Section One: Collecting and Labeling Specimens

Required Specimens

Unless otherwise directed, collect the following specimens from each person who may have been exposed:

Whole blood

1. Collect blood specimens from adults only unless you receive specific instruction from CDC to collect blood from pediatric patients.
2. Collect a minimum of 12 mL of blood.
3. Use 3-4 mL or larger vacuum-fill only (unopened), non-gel, purple-top (EDTA) tubes; use four tubes if using 3-mL tubes.
4. Using indelible ink, mark each purple-top tube of blood in the order collected (e.g., 1, 2, 3, 4 [if using 3-mL tubes]).
5. In addition, collect another specimen using one 3-mL or larger, vacuum-fill only (unopened), non-gel, green- or gray-top tube. Allow the tube to fill to its stated capacity.

Urine

1. Collect at least 40-60 mL from potentially exposed adults and children.
2. Use a screw-cap plastic container; do not overfill.
3. Freeze specimen as soon as possible (–70 °C or dry ice preferred).
4. If other than “clean catch”, note method of collection on the specimen cup (e.g., obtained by catheterization).

Labeling Specimens

1. In addition to unique patient identifiers (e.g., medical records number, specimen identification number) labels should convey the collector’s initials, date and time of collection so that law enforcement officials may trace the specimen to the collector should investigations lead to legal action and the collector has to testify that he or she collected the specimen.
2. If you use bar-coded labels, place the labels on blood tubes and urine cups so that when these containers are upright, the bar code looks like a ladder.
3. In addition, collect another specimen using one 3-mL or larger, vacuum-fill only (unopened), non-gel, green- or gray-top tube. Allow the tube to fill to its stated capacity.

Blanks

For each lot number of tubes and urine cups used for collection, provide the following to be used as blanks for measuring background contamination:

1. Two (2) empty, unopened purple-top tubes.
2. Two (2) empty, unopened green- or gray-top tubes.
3. Two (2) empty, unopened urine cups.

Secondary Packaging for Blood Tubes

- To facilitate processing, package all blood tubes from the same patient together.
- Place absorbent material between the blood tubes and the first layer of secondary packaging. Use adequate absorbent material to absorb the entire contents of the blood tubes.
- Separate each tube of blood collected from other tubes to prevent tube-to-tube contact. The first layer of secondary packaging must be secured with one continuous strip of evidence tape and initialed half on the tape and half on the first layer of secondary packaging by the person making the seal. For example, one of the ways to do this is to:
  - Pack blood tubes in a gridded box lined with absorbent material. Seal the top half of the box to the bottom half with one continuous piece of evidence tape and write your initials half on the tape and half on the box.
  - Wrap and seal the first layer of secondary packaging (e.g., gridded box) with absorbent material.
  - Seal one wrapped gridded box or alternative container inside a clear see-through plastic bag with evidence tape.

Section Two: Packaging Specimens

Packaging consists of the following components: primary receptacles (blood tubes or urine cups), secondary packaging (materials used to protect primary receptacles), and outer packaging (polyethylene foam-insulated, corrugated fiberboard shipper).

Secondary Packaging for Blood Tubes

- Use polystyrene foam-insulated, corrugated fiberboard shipper (may be available from your transfusion service or send-outs department).
- For cushioning, place additional absorbent material in the bottom of the shipper.
- Add a single layer of refrigerator packs on top of absorbent material.
- Place the packaged specimens on top of the refrigerator packs.
- Use additional cushioning material to minimize shifting while the shipper is in transit.
- Place additional refrigerator packs on top of the secondary packaging to maintain a shipping temperature of 1 °C – 10 °C for the duration of transit.
- Place blood shipping manifest in a sealable plastic bag and put on top of packs inside the shipper. Place lid on the shipper.
- Keep chain-of-custody documents for your files.
- Place your return address in the upper left-hand corner of the shipper top and put CDC’s receiving address in center.
- Affix labels and markings adjacent to the shipper’s consignor’s address that appears on the shipper.
- Place the UN 3373 label and the words “Biological Substance, Category B” adjacent to the label on the front of the shipper.

Secondary Packaging for Urine Cups

- Separate each urine cup from other urine cups to prevent contact between urine cups. The first layer of secondary packaging must be secured with one continuous strip of evidence tape and initialed half on the tape and half on the first layer of secondary packaging by the person making the seal. For example, one of the ways to do this is to:
  - Pack urine cups in a gridded box lined with absorbent material. Seal the top half of the box to the bottom half with one continuous piece of evidence tape and write your initials half on the tape and half on the box.
- Place urine cups, boxed and secured properly with evidence tape, in the next layer of secondary packaging. An example of acceptable material is the Saf-T-Pak Disposable 2-Part Pressure Vessel system or its equivalent.
- Secondary packaging must have its closure secured with a single strip of evidence tape initialed half on the packaging and half on the evidence tape by the person making the seal.

Outer Packaging for Urine Cups

- Use polystyrene foam-insulated, corrugated fiberboard shipper (may be available from your transfusion service or send-outs department).
- For cushioning, place additional absorbent material in the bottom of the shipper.
- Place a layer of dry ice on top of the absorbent material. Do not use flakes or large chunks of dry ice for shipment because large chunks have the potential for shattering urine cups during transport.
- Ensure that specimens will remain frozen or will freeze during transport.
- Place packaged urine cups in the shipper.
- Use additional absorbent or cushioning material between wrapped urine cups to minimize shifting while shipper is in transit.
- Place an additional layer of dry ice on top of samples.
- Place the urine shipping manifest in a sealable plastic bag and put on top of dry ice inside the shipper. Place lid on the shipper.
- Place packaged urine cups in the shipper.
- Use additional absorbent or cushioning material between wrapped urine cups to minimize shifting while shipper is in transit.
- Place an additional layer of dry ice on top of samples.
- Place the urine shipping manifest in a sealable plastic bag and put on top of dry ice inside the shipper. Place lid on the shipper.
- Keep chain-of-custody documents for your files.
- Place your return address in the upper left-hand corner of the shipper top and put CDC’s receiving address in center.
- Place the UN 3373 label and the words “Biological Substance, Category B” adjacent to the label on the front of the shipper.
- Place a Class 9/UN 1845 hazard label on the same side of the shipper as the UN 3373 marking.
- If the proper shipping name, (either dry ice or carbon dioxide, solid) and Class 9/UN 1845 is not preprinted on the hazard label, add it in an area adjacent to the label.
Section Three: Shipping Specimens

Follow the guidance provided in your state’s chemical-terrorism comprehensive response plan. If you are directed to ship the specimens to CDC, please ship the specimens to the following address:

Centers for Disease Control and Prevention
Attn: Charity Sapp
4770 Buford Hwy.
Building 110 Loading Dock
Atlanta, GA 30341
(770) 488-0343

Preparing Documentation

1. Since blood tubes and urine cups cannot be shipped together in the same package, prepare a separate shipping manifest for each.

2. Note on shipping manifest if urine sample is collected by means other than clean catch (e.g., catheterization).

3. Place each shipping manifest (with specimen identification numbers) in a plastic zippered bag on top of the specimens before closing the lid of the polystyrene foam-insulated, corrugated fiberboard shipper.

4. Do not transport chain-of-custody forms with specimens. Each entity or organization handling the specimens is responsible for the specimens only during the time that it has control of the specimens.

5. Each entity or organization receiving the specimens must sign-off on the chain-of-custody form of the entity or organization relinquishing the specimens to close that chain. Electronic procedures such as electronic chain-of-custody and barcode readers will expedite this process.

6. When receiving specimens, each new entity or organization must begin its own chain of custody. The entity or organization relinquishing the specimens must sign its chain of custody to close the chain and indicate that they have transferred the specimens.

Note: When the person relinquishing the specimens (relinquisher) and the person receiving the specimens (receiver) are not together at the time of specimen transfer, the relinquisher must document on its chain-of-custody form that the receiver is the express courier (e.g., FedEx, Delta Dash, DHL, UPS) and must document the shipment tracking number or have the person transporting the specimens sign the chain-of-custody to indicate that he or she has taken control of the specimens. Likewise, when receivers get the specimens, they will document on their chain-of-custody form that the relinquisher is the express courier (and provide the tracking number) or have the person transporting the specimens sign the chain-of-custody form.

Questions

For questions concerning these instructions, please contact:

Centers for Disease Control and Prevention
