle exhaust or high humidity, at these locations.

No odor, sheen, or NAPL was observed during sampling at any location. The groundwater collected from HDMW2253-03 showed a slight brown coloration, similar to observations made in previous events. All other groundwater samples were observed as clear of color and sediment.

Due to safety concerns related to entering the Red Hill Shaft access manhole, depth to groundwater measurement at RHMW2254-01 is no longer collected starting from the Second Quarter 2019 groundwater monitoring event. Additionally, due to the design of the multilevel monitoring wells, depths to groundwater cannot be measured in the monitoring zones of RHMW11, RHMW13, RHMW14, and RHMW15. Cumulative results of water pressure, temperature, and elevation for multilevel monitoring wells are presented in Appendix D of the *Fourth Quarter 2020 Groundwater Monitoring Report* (DON 2021a).

3.2 ANALYTICAL RESULTS

The following are the chemicals analyzed and the respective analytical methods for this monitoring event:

- TPH-d and TPH-o by EPA SW846 Test Method 8015B
- TPH-g, benzene, toluene, ethylbenzene, and xylenes by EPA Method 8260B
- 1-methylnaphthalene, 2-methylnaphthalene, and naphthalene by EPA Method 8270D SIM
- Phenol by EPA Method 8270D
- 2-(2-methoxyethoxy)-ethanol by a proprietary laboratory procedure
- Nitrate, chloride, and sulfate by EPA Method 300.0
- Nitrate-nitrite as nitrogen, methane, ferrous iron, and alkalinity by EPA 353.2, RSK 175, SM 3500-Fe-B, and SM2320B, respectively
- Total organic carbon (TOC) by EPA Method 9060A

The sampling results include the chemicals analyzed and the respective analytical methods for each groundwater sample are identified in Table 3-2. Copies of the laboratory reports are presented in Appendix C.1. Copies of the third-party data validation reports are presented in Appendix C.2.

Notes:

Bold text indicates detected value.

Bold and shaded text indicates analyte exceeds the screening criterion.

— = not analyzed or not applicable
µg/L = microgram per liter
CAS = Chemical Abstracts Service
COC = chain-of-custody
EB = equipment blank (rinsate)
FB = field blank (source water)
FD = field duplicate
ID = identification
J = estimated value
mg/L = milligram per liter
mV = millivolt
N = normal (primary) sample
no. = number
QC = quality control
U = nondetect value
R = Rejected
SSRBL = Site-Specific Risk-Based Level
TB = trip blank
TPH-g = total petroleum hydrocarbons-gasoline range organics
TPH-d = total petroleum hydrocarbons-diesel range organics
TPH-o = total petroleum hydrocarbons-residual range organics (i.e., TPH-oil)

[a] SSRBL applies to RHMW01, RHMW02, and RHMW03.

[b] For EPA 8015 TPH-d and TPH-o, analysis of silica gel clean extract was performed on samples with TPH-d and/or TPH-o detection.

[c] Nitrate result converted to nitrate as nitrogen by multiplying nitrate result by a factor of 0.2259 (CalEPA 2011).

This page intentionally left blank

Analytical results were compared to the current LTM screening criteria as established by the February 4, 2016, AOC Statement of Work Sections 6 and 7 scoping completion letter (EPA Region 9 and DOH 2016) and updated with the most recent DOH (2017) Tier 1 EALs in Table D-1b (Section 1.2). The field and QC sample results of the First Quarter 2021 groundwater monitoring event are summarized in Table 3-2.

Figure 2 presents COPC detections, and Figure 3A and Figure 3B present the natural attenuation parameter (NAP) results at all monitoring locations. A description of laboratory data qualifiers and definitions and basic concepts of the terms DL, LOD, and LOQ are presented in the DoD Environmental Data Quality Workgroup Fact Sheet included as Appendix C.3.

Notes

1. Map projection: NAD 1983 UTM Zone 4N
2. Base Map: DigitalGlobe, Inc. (DG) and NRCS. Publication_Date: 2015
3. Only analytes with detections and associated SGC data (if applicable) are shown.
4. COPC screening criteria is based on DOH Tier 1 groundwater environmental action levels for sites where groundwater is a potential or current drinking water resource and the nearest surface water body is greater than 150 meters from the release site.
5. Results marked with the qualifier "A" indicates result is mostly or wholly due to laboratory TPH-d/o contamination.

ABBREVIATIONS:

FD	field duplicate sample
ID	identification
J	estimated value
N	primary (normal) sample
SGC	silica gel cleanup
SSRBL	site-specific risk based level
TPH	total petroleum hydrocarbon
TPH-d	TPH-diesel range organics
TPH-g	TPH-gasoline range organics
TPH-o	TPH-oil/residual range organics
U	non-detect value (reported as less than the limit of detection)
µg/L	microgram per liter
1300	Exceeds screening criterion

Bold text indicates detected value.

3.2.1 Analytical Results

Analytical results for the First Quarter 2021 groundwater monitoring event are summarized as follows:

- *RHMW2254-01 (primary and duplicate), RHMW01, RHMW04, RHMW05, RHMW06, RHMW07, RHMW08, RHMW09, RHMW10, RHMW19, RHMW11-05, RHMW13-05 (primary and duplicate), RHMW14-03, RHMW15-05, HDMW2253-03,* and *OWDFMW01:* No COPCs were detected.
- *RHMW02 (primary and duplicate):* TPH-d (1,500 and 1,600 µg/L), 1-methylnaphthalene (25 and 23 µg/L), 2-methylnaphthalene (17 and 16 µg/L), and naphthalene (44 and 41 µg/L) were detected at concentrations exceeding their respective screening criteria (400, 10, 10, and 17 µg/L). TPH-d with SGC analysis was detected at significantly lower concentrations than the non-SGC analysis, suggesting that the majority of the non-SGC TPH-d results were biodegradation by-products. The concentrations of TPH-d did not exceed the SSRBL of 4,500 µg/L. TPH-d with SGC analysis (390 and 380 µg/L), and TPH-o (180 J and 330 µg/L) were detected at concentrations below their respective LTM screening criteria (400 and 500 µg/L). No other COPCs were detected.
- *RHMW03:* TPH-d (180 J µg/L) and TPH-o (220 J µg/L) were detected at estimated concentrations below their LTM respective screening criteria (400 and 500 µg/L). The TPH-d and TPH-o with SGC analysis results were non-detect, suggesting that the non-SGC TPH-d result consisted entirely of biodegradation by-products. No other COPCs were detected.

Consistent with previous monitoring events, no NAPL or visible sheen was observed, and no odors were noted in the groundwater collected from all monitoring locations for the duration of the sampling. Similar to observations made during previous monitoring events, a slight brown color was observed in the groundwater collected from HDMW2253-03, which is not screened and terminates 50 feet below the groundwater surface. Other than the slight brown color, no odors, sheen, or NAPL were noted at HDMW2253-03.

3.3 GROUNDWATER CONTAMINANT CONCENTRATIONS

A table of cumulative historical groundwater results is included as Appendix A.1. The historical groundwater COPC concentrations for TPH-g; TPH-d; TPH-o; benzene, toluene, ethylbenzene, and xylenes; 1-methylnaphthalene; 2-methylnaphthalene; and naphthalene are illustrated in Appendix A.2. Starting with the March 2020 groundwater data, the cumulative groundwater COPC graphs (Appendix A.2) differentiate TPH-d and TPH-o detections due to laboratory contamination. Cumulative NAP measurements starting from the Fourth Quarter 2016 event are illustrated in Appendix A.3.1, and current NAP measurements are illustrated in Appendix A.3.2. There are no graphs for lead scavengers, fuel additives, and analytes that are no longer included as COPCs for the Red Hill groundwater LTM program (EPA Region 9 and DOH 2016). The only detections of lead scavengers and other fuel additives in groundwater samples were below-screening-criteria concentrations of 1,2-dichloroethane from April 2015 to January 2016 at OWDFMW01 and phenol (one detection) during a December 2016 sampling event at RHMW09.

3.4 DATA VALIDATION AND ASSESSMENT

The analytical laboratory data for the First Quarter 2021 groundwater monitoring event were submitted to a third-party data validator (Laboratory Data Consultants, Inc.) for data validation and assessment. Analytical data from monitoring events from 2005 to Third Quarter 2016 underwent a limited data verification for all events in which a third-party data validation was not performed (DON 2018a). Analytical data from Fourth Quarter 2016 onward were validated by a third-party data validator.

The objective of data validation is to provide data of known quality for project decisions. Data quality is judged in terms of precision, accuracy, representativeness, comparability, completeness, and sensitivity. Data validation is performed in accordance with the data validation procedures in the NAVFAC Pacific Environmental Restoration Program *Project Procedures Manual* (DON 2015b), and consistent with the protocol in the DoD QSM Version 5.1 (DoD and DOE 2017), as presented in the SAP and addenda (DON 2017b; 2017c; 2017d; 2021b). A number of factors may affect the quality of data, including sample collection methods; sample analysis methods; and adherence to established procedures for sample collection, preservation, management, shipment, and analysis. Data validation reports are presented in Appendix C.2.

Precision

Precision is defined as the reproducibility of replicate measurements. Precision is evaluated by the relative percent difference (RPD) of field duplicates, LCS/LCSD, MS/MSD, and laboratory duplicate results. Field duplicate and MS/MSD samples were collected at a rate of approximately 10 percent of primary samples. Field duplicates were sent to the laboratory along with the primary samples. Primary and field duplicate RPDs are presented in Table 3-3. When COPCs were not detected in the primary and field duplicate samples, no RPDs could be calculated.

Table 3-3: Field Duplicate Analyte RPDs

Sampling Location	Analyte	Screening Criterion (µg/L)	Sample ID	Concentration (µg/L)	RPD [a, b]
RHMW02	TPH-d	400	ERH1219	1,500	6%
			ERH1220	1,600	
	TPH-d w/SGC	400	ERH1219	390	3%
			ERH1220	380	
	TPH-o	500	ERH1219	180 J	59%
			ERH1220	330	
	1-Methylnaphthalene	10	ERH1219	25	8%
			ERH1220	23	
	2-Methylnaphthalene	10	ERH1219	17	6%
			ERH1220	16	
	Naphthalene	17	ERH1219	44	7%
			ERH1220	41	

% percent
J estimated value
N/A not applicable; COPCs not detected in primary and field duplicate samples
U non-detect value

[a] Field duplicate RPD measurement performance criterion for groundwater is 50 percent in accordance with the criteria presented in Table 5-1 of the SAP (DON 2017b, 2018c) and Table 3-2 of the SAP addenda (DON 2017d, 2018g).

[b] RPD = $\frac{|(x2 - x1)|}{((X2+X1)/2)}$

All primary and field duplicate samples RPDs except for TPH-o in RHMW02 were within the 50 percent measurement performance criteria (Table 3-3). Data were not flagged based on field duplicate imprecision. No other COPCs besides those listed in Table 3-3 were detected in the primary and field duplicate samples collected during the First Quarter 2021 groundwater monitoring event.

No other precision concerns were identified during validation of sample results. Data usability of the samples is discussed in Section 3.5.

Accuracy

Accuracy is defined as the degree of conformity of a measurement to a standard or true value. Accuracy is evaluated through measurement of the percent recovery (%R) of an analyte in a reference standard or spiked sample. Accuracy also encompasses the percent difference (%D) between the initial calibration verification and the continuing calibration verification. Accuracy limits for surrogates, LCS, MS, and MSD samples are either prescribed by the DoD or established by the individual laboratory. The acceptance criteria for accuracy are dependent on the analytical method and based on historical laboratory or DoD data.

Due to presence of headspace in the sample vials, 66 results for 1,2-dichloroethane, benzene, ethylbenzene, toluene, total xylenes, TPH-g, and methane were flagged as non-detect estimated (UJ), and one (1) detected result for methane was flagged as estimated (J) from the laboratory-prepared trip blanks. Headspace were observed only in the trip blank samples, and headspace was not observed in the groundwater samples.

One chloride result was flagged as estimated (J) due to low initial calibration verification %R.

Five nitrate results and five TOC results were flagged as estimated (J) due to high continuing calibration verification %Rs.

One 2-methylnaphthalene result was flagged as non-detect estimated due to low MS and MSD %Rs.

No other accuracy concerns identified during validation affected sample results. Data usability is discussed in Section 3.5.

Representativeness

Representativeness is the degree to which data accurately and precisely represent a characteristic of a population, parameter variations at a sampling point, or an environmental condition. Representativeness was achieved by conducting sampling in accordance with the sample collection procedures described in the AOC Statement of Work Sections 6 and 7 WP/SOW (DON 2017a) and the SAP (DON 2017b; 2017c; 2017d), including standardized sample collection methods identified in NAVFAC Pacific Environmental Restoration Program Project Procedure I-C-3, *Monitoring Well Sampling* (DON 2015b).

Representativeness is also evaluated through compliance with the method-recommended sample holding time and sample preservation methods and through the analysis of blank samples, including method blank, equipment blank, field blank, and trip blank samples. All sample holding times and sample preservation were evaluated in accordance with EPA SW-846 method recommendations and DoD QSM Version 5.1 (DoD and DOE 2017).

All samples were associated with a trip blank and laboratory blanks. Field and equipment blanks were collected and analyzed to demonstrate efficiency of field equipment decontamination.

One nitrate-nitrite as nitrogen result was flagged as non-detect (U) due to laboratory contamination as indicated by the results of the associated calibration blanks.

One ferrous iron result was flagged as estimated (J) and another ferrous iron result flagged as non-detect estimated (UJ) due to samples' analyses occurring one day past the 7-day method-recommended sample holding time.

Three nitrate results were flagged as estimated (J) and two nitrate results flagged as non-detect estimated (UJ) due to the samples being extracted beyond the method-recommended 48-hr holding time. These samples were analyzed between 50.28 and 53.33 hours after collection. All groundwater samples were also analyzed for nitrate-nitrite as nitrogen, which can be used to confirm the nitrate results. Nitrate was recovered between 24 and 94 percent of the calculated equivalent nitrate concentration based on nitrate-nitrite as nitrogen results (Table 3-4). Of the samples that were extracted out of holding time, the RHMW03, RHMW06, and RHMW14-03 nitrate results recovered below 90 percent of the calculated equivalent nitrate concentration, indicating possible low bias.

Table 3-4: Nitrate Result Confirmation

Location	Sample ID	Nitrate Result (mg/L)	Nitrate-Nitrite as Nitrogen Result (mg/L)	Calculated Equivalent Nitrate Concentration Based on Nitrate-Nitrite as Nitrogen Result (mg/L) [a]	%R
RHMW2254-01	ERH1214	2.6	0.82	3.63	72%
RHMW01	ERH1217	< 0.18 U	< 0.090 U	— [c]	— [c]
RHMW02 [b]	ERH1219	< 0.18 UJ	< 0.039 U	— [c]	— [c]
RHMW03 [b]	ERH1222	3.0 J	1.8	7.97	38%
RHMW04	ERH1224	2.1	0.49	2.17	97%
RHMW05	ERH1226	1.3	0.83	3.68	35%
RHMW06 [b]	ERH1228	0.93 J	0.60	2.66	35%
RHMW07	ERH1232	1.6 J	1.1	4.87	33%
RHMW08	ERH1230	1.5 J	1.4	6.20	24%
RHMW09	ERH1240	0.71	0.59	2.61	27%
RHMW10	ERH1236	0.72 J	0.41	1.82	40%
RHMW11-05	ERH1242	< 0.18 U	< 0.090 U	— [c]	— [c]
RHMW13-05 [b]	ERH1244	< 0.18 UJ	< 0.090 U	— [c]	— [c]
RHMW14-03 [b]	ERH1247	0.64 J	0.37	1.64	39%
RHMW15-05	ERH1249	1.8	0.43	1.90	94%
RHMW19	ERH1212	0.84	0.39	1.73	49%
HDMW2253-03	ERH1234	0.94	0.23	1.02	92%
OWDFMW01	ERH1238	2.6	2.2	9.75	27%

— not calculable
% percent
J estimated value
U non-detect value
UJ non-detect estimate value
[a] Nitrate-nitrite as nitrogen result converted to nitrate by multiplying nitrate-nitrite as nitrogen result by a factor of 4.43 (CalEPA 2011).
[b] Groundwater samples from these locations were analyzed outside of the holding time for nitrate.
[c] No equivalent nitrate concentration or %R was calculated due to the nitrate or nitrate-nitrite results reported as non-detect(s).

The representativeness of the data is considered acceptable after qualification for recommended holding time. Data usability is discussed in Section 3.5.

Completeness

Completeness is defined as the overall percentage of valid analytical results (including estimated results) compared to the total number of analytical results reported by the analytical laboratory.

Of the 591 results reported, none of the results from the First Quarter 2021 event were rejected. In instances where re-analysis was performed for a sample thus yielding two possible results for an analyte, the validators rejected the least technically acceptable result; none of the rejected data caused a data gap for the monitoring event. The completeness of the data (100 percent) met the 90 percent completeness goal.

Comparability

Comparability expresses the confidence with which one data set can be compared to another. Comparability can be related to accuracy and precision because these quantities are measures of data reliability. Data with acceptable precision and accuracy are considered comparable if collection techniques, analytical procedures, methods, and reporting are equivalent.

Samples collected from 2005 through the current monitoring event have been analyzed by multiple laboratories (Table 1-3). Data comparability is complicated by differences in analytical methods and extraction and analysis protocols used. For example, TPH-g and naphthalene have been reported using different EPA methods (either or both EPA 8260 and EPA 8270 SIM), and TPH-d and TPH-o have been reported using the same method (EPA 8015) but with differing carbon ranges over time (e.g., C10–C28, C10–C24 for reporting TPH-d) and different extraction methods (i.e., separatory funnel liquid-liquid extraction [EPA 3510] versus continuous liquid-liquid extraction [EPA 3520]), yielding different TPH concentrations.

Current analytical methods used are aimed to have laboratory limits lower than the current screening criteria. Starting from the Fourth Quarter 2016 event, analytical method DLs, LODs, and LOQs have been lower for most analytes than they had been during previous events, except for the EPA Method 8015 TPH-d and TPH-o DLs, LODs, and LOQs starting from March 2020. The method used to analyze TPH-g was also changed from EPA Method 8015 to EPA Method 8260 to improve sensitivity. The changed reporting limits should be considered when results are compared to data from earlier events. An evaluation of data reported between laboratories is presented in the AOC Statement of Work Sections 6 and 7 *Conceptual Site Model* (CSM) report (DON 2019b) as part of the AOC Statement of Work Sections 6 and 7 investigation.

The laboratory used standard analytical methods for all analyses. In all cases, the DLs and LODs attained were below the specified LOQs. Target analytes detected below the LOQs flagged (J) by the laboratory should be considered estimated.

Sensitivity

The LOQs are established by the laboratory based on the LODs or instrument DLs, historical data, and limits established for the various methods. The LOQs and LODs for samples may require adjustment by the laboratory due to matrix interference or when high levels of target analytes necessitate dilution before analysis. Matrix interference and sample dilutions decrease sensitivity and increase the LOQs/LODs. No results in this data set had increased LOQs or LODs that impacted sensitivity and data usability.

3.5 DATA ASSESSMENT AND USABILITY CONCLUSIONS

The precision, accuracy, representativeness, comparability, completeness, and sensitivity criteria were evaluated, and with some exceptions the criteria were met. Results associated with QC data that failed acceptance criteria are discussed in Section 3.2. Data quality issues that need to be taken into account for project decisions are summarized below.

The RPD for TPH-o at RHMW02 exceeded the 50 percent measurement performance criteria by 9 percent. However, the primary and field duplicate TPH-o detections for RHMW02 were below screening criteria and were consistent with historical detections of TPH-o at this monitoring location. Thus, the field duplicate imprecision does not impact the data usability.

The presence of headspace in the vials analyzed for benzene, ethylbenzene, toluene, total xylenes, TPH-g, and methane led to 67 results qualified as either estimated or non-detect estimated due to possible low bias. The affected results were from laboratory-prepared trip blanks, associated with groundwater samples from RHMW01 through RHMW08, RHMW10, RHMW19, and the field and equipment blanks. Since the associated groundwater and field and equipment blanks results are either non-detect or detected in concentrations in line with historical results, the data are not impacted.

The low initial calibration verification %R for the chloride led to the RHMW01 result flagged as estimated due to possible low bias. However, as the RHMW01 chloride result is in line with historical data, the data is not impacted by the low bias.

The high continuing calibration verification %Rs affected five nitrate results (RHMW06, RHMW07, RHMW08, RHMW10, and RHMW14-03) and five TOC results (RHMW01, RHMW04, RHMW11-05, RHMW13-05, and HDMW2253-03). The results were flagged as estimated (J) to indicate possible high bias. Since the nitrate and TOC results are consistent with historical concentrations for these locations, the data is not impacted by the possible high bias.

The 2-methylnaphthalene result for RHMW2254-01 (primary sample) was flagged as non-detect estimated due to low MS and MSD %Rs. However, as the non-detect result is consistent with historical data for this location, the data is not impacted by the low bias.

The ferrous iron results for RHMW02 and RHMW03 were analyzed one day past the 7-day method recommended holding time. The result was in line with historical data for these locations, thus the data is not impacted by the possible low bias due to the holding time exceedance. Furthermore, natural attenuation can be confirmed through additional parameters and COPC detections.

Five nitrate results (RHMW02, RHMW03, RHMW06, RHMW13-05, and RHMW14-03) were analyzed beyond the method-recommended 48-hour holding time. Samples were analyzed between 50.28 and 53.33 hours after collection. All results were qualified as estimated (J). The nitrate data for RHMW02, RHMW03, and RHMW13-05 were within range of previous events' concentrations nitrate and for nitrate-nitrite as nitrogen, thus the data is not impacted by the holding time exceedance. The nitrate data for RHMW06 and RHMW14-03 were lower than historical data; however, nitrate data can be confirmed using the nitrate-nitrite as nitrogen results, which remained consistent with historical data. Evaluation of natural attenuation should be performed using the nitrate data along with the nitrate-nitrate as nitrogen data, thus the RHMW06 and RHMW14-03 data were not significantly impacted by the holding time exceedance.

The third-party data assessment (Appendix C.2) concluded that all data generated during the monitoring events reported herein are usable for the intended purpose with the limitations described above.

4. Natural Attenuation Evaluation

The natural attenuation evaluation uses the following lines of evidence:

- The use of historical groundwater primary indicators (COPC data) to demonstrate contaminant concentration over time.
- The use of secondary lines of evidence (hydrogeologic and geochemical data) to evaluate whether natural attenuation processes are active at the site and the rate at which such processes can reduce contaminant concentrations to below screening levels.
- Comparison of TPH-d and TPH-o with and without SGC to evaluate the degree of weathering of the dissolved fuel hydrocarbons based on the fraction of polar-weathered hydrocarbons and total recoverable hydrocarbons.

Two objectives for analyzing NAPs are to assess whether natural attenuation is occurring on site and to evaluate the potential for natural attenuation to reduce the concentrations of petroleum-related constituents in groundwater. Secondary lines of evidence for natural attenuation are based on additional information collected during the groundwater monitoring events and include DO, ORP, pH, specific conductance, dissolved ferrous iron, methane, nitrate, and sulfate.

Biodegradation is the result of microbial-mediated oxidation-reduction reactions in which the simultaneous oxidation of an electron donor and reduction of an electron acceptor occur. Fuel hydrocarbons can be biodegraded by microorganisms in the subsurface under aerobic or anaerobic conditions.

Biodegradation of fuel hydrocarbons causes changes to the groundwater geochemistry. During aerobic biodegradation of hydrocarbons, DO concentrations are depleted as aerobic respiration occurs because DO is the most thermodynamically favored electron acceptor used in biodegradation. ORP is a measure of electron activity and an indicator of the relative tendency of a solute species to gain or lose electrons. Higher ORP measurements suggest that aerobic respiration is occurring.

After DO is depleted in aerobic respiration, anaerobic respiration ensues, and the potential electron acceptors (i.e., nitrate, ferric iron, sulfate, and carbon dioxide) are used in biodegradation. Use of these electron acceptors proceeds along a natural succession in the order as listed above because of decreasing energetic efficiency (Leeson et al. 2004). Nitrate is the most thermodynamically favored electron acceptor of the anaerobic pathways, biodegrading to nitrite (followed by nitrogen gas) and carbon dioxide. Ferric iron in soil can be consumed by anaerobic biodegradation when both DO and nitrate have been depleted in anaerobic groundwater, yielding dissolved ferrous iron in groundwater. Sulfate can be consumed by anaerobic degradation after DO, nitrate, and ferric iron are depleted, yielding precipitated iron sulfides. Lower concentrations of sulfate in groundwater compared to background levels indicate that sulfate reduction is an ongoing biological process for petroleum hydrocarbon degradation within plume areas. When all the soluble electron acceptors (i.e., DO, nitrate, ferric iron, and sulfate) are depleted, groundwater conditions can become conducive to fermentation, and methane can be generated.

Alkalinity is a general indicator of the buffering capacity of an aquifer system against pH changes due to attenuation processes in the groundwater. Production of carbon dioxide during biodegradation causes carbonate minerals to dissolve, increasing alkalinity concentrations in the groundwater. Alkalinity is used in conjunction with pH measurements to evaluate the groundwater's capacity to neutralize metabolic acids produced by biodegradation.

Both aerobic and anaerobic biodegradation may be occurring at the site. COPCs such as naphthalene are known to degrade both aerobically and anaerobically, and geochemical parameters indicative of biodegradation may vary with location and with time (Wiedemeier et al. 1999). A more detailed evaluation of natural attenuation at the Red Hill groundwater monitoring locations is presented in the AOC Statement of Work Sections 6 and 7 CSM report (DON 2019b) and the *Investigation and Remediation of Releases (IRR) Report* (DON 2020).

The field water quality data parameters for the First Quarter 2021 groundwater monitoring event are included in the field sampling logs (Appendix B.1). Table 3-2, Figure 3A and Figure 3B summarize DO, ORP, and other NAP results. Graphs of the DO, ORP, and NAP results are presented in Appendix A.3.

Unweathered petroleum contains (non-polar) hydrocarbons that, when weathered in the environment, create polar compounds as byproducts of biological sources and processes. SGC is commonly used to separate polar from nonpolar compounds. Polar compounds will preferentially adsorb to silica, while non-polar compounds will not. DOH TGM Section 9.3.1.2, Total Petroleum Hydrocarbons, discusses the use of SGC to separate out the polar TPH fraction and compare the remaining non-polar TPH fraction to the screening criteria: "*Comparison of data for groundwater samples tested with and without silica gel cleanup could be useful for assessing the state of natural biodegradation within a plume of petroleum-contaminated groundwater and optimizing remedial and monitoring actions*" (DOH 2018). Analysis of SGC TPH-d or SGC TPH-o was performed on samples with detected concentrations of TPH-d or TPH-o without SGC (see Section 4.1.8 for additional discussion).

4.1 EVALUATION USING NATURAL ATTENUATION PARAMETERS

NAPs were collected during the groundwater monitoring field activities and included DO and ORP, nitrate, ferrous iron, methane, sulfate, and chloride. These parameters indicate the conditions under which natural attenuation is likely occurring.

4.1.1 Dissolved Oxygen and Oxidation-Reduction Potential

DO and ORP concentrations for the First Quarter 2021 groundwater monitoring event were generally consistent with previous measurements. The background (RHMW04) DO measurement for the monitoring event was 8.99 mg/L, which is consistent with literature values for O'ahu groundwater (Hunt Jr. 2004); the background ORP measurement was 120.2 millivolts.

The First Quarter 2021 ORP measurements were higher than historical measurements for the following monitoring locations: RHMW2254-01, RHMW01, RHMW02, RHMW03, RHMW05, RHMW11-05, RHMW13-05, RHMW14-03, RHMW15-05, and OWDFMW01. The same field multiparameter instrument was used for all above-mentioned locations; all other locations used a different field multiparameter instrument. Evaluation of the field data indicates that the higher ORP values were due to a multiparameter instrument issue, and not attributable to changes in the groundwater chemistry. Thus, ORP data for the above listed monitoring locations should be evaluated along with historical data due to the high bias with the First Quarter 2021 measurements.

Similar to previous events, the monitoring locations with consistent COPC detections had depressed DO measurements (1.05 to 3.16 mg/L at RHMW01, RHMW02, and RHMW03) and low ORP values (-20.3 to 30.4 millivolts) compared to background measurements. In RHMW01, RHMW02, and RHMW03, the depleted DO in conjunction with the historical presence of dissolved-phase COPCs and other NAP results such as the dissolved methane concentrations (560 and 5,400 µg/L at RHMW01 and RHMW02, respectively) indicates that both aerobic and anaerobic respirations are likely

occurring. The presence of dissolved-phase COPCs and the DO depletion at RHMW03 are indicative of aerobic biodegradation, but the non-detect concentration of methane (< 1.00 U µg/L) indicates that methanogenesis is likely not occurring at RHMW03.

RHMW11-05, RHMW13-05, RHMW14-03, RHMW15-05, and HDMW2253-03 also had low DO measurements (ranging from 0.36 to 1.53 mg/L), consistent with previous events and with historical multilevel monitoring well DO measurements. The consistently low DO, high ORP, and lack of COPC detections indicate that the low DO values are the baseline for these monitoring locations (and a facet of multilevel monitoring wells) and are not related to attenuation of the COPCs.

4.1.2 Nitrate

Of the known anaerobic pathways for hydrocarbon biodegradation, nitrate is the most thermodynamically favored electron acceptor; decreased nitrate concentrations suggest that anaerobic respiration may be occurring. For the First Quarter 2021 monitoring event, RHMW01, RHMW02, RHMW11-05, and RHMW13-05 had non-detect or very low nitrate concentrations.

The non-detect nitrate results in RHMW01 and RHMW02 in conjunction with the DO and ORP measurements suggest that anaerobic respiration is likely occurring at these two wells.

Similar to previous NAP measurements at multilevel monitoring wells RHMW11 and RHMW13, non-detect or very low nitrate concentrations recorded during the First Quarter 2021 monitoring event are baseline for multilevel monitoring zones and not related to attenuation of the COPCs.

Evaluation of the nitrate results in conjunction with the DO and ORP results for wells other than RHMW01 and RHMW02 suggests that attenuation is likely not occurring and decreased nitrate concentrations are likely the result of natural variation between monitoring events or the result of laboratory blank contamination impacts.

4.1.3 Ferrous Iron

During biodegradation, bacteria will typically break down ferric iron in soil once oxygen is depleted, which causes ferrous iron to be released to groundwater. Elevated levels of ferrous iron indicate that the groundwater environment has undergone iron reduction for anaerobic respiration. Ferrous iron was detected in: RHMW01 (0.37 J mg/L), RHMW02 (1.9 J mg/L), RHMW14-03 (0.16 J mg/L), and HDMW2253-03 (0.77 J mg/L). When compared to the other monitoring locations, COPC detections, and evaluated with other NAPs discussed above, the ferrous iron results for RHMW01 and RHMW02 also suggest that anaerobic biodegradation is likely occurring at these wells. The ferrous iron concentration at HDMW2253-03 is within the historical concentration range for this location. The COPC and other NAP results do not indicate anaerobic biodegradation at RHMW14-03.

4.1.4 Methane

An additional line of evidence for biological degradation of petroleum hydrocarbons includes the presence of methane, a reaction byproduct of fermentative biological reactions that can occur after oxygen is depleted by aerobic biodegradation. Methane was detected in the samples from RHMW01 (560 µg/L), RHMW02 (5,400 µg/L), and RHMW13-05 (9.6 µg/L). The elevated methane concentrations along with the historical results of TPH detections found at RHMW01 and consistent TPH detections at RHMW02 suggest that methanogenic biodegradation is occurring in these wells. The relatively low concentration of methane found at RHMW13-05 coupled with TPH non-detections or previous detections that were attributable to laboratory contamination suggest that methanogenesis is likely not occurring.

4.1.5 Sulfate

Sulfate is normally consumed by bacteria only after DO, nitrate, and ferric iron have been depleted. Concentrations of sulfate lower than background concentrations, when evaluated in conjunction with depressed DO and nitrate concentrations, suggest that anaerobic activity is occurring. The concentration of sulfate in groundwater at RHMW01, RHMW02, RHMW09, RHMW10, RHMW14-03, and RHMW19 were lower than the background sulfate concentration in RHMW04 (9.2 mg/L). The sulfate results in conjunction with COPC detections suggest that anaerobic activity may be occurring at RHMW01 and RHMW02.

Sulfate results for many monitoring locations fell below the historical data range during the Fourth Quarter 2020 and First Quarter 2021 monitoring events. The low sulfate results for several wells during the Fourth Quarter 2020 event rebounded to expected sulfate concentrations during the First Quarter 2021 (see Appendix A.3.1 for cumulative NAPs graphs for RHMW2254-01, RHMW04, RHMW07, OWDFMW01, and HDMW2253-03). Of the First Quarter 2021 data, sulfate results were still lower than historical range for the following locations: RHMW03, RHMW05, RHMW06, RHMW08, RHMW09, RHMW10, RHMW19, RHMW13-05, and RHMW14-03. QC parameters associated with these samples were within acceptance criteria, and no immediate cause (i.e., field condition, sampling issue, or analytical laboratory concern) for the lower sulfate results can be identified. Sulfate results for the upcoming monitoring events will continue to be assessed to see if a decreasing sulfate trend is occurring at these locations.

4.1.6 Chloride

Chloride is a general water quality parameter, and background concentrations of chloride in the aquifer are a result of mineral dissolution. Evaluation of NAP data from the Fourth Quarter 2016 monitoring event onward and the groundwater geochemistry parameters indicates that the chloride concentrations at the site are due to the aquifer geochemistry and are not related to anaerobic dechlorination.

Chloride concentrations at RHMW01, RHMW02, RHMW03, RHMW08, RHMW09, RHMW10, RHMW19, RHMW11-05, RHMW13-05, RHMW14-03, and RHMW15-05 were below the background (RHMW04) concentration of 72.8 mg/L. All other locations analyzed had chloride concentrations higher than background.

Chloride results for several monitoring locations fell below the historical data range during the Fourth Quarter 2020 and First Quarter 2021 monitoring events: during Fourth Quarter 2020 event, RHMW2254-01, RHMW02, RHMW03, RHMW04, RHMW05, RHMW08, HDMW2253-03, and OWDFMW01; and during the First Quarter 2021 event, RHMW02, RHMW03, RHMW08, RHMW09, RHMW10, and RHMW14-03. QC parameters associated with these samples were generally within acceptance criteria, and no immediate cause (i.e., field condition, sampling issue, or analytical laboratory concern) for the lower chloride results can be identified. Chloride results for the upcoming monitoring events will continue to be assessed to see if a decreasing sulfate trend is occurring at these locations.

4.1.7 Alkalinity

The alkalinity concentrations in RHMW01, RHMW02, RHMW03, RHMW05, RHMW06, RHMW07, RHMW08, OWDFMW01, RHMW11-05, and RHMW13-05 were greater than the background concentration (RHMW04) of 76.6 mg/L. The elevated alkalinity at RHMW01, RHMW02, and RHMW03 may be attributable to natural attenuation processes occurring at these locations, which is underscored by historical detections of TPH; the elevated alkalinity at the other monitoring locations

may be attributable to aquifer geochemistry, based on the lack of COPC detections and lack of other NAP results indicative of biodegradation.

4.1.8 TPH with Silica Gel Cleanup

SGC TPH-d and TPH-o results for RHMW02 and RHMW03 showed significantly reduced or non-detect concentrations compared to non-SGC TPH-d and TPH-o results (Table 4-1). The SGC TPH-d and TPH-o results suggest that petroleum weathering is occurring at RHMW01, RHMW02, and RHMW03, especially when evaluated in conjunction with the other NAPs.

For RHMW02, the SGC TPH-d concentrations for the primary and field duplicate samples were 390 and 380 µg/L (with non-SGC TPH-d concentrations of 1,500 and 1,600 µg/L), respectively. The SGC TPH-d results indicate that biodegradation is occurring. The historical recoveries of TPH-d with SGC to TPH-d (without SGC) for RHMW02 have ranged from 14 to 57 percent, thus indicating that 43–86 percent of the reported results for TPH-d are likely biodegradation byproducts.

Non-SGC chromatograms for the RHMW02 sample show signal evidence of soluble components of degraded jet fuel, with a large portion of the mass showing a signature indicative of polar metabolites from petroleum degradation. The corresponding SGC chromatogram for RHMW02 is characteristic of dissolved aromatic hydrocarbons expected from jet fuel. Further evaluation of the SGC TPH results and natural attenuation, along with the potential role of other site-specific factors (e.g., complex geology, surface water recharge, infiltration rates), was included in the AOC Statement of Work Sections 6 and 7 CSM Report (DON 2019b) and the IRR Report (DON 2020).

Table 4-1 presents a comparison of TPH-d and TPH-o concentrations without and with SGC for RHMW01, RHMW02, and RHMW03 from the Fourth Quarter 2016 monitoring event onward.

4.1.9 Total and Dissolved Organic Carbon

TOC concentrations in groundwater samples include all volatile, non-volatile, soluble, and insoluble forms of carbon present in the sample, while dissolved organic carbon (DOC) concentrations include only the volatile, non-volatile, and soluble forms of carbon. TOC and DOC concentrations are useful especially for samples with known high concentrations of polar hydrocarbons and metabolites, which are not efficiently extracted and analyzed using the TPH-d and TPH-o analysis. However, as the TOC and DOC method (EPA 9060) does not discriminate between petroleum and non-petroleum hydrocarbons, TOC and DOC must be evaluated in conjunction with TPH and other NAP results to determine if the TOC and DOC concentrations found in groundwater samples may be contributed by petroleum constituents in groundwater.

For the First Quarter 2021 monitoring event, only TOC was analyzed for in the groundwater samples; DOC is usually analyzed only for the first sampling event for newly installed monitoring wells. TOC results in RHMW01, RHMW02, and RHMW03 are in line with historical TPH, SGC TPH, and NAP data, indicating that petroleum constituents and petroleum biodegradation byproducts are present at these wells, contributing to TOC concentrations. Additionally, the TOC concentrations were higher than corresponding TPH concentrations (e.g., for RHMW02 *primary*, TOC was 3.2 mg/L [3,200 µg/L] and TPH-d was 1.5 mg/L [1,500 µg/L]), confirming that the TPH method does not capture all polar hydrocarbons and metabolites present in the groundwater and supporting evidence of natural attenuation occurring at these locations. Additionally, the TOC concentrations at other locations may also indicate the presence of polar hydrocarbons and metabolites that are not captured in the TPH extraction. To further illustrate, TPH-d and TPH-o were non-detects at RHMW11-05; however, TOC was 13.7 mg/L (13,700 µg/L). Therefore, the COPC and NAP concentrations at locations other than

RHMW01, RHMW02, and RHMW03 do not indicate that biodegradation is currently occurring and instead suggest a non-petroleum source of carbon.

4.2 NAP CONCENTRATIONS

Graphs of cumulative groundwater NAP results are presented in Appendix A.3.1, and graphs of NAP results for the First Quarter 2021 event are presented in Appendix A.3.2. Evaluation of the NAP data from the Fourth Quarter 2016 monitoring event onward indicates that there is no evidence that seasonal variations (i.e., wet- and dry-season effects) influence NAP concentrations (and thus biodegradation) in groundwater at the Red Hill monitoring well network.

The NAP concentrations at RHMW01, RHMW02, and RHMW03 indicate that aerobic or anaerobic biodegradation may be occurring at these locations. This is confirmed by the SGC TPH results, which generally present a relatively low ratio of non-biodegraded (non-polar) hydrocarbons to biodegradation byproduct hydrocarbons (polar hydrocarbons and metabolites). However, evaluation of NAPs along with TPH trends (based on numerical TPH results alone) must be conducted with caution. The variability from one laboratory to another of TPH-d procedures and results precludes reliable trend analyses, such that higher or lower results over time may be due not to changing conditions in the groundwater at the Facility but rather to changes in the laboratory's TPH extraction and analysis protocols. Nonetheless, the RHMW03 NAP results (i.e., depleted DO and relatively high concentrations of other electron acceptors) indicate that continuous aerobic biodegradation is occurring at this location, possibly due to an influx of oxygenated water at this location providing sufficient DO so that anaerobic biodegradation is not evident. Similarly, continuous aerobic and anaerobic biodegradation is occurring at RHMW01 and RHMW02, based on the depleted electron acceptors and presence of dissolved methane. Notably, methane concentrations at RHMW01 have generally decreased over time, which may be an indicator of reduced available biodegradable fuel at the subsurface from various natural source-zone depletion processes and natural attenuation.

Additional evaluation of the 2014 fuel release, natural source-zone depletion, and natural attenuation at the Facility is discussed in the AOC Statement of Work Sections 6 and 7 CSM Report (DON 2019b) and IRR Report (DON 2020).

Table 4-1: Comparison of TPH Concentrations Without and With Silica Gel Cleanup, First Quarter 2021 Quarterly Groundwater Monitoring Event

Note: **Bold text** indicates concentrations exceeding the TPH-d screening criterion of 400 µg/L.

% = percent

* = result is due to laboratory solvent contamination (indicator used in *Second Quarter 2020 Groundwater Monitoring Report*)

µg/L = microgram per liter

A = result is due to laboratory solvent contamination

J = estimated value

Qtr = quarter

SGC = silica gel cleanup

U = non-detect value

[a] Table presents only quarterly and monthly monitoring events during which TPH with SGC is analyzed.

[b] Primary and field duplicate samples.

[c] Result was flagged as non-detect during data validation due to laboratory method blank contamination.

5. Lead Scavengers

The scoping completion letter for AOC Statement of Work Sections 6 and 7 dated February 4, 2016, (EPA Region 9 and DOH 2016) required that lead scavengers (1,2-dichloroethane and 1,2-dibromoethane) be analyzed for at least 1 year of sampling, and indicated that lead scavenger testing can be then discontinued at a given well if analyte concentrations are below DOH EALs.

Lead scavengers were analyzed in groundwater samples collected from newly installed Red Hill monitoring wells. RHMW13 is a multilevel monitoring well installed in March 2020. RHMW13 Zone 5 was sampled during 1 year of monitoring (Second Quarter 2020 to First Quarter 2021); other monitoring zones were also sampled during Second Quarter 2020 (Zones 1, 2, 3 and 4) in accordance with the SAP and addenda (DON 2017b; 2017c; 2017d; 2021b). Analytical results for 1,2-dibromoethane and 1,2-dichloroethane for all zones are presented in Table 5-1. Analytical results for RHMW13 show non-detect concentrations for the lead scavengers during all monitoring events. LODs are below the respective screening criteria. Full analytical and validation reports are presented in Appendix C and in previous groundwater monitoring reports.

U non-detect
[a] DOH EALs: Table D-1b, Groundwater Action Levels (groundwater is a current or potential drinking water resource; surface water body is not located within 150 meters of release site) (DOH 2017).
[b] Results reported as less than the laboratory's LOD.

In accordance with the February 4, 2016, scoping completion letter, RHMW13 underwent 1 year of monitoring and had lead scavenger non-detect concentrations below the groundwater action levels. Thus, testing for lead scavengers will be discontinued for RHMW13.

Lead scavengers were also analyzed in groundwater samples collected from RHMW19; lead scavengers were not detected. Testing for lead scavengers at RHMW19 will continue until 1 year of monitoring is completed (anticipated to be during Second Quarter 2021 monitoring event) and will be evaluated if testing can be discontinued in accordance with the February 4, 2016 scoping completion letter.

6. Summary, Conclusions, and Recommendations

6.1 SUMMARY

During the First Quarter 2021 groundwater monitoring event, groundwater samples were collected from 18 monitoring locations within the Red Hill groundwater monitoring network. These included:

- The sampling point at Red Hill Shaft (RHMW2254-01)
- Twelve single-screen monitoring wells located within the Facility boundary (RHMW01 through RHMW10, RHMW19, and OWDFMW01)
- One deep monitor well located outside the Facility boundary at the Hālawa Correctional Facility (Hālawa Deep Monitor Well [HDMW2253-03])
- One sampling zone each at two multilevel monitoring wells (RHMW11 and RHMW14) located at the Hālawa Correctional Facility:
  - RHMW11 Zone 5
  - RHMW14 Zone 3
- One sampling zone each at multilevel monitoring wells (RHMW13 and RHMW15) located within the Facility boundary:
  - RHMW13 Zone 5
  - RHMW15 Zone 5

Of the monitoring locations sampled during this event, primary and field duplicate samples were collected from:

- Sampling point RHMW2254-01
- Monitoring well RHMW02
- Multilevel monitoring well RHMW13 Zone 5 (RHMW13-05)

The following multilevel monitoring zones were not sampled in this sampling event due to lack of detections of COPCs in previous monitoring events:

- RHMW11 Zones 1 to 4
- RHMW14 Zones 1 to 2
- RHMW13 Zones 1 to 4
- RHMW15 Zones 1 to 4

The following multilevel monitoring zones were not sampled in this sampling event due to low hydraulic conductivity at these zones:

- RHMW11 Zones 6 to 8
- RHMW14 Zones 4 to 8

No detectable amounts of NAPL or sheen were present, and no odors were noted in the groundwater collected from all monitoring locations during the First Quarter 2021 monitoring event. A slight brown color was observed in the groundwater collected from HDMW2253-03. Other than the slight brown color, no odors, sheen, or NAPL were noted at HDMW2253-03.

During the First Quarter 2021 event, COPCs were detected at RHMW02 and RHMW03. No SSRBL exceedances were reported. Analytical results for the groundwater monitoring event are summarized as follows:

- *RHMW2254-01 (primary and duplicate), RHMW01, RHMW04, RHMW05, RHMW06, RHMW07, RHMW08, RHMW09, RHMW10, RHMW19, RHMW11-05, RHMW13-05 (primary and duplicate), RHMW14-03, RHMW15-05, HDMW2253-03,* and *OWDFMW01:* No COPCs were detected.
- *RHMW02 (primary and duplicate):* TPH-d (1,500 and 1,600 µg/L), 1-methylnaphthalene (25 and 23 µg/L), 2-methylnaphthalene (17 and 16 µg/L), and naphthalene (44 and 41 µg/L) were detected at concentrations exceeding their respective screening criteria (400, 10, 10, and 17 µg/L). TPH-d with SGC analysis was detected at significantly lower concentrations than the non-SGC analysis, suggesting that the majority of the non-SGC TPH-d results were biodegradation by-products. The concentrations of TPH-d did not exceed the SSRBL of 4,500 µg/L. TPH-d with SGC analysis (390 and 380 µg/L), and TPH-residual range organics (TPH-o) (180 J and 330 µg/L) were detected at concentrations below their respective LTM screening criteria (400 and 500 µg/L). No other COPCs were detected.
- *RHMW03:* TPH-d (180 J µg/L) and TPH-o (220 J µg/L) were detected at estimated concentrations below their respective LTM screening criteria (400 and 500 µg/L). The TPH-d and TPH-o with SGC analysis results were non-detect, suggesting that the non-SGC TPH-d result consisted entirely of biodegradation by-products. No other COPCs were detected.

The NAP and SGC TPH data present evidence of aerobic and anaerobic biodegradation occurring in the vicinity of RHMW02 based on depleted DO, elevated dissolved methane concentrations, depleted nitrate and sulfate concentrations, and high alkalinity concentrations compared to other monitoring wells in the network. Additionally, SGC TPH-d concentrations at RHMW02 indicate that the majority of the reported non-SGC TPH mass is likely biodegradation byproducts. The concentrations of NAPs and depressed SGC TPH at RHMW03 suggest that aerobic and anaerobic biodegradation are also occurring there. Historical COPC detections and depleted DO, dissolved methane, depleted nitrate, and reduced sulfate concentrations at RHMW01 suggest anaerobic biodegradation is occurring in that location.

6.2 CONCLUSIONS AND RECOMMENDATIONS

During the First Quarter 2021 groundwater monitoring event, TPH-d, TPH-o, 1-methylnapthalene, 2-methylnaphthalene, and naphthalene were detected at RHMW02, and TPH-d and TPH-o were detected at RHMW03. No COPCs, fuel additives, nor lead scavengers were detected at any other monitoring locations.

No SSRBL exceedances occurred at RHMW02 and RHMW03. Screening criteria exceedances (TPH-d, 1-methylnaphthalene, 2-methylnaphthalene, and naphthalene) occurred only at RHMW02.

Based on the groundwater monitoring results, pursuant to the *Groundwater Protection Plan* (DON 2014) and in accordance with AOC Statement of Work Sections 6 and 7 (EPA Region 9 and DOH 2015), groundwater monitoring at locations within the Red Hill groundwater monitoring network will continue.

Based on no detections of lead scavengers at all sampled RHMW13 multilevel monitoring well zones for 1 year of sampling, it is recommended that testing for lead scavengers be discontinued for RHMW13.

It is recommended that the Red Hill groundwater LTM program continue testing for NAPs at each monitoring event and continue SGC TPH-d and TPH-o analysis for all locations with non-SGC TPH-d or TPH-o detections.

Table A.1: Cumulative Groundwater COPC Results, First Quarter 2021 Groundwater Monitoring Event (cont'd)
Red Hill Bulk Fuel Storage Facility, JBPHH, O'ahu, Hawai'i

Notes:
A data verification effort was conducted after the Second Quarter 2018 groundwater monitoring event to verify reported values and make data qualification consistent with the current data validation procedures. As such, data presented in the Third Quarter 2018 groundwater monitoring event (and succeeding) cumulative data tables may differ from data presented in cumulative data tables in previous reports.
Table A.1-6 presents a comparison of values, qualifiers, and notes between pre- and post-data verification.
DOH Tier 1 Environmental Action Levels, Table D-1b. Groundwater Action Levels (Groundwater IS a current or potential drinking water resource, surface water body IS NOT located within 150 meters of release site).

Grey highlight	Exceeds EAL
Bold	Detected value
*	Duplicate sample
***	Samples ES087 and ES088 possibly switched prior to analysis.
****	TPH-g analyzed by either 8015 or 8260.
*****	Analyzed by either 8260, 8260 SIM, 8011, 504.1, and/or 524.2.
%D	RH-B-003
%R	percent recovery
%RSD	percent relative standard deviation
µg/L	micrograms per liter
COPC	chemical of potential concern
DL	detection limit
DOH	Department of Health, State of Hawai‘i
EAL	environmental action level
ID	identification
MDL	method detection limit
MRL	method reporting limit
QC	quality control
r	correlation coefficient
r^2	coefficient of determination
RL	reporting limit
RPD	relative percent difference
RRF	relative response factor
TPH	total petroleum hydrocarbons
TPH-g	total petroleum hydrocarbons-gasoline range organics
[a]	MDL values were used for non-detects.
[b]	MRL values were used for non-detects.
[c]	No analytical lab reports found, could not verify results.
[d]	No analytical lab reports available, used data table from groundwater monitoring report.
[e]	Results from stilling basin, pumps offline.
[f]	Results from stilling basin, pumps online.
[g]	Analyzed by Method 6010B.
[h]	Analyzed by Method 6020.
[k]	Analyzed by Method 200.8.

Result Qualifiers (Q)

J	Estimated value.
U	The compound was analyzed for but not detected above the stated limit.
R	Rejected

Reason Codes (rc)

b	Presumed contamination from preparation (method blank).
c	Calibration %RSD, r, r^2, or %D were noncompliant.
e	Matrix Spike/Matrix Spike Duplicate or Duplicate RPD was high.
f	Presumed contamination from field blank or equipment rinsate.
h	Holding times were exceeded.
i	Internal standard performance was unsatisfactory.
l	Laboratory Control Sample/Laboratory Control Sample Duplicate %R or RPD was not within control limits.
m	Instrument performance check was noncompliant.
q	Matrix Spike/Matrix Spike Duplicate recovery was poor.
r	Calibration RRF was <0.05.
s	Surrogate recovery was outside QC limits.
t	Presumed contamination from trip blank.
v	Unusual problems found with the data. Description of the problem can be found in the associated laboratory or groundwater monitoring report.

Data Notes (note)

I	RL/DL elevated due to chromatographic interference.
W	Chromatographic signature was mostly non-petroleum hydrocarbon peaks.
X	Possible high bias due to matrix interference.
Y, F13	Chromatographic pattern was inconsistent with the profile of the reference fuel standard; or, fuel or product type: mixed or unknown
Z	Chromatographic signature does not resemble a petroleum product.
O, F4	Chromatogram is main match to hydrocarbons in diesel fuel range; or, fuel type: diesel fuel
F3	Fuel type: kerosene or jet fuel
F6	Product type: hydraulic fluid

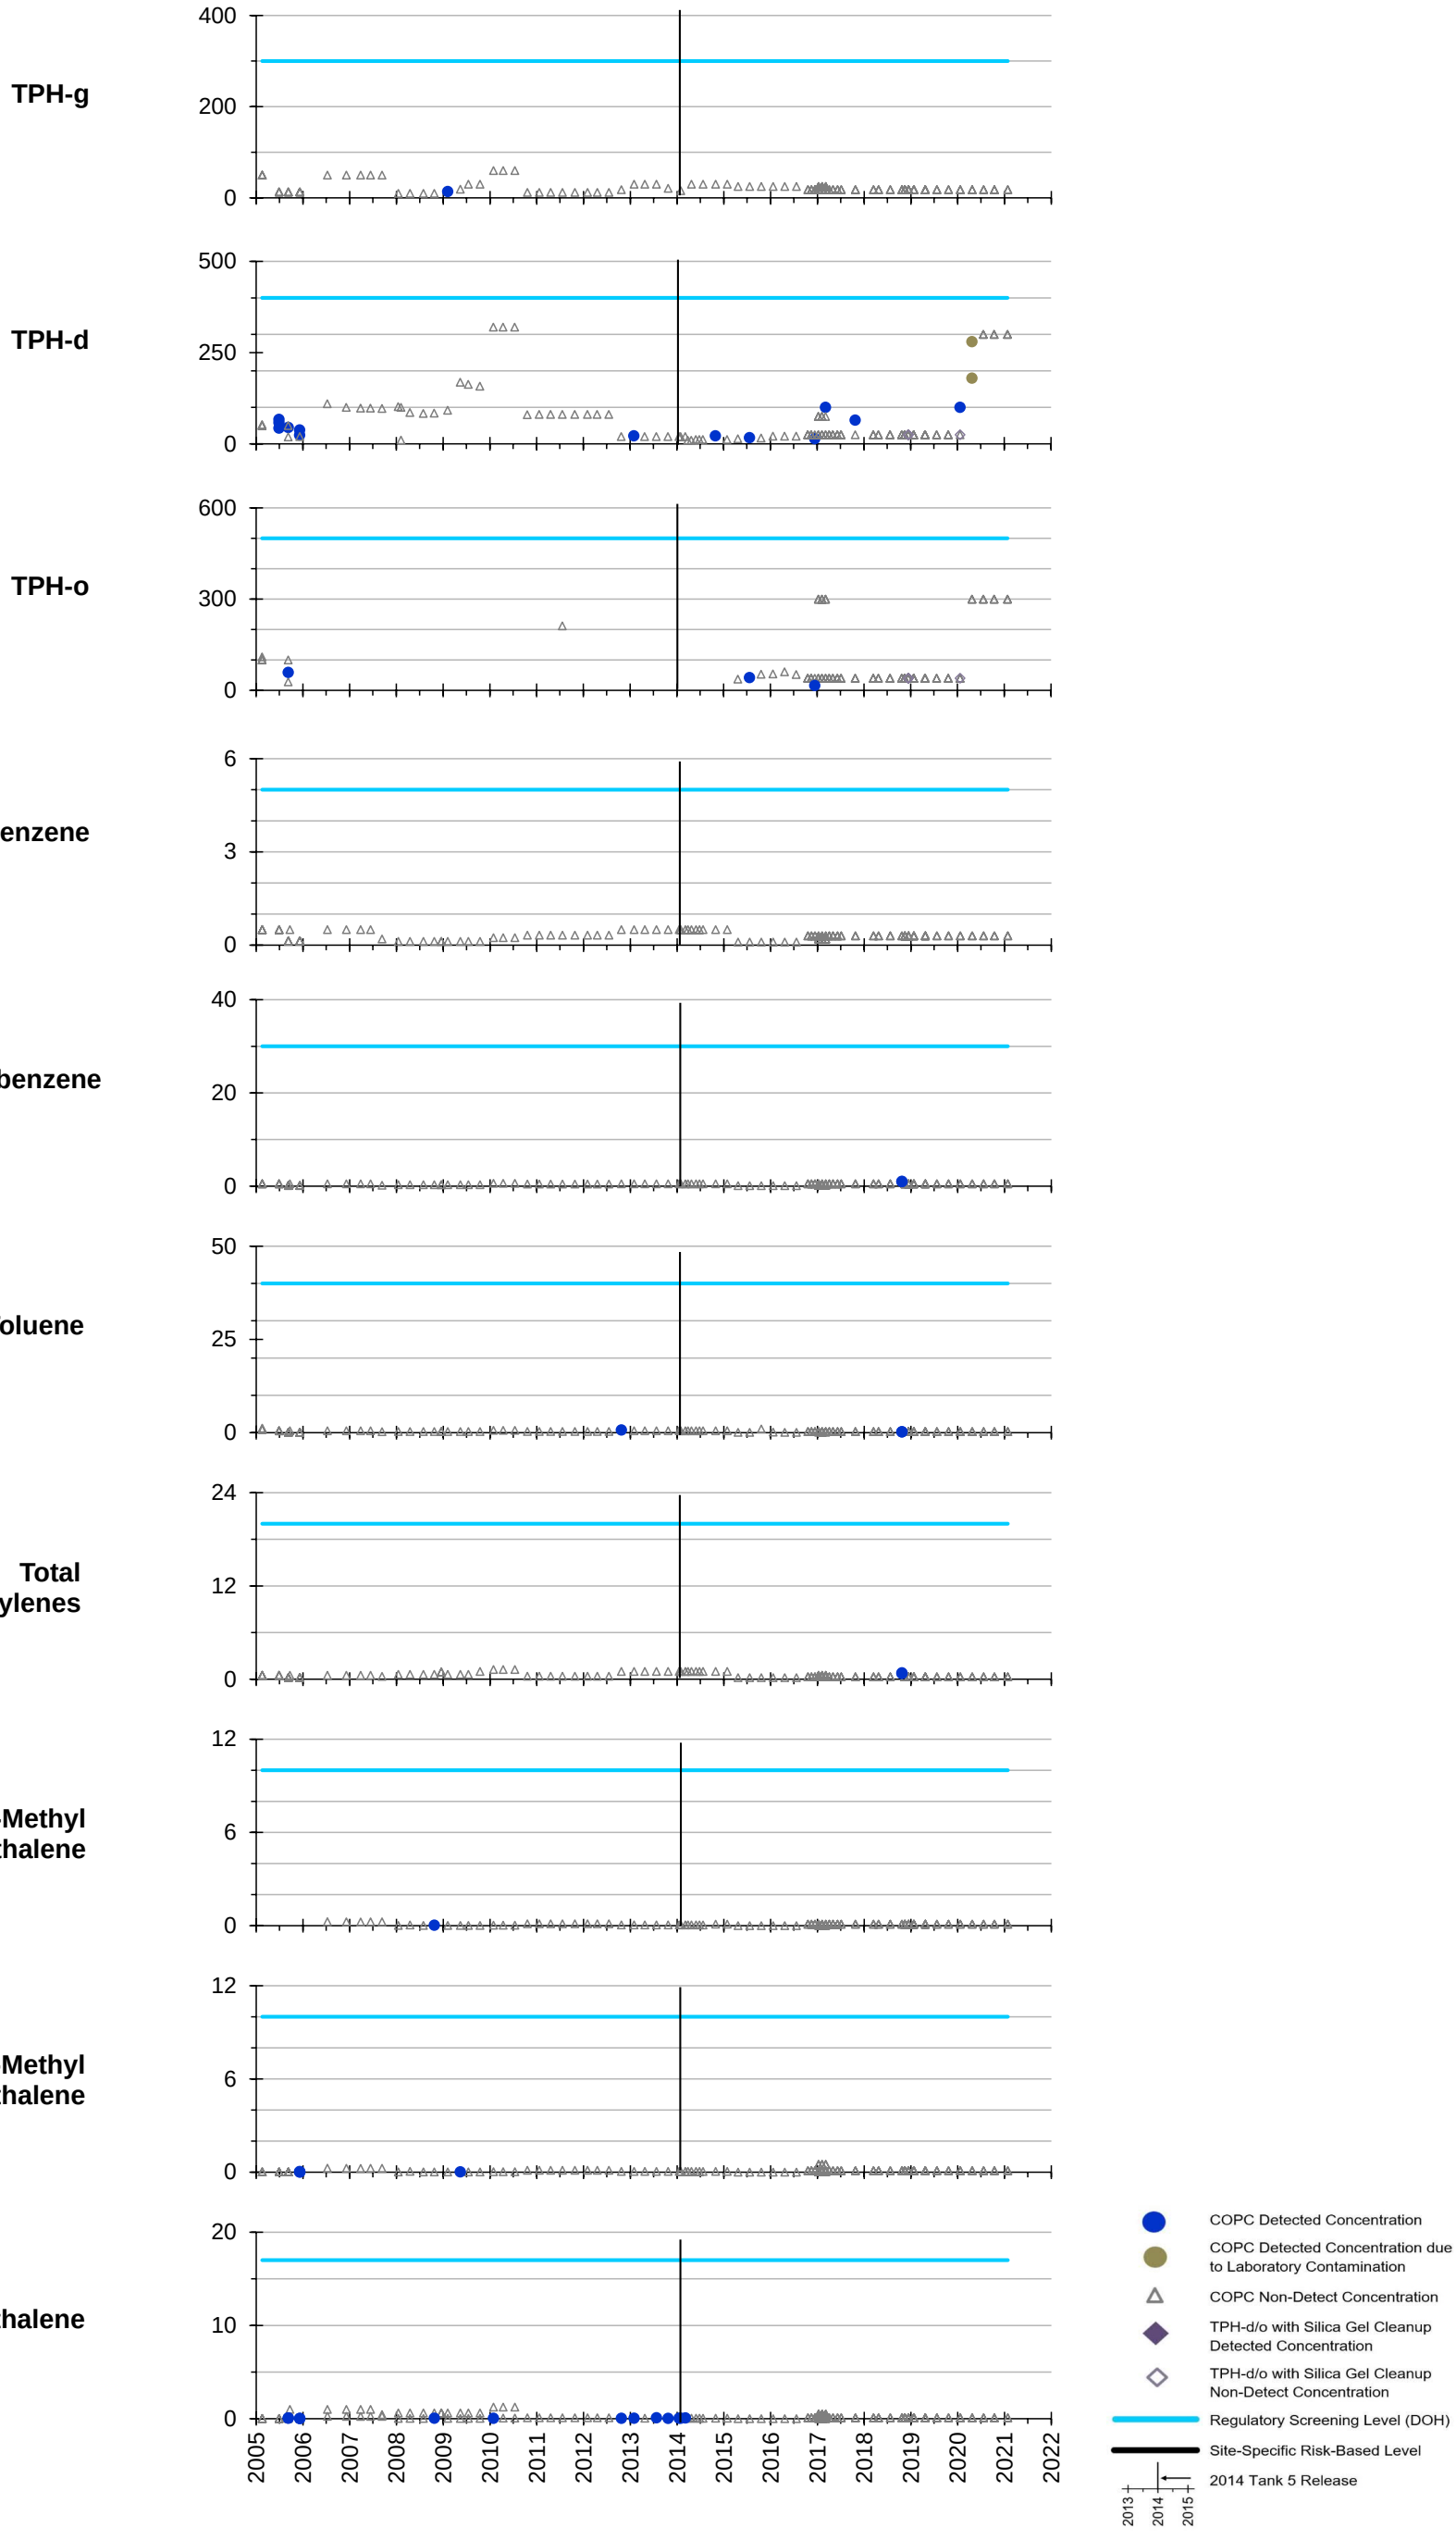
Appendix A.2 Groundwater Concentration Graphs

RHMW2254-01

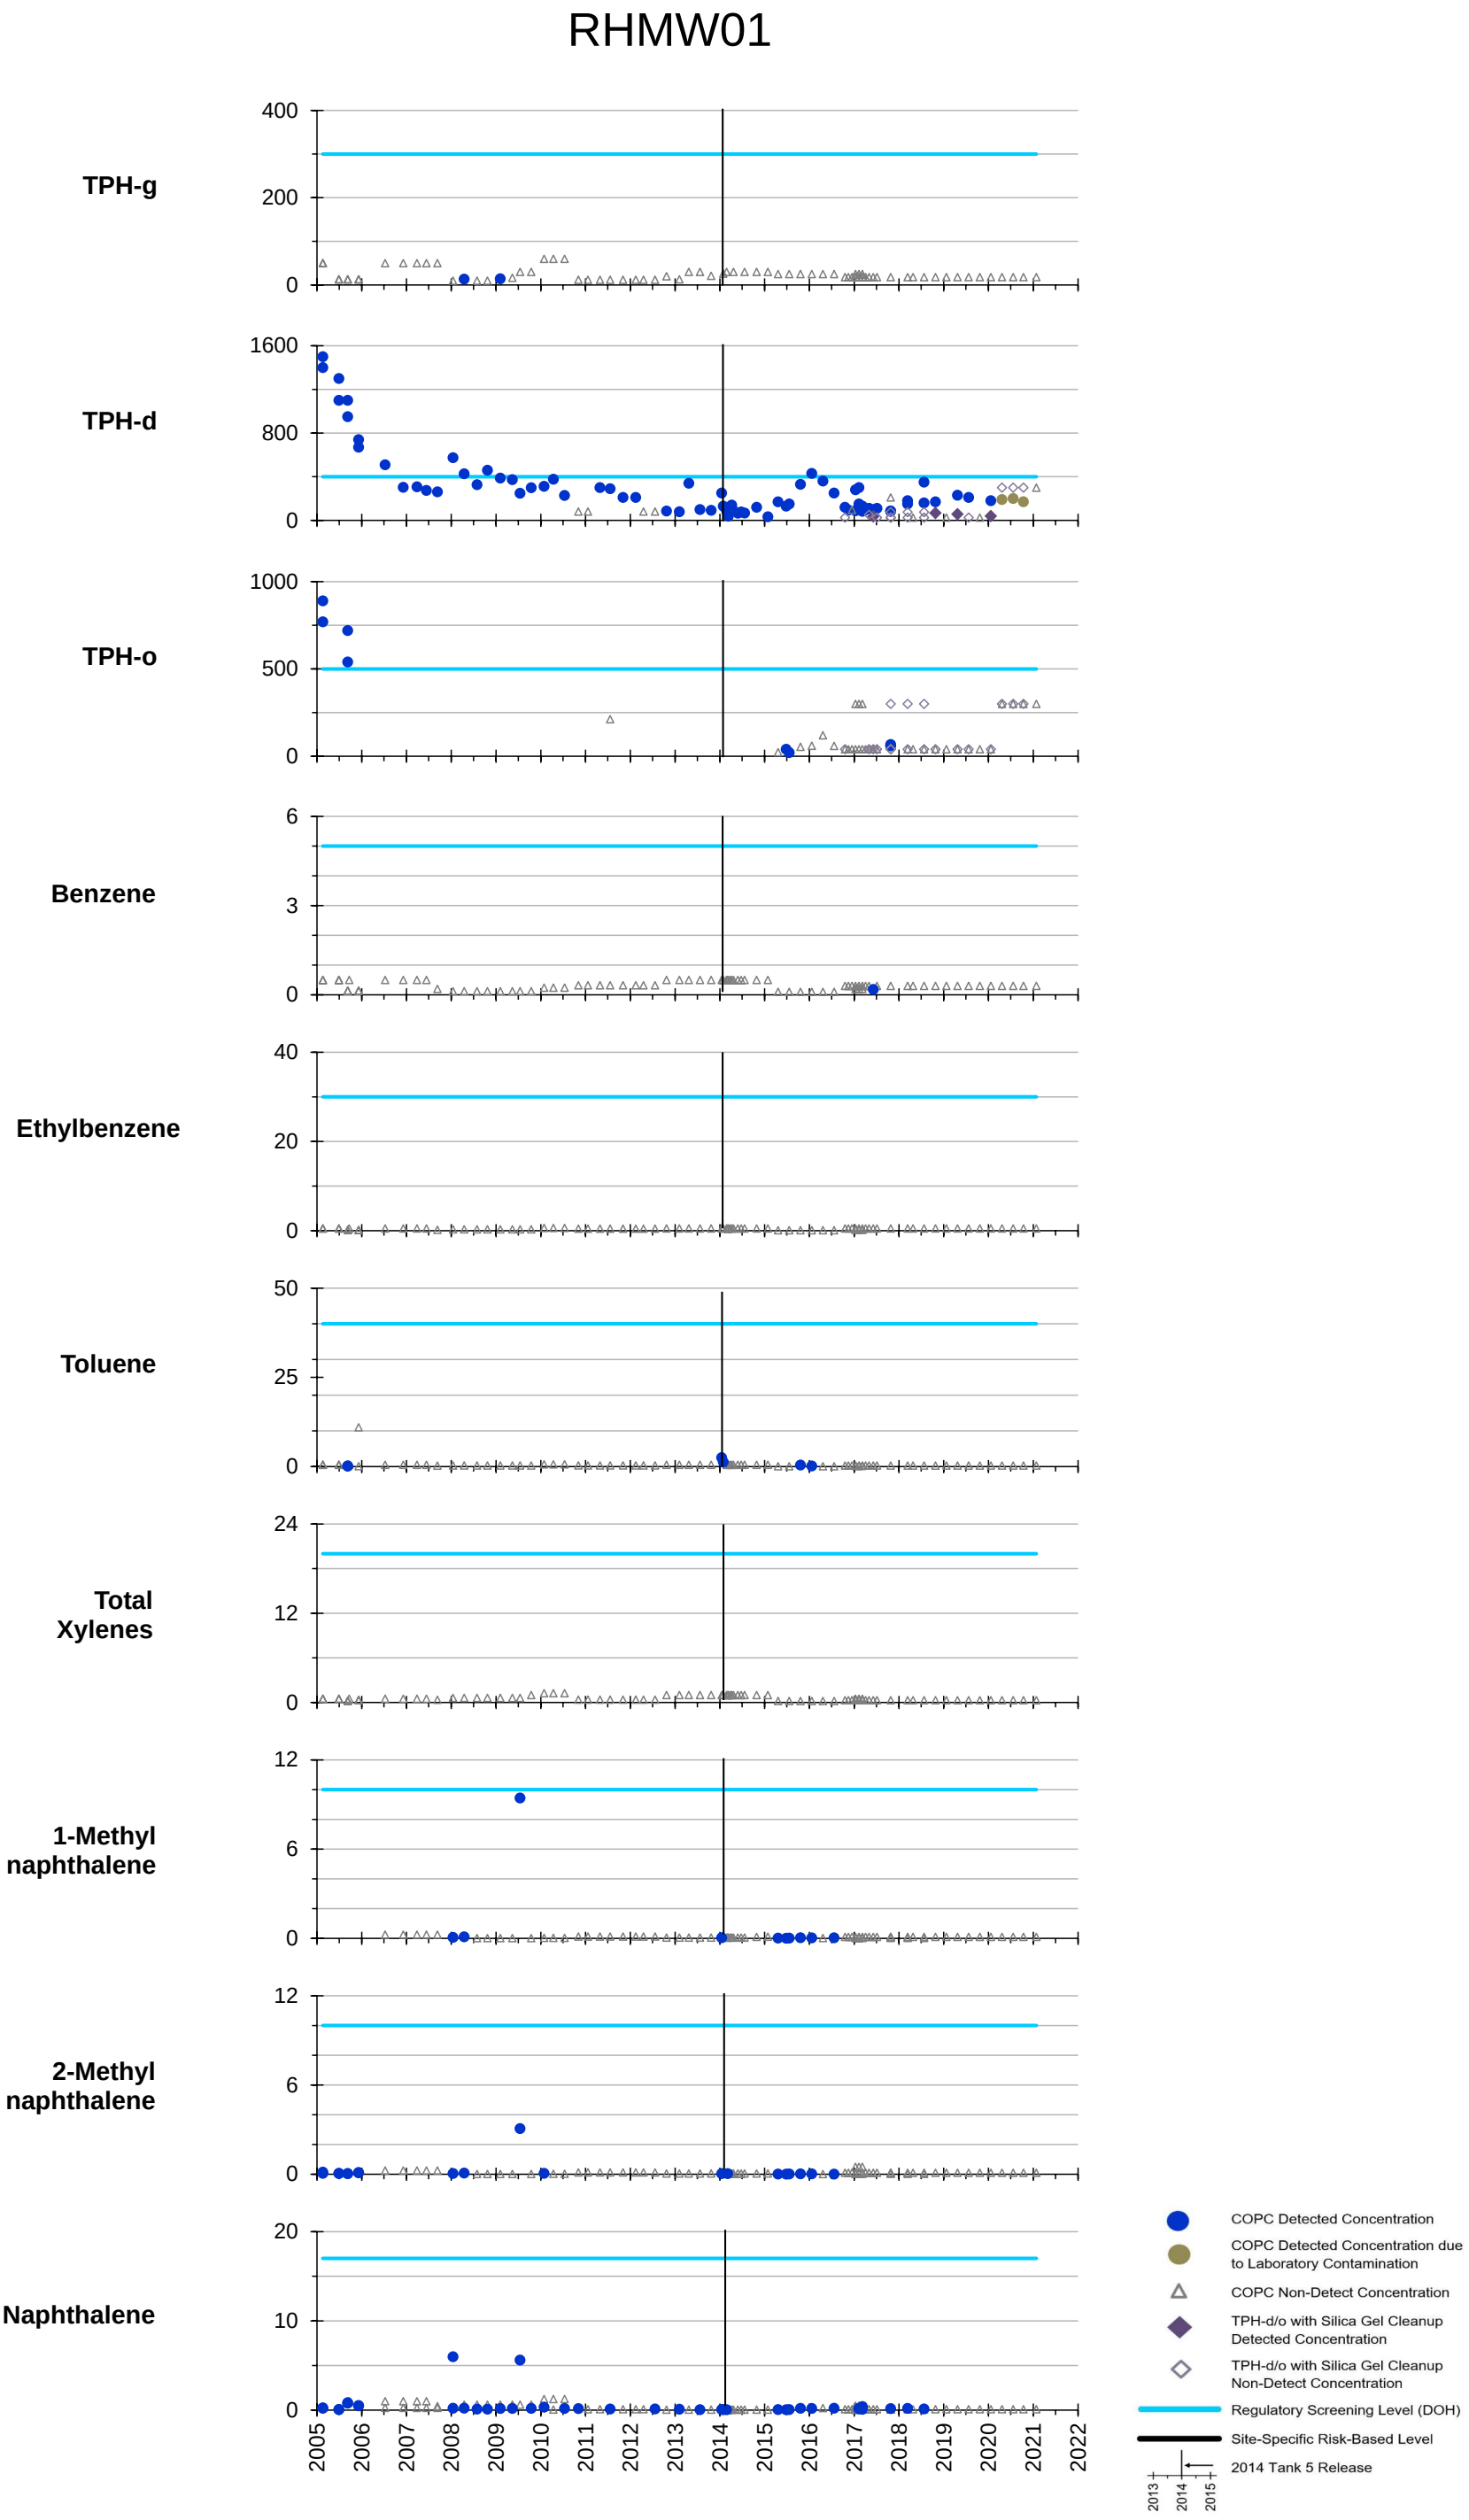


All results in micrograms per liter (µg/L or parts per billion).

EPA Region 9 Laboratory split sampling data from First to Third Quarters 2017 included in the graphs.

Laboratory reporting limits for TPH-d and TPH-o were raised in March 2020 in accordance with the most current DoD QSM (2019), TNI Manual (2016), and 40 CFR Part 136 (Methods Update Rule 2017).

Appendix A.2 Groundwater Concentration Graphs

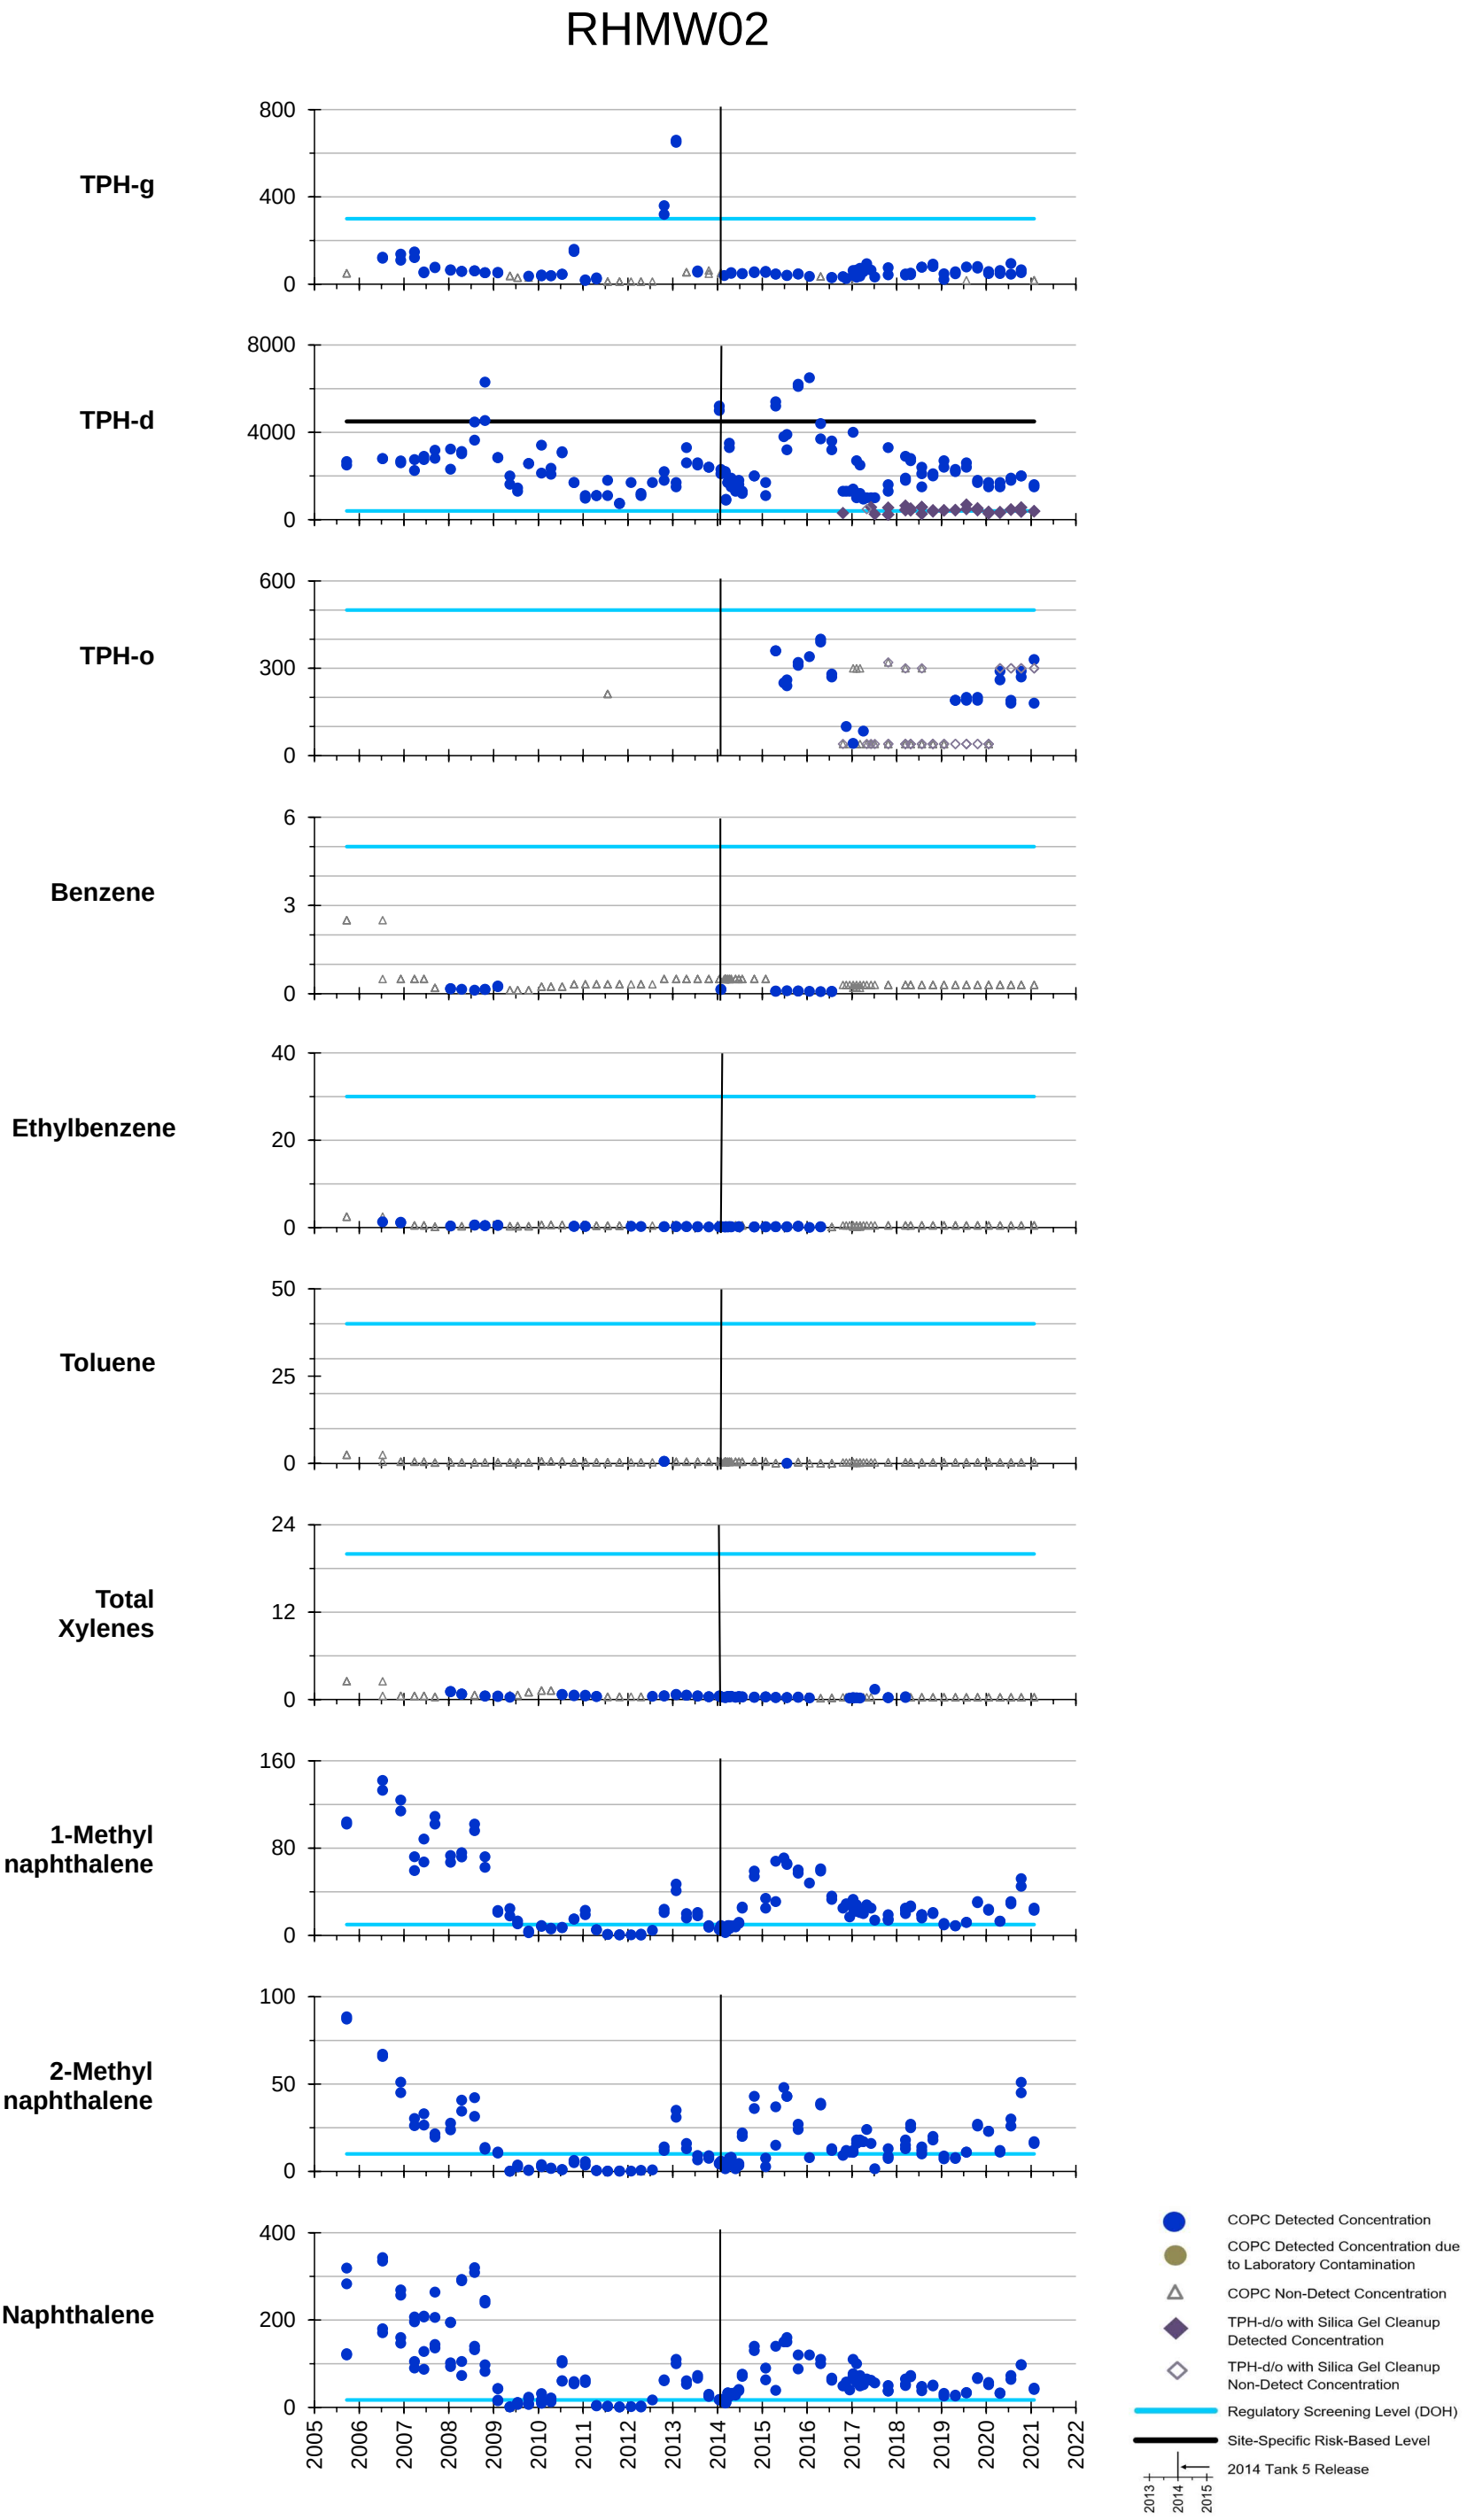


All results in micrograms per liter (µg/L or parts per billion).

EPA Region 9 Laboratory split sampling data from First to Fourth Quarters 2017, First Quarter 2018, and Third Quarter 2018 included in the graphs.

Laboratory reporting limits for TPH-d and TPH-o were raised in March 2020 in accordance with the most current DoD QSM (2019), TNI Manual (2016), and 40 CFR Part 136 (Methods Update Rule 2017).

Appendix A.2 Groundwater Concentration Graphs



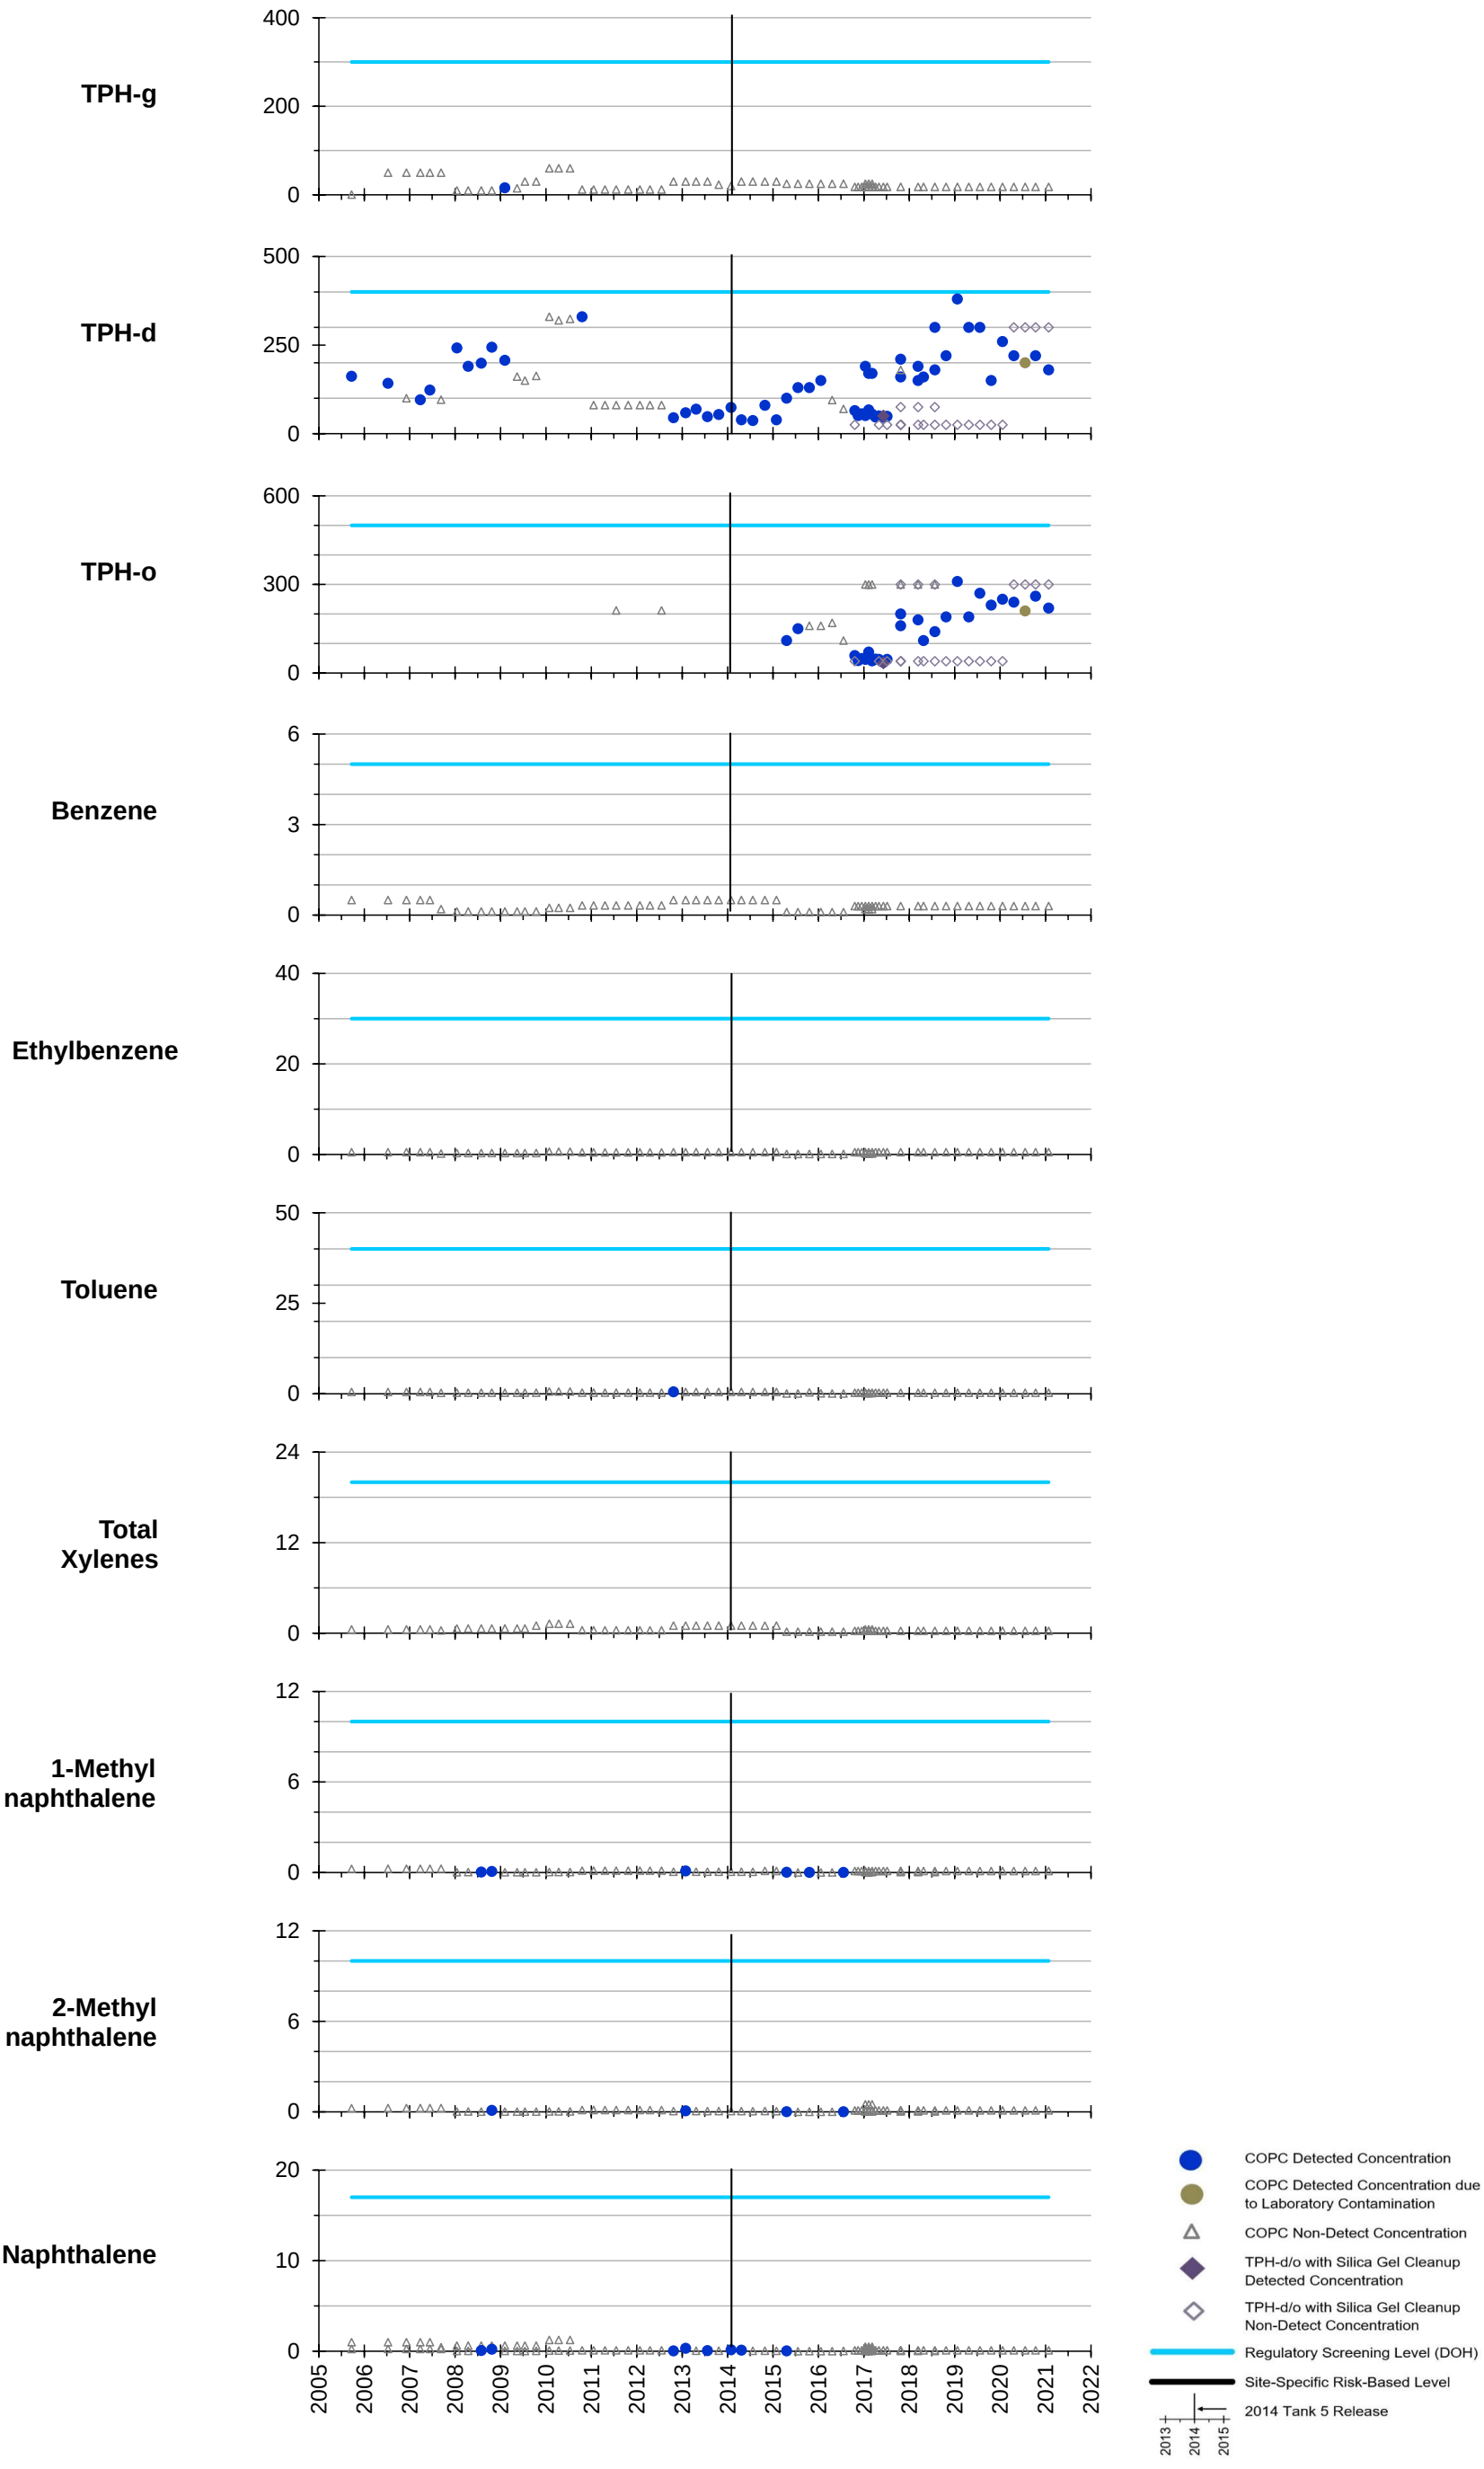
All results in micrograms per liter (µg/L or parts per billion).

EPA Region 9 Laboratory split sampling data from First to Fourth Quarters 2017, First Quarter 2018, and Third Quarter 2018 included in the graphs.

Laboratory reporting limits for TPH-d and TPH-o were raised in March 2020 in accordance with the most current DoD QSM (2019), TNI Manual (2016), and 40 CFR Part 136 (Methods Update Rule 2017).

Appendix A.2 Groundwater Concentration Graphs

RHMW03

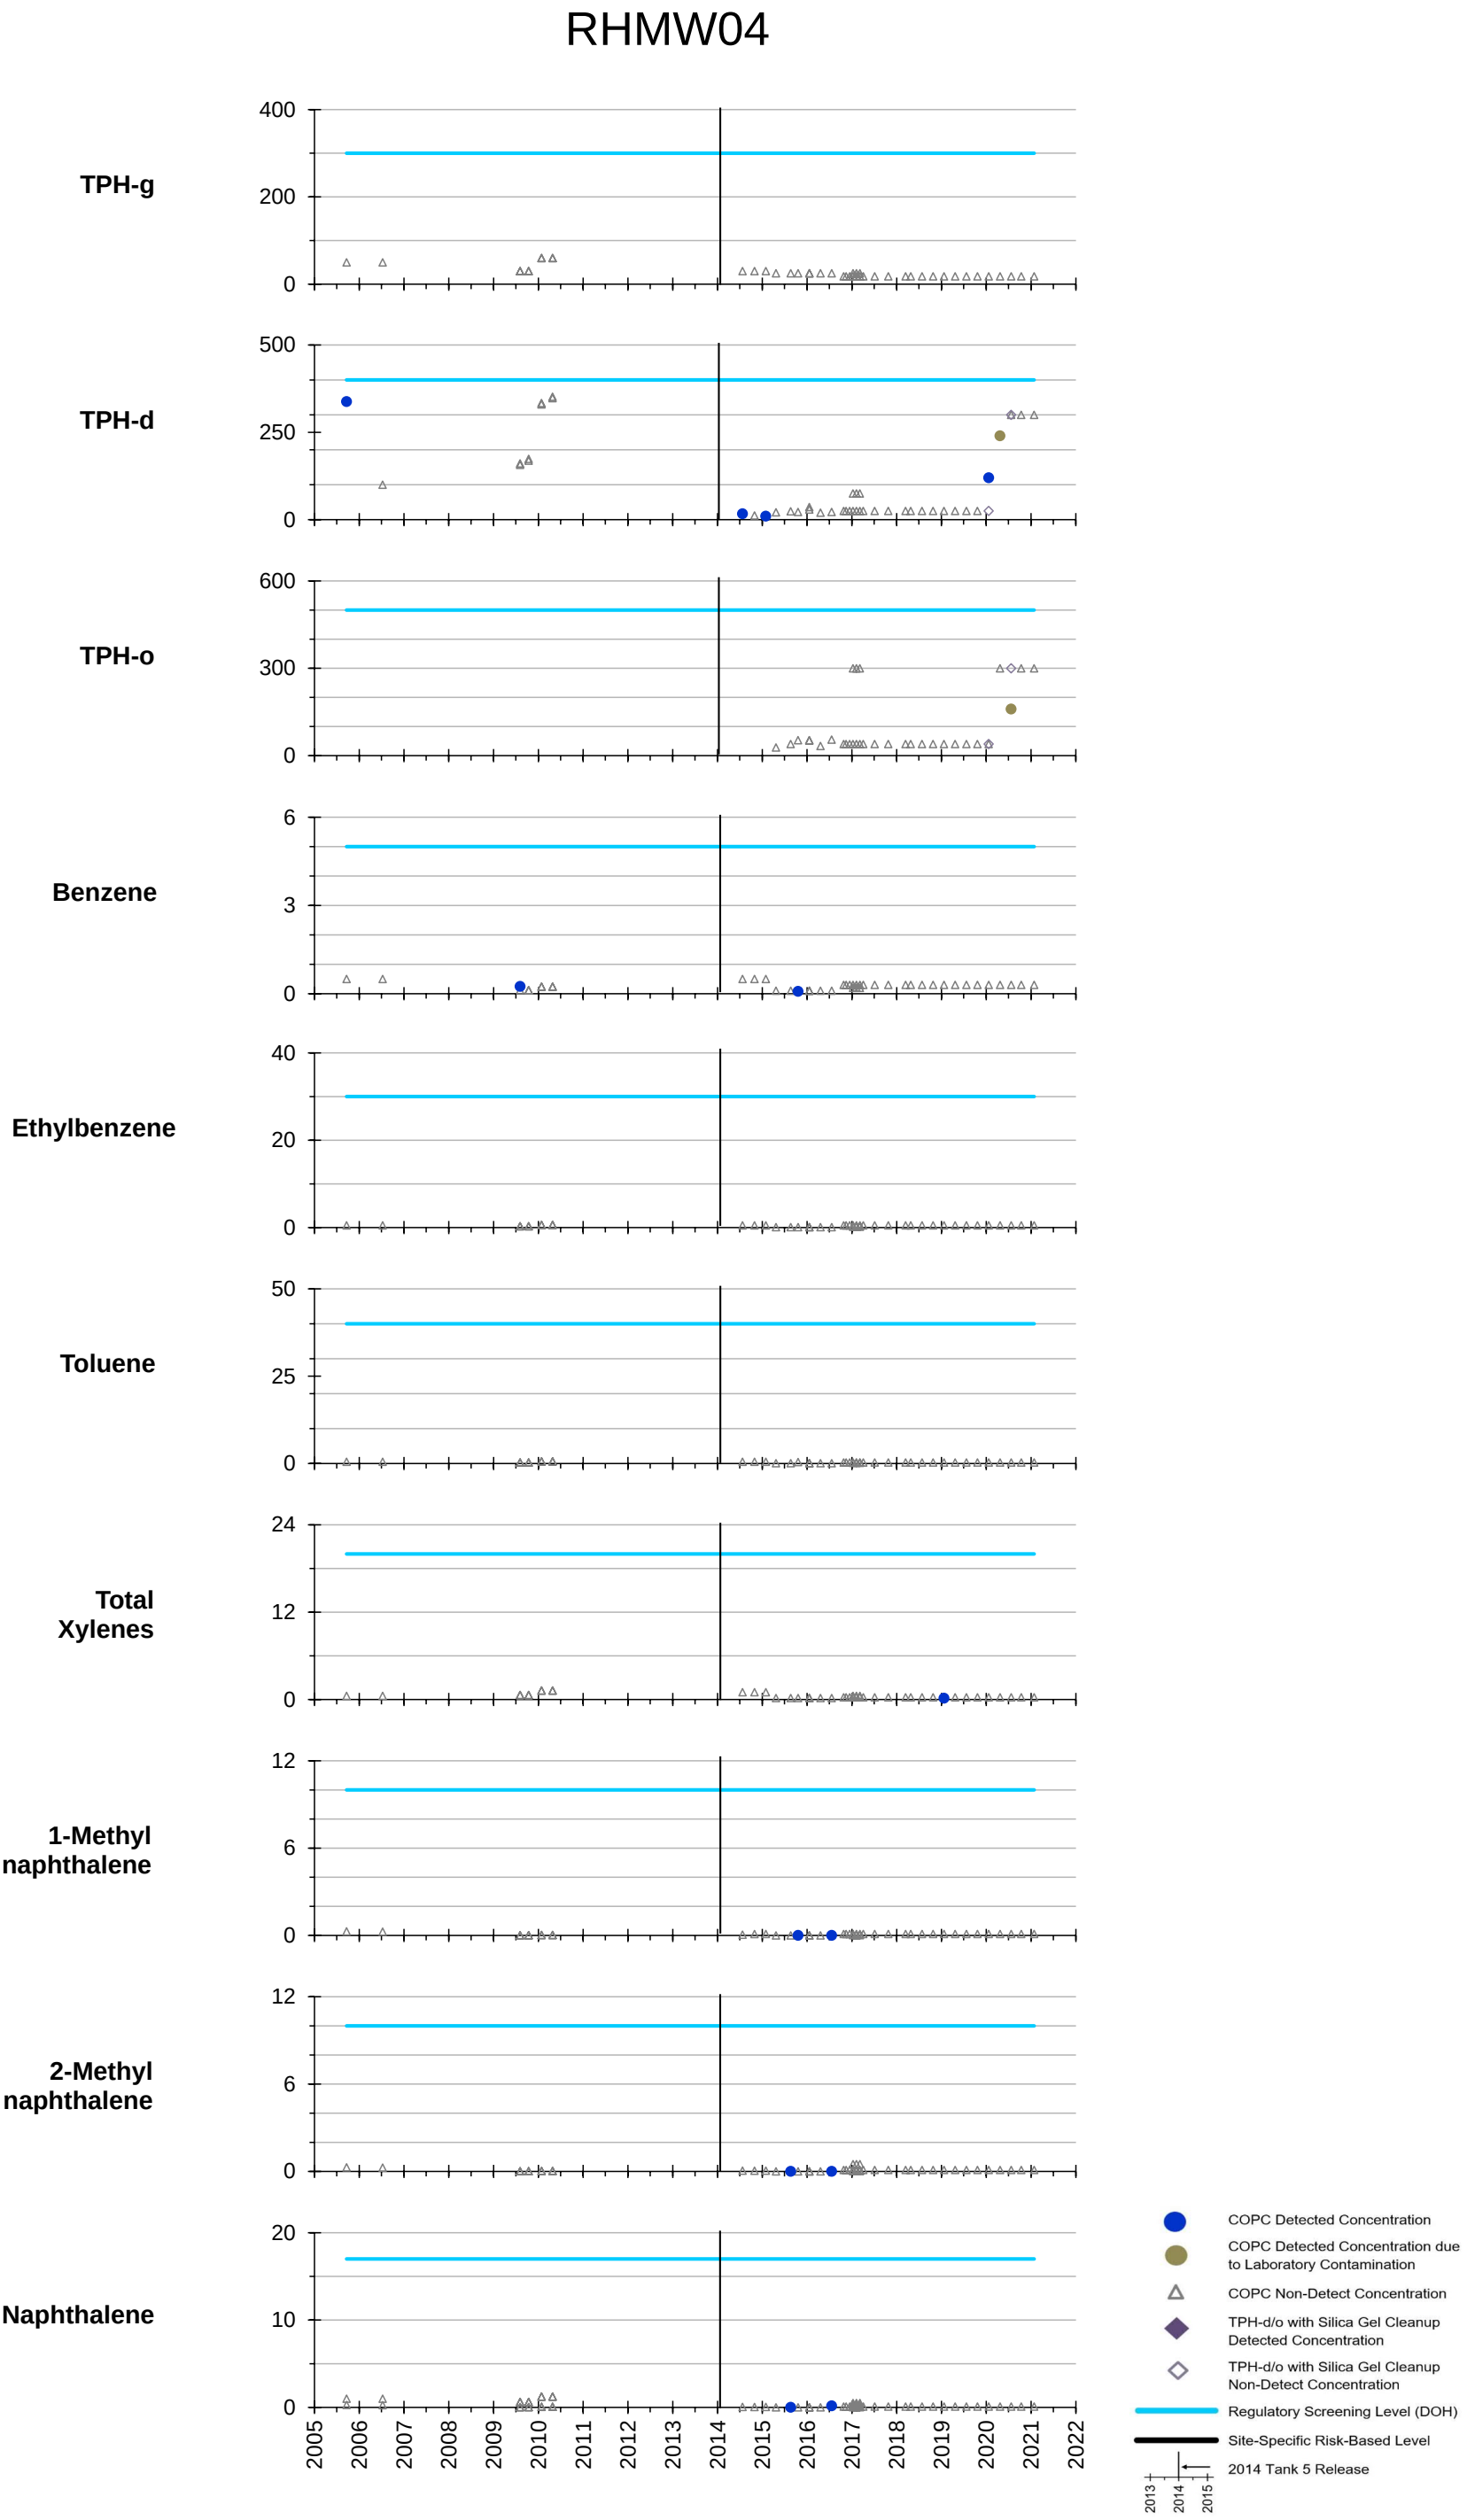


All results in micrograms per liter (µg/L or parts per billion).

EPA Region 9 Laboratory split sampling data from First to Fourth Quarters 2017, First Quarter 2018, and Third Quarter 2018 included in the graphs.

Laboratory reporting limits for TPH-d and TPH-o were raised in March 2020 in accordance with the most current DoD QSM (2019), TNI Manual (2016), and 40 CFR Part 136 (Methods Update Rule 2017).

Appendix A.2 Groundwater Concentration Graphs

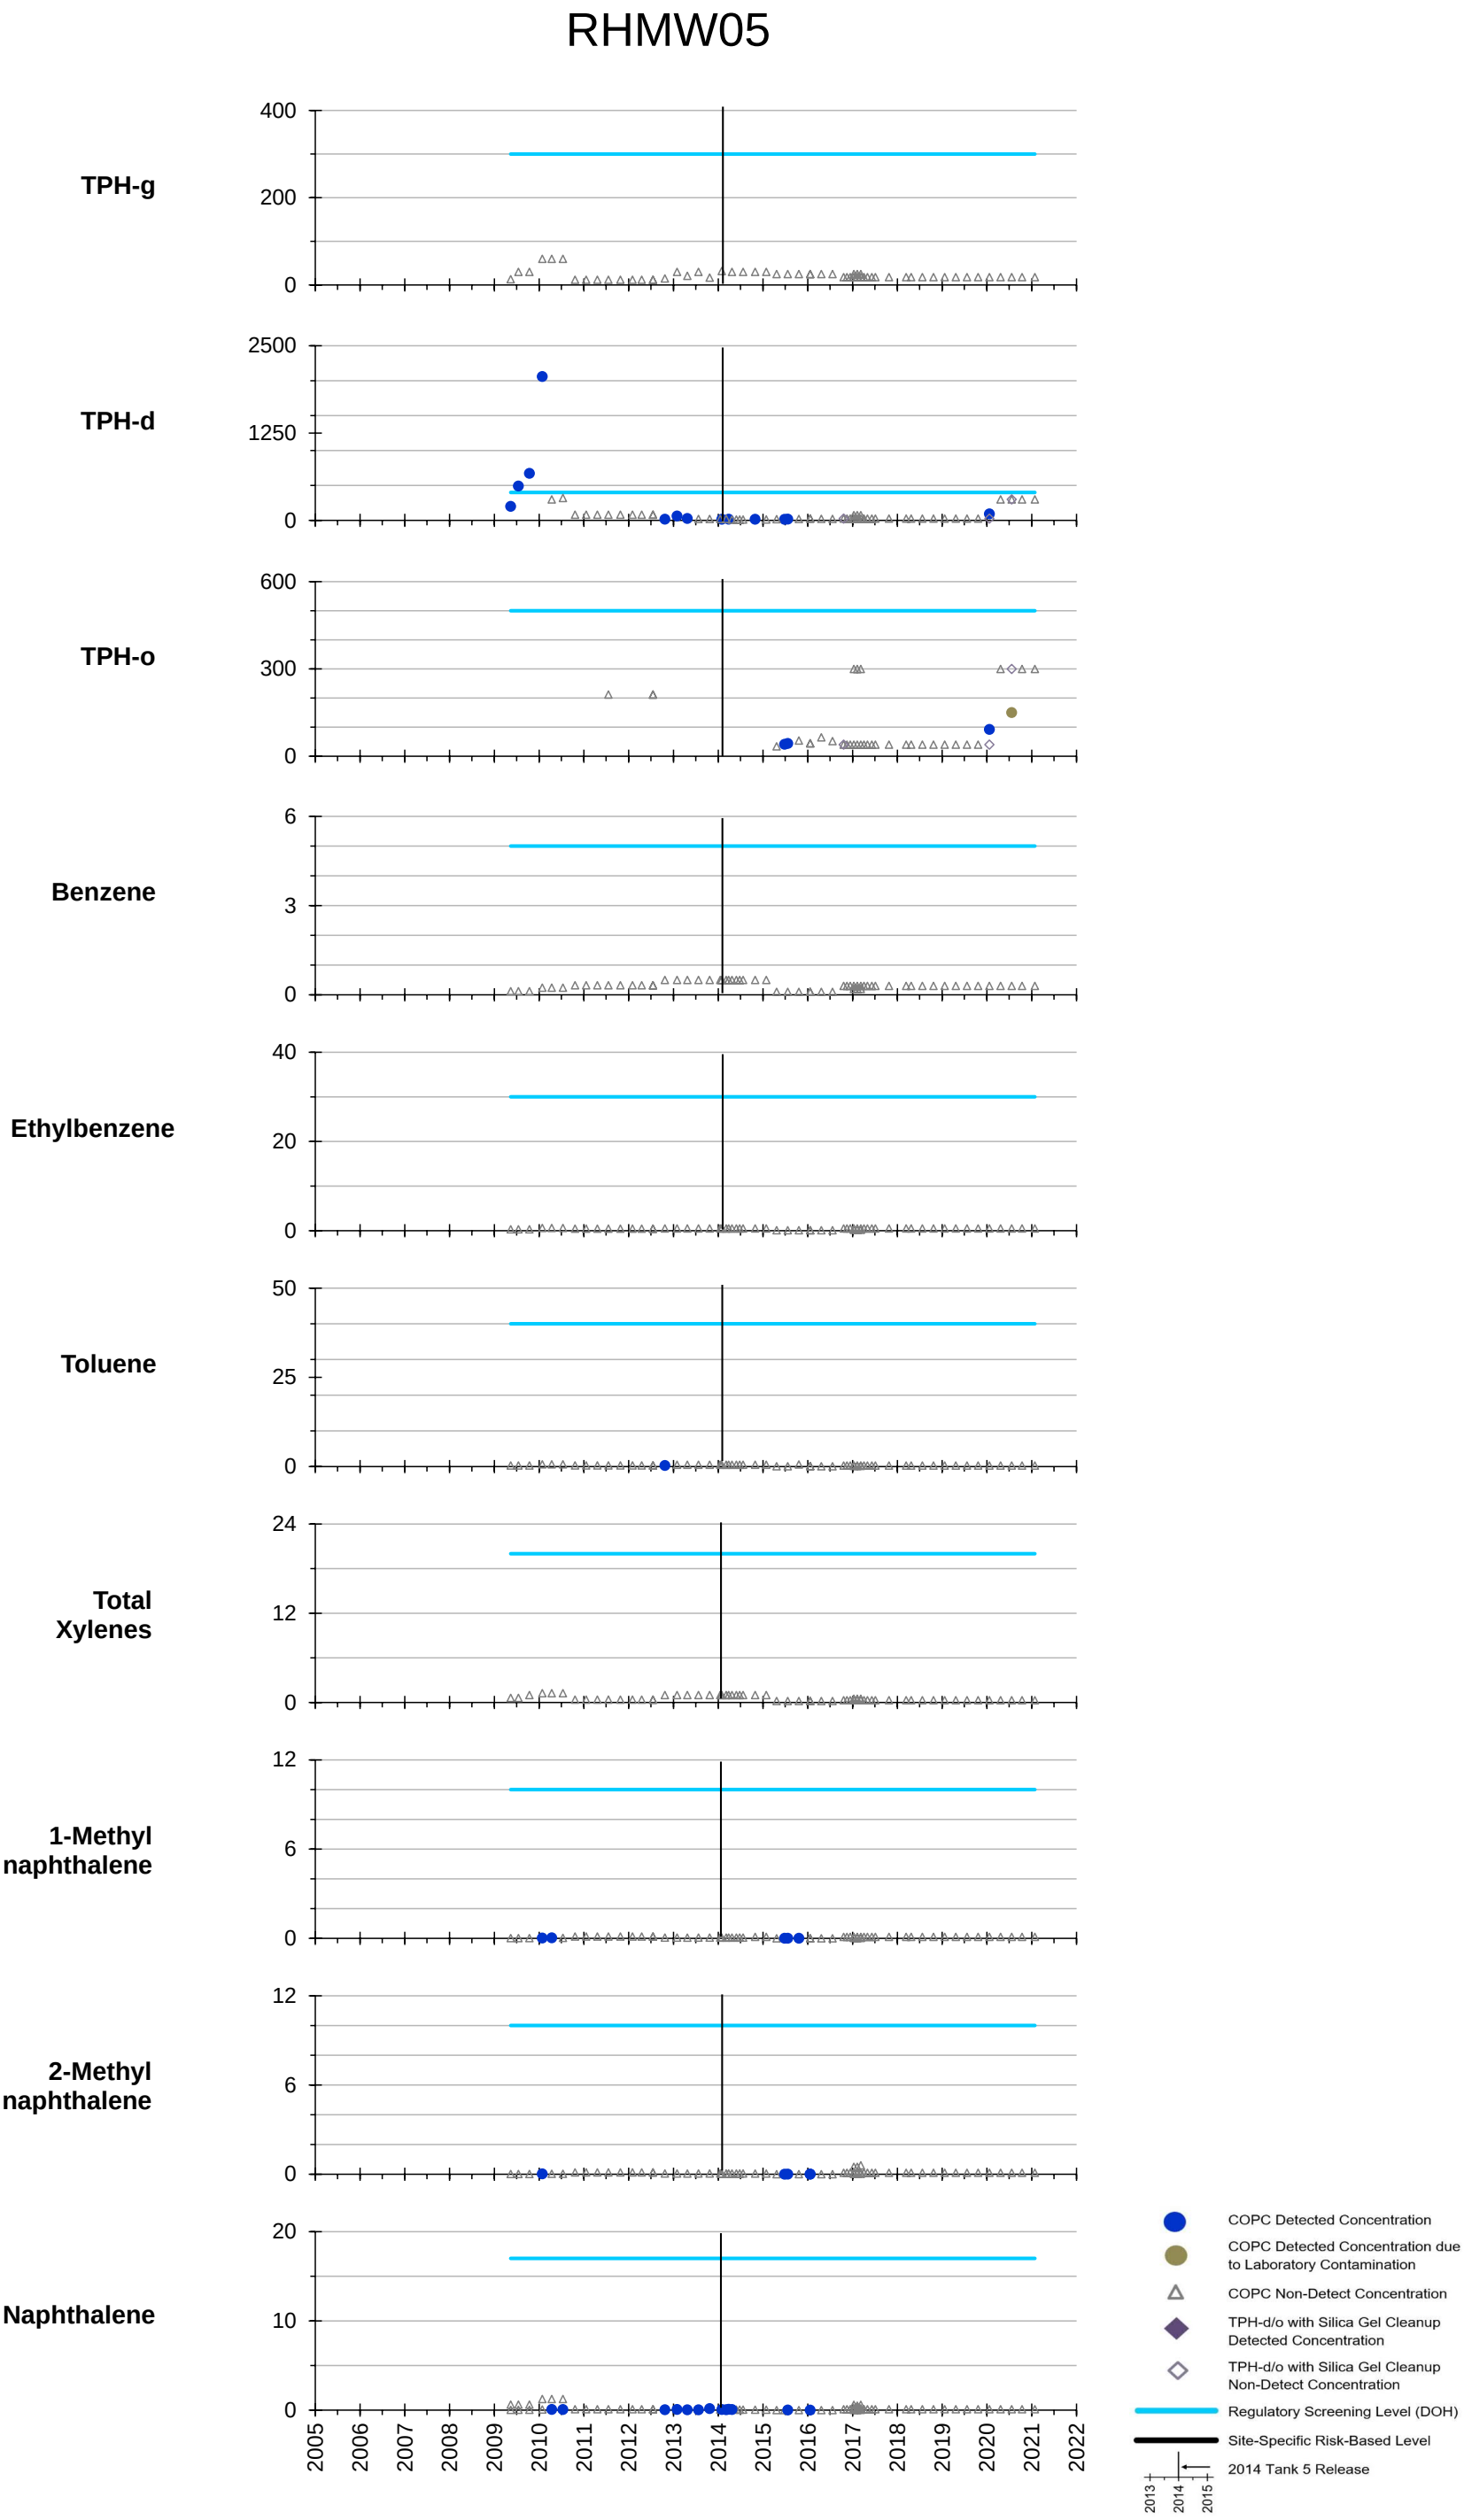


All results in micrograms per liter (µg/L or parts per billion).

EPA Region 9 Laboratory split sampling data from First to Third Quarters 2017 included in the graphs.

Laboratory reporting limits for TPH-d and TPH-o were raised in March 2020 in accordance with the most current DoD QSM (2019), TNI Manual (2016), and 40 CFR Part 136 (Methods Update Rule 2017).

Appendix A.2 Groundwater Concentration Graphs

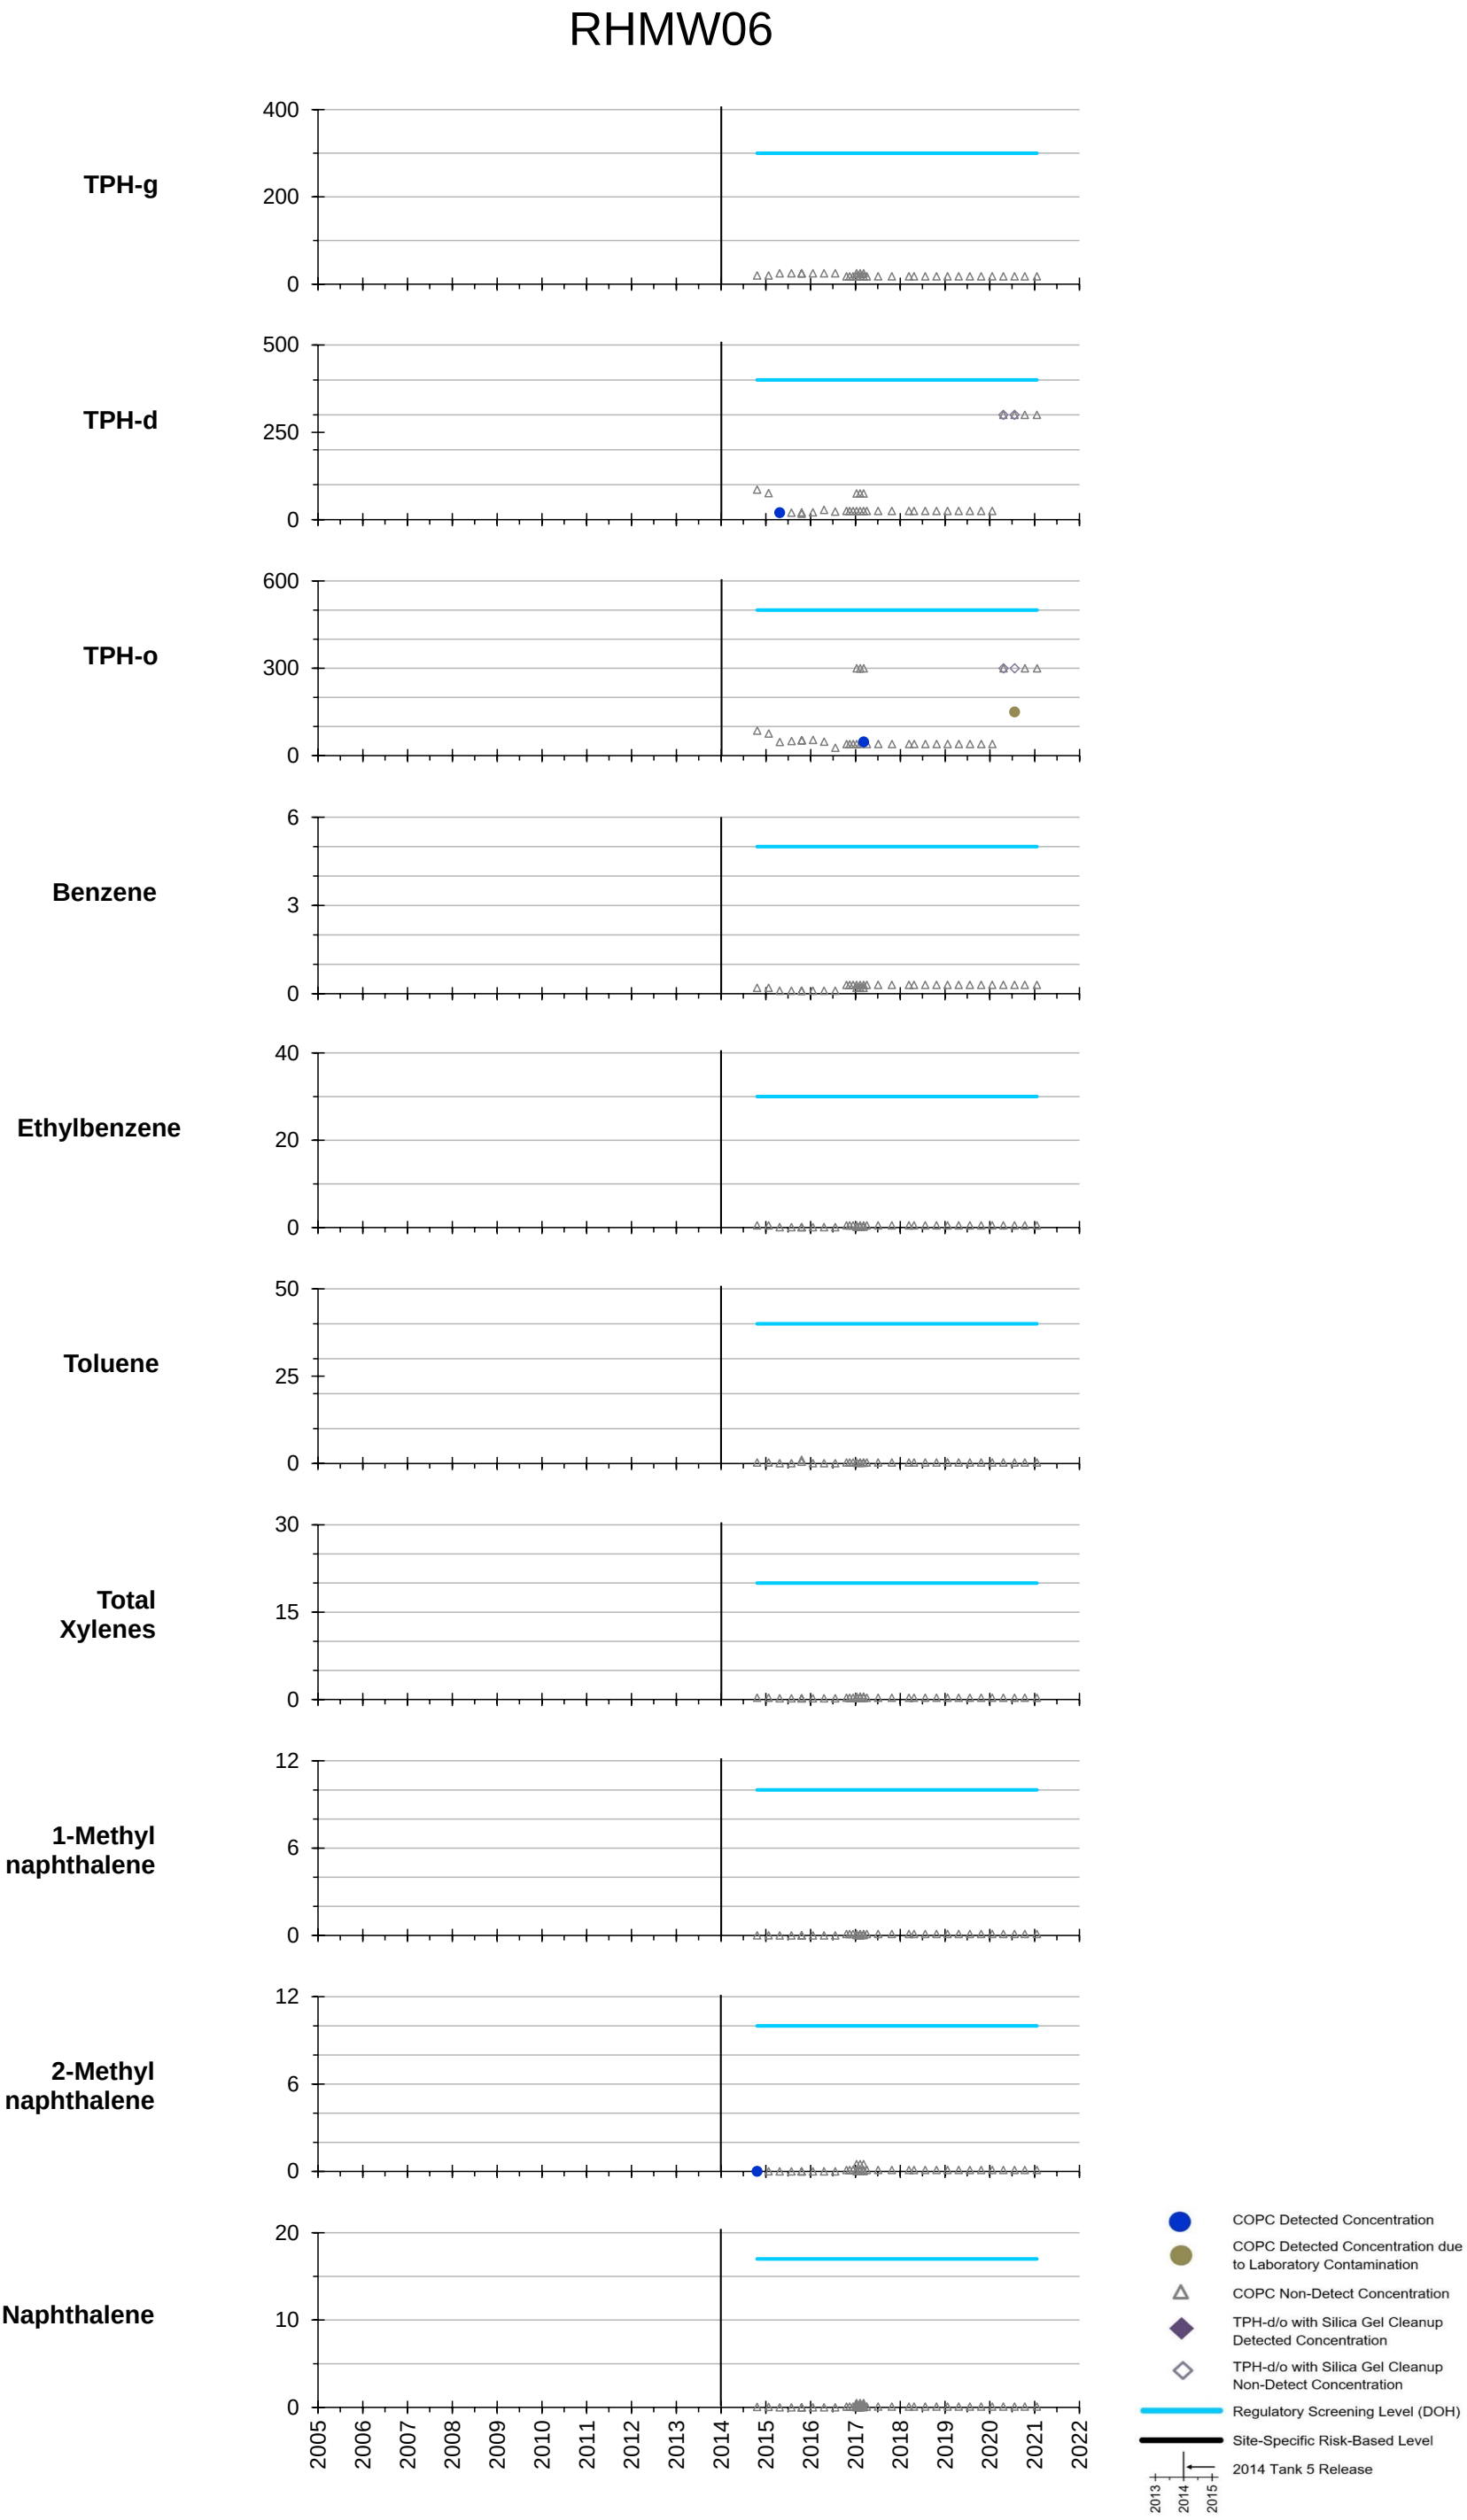


All results in micrograms per liter (µg/L or parts per billion).

EPA Region 9 Laboratory split sampling data from First to Third Quarters 2017 included in the graphs.

Laboratory reporting limits for TPH-d and TPH-o were raised in March 2020 in accordance with the most current DoD QSM (2019), TNI Manual (2016), and 40 CFR Part 136 (Methods Update Rule 2017).

Appendix A.2 Groundwater Concentration Graphs



All results in micrograms per liter (µg/L or parts per billion).

EPA Region 9 Laboratory split sampling data from First to Third Quarters 2017 included in the graphs.

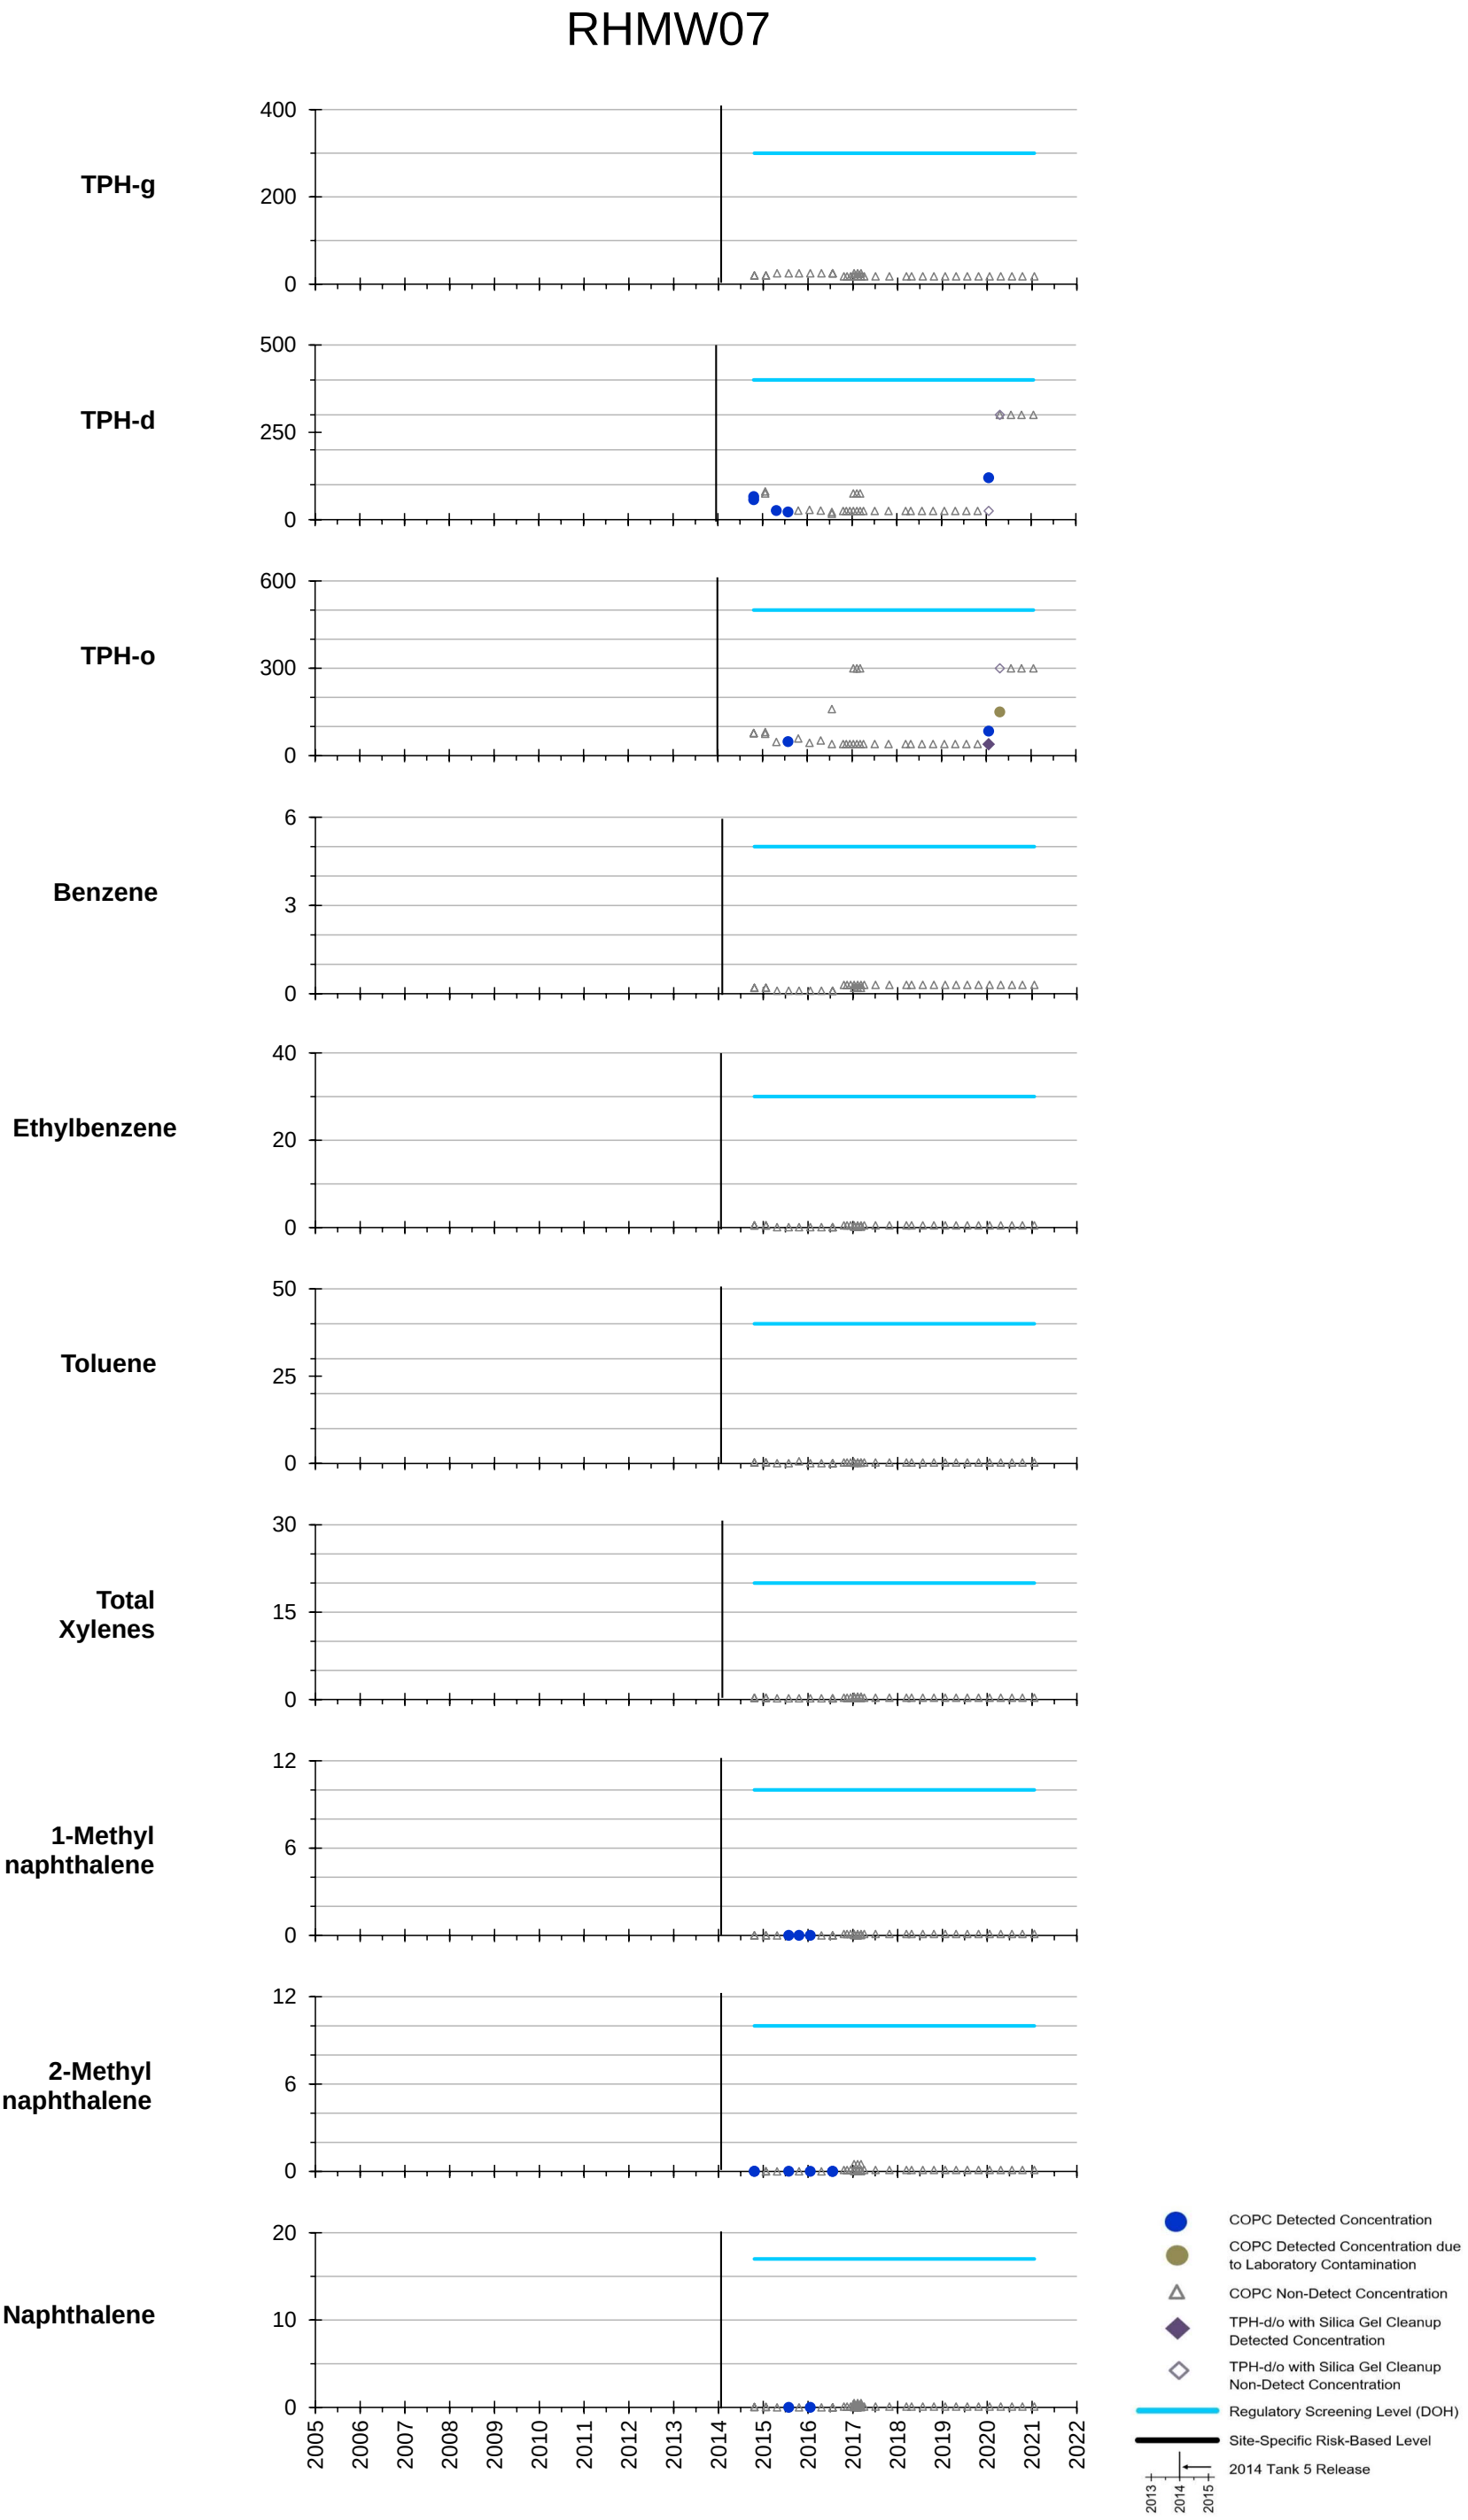
Appendix A.2 Groundwater Concentration Graphs

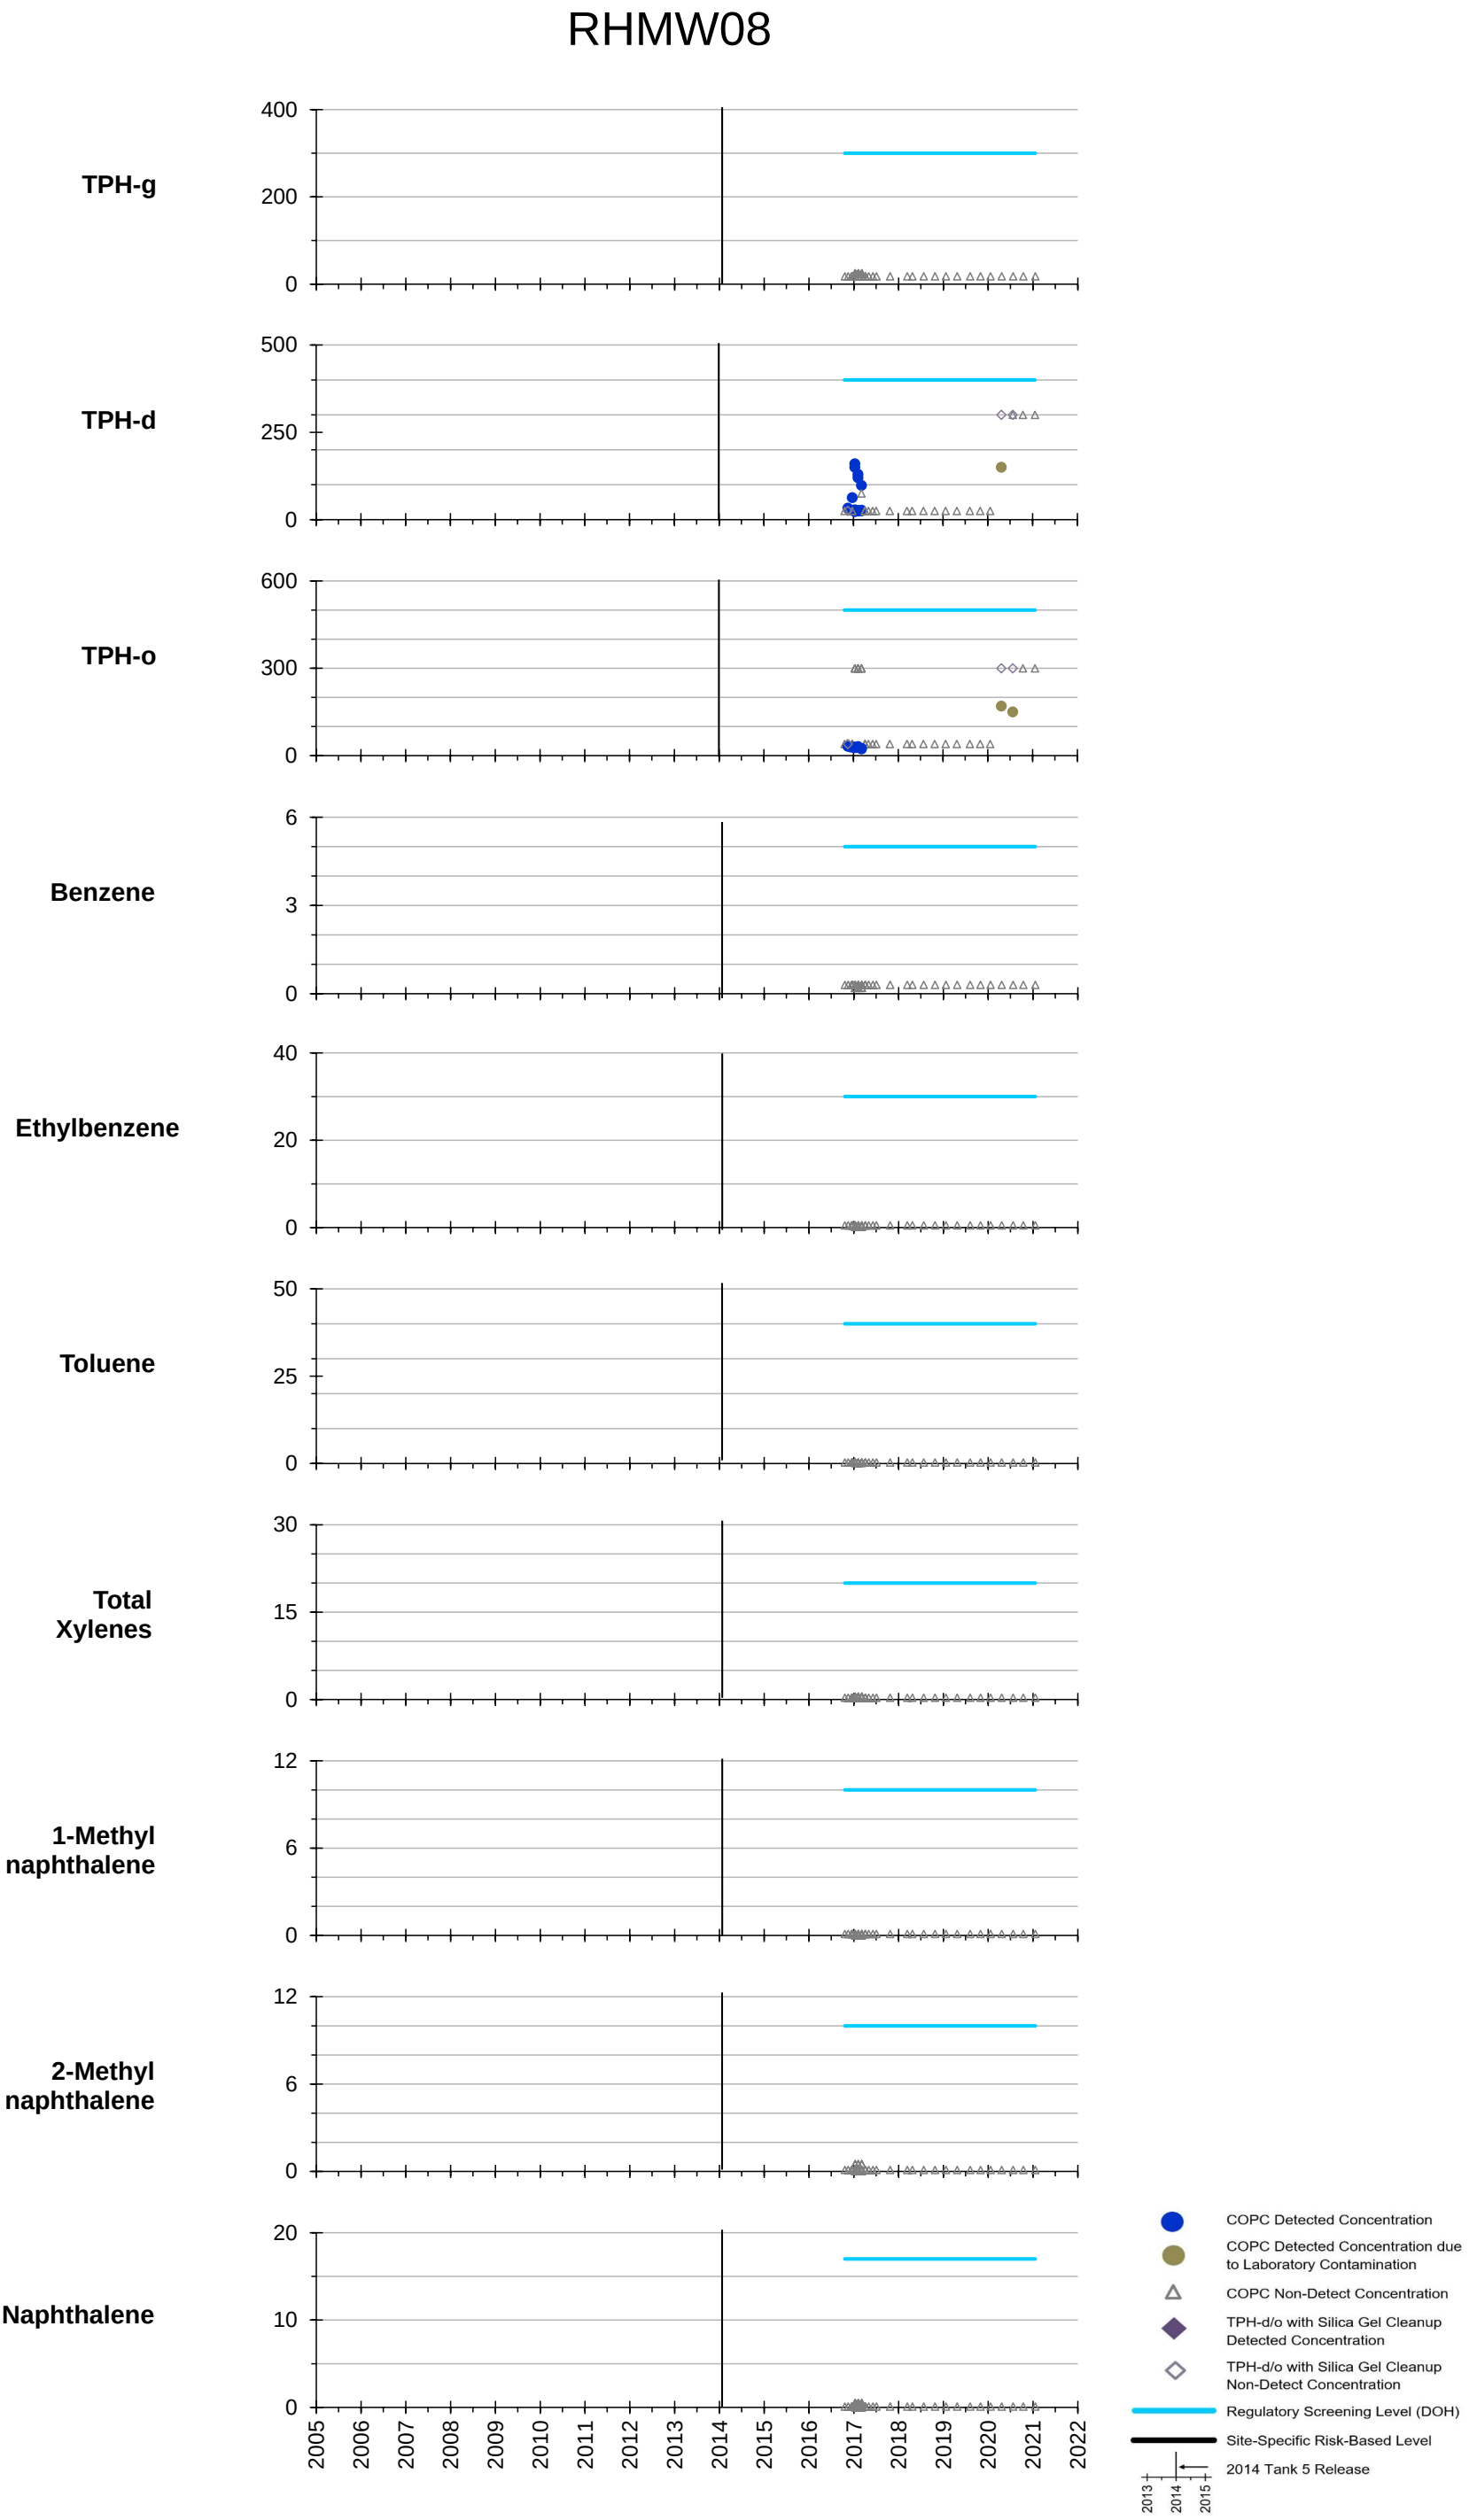


All results in micrograms per liter (µg/L or parts per billion).

EPA Region 9 Laboratory split sampling data from First to Third Quarters 2017 included in the graphs.

Laboratory reporting limits for TPH-d and TPH-o were raised in March 2020 in accordance with the most current DoD QSM (2019), TNI Manual (2016), and 40 CFR Part 136 (Methods Update Rule 2017).

Appendix A.2 Groundwater Concentration Graphs



All results in micrograms per liter (µg/L or parts per billion).

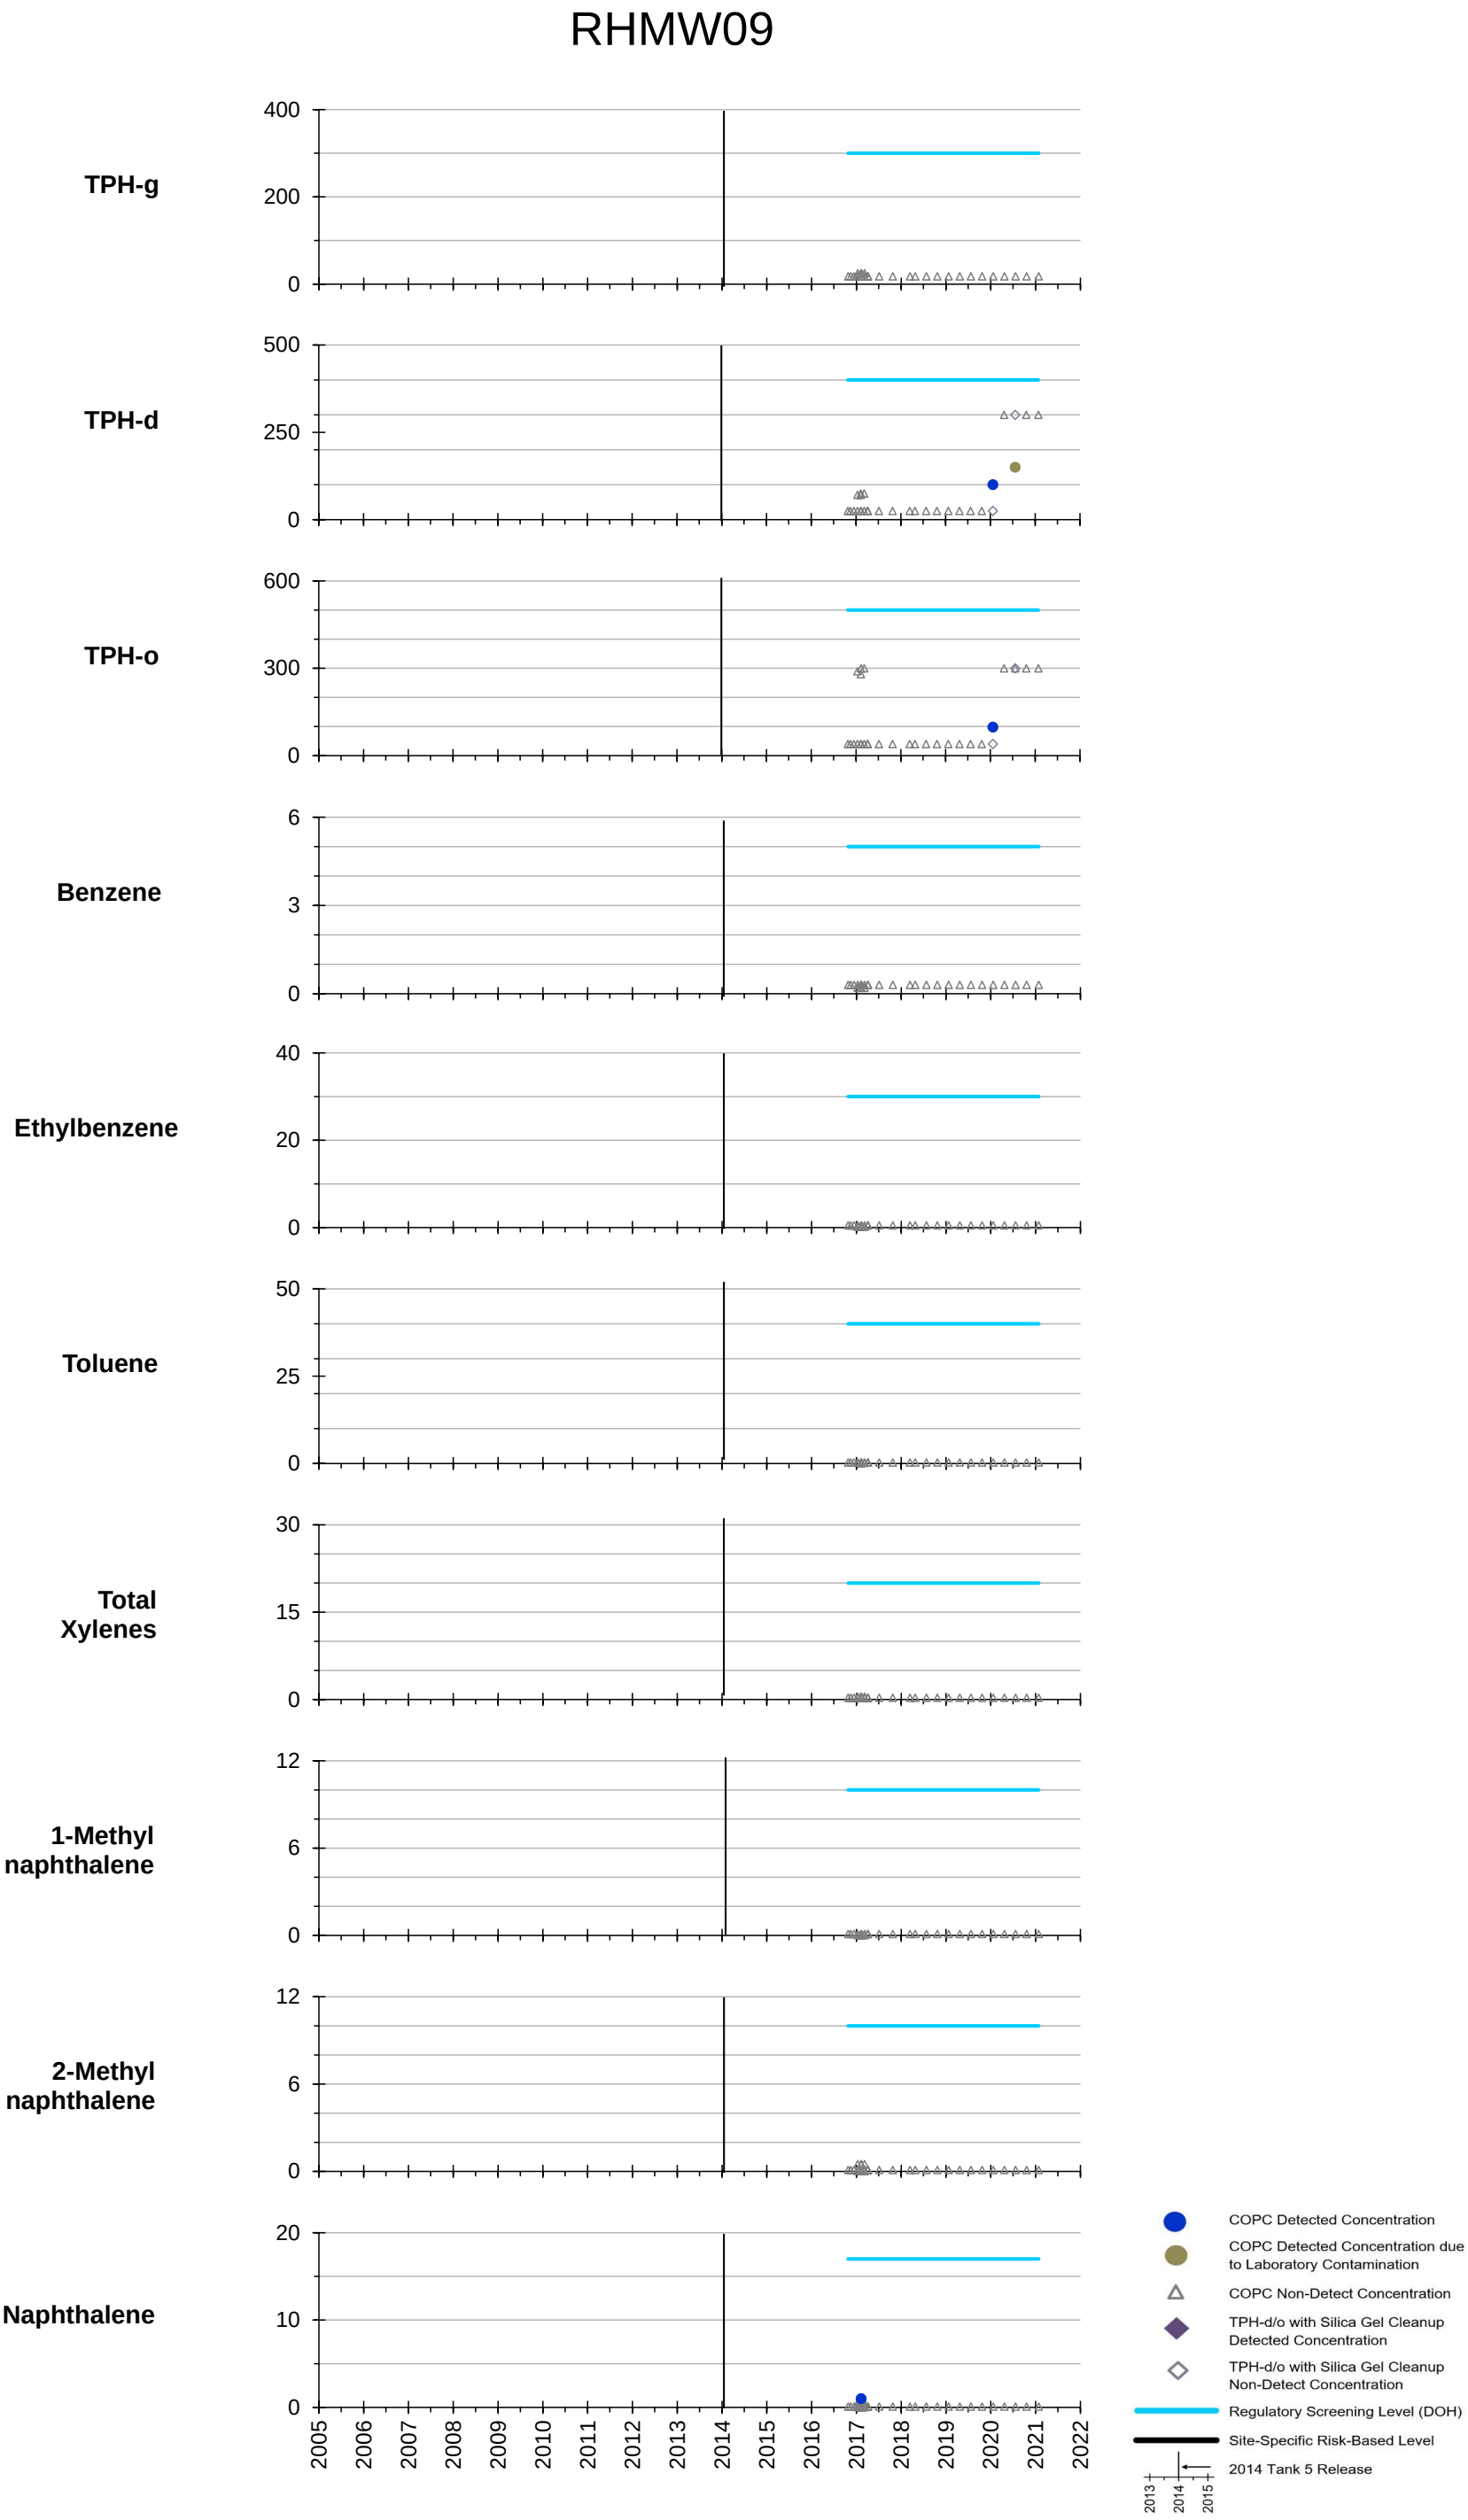
Laboratory reporting limits for TPH-d and TPH-o were raised in March 2020 in accordance with the most current DoD QSM (2019), TNI Manual (2016), and 40 CFR Part 136 (Methods Update Rule 2017).

Appendix A.2 Groundwater Concentration Graphs



All results in micrograms per liter (µg/L or parts per billion).

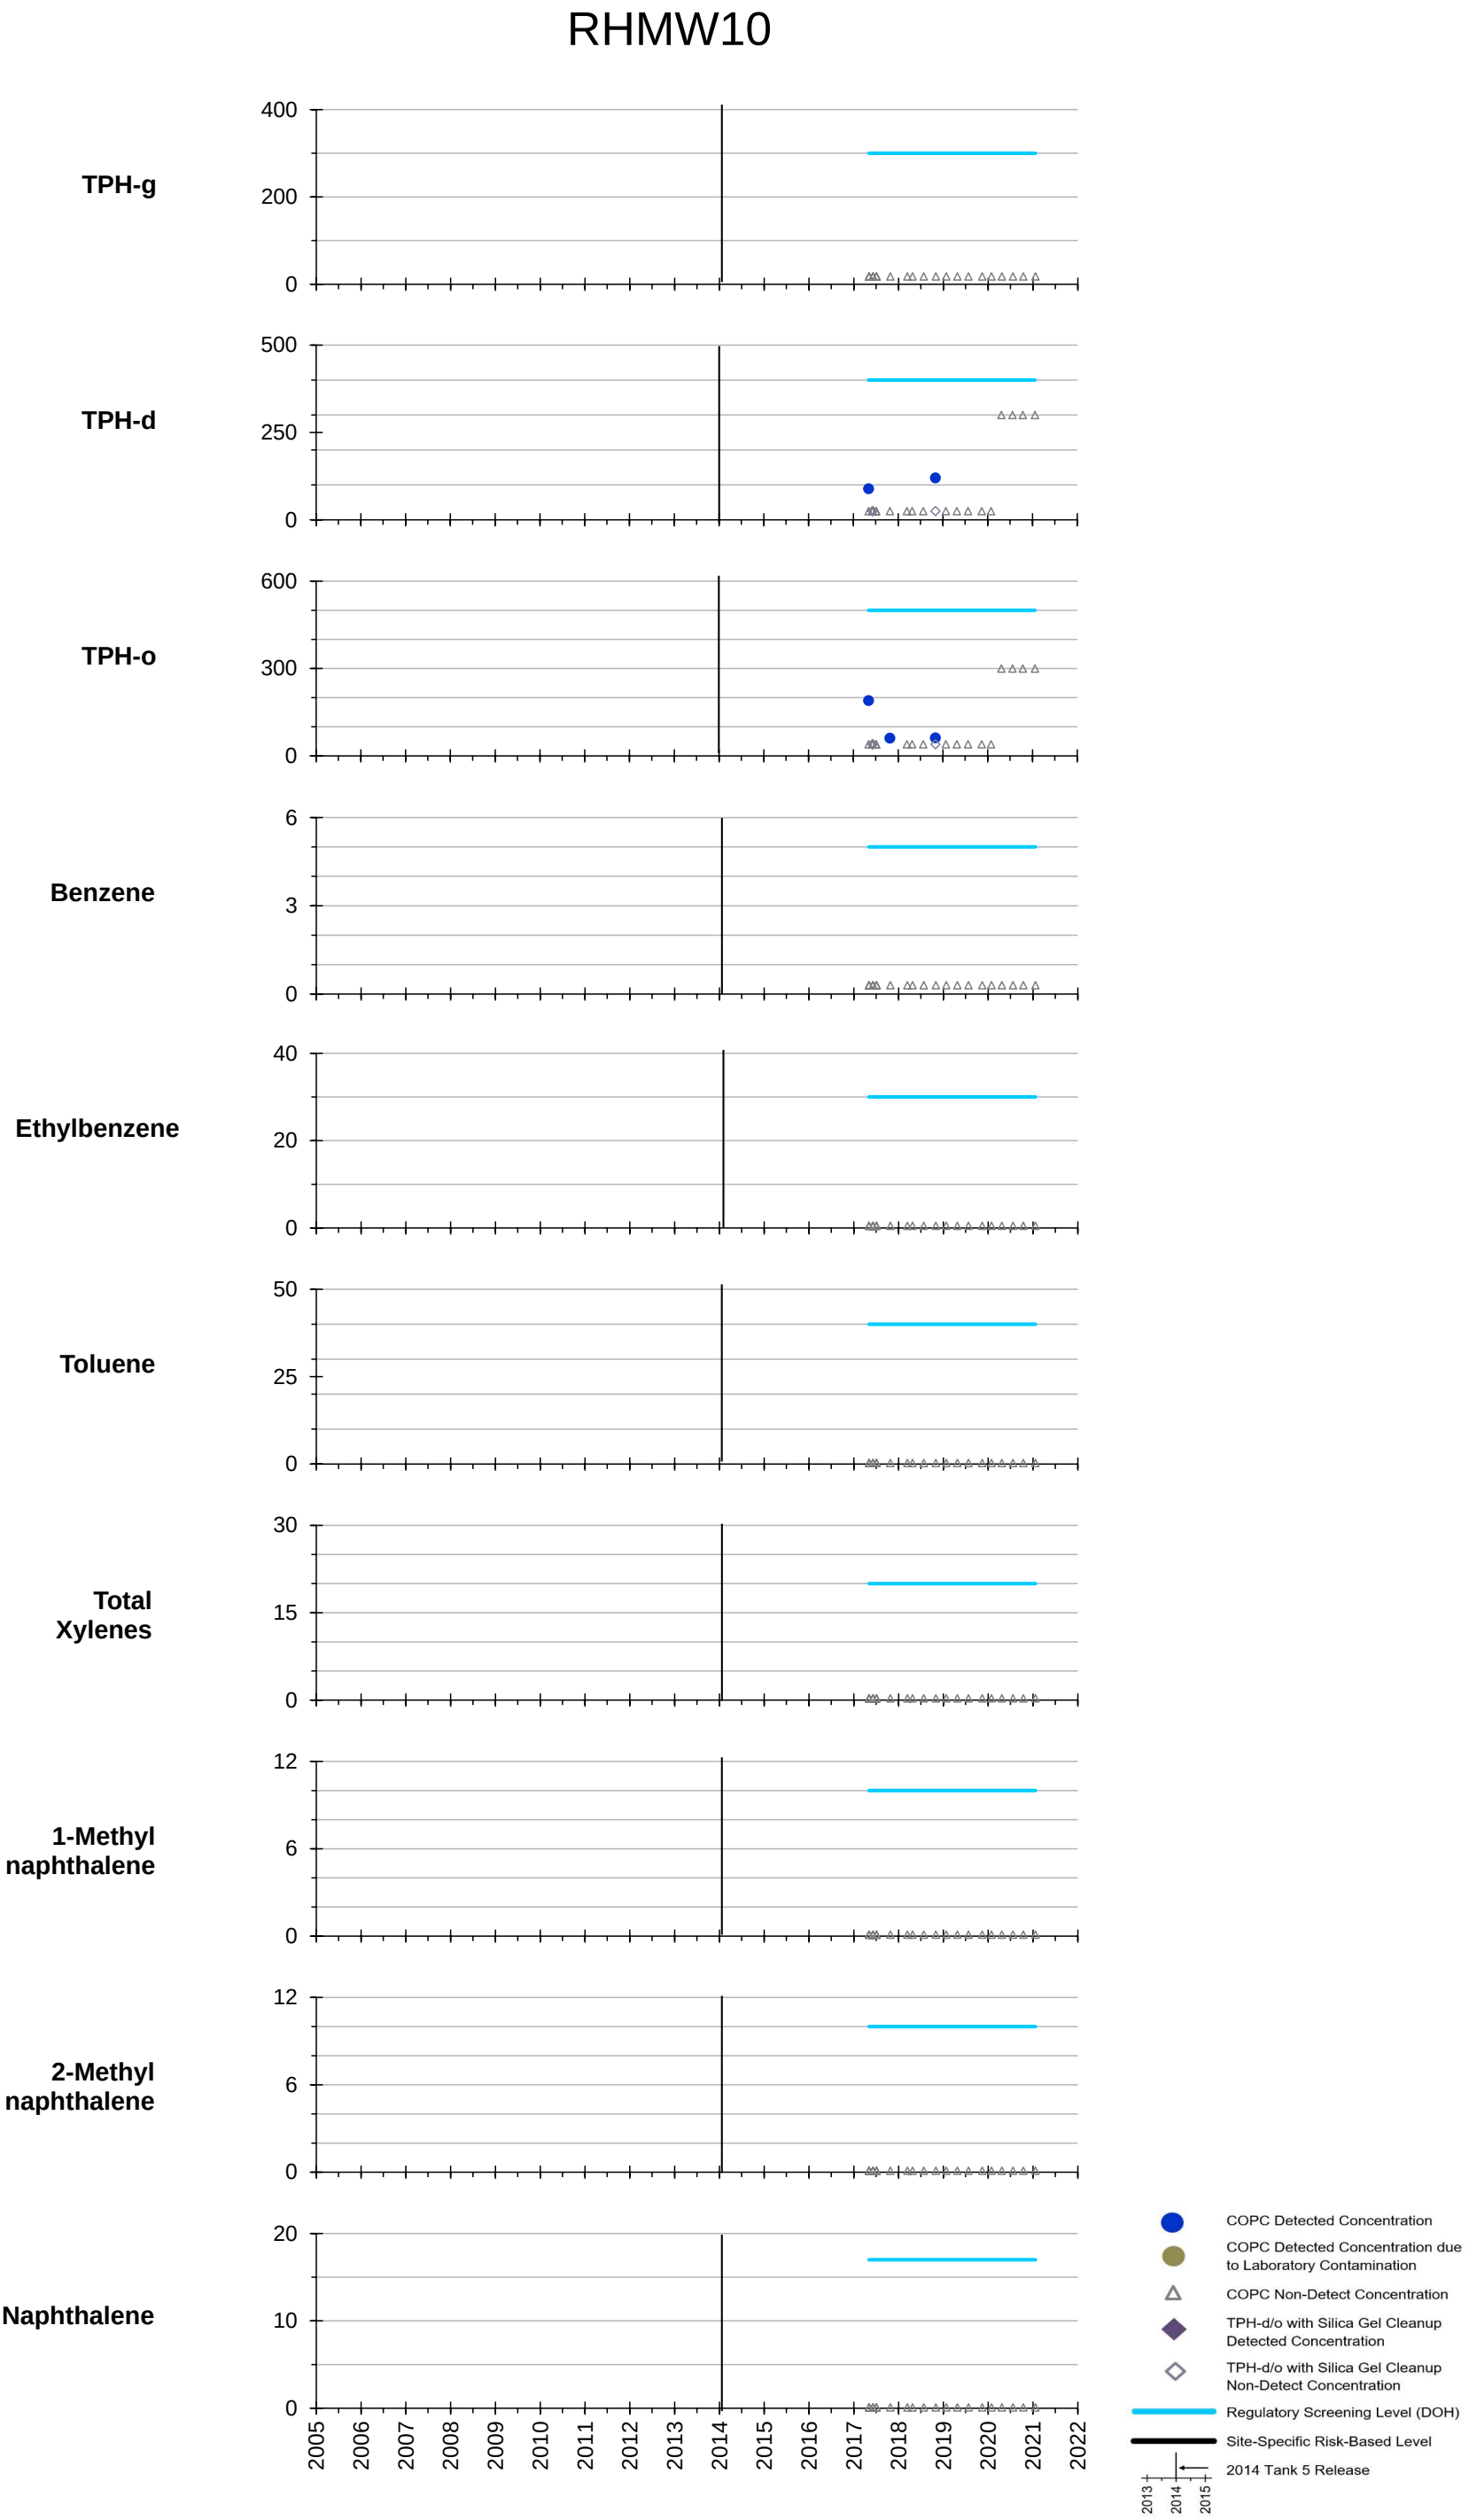
Laboratory reporting limits for TPH-d and TPH-o were raised in March 2020 in accordance with the most current DoD QSM (2019), TNI Manual (2016), and 40 CFR Part 136 (Methods Update Rule 2017).

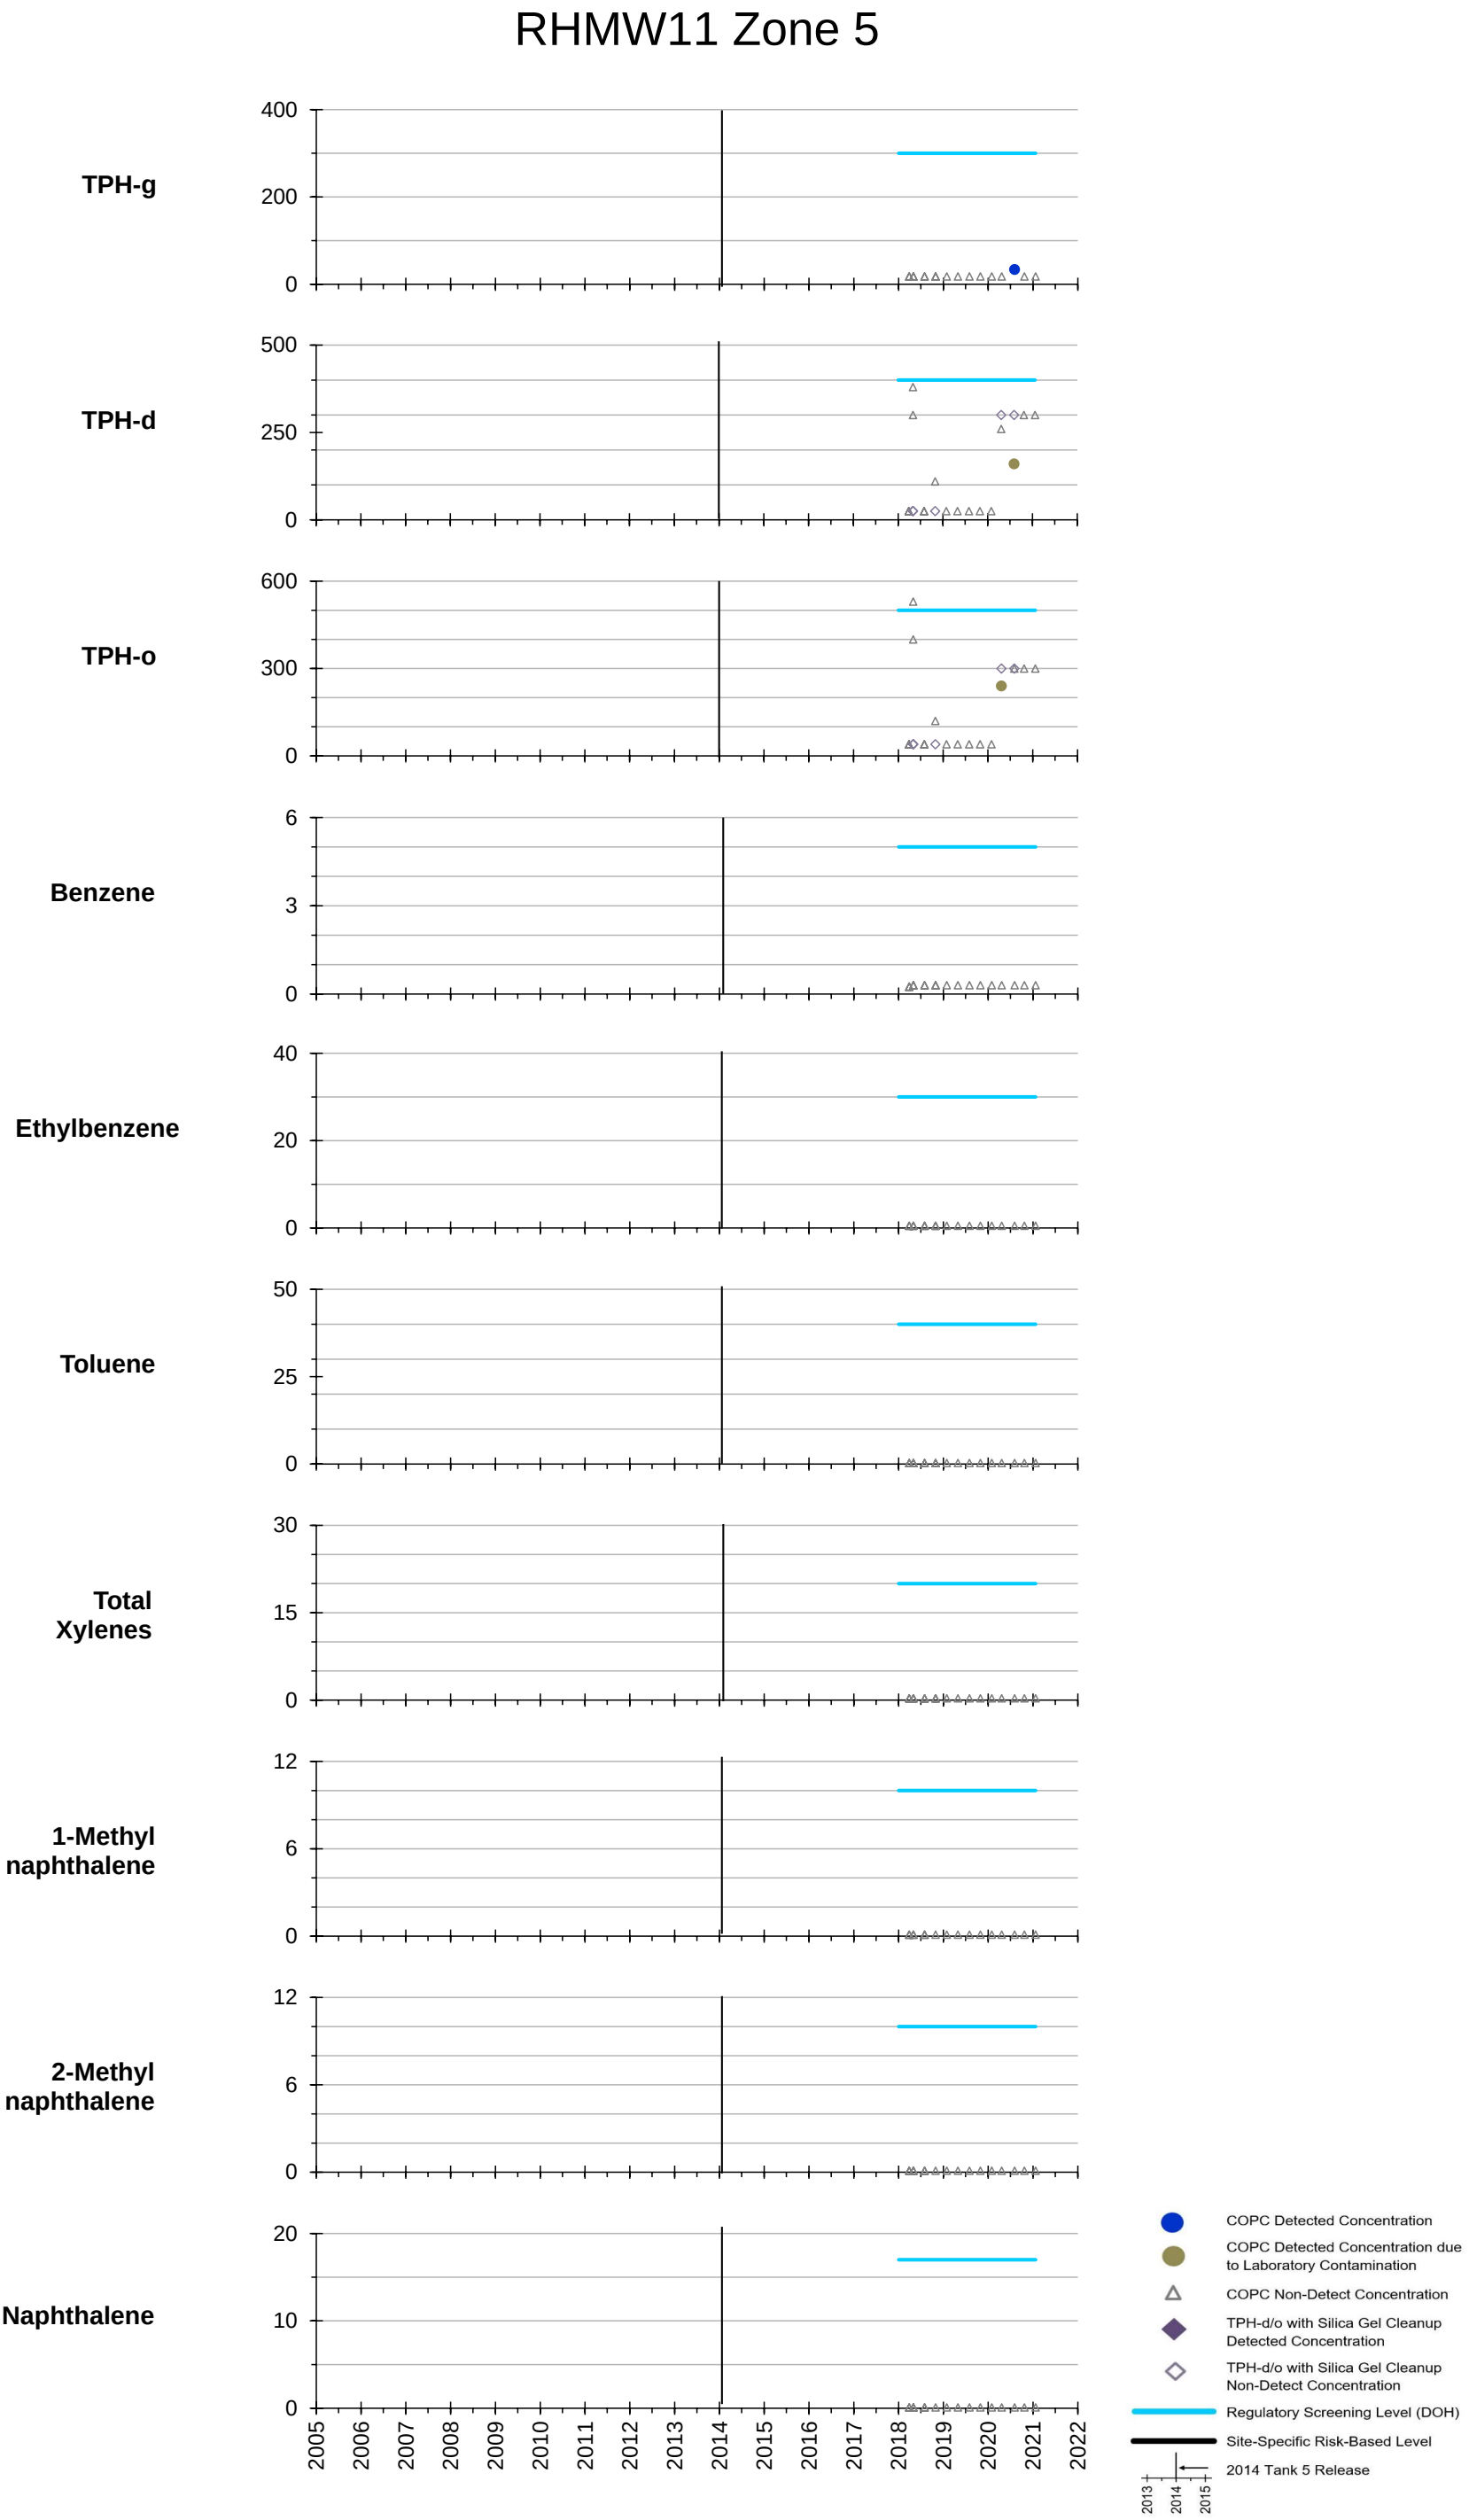
Appendix A.2 Groundwater Concentration Graphs



All results in micrograms per liter (µg/L or parts per billion).

Laboratory reporting limits for TPH-d and TPH-o were raised in March 2020 in accordance with the most current DoD QSM (2019), TNI Manual (2016), and 40 CFR Part 136 (Methods Update Rule 2017).

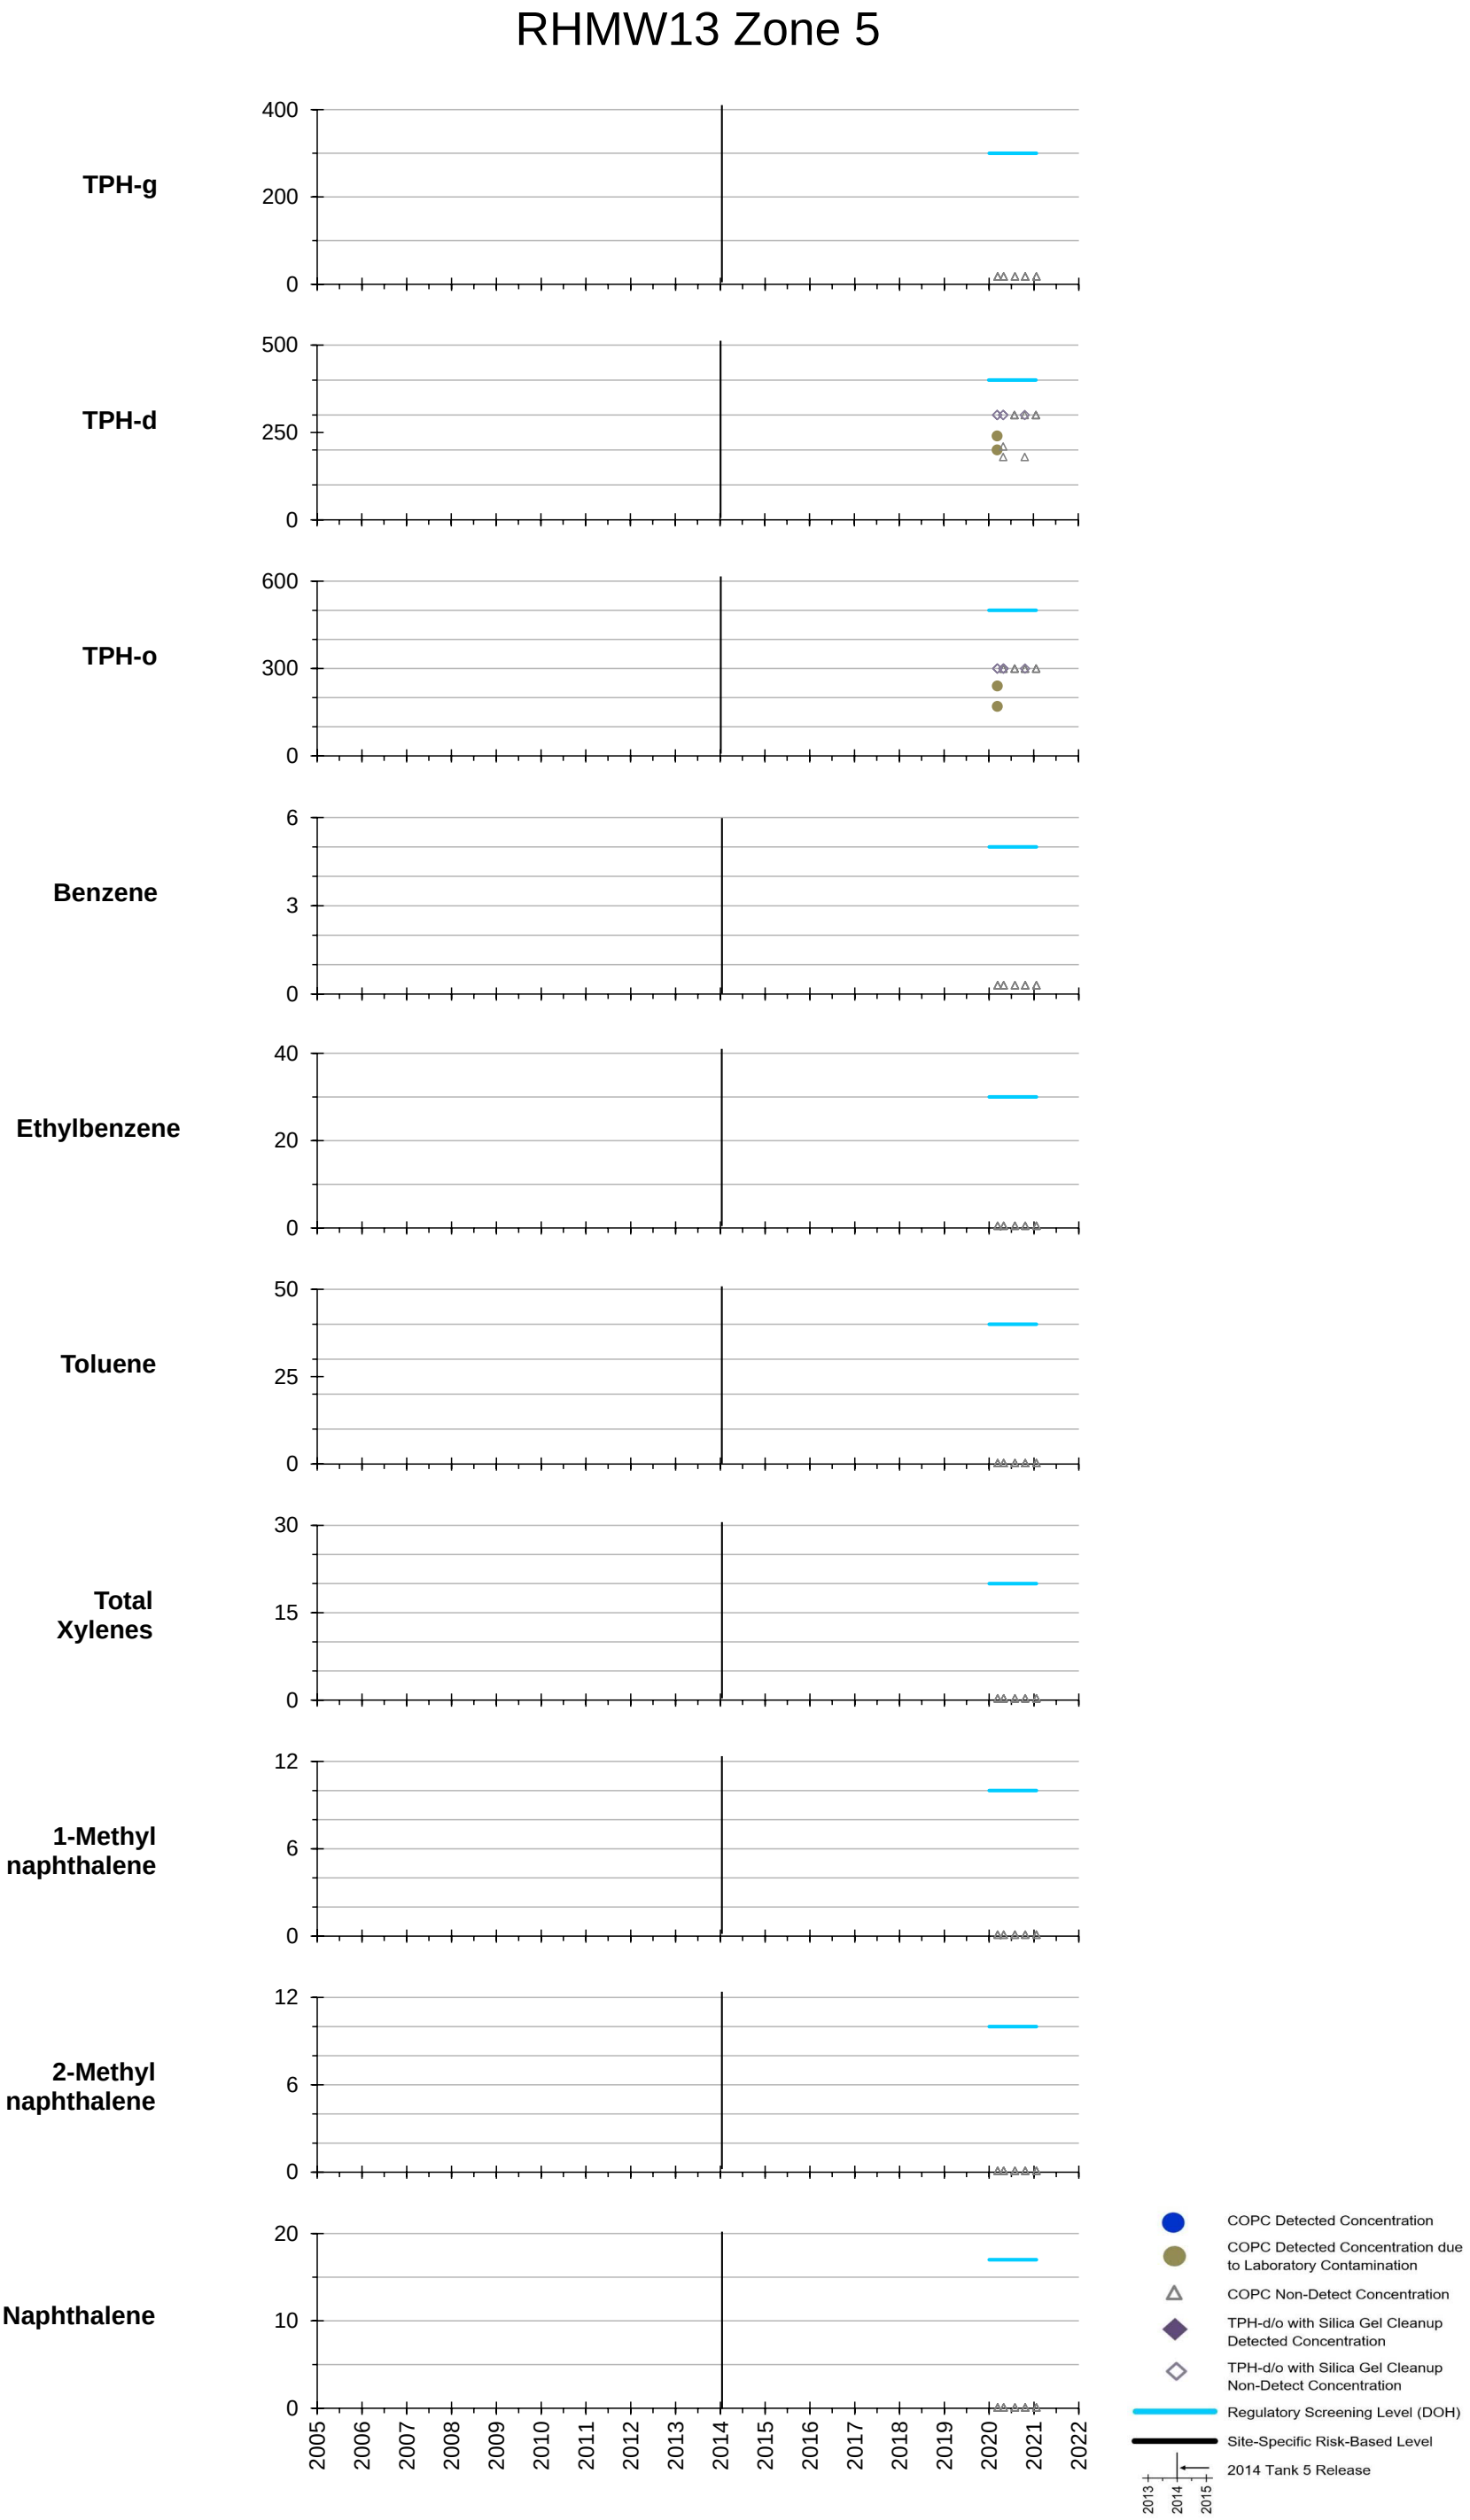
Appendix A.2 Groundwater Concentration Graphs



All results in micrograms per liter (µg/L or parts per billion).

Laboratory reporting limits for TPH-d and TPH-o were raised in March 2020 in accordance with the most current DoD QSM (2019), TNI Manual (2016), and 40 CFR Part 136 (Methods Update Rule 2017).

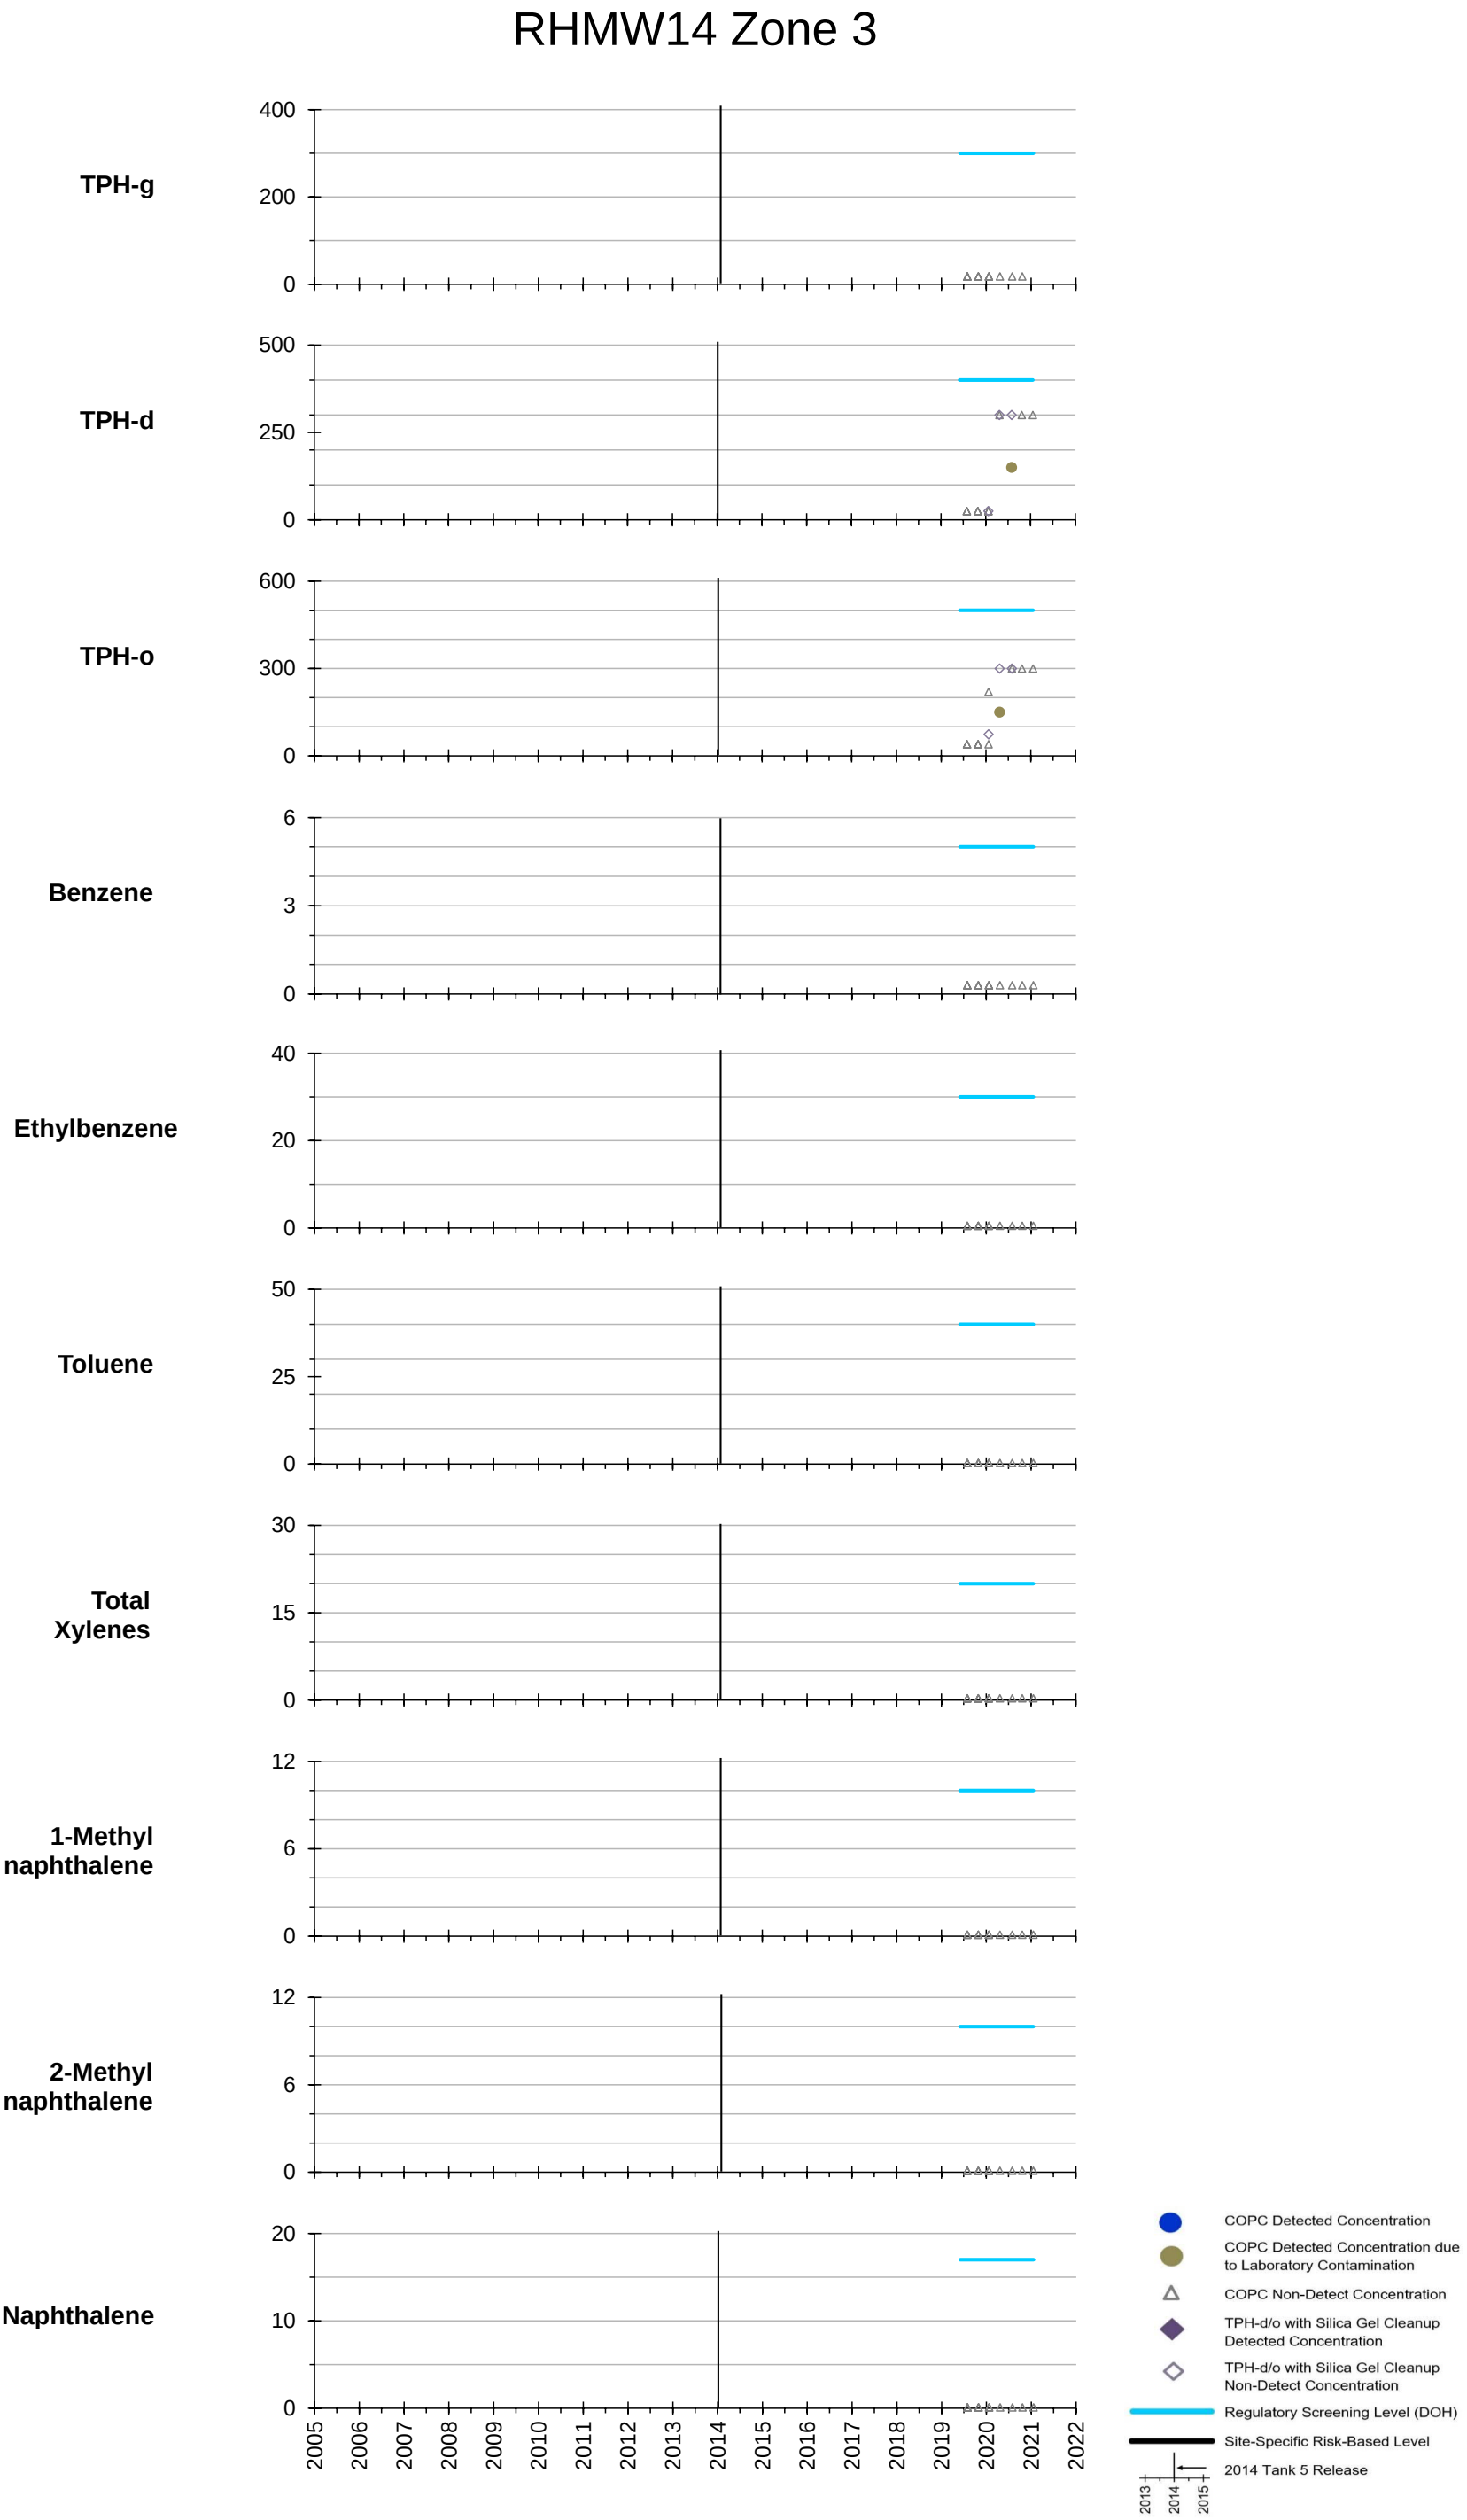
Appendix A.2 Groundwater Concentration Graphs



All results in micrograms per liter (µg/L or parts per billion).

Laboratory reporting limits for TPH-d and TPH-o were raised in March 2020 in accordance with the most current DoD QSM (2019), TNI Manual (2016), and 40 CFR Part 136 (Methods Update Rule 2017).

Appendix A.2 Groundwater Concentration Graphs



All results in micrograms per liter (µg/L or parts per billion).

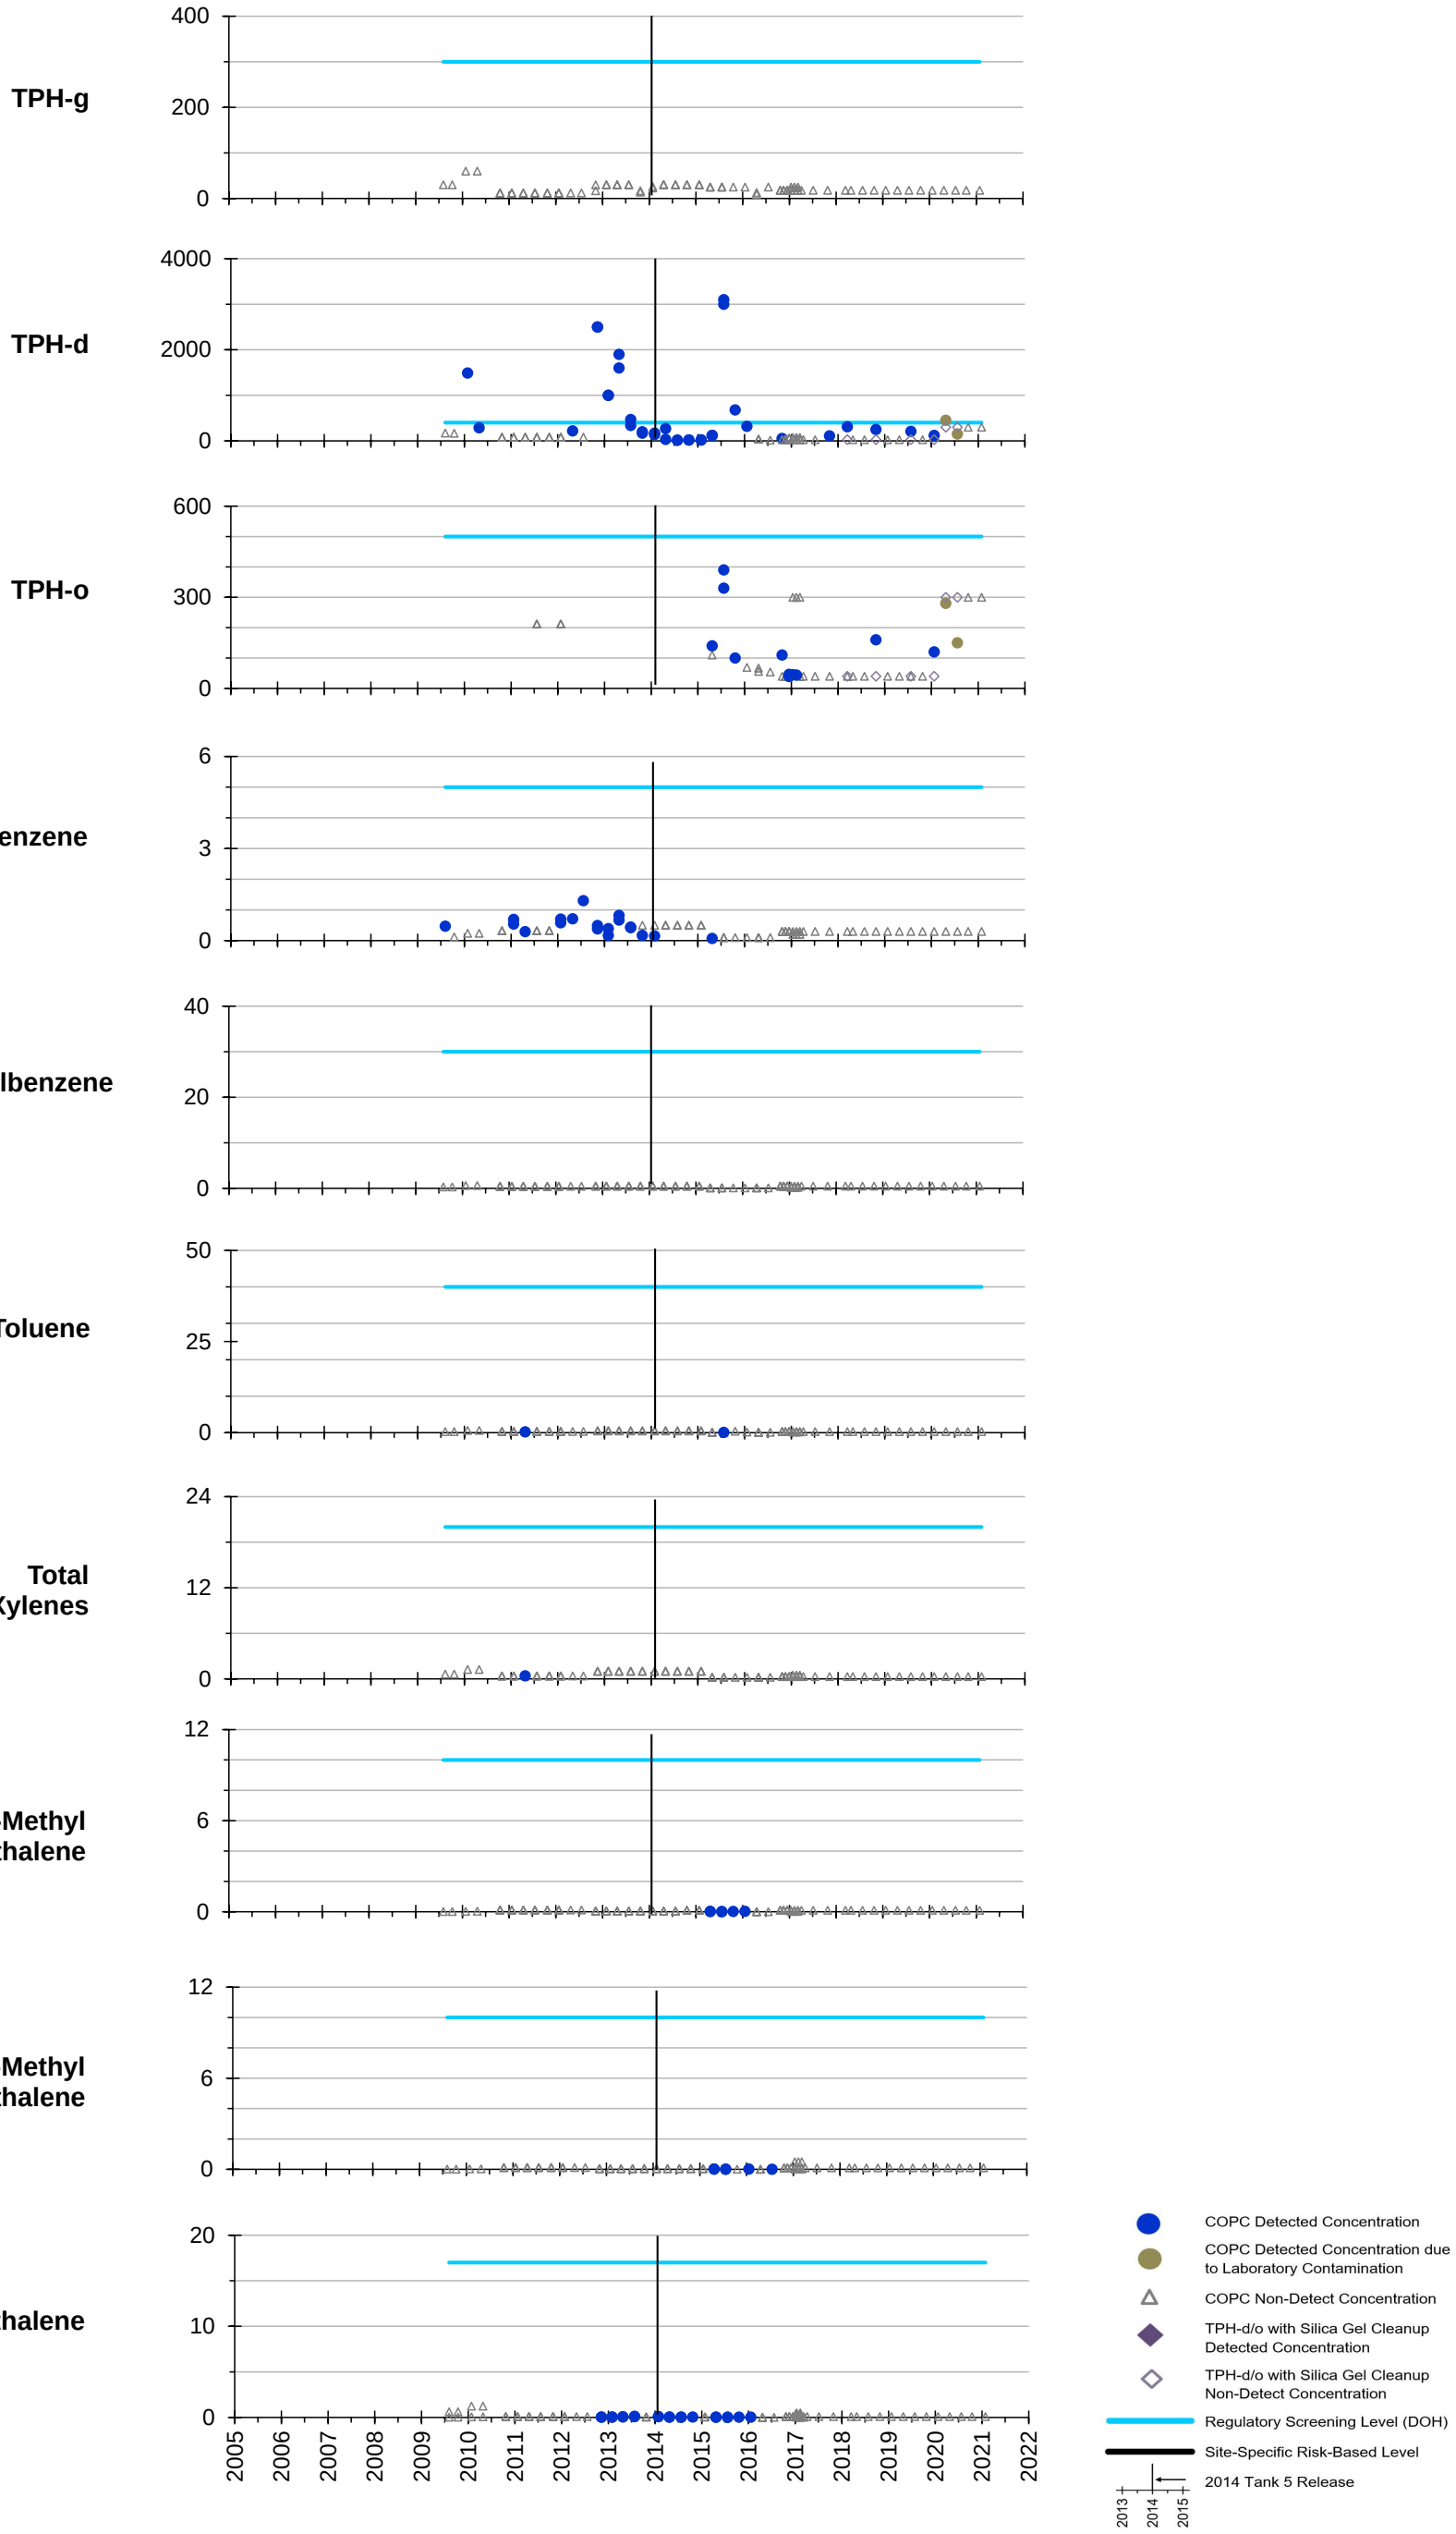
EPA Region 9 Laboratory split sampling data from First to Third Quarters 2017 included in the graphs.

Laboratory reporting limits for TPH-d and TPH-o were raised in March 2020 in accordance with the most current DoD QSM (2019), TNI Manual (2016), and 40 CFR Part 136 (Methods Update Rule 2017).

Appendix A.2 Groundwater Concentration Graphs

OWDFMW01



All results in micrograms per liter (µg/L or parts per billion).

EPA Region 9 Laboratory split sampling data from First to Third Quarters 2017 included in the graphs.

Laboratory reporting limits for TPH-d and TPH-o were raised in March 2020 in accordance with the most current DoD QSM (2019), TNI Manual (2016), and 40 CFR Part 136 (Methods Update Rule 2017).

Notes:

—	no data
btoc	below top of casing
ft	foot or feet
LTM	long-term monitoring
PVC	polyvinyl chloride

[a] Dates in month year format (e.g., Sep 2007) were obtained from oil/water interface reports, and exact dates were not available.

[b] The April 2009 measurements were pushed back a week (to 5/6/2009) due to the RHMW05 installation.

[c] The measurements have been corrected based on water level tape calibration and gyroscopic survey. See associated groundwater monitoring report.

Source:

Depth to groundwater values from recent oil/water interface reports and from the Appendix A Groundwater Tables GW-9, GW-10, GW-14, GW-15, and GW-17 through GW-24 in:
Department of the Navy. 2007. *Existing Data Summary and Evaluation Report for Groundwater Flow and Contaminant Fate and Transport Modeling, Red Hill Bulk Fuel Storage Facility, Joint Base Pearl Harbor-Hickam, O'ahu, Hawai'i; March 5, 2017 [Revision 00].* Prepared by AECOM Technical Services, Inc., Honolulu, HI. Prepared for Defense Logistics Agency Energy, Fort Belvoir, VA, under Naval Facilities Engineering Command, Hawaii, JBPHH HI.

Reference points for these depth to water measurements may have varied over time:

- Reference points for data prior to October 2016 are unknown.
- Reference points for RHMW01 to RHMW05, OWDFMW01, and HDMW2253-03 are the tops of permanent casings.
- Reference point for RHMW2254-01 was the top of the PVC casing for data prior to March 2018, and the high precision survey mark for data from March 2018 onwards.
- Reference points for RHMW06 to RHMW10 from October 2016 to July 2017 groundwater LTM events were the tops of the stand tubes (RHMW06 and RHMW07) and the tops of the slip rings (RHMW08, RHMW09, and RHMW10).
- Reference points for RHMW06 to RHMW10 from October 2017 groundwater LTM event onwards are the high precision survey mark on the tops of the gray plates.

Bold	Detected value
µg/L	micrograms per liter
mg/L	miligrams per liter
No.	number
ID	identification
—	No result
Result Qualifiers (Q)	
J	Estimated value
U	The compound was analyzed for but not detected above the stated limit
D	

[a] The results for RHMW11-07 that were collected in August 2019 and the results for RHMW14 from July-August 2019 were recollected in October 2019 after additional zone purging was performed.

Data Validatable Report

February 12, 2021

AECOM
1001 Bishop Street, Suite 1600
Honolulu, Hawaii 96813

Attn: Brooke Gottmeier

Title: Report of Data: Case 94808

Project: 60571032 CV18F0126 Red Hill Fuel Storage, HI

Contract #: Prime contract # for DoD: NAVY CLEAN N62742-17-F-1800, CV18F0126
Subcontract: 18S-22209-HI27

Dear Ms. Gottmeier:

Two water samples were received January 20, 2021. Written results for the requested analyses are being provided on this February 12, 2021.

Results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

If you have any questions or require further information, please contact your APPL Project Manager, Libby Cheeseborough, libby@applinc.com, at your convenience. Thank you for choosing APPL, Inc.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. These test results meet all requirements of NELAC and DoD QSM. Release of the hard copy has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

Loren Portwood, Laboratory Director

CASE NARRATIVE

Case Narrative

ARF: 94808

Project: 60571032 CV18F0126 Red Hill Fuel Storage. HI

Sample Receipt Information:

Two water samples were received January 20, 2021, at 3.0°C. The sample group was assigned Analytical Request Form (ARF) number 94808.

Sample Preparation and Analysis Information:

For the EPA 8015B analysis, the sample was extracted according to EPA method 3520C. The sample extracts were silica gel cleaned according to APPL's SOP CLN004 and placed on hold.

For the EPA 8270D Phenol analysis, the sample was extracted according to EPA method 3520C.

For the EPA 8270D SIM analysis, the sample was extracted according to EPA method 3520C.

For the APPL SOP ANA2MEE analysis, the sample was extracted according to EPA method 3535.

For the EPA 8260B analysis, the samples were purged according to EPA method 5030B.

For the RSK-175 analysis, the sample was allowed to equilibrate for 10 minutes at 40°C and a portion of the headspace was analyzed.

For the EPA 9060A, 300.0, 353.2, SM 2320B, and SM 3500FeB analyses, the sample was prepared according to the methods.

Only the portion of the injection log relative to these samples is included. A full sequence log is available upon request. Measurement uncertainty can be reported upon request.

Analytical Exceptions, Deviations and Abnormalities.

SOP ANA2MEE: One RPD exceeded the 20% control limit.

Abbreviations and Flags

FLAG	DESCRIPTION
#	Recovery or RPD outside control limits
*	Recovery or RPD outside control limits
B	Analyte detected in associated method blank
C1	Reason for correction: wrote incorrect response
C2	Reason for correction: calculated incorrectly
C3	Reason for correction: needs to be rechecked
C4	Reason for correction: data not usable
DO	Diluted out
E	Exceeds linear range
F	Estimated value
G1	Includes a wide range of hydrocarbons which does not match our gasoline standard
G10	Includes a match to hydrocarbon profiles within the range of mineral spirits
G11	Includes a match to hydrocarbon profiles within the range of JP-4
G12	Pattern does not match the gasoline standard; the carbon range for this sample is consistent with JP8
G13	Closely resembles the hydrocarbon profile of aviation gasoline
G14	Analyte concentration may be biased due to carry over
G2	Closely resembles the boiling point hydrocarbon profile consistent with weathered gasoline
G3	Includes higher boiling hydrocarbons
G4	Includes dominant peak(s) not indicative of petroleum hydrocarbons
G5	Is mainly dominant peak(s) not indicative of petroleum hydrocarbons
G6	Contains recognizable contaminant peak(s) which has been removed from quantitation
G7	Is mainly a match to hydrocarbons within the range of gasoline
G8	Closely resembles the boiling point hydrocarbon profile consistent with weathered gasoline
G9	Includes hydrocarbons within the range of kerosene
J	Estimated value
M	Matrix effect
MI1	Manual integration: integration does not follow baseline
MI2	Manual integration: non-target peak interference
MI3	Manual integration: to split a peak that was integrated as one peak by the computer
MI4	Manual integration: to integrate a split peak
MI5	Manual integration: the whole peak or part of the peak was not integrated
MI6	Manual integration: computer integrated wrong peak
MI7	Manual integration: other - explain
MDL	Method detection limit
ND	Not detected
NT	Non-target
Q	Acceptance criteria not met
T1 I	Includes wide range of hydrocarbons not indicative of diesel
T1 M	Is mainly wide range of hydrocarbons not necessarily indicative of diesel
T2 I	Includes lower boiling hydrocarbons, i.e. mineral spirits, kerosene, stoddard solvent, white gas
T2 M	Is mainly lower boiling hydrocarbons, i.e. mineral spirits, kerosene, stoddard solvent, white gas
T3 I	Includes higher boiling hydrocarbons, i.e. asphaltene, waster oil, motor oil, or weathered diesel fuel
T3 M	Is mainly higher boiling hydrocarbons, i.e. asphaltene, waster oil, motor oil, or weathered diesel fuel
T4 I	Includes dominant peak(s) not indicative of hydrocarbons
T4 M	Is mainly dominant peak(s) not indicative of hydrocarbons
T5	Contains recognizable contaminant peak(s) which has been removed from quantitation
T6	Is mainly a match to hydrocarbons within range of diesel fuel
T7	Closely resembles the boiling point hydrocarbon profile consistent with diesel fuel
T8	Includes a match to hydrocarbon profiles within range of diesel and kerosene fuel
T9 I	Includes non-diesel hydrocarbons within boiling point range of diesel fuel
T9 M	Is mainly non-diesel hydrocarbons within boiling point range of diesel fuel.
Y	Percent difference between primary and confirmation column > 40%

COOLER RECEIPT FORM **ARF: 94808**

1) Project: 60571032 CV18F0126 Red Hill Fuel Storage Date Received: 01/20/21

2) Coolers: Number of Coolers: 1

3) YES Were custody seals present and intact?
How many? 2 Name/Date on seal? SEE BELOW

4) YES Was there a shipping slip? Carrier name: FEDEX

5) Type of packing in cooler: X bubble wrap __ popcorn __ foam X plastic bags __ other
X wet ice __ dry ice __ no ice __ gel ice

6) YES Were cooler temperatures acceptable?

7) Serial number of calibrated thermometer used: R1 CF:+0.0°C

8) Cooler temp(s): In °C. Thermometer Temp / Corrected Temp
1: 3.0/3.0 2: _____ 3: _____ 4: _____ 5: _____ 6: _____
7: _____ 8: _____ 9: _____ 10: _____ 11: _____ 12: _____

Chain of custody:

9) YES Was a chain of custody received?

10) YES Were the custody papers complete/signed in the appropriate places?

Sample Labels:

11) YES Were all sample labels complete (sample ID, date/time of sampling, etc.)?

12) YES Did all container labels agree with custody papers?

Sample Containers:

13) YES Were all containers sealed in separate bags?

14) YES Did all containers arrive in good condition:(unbroken, no leakage, no cracked/broken lids)?

15) YES Were correct containers and preservatives used for the tests indicated?

16) YES Was a sufficient amount of sample sent for tests indicated?

17) NA Were bubbles present in volatile samples?
If yes, the following were received with air bubbles:
Larger than a pea: BA25433w04
Smaller than a pea: BA25433w02-03

Preservation Hold time:

18) No Was a sufficient amount of holding time remaining to analyze the samples?

19) Yes Was the pH taken of all non-VOA preserved samples and written on the sample container?

20) Yes Was the pH of acid preserved non-VOA samples < 2?

21) NA Was the pH of the "basic" preserved samples for Cyanide > 12, Sulfide >9, Hexchrom >9?

22) NO Were unpreserved VOA Vials received for VOA Dept analysis?

23) NA If "yes", are the unpreserved VOA vials noted in the ADD TEST FIELD on the ARF?
pH strip lot number: HC908519
Lab notified if pH was not adequate: _____

Notes/Deficiencies:
ferrous iron arrived out of hold time

Corrective Action

CA Tracking No.: 496

Section I : Initiation of Corrective Action Request (CAR)

Date of occurrence: 01/27/21

CAR initiated by: Paula McCartney

Description of problem:

The analyst for EPA method 3500FeB, Ferrous Iron, inadvertently overwrote the raw data for SDG's 94807 AECOM CTO19F0135 and 94808 AECOM Red Hill.

Section II : Root Cause Analysis: (Investigate the problem)

It is unknown if the analyst was aware the raw data had been overwritten. The analyst did not follow the protocol outlined in section 12.0 Procedure, SOP # ANA3500FeBc, rev. 6 09/11/20 which states "Open the Ferrous Iron spectrometer sheet template located in I:\TEMPLATES. Rename and save the file under your QCG (Quality Control Group identification) date and method in I:\Spec Sheets\Ferrous Iron (Fe2). For instance: 110409A-3500FeBc. This is where the results, that are read from the spectrometer, will be entered."

Due to this incident and additional oversights, the analyst was terminated from employment. The report for 94807 was signed off by the analyst and reviewed by the supervisor. See the attached multilevel review forms. At this time it was observed by the reviewer for 94807 that the raw data was missing. We immediately attempted to retrieve the information from the backup server but too much time had elapsed and the file could not be found. The samples were reanalyzed outside of holding time and both sets of results were included in the report. The client was notified.

It was unknown at the time that 94808 had also been grouped in this batch since the analyst was not available to inquire as to what other samples had been analyzed together with 94807. For SDG 94808 the report was assembled by the supervisor and reviewed by another employee. Neither one made note of the missing raw data. It was brought to our attention by Stella Cuenco at LDC. The only available pieces of raw data were sent to LDC and the client.

Section III: Corrective Action Plan (CAP):

The employee who made the initial error was dismissed from employment. The supervisor and the reviewer of the SDG 97808 were retrained to properly review the data as noted by the signatures below.

Section IV : Assessment of CA (Monitoring of Corrective actions)

Was the CA implemented effective?:

Yes, the data reviewer and the supervisor were retrained and a copy of this corrective action has been placed in their training files.

Section V : Closure of CA (To be completed by QAU and responsible Manager)

Are additional audits needed?:

A notation was made in the QA calendar to verify that the replacement analyst for ferrous iron is properly trained as per SOP# ANA3500FeBc.

Does CAR require client notification?:

Yes. A copy of this corrective action was sent to the client.

This CAR is valid, complete and does not require any further action.

Data Validatable Report

February 17, 2021

AECOM
1001 Bishop Street, Suite 1600
Honolulu, Hawaii 96813

Attn: Brooke Gottmeier

Title: Report of Data: Case 94825

Project: 60571032 CV18F0126 Red Hill Fuel Storage, HI

Contract #: Prime contract # for DoD: NAVY CLEAN N62742-17-F-1800, CV18F0126
Subcontract: 18S-22209-HI27

Dear Ms. Gottmeier:

Two water samples were received January 21, 2021. Written results for the requested analyses are being provided on this February 17, 2021.

Results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

If you have any questions or require further information, please contact your APPL Project Manager, Libby Cheeseborough, libby@applinc.com, at your convenience. Thank you for choosing APPL, Inc.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. These test results meet all requirements of NELAC and DoD QSM. Release of the hard copy has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

Loren Portwood, Laboratory Director

CASE NARRATIVE

Case Narrative

ARF: 94825

Project: 60571032 CV18F0126 Red Hill Fuel Storage. HI

Sample Receipt Information:

Two water samples were received January 21, 2021 at 1.1°C and 4.0°C. The sample group was assigned Analytical Request Form (ARF) number 94825.

Sample Preparation and Analysis Information:

For the EPA 8015B analysis, the sample was extracted according to EPA method 3520C. The sample extracts were silica gel cleaned according to APPL's SOP CLN004 and placed on hold.

For the EPA 8270D Phenol analysis, the sample was extracted according to EPA method 3520C.

For the EPA 8270D SIM analysis, the sample was extracted according to EPA method 3520C.

For the APPL SOP ANA2MEE analysis, the sample was extracted according to EPA method 3535.

For the EPA 8260B analysis, the samples were purged according to EPA method 5030B.

For the RSK-175 analysis, the sample was allowed to equilibrate for 10 minutes at 40°C and a portion of the headspace was analyzed.

For the EPA 9060A, 300.0, 353.2, SM 2320B, and SM 3500FeB analyses, the sample was prepared according to the methods.

Only the portion of the injection log relative to these samples is included. A full sequence log is available upon request. Measurement uncertainty can be reported upon request.

Analytical Exceptions, Deviations and Abnormalities.

SOP ANA2MEE: The RPD exceeded the 20% control limit.

Abbreviations and Flags

FLAG	DESCRIPTION
#	Recovery or RPD outside control limits
*	Recovery or RPD outside control limits
B	Analyte detected in associated method blank
C1	Reason for correction: wrote incorrect response
C2	Reason for correction: calculated incorrectly
C3	Reason for correction: needs to be rechecked
C4	Reason for correction: data not usable
DO	Diluted out
E	Exceeds linear range
F	Estimated value
G1	Includes a wide range of hydrocarbons which does not match our gasoline standard
G10	Includes a match to hydrocarbon profiles within the range of mineral spirits
G11	Includes a match to hydrocarbon profiles within the range of JP-4
G12	Pattern does not match the gasoline standard; the carbon range for this sample is consistent with JP8
G13	Closely resembles the hydrocarbon profile of aviation gasoline
G14	Analyte concentration may be biased due to carry over
G2	Closely resembles the boiling point hydrocarbon profile consistent with weathered gasoline
G3	Includes higher boiling hydrocarbons
G4	Includes dominant peak(s) not indicative of petroleum hydrocarbons
G5	Is mainly dominant peak(s) not indicative of petroleum hydrocarbons
G6	Contains recognizable contaminant peak(s) which has been removed from quantitation
G7	Is mainly a match to hydrocarbons within the range of gasoline
G8	Closely resembles the boiling point hydrocarbon profile consistent with weathered gasoline
G9	Includes hydrocarbons within the range of kerosene
J	Estimated value
M	Matrix effect
MI1	Manual integration: integration does not follow baseline
MI2	Manual integration: non-target peak interference
MI3	Manual integration: to split a peak that was integrated as one peak by the computer
MI4	Manual integration: to integrate a split peak
MI5	Manual integration: the whole peak or part of the peak was not integrated
MI6	Manual integration: computer integrated wrong peak
MI7	Manual integration: other - explain
MDL	Method detection limit
ND	Not detected
NT	Non-target
Q	Acceptance criteria not met
T1 I	Includes wide range of hydrocarbons not indicative of diesel
T1 M	Is mainly wide range of hydrocarbons not necessarily indicative of diesel
T2 I	Includes lower boiling hydrocarbons, i.e. mineral spirits, kerosene, stoddard solvent, white gas
T2 M	Is mainly lower boiling hydrocarbons, i.e. mineral spirits, kerosene, stoddard solvent, white gas
T3 I	Includes higher boiling hydrocarbons, i.e. asphaltene, waster oil, motor oil, or weathered diesel fuel
T3 M	Is mainly higher boiling hydrocarbons, i.e. asphaltene, waster oil, motor oil, or weathered diesel fuel
T4 I	Includes dominant peak(s) not indicative of hydrocarbons
T4 M	Is mainly dominant peak(s) not indicative of hydrocarbons
T5	Contains recognizable contaminant peak(s) which has been removed from quantitation
T6	Is mainly a match to hydrocarbons within range of diesel fuel
T7	Closely resembles the boiling point hydrocarbon profile consistent with diesel fuel
T8	Includes a match to hydrocarbon profiles within range of diesel and kerosene fuel
T9 I	Includes non-diesel hydrocarbons within boiling point range of diesel fuel
T9 M	Is mainly non-diesel hydrocarbons within boiling point range of diesel fuel.
Y	Percent difference between primary and confirmation column > 40%

COOLER RECEIPT FORM **ARF: 94825**

1) Project: 60571032 CV18F0126 Red Hill Fuel Storage Date Received: 01/21/21

2) Coolers: Number of Coolers: 2

3) YES Were custody seals present and intact?
How many? 4 Name/Date on seal? SEE BELOW

4) YES Was there a shipping slip? Carrier name: FEDEX

5) Type of packing in cooler: X bubble wrap __ popcorn __ foam X plastic bags __ other
X wet ice __ dry ice __ no ice __ gel ice

6) YES Were cooler temperatures acceptable?

7) Serial number of calibrated thermometer used: IRB CF:-1.9°C/R1 CF:+0.0°C

8) Cooler temp(s): In °C. Thermometer Temp / Corrected Temp
1: 3.0/1.1 2: 4.0/4.0 3: ____ 4: ____ 5: ____ 6: ____
7: ____ 8: ____ 9: ____ 10: ____ 11: ____ 12: ____

Chain of custody:

9) YES Was a chain of custody received?

10) YES Were the custody papers complete/signed in the appropriate places?

Sample Labels:

11) YES Were all sample labels complete (sample ID, date/time of sampling, etc.)?

12) YES Did all container labels agree with custody papers?

Sample Containers:

13) YES Were all containers sealed in separate bags?

14) YES Did all containers arrive in good condition:(unbroken, no leakage, no cracked/broken lids)?

15) YES Were correct containers and preservatives used for the tests indicated?

16) YES Was a sufficient amount of sample sent for tests indicated?

17) Yes Were bubbles present in volatile samples?
If yes, the following were received with air bubbles:
Larger than a pea: ____
Smaller than a pea: BA25525w02-04

Preservation Hold time:

18) No Was a sufficient amount of holding time remaining to analyze the samples?

19) Yes Was the pH taken of all non-VOA preserved samples and written on the sample container?

20) Yes Was the pH of acid preserved non-VOA samples < 2?

21) NA Was the pH of the "basic" preserved samples for Cyanide > 12, Sulfide >9, Hexchrom >9?

22) NO Were unpreserved VOA Vials received for VOA Dept analysis?

23) NA If "yes", are the unpreserved VOA vials noted in the ADD TEST FIELD on the ARF?
pH strip lot number: HC908519
Lab notified if pH was not adequate: ____

Notes/Deficiencies:
Ferrous iron received out of hold time. Nitrate received out of hold time.
