EXECUTIVE SUMMARY

This groundwater monitoring report presents the results of the First Quarter 2020 groundwater monitoring event conducted during January 20–30, 2020, at the Red Hill Bulk Fuel Storage Facility (Facility), Joint Base Pearl Harbor-Hickam, Hawai‘i. The Facility is located in the south-central portion of the island of O‘ahu. The Facility contains 18 active and 2 inactive underground fuel storage tanks. The State of Hawai‘i Department of Health (DOH) Facility identification number is 9-102271. The DOH Release identification numbers are 990051, 010011, 020028, and 140010.

The groundwater sampling was conducted as part of the Red Hill groundwater long-term monitoring (LTM) program pursuant to the *Groundwater Protection Plan* (DON 2014) and performed under the Comprehensive Long-Term Environmental Action Navy V contract task order 18F0126. Data collected for this groundwater monitoring event also support Sections 6 and 7 of the *Administrative Order on Consent* [AOC] *in the Matter of Red Hill Bulk Fuel Storage Facility, EPA Docket No: RCRA 7003-R9-2015-01 and DOH Docket No: 15-UST-EA-01*, Attachment A, Statement of Work (EPA Region 9 and DOH 2015). The purpose of the sampling is to assess the condition of groundwater beneath the Facility and to ensure that the United States Department of the Navy (Navy) remains in compliance with DOH Underground Storage Tank release response requirements as described in Hawai‘i Administrative Rules Chapter 11-280.1, Subchapter 6, Release Response Action. The sampling was conducted in accordance with the Naval Facilities Engineering Command, Pacific Environmental Restoration Program *Project Procedures Manual* (DON 2015b), the DOH *Technical Guidance Manual for the Implementation of the Hawaii State Contingency Plan* (DOH 2018), and the AOC Statement of Work Sections 6 and 7 *Work Plan/Scope of Work* (DON 2017a). A *Sampling and Analysis Plan* and addenda (DON 2017b; 2017c; 2017d; 2018e) were also prepared for AOC Statement of Work Sections 6 and 7 that contain updated information for the groundwater sampling.

During the First Quarter 2020 groundwater monitoring event, AECOM Technical Services, Inc. personnel collected groundwater samples from 20 monitoring locations within the Red Hill groundwater monitoring network. These include: the sampling point at Red Hill Shaft (RHMW2254-01); 11 single-screen monitoring wells located within the Facility boundary (RHMW01 through RHMW10 and OWDFMW01); one deep monitor well located outside of the Facility at the Hālawa Correctional Facility (Hālawa Deep Monitor Well [HDMW2253-03]); four sampling zones at two multilevel monitoring wells (RHMW11 and RHMW14) located at the Hālawa Correctional Facility; and three sampling zones at one multilevel monitoring well (RHMW15) located within the Facility boundary. Of the multilevel monitoring well zones listed above, the following multilevel monitoring well zones were sampled during this event: RHMW11 Zone 5, RHMW14 Zones 1 to 3, and RHMW15 Zones 3 to 5. The following multilevel monitoring zones were not sampled in this sampling event: RHMW11 Zones 1 to 4 and RHMW15 Zones 1 to 2 due to lack of detections of chemicals of potential concern (COPCs) in previous monitoring events, and RHMW11 Zones 6 to 8 and RHMW14 Zones 4 to 8 due to the low hydraulic conductivity of the aquifer in these zones.

Primary and field duplicate samples were collected from sampling point RHMW2254-01, monitoring well RHMW02, and multilevel monitoring well RHMW14 Zone 3 (RHMW14-03). Analytical results from the sampling event were compared to the current LTM screening criteria. The LTM screening criteria were agreed upon by the AOC Parties and were presented in the February 4, 2016, AOC Statement of Work Sections 6 and 7 scoping completion letter (EPA Region 9 and DOH 2016). The LTM screening criteria were updated (as applicable) with the most current (Fall 2017) DOH Tier 1 groundwater environmental action levels for sites where groundwater is a potential or current drinking water resource and the nearest surface water body is greater than 150 meters from the release site (DOH 2017).

The analytical results for groundwater samples collected from RHMW01, RHMW02, and RHMW03 were also compared to the Site-Specific Risk-Based Levels (SSRBLs) for total petroleum hydrocarbons (TPH)-diesel range organics (TPH-d) (4,500 micrograms per liter [µg/L]) and benzene

(750 µg/L). The use of these screening SSRBLs was described in the Red Hill *Groundwater Protection Plan* (DON 2014) and later presented in the February 4, 2016, AOC Statement of Work Sections 6 and 7 scoping completion letter (EPA Region 9 and DOH 2016).

No detectable amounts of free product, sheen, or color were present in groundwater from any monitoring well. During the First Quarter (January) 2020 event, COPCs were detected at RHMW2254–01, RHMW01, RHMW02, RHMW03, RHMW04, RHMW05, RHMW07, RHMW09, and OWDFMW01, and no SSRBL exceedances were reported; no COPCs were detected in any other monitoring well or zone sampled during this event. Analytical results for the groundwater monitoring event are summarized as follows:

- *RHMW06, RHMW08, RHMW10, RHMW11-05, RHMW14-01, RHMW14-02, RHMW14-03 (primary and duplicate), RHMW15-03, RHMW15-04, RHMW15-05, and HDMW2253-03:* No COPCs were detected.
- *RHMW2254-01 (primary and duplicate):* TPH-d (100 and < 25 U µg/L) was detected at a concentration below the screening criterion (400 µg/L) in the primary sample but was not detected in the duplicate sample. However, the chromatogram displayed a chemical signature not indicative of hydrocarbons related to petroleum products used at the Facility. Evaluation of the sample, field quality control (QC), and laboratory QC chromatograms showed similar chromatographic signatures present in the groundwater samples, field QC samples, and laboratory method blanks, indicating laboratory artifacts contribution. The TPH-d with silica gel cleanup (SGC) analysis result was non-detect, suggesting that the non-SGC TPH-d result consists entirely of non-petroleum hydrocarbons.
- *RHMW01:* TPH-d (180 J µg/L) was detected at a concentration below the screening criterion (400 µg/L). The TPH-d with SGC analysis result was 39 J µg/L, suggesting that the non-SGC TPH-d result was mostly biodegradation by-products.
- *RHMW02 (primary and duplicate):* TPH-d (1,500 J and 1,700 µg/L), 1-methylnaphthalene (23 and 24 µg/L), 2-methylnaphthalene (23 and 23 µg/L), and naphthalene (52 and 57 µg/L) were detected at concentrations exceeding the respective screening criteria (400, 10, 10, and 17 µg/L). TPH-d was also detected in the SGC analysis, but at significantly lower concentrations (280 and 360 µg/L), suggesting that the majority of the non-SGC TPH-d results were biodegradation by-products. The concentrations of TPH-d did not exceed the SSRBL of 4,500 µg/L. TPH-gasoline range organics (58 and 49 µg/L) was detected at concentrations below the screening criterion (300 µg/L). No other COPCs were detected.
- *RHMW03:* TPH-d (260 µg/L) and TPH-o (250 µg/L) were detected at concentrations below the respective screening criteria (400 and 500 µg/L). The TPH-d and TPH-o with SGC analysis results were non-detect, suggesting that the non-SGC TPH-d result consists entirely of biodegradation by-products.
- *RHMW04, RHMW05, RHMW07, RHMW09, and OWDFMW01:* TPH-d and/or TPH-o were detected below their respective screening criteria (400 and 500 µg/L) in RHMW04 (120 and < 40 U µg/L), RHMW05 (93 and 92 µg/L), RHMW07 (120 and 84 µg/L), RHMW09 (100 and 98 µg/L), and OWDFMW01 (120 and 120 µg/L). Evaluation of the sample, field QC, and laboratory QC chromatograms indicated laboratory artifacts contribution. TPH-d and TPH-o with SGC analysis results were non-detect except for TPH-o with SGC in RHMW07 (39 J µg/L). These results suggest that the non-SGC TPH-d and TPH-o results consisted of non-petroleum hydrocarbons.

Analytical results of natural attenuation parameters (NAPs) suggest that biodegradation is occurring in the vicinity of RHMW02 based on depleted dissolved oxygen (DO), depleted nitrate and sulfate concentrations, and elevated dissolved methane concentrations. Concentrations of SGC TPH-d and polynuclear aromatic hydrocarbons (PAHs) also suggest that biodegradation is occurring at RHMW02. The depleted DO, dissolved methane, depleted nitrate, and reduced sulfate concentrations at RHMW01 and the depleted DO at RHMW03 indicate that biodegradation is likely occurring at these locations. Evaluation of COPC results and NAP concentrations at all other monitoring locations does not indicate biodegradation.

1. Introduction

This groundwater monitoring report presents the results of the First Quarter 2020 groundwater monitoring event conducted during January 20–30, 2020, at the Red Hill Bulk Fuel Storage Facility (Facility), Joint Base Pearl Harbor-Hickam (JBPHH), O‘ahu, Hawai‘i (Figure 1). In accordance with the *Groundwater Protection Plan* (DON 2014), the purpose of the sampling is to (1) assess the condition of groundwater beneath the Facility with respect to chemical constituents associated with Jet Fuel Propellant and Marine Diesel Fuel (F-76), and (2) ensure that the United States (U.S.) Department of the Navy (Navy) remains in compliance with the State of Hawai‘i Department of Health (DOH) Underground Storage Tank release response requirements codified in Hawai‘i Administrative Rules Chapter 11-280.1, Subchapter 6, Release Response Action. The DOH Facility identification number (no.) for the Facility is 9-102271. The DOH Release identification nos. are 990051, 010011, 020028, and 140010.

The groundwater sampling was conducted under Naval Facilities Engineering Command (NAVFAC) Pacific Contract No. N62742-17-D-1800 as part of the long-term groundwater and soil vapor monitoring program at the Facility for Naval Supply Systems Command Fleet Logistics Center Pearl Harbor. Soil vapor monitoring at Red Hill is being conducted under another contract and reported separately. The groundwater sampling was conducted in accordance with the NAVFAC Pacific Environmental Restoration Program, *Project Procedures Manual* (DON 2015b); the DOH *Technical Guidance Manual for the Implementation of the Hawaii State Contingency Plan* (TGM) (DOH 2018); and the Administrative Order on Consent (AOC) Statement of Work Sections 6 and 7, *Work Plan/Scope of Work* (WP/SOW) (DON 2017a). A Sampling and Analysis Plan (SAP) and addenda (DON 2017b; 2017c; 2017d; 2018e) containing updated information for the groundwater sampling were also prepared for AOC Statement of Work Sections 6 and 7 (EPA Region 9 and DOH 2015).

This report presents the results for sampling activities conducted at groundwater monitoring locations both within and outside of the Facility boundaries. Cumulative historical monitoring results for the Red Hill groundwater monitoring network are presented in tables and charts in Appendix A. Field activity and analytical documentation for the monitoring event are presented in Appendix B and Appendix C, respectively.

1.1 Site Description

The Facility is located on Federal Government land (on land zoned by the City and County of Honolulu as a mix of F-1 Federal and Military and P-1 Restricted Preservation districts) in south-central O‘ahu, approximately 2.5 miles northeast of Pearl Harbor (Figure 1). It is located on a low ridge on the western edge of the Ko‘olau Mountain Range that divides Hālawa Valley and Moanalua Valley. The Facility occupies 144 acres of land, and the majority of the ground surface of the site lies at an elevation of approximately 200–500 feet above mean sea level. Proximate to the Facility lie Hālawa Industrial Park and Hālawa Correctional Facility to the north, preservation land to the northeast, residential neighborhoods in Moanalua Valley to the southeast, and additional residential neighborhoods and the U.S. Coast Guard reservation to the southwest. A quarry is located less than one-quarter mile to the northwest.

The Facility contains 18 active and 2 inactive underground fuel storage tanks that are operated by Naval Supply Systems Command Fleet Logistics Center Pearl Harbor. Each tank has a capacity of approximately 12.5 million gallons. The bottoms of the Facility’s tanks are located approximately 100 feet above the basal aquifer. The fuel storage tanks currently contain Jet Fuel Propellant No. 5 (JP-5), North Atlantic Treaty Organization-grade F-24 jet fuel, and F-76. The current status of each tank is summarized in Table 1-1.

Table 1-1: Current Status of the Facility's Fuel Storage Tanks as of December 2019

Tank ID	Fuel Type	Status [a]	Capacity (million gallons) [b]
F-1	Empty	Inactive	12.5
F-2	F-24	Active	12.5
F-3	F-24	Active	12.5
F-4	F-24	Active	12.5
F-5	Empty	Active	12.5
F-6	F-24	Active	12.5
F-7	JP-5	Active	12.5
F-8	JP-5	Active	12.5
F-9	JP-5	Active	12.5
F-10	JP-5	Active	12.5
F-11	JP-5	Active	12.5
F-12	JP-5	Active	12.5
F-13	Empty	Active	12.5

F-18	JP-5	Active	12.5
F-19	Empty	Inactive	12.5
F-20	JP-5	Active	12.5

F-24 North Atlantic Treaty Organization-grade F-24 jet fuel
ID identification
[a] Active status indicates that a tank is currently available for use but does not necessarily indicate that the tank is currently filled. Inactive status indicates that a tank is currently not available for use.
[b] Tank capacity in this table is approximate and is not necessarily the tank-rated capacity or maximum allowable fill volume.

One sampling point at Red Hill Shaft (RHMW2254-01), 11 single-screen monitoring wells (RHMW01 to RHMW10 and OWDFMW01), and one multilevel monitoring well (RHMW15) are located within the Facility boundary. One single-screen monitoring well (HDMW2253-03) and two multilevel monitoring wells (RHMW11 and RHMW14) are located outside the Facility boundary.

Of the non-multilevel monitoring locations, RHMW01 to RHMW10 and OWDFMW01 are conventional monitoring wells with single screens typically installed across or near the water table. Sampling point RHMW2254-01 is located inside the shaft of Navy Supply Well 2254-01. HDMW2253-03 is a deep monitor well installed by the State of Hawai'i Department of Land and Natural Resources at the Hālawa Correctional Facility and has a solid casing installed to approximately 50 feet below the water table.

RHMW11, RHMW14, and RHMW15 are multilevel monitoring wells that are screened at the water table and at other depths above and below the water table. RHMW11 has eight monitoring zones: one monitoring zone (Zone 8) near the groundwater table, two zones (Zones 6 and 7) below the groundwater table with sampling ports within the saprolite layer (the layer of heavily weathered and altered clay-rich basalts), and five zones (Zones 1 to 5) below the groundwater table with sampling ports within the basalt layer. RHMW14 also has eight monitoring zones: one monitoring zone (Zone 8) near the approximate elevation of the piezometric surface of the regional basal aquifer, four zones (Zones 4 to 7) below the approximate elevation of the piezometric surface of the regional basal aquifer with sampling ports within basalt with relatively lower hydraulic conductivity, and three zones (Zones 1 to 3) below the elevation of the piezometric surface of the regional basal aquifer with sampling ports in the relatively higher hydraulic conductivity portions of the unweathered basalt of the regional basal aquifer. RHMW15 has five monitoring zones all located within high-hydraulic-conductivity portions of unweathered basalt: one monitoring zone (Zone 5) near the approximate elevation of the regional basal aquifer and four zones (Zones 1 to 4) below the elevation of the regional basal aquifer.

1.2 PHYSICAL SETTING

The Facility is situated on the southwest flank of the Koʻolau shield volcano and is primarily underlain by Koʻolau volcanic series basalts. Climatological conditions in the area of the Facility consist of warm to moderate temperatures and low to moderate rainfall. The average annual precipitation is approximately 40 inches, which occurs mainly between November and April (Giambelluca, Nullet, and Schroeder 1986). Average temperatures range from the low 60s to high 80s (degrees Fahrenheit) (Juvik and Juvik 1998).

The Facility is located at the administrative boundary between the Waimalu Aquifer System of the Pearl Harbor Aquifer Sector and the Moanalua Aquifer System of the Honolulu Aquifer Sector. The underlying aquifer is classified as a basal, unconfined, flank-type and is currently used as a drinking water source. The aquifer is considered fresh, with less than 250 milligrams per liter (mg/L) of chloride, and is considered an irreplaceable resource with a high vulnerability to contamination (Mink and Lau 1990).

The nearest drinking water supply well is Navy Supply Well 2254-01 (also known as Red Hill Shaft), located within the Facility's lower tunnel. Navy Supply Well 2254-01 is located approximately 2,600 feet topographically downgradient of the fuel storage tanks (Figure 1) and provides potable water to the JBPHH Water System, which serves approximately 65,200 military customers. NAVFAC Hawaii Utilities Energy Management Division operates Navy Supply Well 2254-01 and its associated water development tunnel.

The nearest surface water body is South Hālawa Stream, which is an ephemeral stream present along the north side of the Facility. Wells RHMW01 through RHMW03, RHMW05, RHMW09, RHMW10, and RHMW15 are located greater than 150 meters from any portion of South Hālawa Stream. Sampling point RHMW2254-01 and wells RHMW04, RHMW06 through RHMW08, RHMW11, RHMW14, HDMW2253-03, and OWDFMW01 are located within 150 meters of a portion of Hālawa Stream. The approximate distance from each well and sampling point to Hālawa Stream is presented in Table 1-2.

Table 1-2: Distance of Sampling Locations to South Hālawa Stream

Sampling Location	Approximate Closest Distance to South Hālawa Stream (meters)
RHMW2254-01	85
RHMW01	232
RHMW02	299
RHMW03	271
RHMW04	81
RHMW05	225
RHMW06	104
RHMW07	81
RHMW08	64
RHMW09	376
RHMW10	452
RHMW11	3 [a]
RHMW14	10 [a]
RHMW15	153
HDMW2253-03	20
OWDFMW01	143

[a] RHMW11 and RHMW14 are located alongside the concrete-lined portion of South Hālawa Stream.

Despite some wells being located within 150 meters of surface water (South Hālawa Stream), there are no indications of any complete pathways to nearby water bodies. Both South Hālawa Stream and Moanalua Stream (located in Moanalua Valley east of the Facility) are intermittent streams (USGS 2017) located approximately 100 feet or more above the water table of the basal aquifer. Moreover, the bottoms of the fuel tanks are located at least 50 feet below the bottom of the streams, and the segment of South Hālawa Stream between Red Hill and Hālawa Correctional Facility is concrete-lined. Thus, groundwater conditions do not affect the nearby stream, and analytical results for the long-term monitoring (LTM) program are therefore compared to the screening criteria based on DOH environmental action levels (EALs) Table D-1b (i.e., groundwater EALs for sites where "groundwater is a current or potential drinking water resource" and the nearest "surface water body is not located within 150 meters of release site") (DOH 2017).

1.3 BACKGROUND

The U.S. Government constructed the Facility in the early 1940s. Twenty tanks were constructed of reinforced concrete and lined with steel. The primary containment material is steel. The fueling system is a self-contained underground unit that was installed into native rock composed primarily of basalt with some interbedded tuffs and breccias (DON 2010). Each tank measures approximately 250 feet in height and 100 feet in diameter. The upper domes of the tanks lie at depths varying between 100 and 200 feet below ground surface (bgs). The tanks currently contain JP-5, North Atlantic Treaty Organization-grade F-24 jet fuel, and F-76. In the past, the tanks also stored Navy special fuel oil, Navy distillate, aviation gasoline, and motor gasoline (DON 2010).

1.3.1 Previous Groundwater Monitoring Results

Groundwater samples for the Red Hill groundwater LTM program have been analyzed by the various offsite laboratories listed in Table 1-3. The Red Hill groundwater LTM program results spanning from 2005 onward are summarized in Table 1-4.

Table 1-3: Red Hill Groundwater LTM Program Analytical Laboratories

[a] Groundwater LTM samples were not collected during the First and Second Quarters 2006 due to Phase I and Phase II site investigation activities (DON 2007) occurring at that time.

[b] Groundwater LTM samples were not collected during the Fourth Quarter 2007.

Groundwater sampling locations are depicted on Figure 1. Detailed cumulative results of historical groundwater monitoring are tabulated in Appendix A.1, and concentration graphs of chemicals of potential concern (COPCs) over time are presented in Appendix A.2. All historical data are compared to the most recently updated (Fall 2017) DOH EALs (DOH 2017). Total petroleum hydrocarbons (TPH)-diesel range organics (TPH-d) and benzene are also compared to the Site-Specific Risk-Based Levels (SSRBLs), as discussed in the Red Hill *Groundwater Protection Plan* (DON 2014), as supplemented by the February 4, 2016, AOC Statement of Work Sections 6 and 7 scoping completion letter (EPA Region 9 and DOH 2016). Historical results indicate that the most, and generally the highest, detected concentrations of COPCs occur in monitoring well RHMW02.

Notes:
Bold and shaded text indicates analyte detected above DOH EAL.
RHMW2254-01 is the sampling point located inside the shaft of the Navy Supply Well 2254-01.
Inside Wells: RHMW01, RHMW02, RHMW03, RHMW05.
Outside Wells: RHMW04, RHMW06, RHMW07, RHMW08, RHMW09, RHMW10, RHMW11, RHMW14, RHMW15, HDMW2253-03, OWDFMW01.
As of the Third Quarter 2018 Groundwater Monitoring Report, the "No. of Detects" and "No. of Non-detects" includes all primary and replicate results; versions of this table previous to the Third Quarter 2018 report included only the maximum detected concentration between primary and replicate samples.
As of the Second Quarter 2019 Groundwater Monitoring Report, the "No. of Detects" and "No. of Non-detects" includes EPA Region 9 Laboratory split sampling data; versions of this table previous to the Second Quarter 2019 report included only data from Navy-contracted laboratories.
— = no data
% = percent
µg/L = microgram per liter
DOH = Department of Health, State of Hawai'i
EAL = Environmental Action Level
EPA = Environmental Protection Agency, United States
no. = number
TPH-d = total petroleum hydrocarbons-diesel range organics
TPH-g = total petroleum hydrocarbons-gasoline range organics
TPH-o = total petroleum hydrocarbons-residual range organics (i.e., TPH-oil)

This page intentionally left blank

No measurable amount of free product has ever been detected in any of the Red Hill monitoring wells. Of the 30 previously sampled monitoring locations (including non-multilevel wells and multilevel well monitoring zones) from 2005 to 2019, only five monitoring locations have ever had COPCs in concentrations exceeding the screening criteria (i.e., RHMW01, RHMW02, RHMW05, HDWMW2253-03, and OWDFMW01). No COPCs have ever exceeded screening criteria at the sampling point (RHMW2254-01) in the Red Hill Shaft. Of the three monitoring wells that the SSRBLs apply to (RHMW01, RHMW02, and RHMW03), only TPH-d in RHMW02 has exceeded the SSRBL. Sampling results analyzed by Navy-contracted laboratories from 2005 to 2019 are summarized below:

- *RHMW2254-01* is a sampling point located inside the shaft of Navy Supply Well 2254-01. Detections of TPH-gasoline range organics (TPH-g), TPH-d, TPH-residual range organics (TPH-o), and polynuclear aromatic hydrocarbons (PAHs) occurred occasionally during monitoring events between 2005 and October 2017, but no COPCs were detected above the screening criteria. Ethylbenzene, toluene, and total xylenes were detected below screening criteria during the Fourth Quarter (October) 2018 groundwater monitoring event but were non-detect during the subsequent monthly (November and December 2018) monitoring events; thus, the Fourth Quarter 2018 detections could not be verified. No COPCs have been detected since Fourth Quarter 2018.
- *RHMW01*, an inside-tunnel monitoring well located southwest of the tank farm, was installed in 2001 (DON 2002). TPH-d has consistently been detected at RHMW01 but has not exceeded the DOH screening criterion (400 micrograms per liter [µg/L]) since the First Quarter (January) 2016 monitoring event. TPH-d has never exceeded the SSRBL (4,500 µg/L). PAHs were periodically detected below the screening criteria. Sporadic detections of benzene and toluene below their respective screening criteria occurred in 2005, 2014, and 2017.
- *RHMW02*, an inside-tunnel monitoring well located next to Tank 6, was installed in 2005 (DON 2007). TPH-g was detected and exceeded the screening criterion (300 µg/L) during Fourth Quarter 2012 and First Quarter 2013 monitoring events. TPH-d has consistently been detected; concentrations exceeded the screening criterion (400 µg/L) in all monitoring events and exceeded the SSRBL in 2008, 2014, 2015, and 2016. TPH-o was detected below the screening criterion (500 µg/L) in most monitoring events from 2015 onward. Silica gel cleanup (SGC) TPH-d and TPH-o results showed reduced or non-detect concentrations compared to non-SGC TPH-d and TPH-o results, indicating that the majority of the reported non-SGC TPH mass is likely biodegradation by-products. PAHs regularly exceeded their screening criteria during monitoring events from 2005 onward. Ethylbenzene and total xylenes were also detected in most events between 2005 and 2018 at trace concentrations below the screening criteria. Benzene and toluene were also detected at trace concentrations below the screening criteria between 2008 and 2016 but less frequently than ethylbenzene and total xylenes.
- *RHMW03*, an inside-tunnel monitoring well located next to Tank 14, was installed in 2005 (DON 2007). TPH-d and TPH-o were frequently detected but at concentrations below the screening criteria. SGC TPH-d and TPH-o results were usually non-detect. TPH-g, toluene, and PAHs were occasionally detected at trace concentrations below screening criteria between 2005 and 2016. No COPCs have been detected above the screening criteria.
- *RHMW04*, an outside-tunnel monitoring well located northeast of the tank farm, was installed in 2005 as a background monitoring location (DON 2007). TPH-d, benzene, total xylenes, and PAHs were sporadically detected below screening criteria. No other COPCs have been detected.
- *RHMW05*, an inside-tunnel monitoring well located southwest of the tank farm and east of sampling point RHMW2254-01, was installed in 2009. TPH-d exceeded the screening

criterion during monitoring events in 2009 and 2010, but subsequent TPH-d detections were below the screening criterion. TPH-o, toluene, and PAHs were occasionally detected below screening criteria, but no COPCs have been detected after January 2016. Evaluations of historical TPH chromatograms suggested non-petroleum chemical signatures.

- *RHMW06 & RHMW07*, outside-tunnel monitoring wells located north of the tank farm, were installed in 2014 in response to the January 2014 release (DON 2015a). TPH-d, TPH-o, and PAHs were occasionally detected below screening criteria. No COPCs have ever been detected above screening criteria and no COPCs have been detected after March 2017.
- *RHMW08 & RHMW09*, outside-tunnel monitoring wells located west and south, respectively, of Tank 1, were installed in 2016 as part of the AOC Statement of Work Sections 6 and 7 investigation (DON 2017a). TPH-d and TPH-o have been detected below the screening criteria at RHMW08 from November 2016 to March 2017 but have not been detected since. The only COPC detected at RHMW09 was one detection of naphthalene at a concentration below the screening criterion by U.S. Environmental Protection Agency (EPA) Region 9 during the February 2017 split sampling event.
- *RHMW10*, an outside-tunnel monitoring well located south of Tank 14, was installed in April 2017 as part of the AOC Statement of Work Sections 6 and 7 investigation (DON 2017a). TPH-d and TPH-o were sporadically detected at concentrations below the screening criteria. No other COPCs have been detected.
- *RHMW11*, an outside-tunnel multilevel monitoring well located at the Hālawa Correctional Facility north of the tank farm, was installed in November 2017 as part of the AOC Statement of Work Sections 6 and 7 investigation (DON 2017a). Five of the eight multilevel monitoring zones (RHMW11 Zones 1 to 5) were sampled during the First, Second, and Third Quarter 2018 events. Sampling was discontinued for RHMW11 Zones 1 to 4 due to lack of COPC detections in groundwater samples collected from all five zones during the First Quarter 2018 through Third Quarter 2018. Groundwater samples continued to be collected from RHMW11 Zone 5 thereafter. RHMW11 Zone 7 (one of the three zones located in the saprolite formation with low hydraulic conductivity) was sampled during the Third Quarter 2019 monitoring event to collect general chemistry data from formation water within the saprolite formation. No COPCs have been detected in any of the RHMW11 multilevel monitoring zones that have been sampled.
- *RHMW14,* an outside-tunnel multilevel monitoring well located at the Hālawa Correctional Facility northwest of Tank 1, was installed in March 2019 as part of the AOC Statement of Work Sections 6 and 7 investigation (DON 2017a). RHMW14 has eight multilevel monitoring zones. Three of the eight zones (RHMW14 Zones 1 to 3) are in relatively higher hydraulic conductivity portions of the unweathered basalt formation, while the other five zones (RHMW14 Zones 4 to 8) are within relatively lower-hydraulic-conductivity portions of the basalt. Groundwater samples have been collected from six of eight multilevel monitoring zones (RHMW14 Zones 1 to 5 and Zone 7). No COPCs have been detected in any of the RHMW11 multilevel monitoring zones that have been sampled.
- *RHMW15*, an outside-tunnel multilevel monitoring well located between RHMW2254-01 and RHMW05 within the Facility boundaries, was installed in July 2019 as part of the AOC Statement of Work Sections 6 and 7 investigation (DON 2017a). RHMW15 has five multilevel monitoring zones. The five monitoring zones are located in relatively higher hydraulic conductivity portions of the unweathered basalt formation, with RHMW15 Zone 5 located near the basal aquifer water table. RHMW15 was initially sampled during the Third Quarter 2019 monitoring event. No COPCs have been detected in any of the RHMW15 multilevel

monitoring zones sampled during the Third Quarter 2019 (Zones 1 to 5) and Fourth Quarter 2019 (Zones 3 to 5) monitoring events.

- *HDMW2253-03*, an outside-tunnel well located north of the tank farm at the Hālawa Correctional Facility, was installed in 2000 by the State of Hawai'i Department of Land and Natural Resources below the groundwater table without a well screen. TPH-d was detected above the screening criterion during the First Quarter 2013 quarterly monitoring event, but no other COPCs have exceeded screening criteria, and no COPCs have been detected since the Third Quarter 2016 monitoring event. HDMW2253-03 was not sampled during quarterly and monthly monitoring events from April to July 2017 due to experimental testing conducted by the State of Hawai'i Department of Land and Natural Resources Commission on Water Resource Management and the University of Hawai'i.
- *OWDFMW01*, located at the former Oily Waste Disposal Facility west of Navy Supply Well 2254-01, was installed in 1998 (DON 2000). TPH-d exceeded the screening criterion during quarterly monitoring events in 2010, 2012, 2013, and 2015. No other COPCs have exceeded screening criteria. Evaluations of historical TPH chromatograms suggested that TPH detections have non-petroleum chemical signatures.

The TPH and PAH concentrations for the Second Quarter 2018 through Fourth Quarter 2018 monitoring events were higher than the reported results from the Fourth Quarter 2016 through First Quarter 2018 monitoring events. The increase in concentrations starting from the Fourth Quarter 2017 through Third Quarter 2018 are attributable to changes made to the Navy-contracted laboratory's extraction and analysis protocols in an effort to optimize the laboratory's EPA Method 8015 and EPA Method 8270 selected ion monitoring (SIM) standard operating procedures. The changes were prompted by the January–March 2017 split sampling and October 2017 TPH-d performance testing results conducted by the EPA Region 9 laboratory in Richmond, California, and the Navy-contracted laboratory (EPA Region 9 and DOH 2018; DON 2017e). The split sampling and performance testing results showed that the EPA Region 9 laboratory had higher TPH-d and PAH recoveries than the Navy-contracted laboratory for analytes present in groundwater samples at high concentrations (EPA Region 9 and DOH 2017a, 2018; DON 2018b). The differences in recoveries were due to the EPA Region 9 laboratory protocols' being more effective at recovering higher TPH-d and PAH concentrations, especially for samples with higher concentrations of polar hydrocarbons and metabolites. Changes made to the Navy-contracted laboratory's protocols include: using calibration standards identical to those used by the EPA Region 9 laboratory, sample acidification to pH less than 5 prior to extraction, switching extraction methodologies from EPA Method 3510C (separatory funnel liquid-liquid extraction) to EPA Method 3520C (continuous liquid-liquid extraction), using a rotary evaporator for extract condensation, and reduction of the field-collected sample volume for optimal extraction within the liquid-liquid extractor vessel. The Third Quarter 2018 split sampling event results indicated that TPH-d and PAH data generated by the Navy-contracted laboratory were approximately 12–37 percent lower than results reported by the EPA Region 9 laboratory (DON 2018a). The Navy-contracted laboratory's recoveries have significantly improved since the First Quarter 2017 split sampling event, during which recoveries were approximately 65 percent lower than the EPA Region 9 laboratory's results. After the method optimizations, there were no apparent increases in the TPH and PAH concentration trends. Evaluation of the split sampling data is presented in detail in the Third Quarter 2018 monitoring report (DON 2018a).

1.3.2 Previous Reports

The Red Hill groundwater LTM reports listed in Table 1-5 were prepared and submitted to DOH. Starting from the Fourth Quarter 2016 groundwater monitoring event, information for both the inside-tunnel and outside-tunnel monitoring locations has been combined into one report.

Table 1-5: Previous Groundwater Monitoring Reports

2. Groundwater Monitoring Activities

During the First Quarter 2020 monitoring event, groundwater samples were collected from 20 monitoring locations within the Red Hill groundwater monitoring network: RHMW2254-01; 11 monitoring wells located within the Facility boundary (RHMW01 through RHMW10 and OWDFMW01); 1 monitoring well located outside of the Facility at the Hālawa Correctional Facility (HDMW2253-03); 1 sampling zone at multilevel monitoring well RHMW11 and 3 sampling zones at multilevel monitoring well RHMW14, both located at the Hālawa Correctional Facility; and 3 sampling zones at RHMW15, located within the Facility boundary. The following multilevel monitoring well zones were sampled during this event: RHMW11 Zone 5, RHMW14 Zones 1 to 3, and RHMW15 Zones 3 to 5. The following multilevel monitoring zones were not sampled in this sampling event: RHMW11 Zones 1 to 4 and RHMW15 Zones 1 and 2 due to lack of detections of COPCs in previous monitoring events, and RHMW11 Zones 6 to 8 and RHMW14 Zones 4 to 8 due to low hydraulic conductivity at these zones.

All samples were collected in accordance with the AOC Statement of Work Sections 6 and 7 WP/SOW (DON 2017a), SAP (DON 2017b; 2017c), SAP Addendum 01 (DON 2017d), and SAP Addendum 03 (DON 2018e). The WP/SOW and SAP are consistent with DOH underground storage tank release response requirements (Hawai'i Administrative Rules, Chapter 11-280.1), NAVFAC Pacific Environmental Restoration Program Project Procedure I-C-3, *Monitoring Well Sampling* (DON 2015b), and the Red Hill *Groundwater Protection Plan* (DON 2014). Prior to purging and sampling, ambient and headspace vapor readings (volatile organic compounds [VOCs], oxygen, hydrogen sulfide, carbon monoxide, and lower explosive levels of vapors) were measured using a MultiRAE multi-gas monitor at all inside-tunnel sampling locations, and VOCs were measured using a MiniRAE 3000 photoionization detector (PID) at all outside-tunnel sampling locations. The depth to groundwater was measured using Heron oil/water interface probes and calibrated Solinst water level measuring tapes (see Appendix B.3 for tape correction factors). No free product or sheen was observed in any of the wells. Headspace PID detections occurred at RHMW2254-01, RHMW05, and OWDFMW01. Field measurements and observations are presented in the groundwater purge logs in Appendix B.1 and the field logbooks in Appendix B.2.

2.1 GROUNDWATER SAMPLING

2.1.1 Single-Screen (Non-Multilevel) Monitoring Well Sampling

Prior to collecting groundwater samples, the non-multilevel monitoring wells were purged of standing water in the well casings. These monitoring locations each contain a dedicated bladder pump, which was used to purge the well and collect samples. The groundwater wells were purged using low-flow sampling methodology at flow rates of approximately 0.10–0.30 liter per minute to minimize VOC loss and drawdown.

To operate the pump, a portable air compressor with an in-line filter was connected to a QED Environmental Systems MicroPurge MP10 Controller, which was then connected to the pump. The compressor was turned on to power the pump, and the controller was used to adjust the pumping rate to less than 1 liter of water per minute. Compressed nitrogen gas was used to purge and sample these non-multilevel monitoring wells.

Water quality parameters were monitored on a periodic basis during well purging using an In-Situ Inc. smarTROLL multi-parameter handheld water quality meter. Parameters measured included total dissolved solids, pH, temperature, specific conductivity, dissolved oxygen (DO), turbidity, oxidation-reduction potential (ORP), and salinity. The water quality parameters were used to evaluate whether the natural characteristics of the aquifer formation water were present within the monitoring wells before the samples were collected. A minimum of five readings were collected at each well during the purging process. When feasible, water level measurements were collected and recorded during purging to detect indications of drawdown; if drawdown was detected approaching 0.2 foot, the rate of low-flow purging was reduced. Purging was considered complete when at least three consecutive water quality measurements stabilized within the specified range for each parameter noted in groundwater sampling logs (Appendix B.1) and in accordance with NAVFAC Pacific Environmental Restoration Program Project Procedure I-C-3, *Monitoring Well Sampling* (DON 2015b). The readings were recorded on the groundwater sampling logs (Appendix B.1). Field notes were recorded to document the monitoring event (Appendix B.2).

Once water quality parameters stabilized, groundwater samples were immediately collected from the wells using the bladder pumps. Groundwater samples from these non-multilevel monitoring wells were collected no more than 2.5 hours after purging was completed. Groundwater samples were collected in sampling containers that were pre-preserved (as necessary) and provided by the analytical

laboratory. Samples collected for ferrous iron analysis were filtered in the field using new, individual 0.45-micron filters attached at the end of the pump/probe discharge tubing.

2.1.2 Multilevel Monitoring Well Sampling

Due to the multilevel monitoring well design of RHMW11, RHMW14, and RHMW15, purging was not required immediately prior to collecting groundwater from the sampled monitoring zone since the measurement ports allow groundwater to flow directly from the surrounding formation and there is no filter pack. Groundwater was collected using sampling probes from the following multilevel monitoring zones:

- *RHMW11:* Zone 5 (located within the basalt layer at 285.3 feet bgs).
- *RHMW14:* Zone 1 (at 456.6 feet bgs), Zone 2 (at 415.3 feet bgs), and Zone 3 (at 325.1 feet bgs). These zones are within the relatively hydraulically conductive portions of the basalt formation.
- *RHMW15:* Zone 3 (at 410.5 feet bgs), Zone 4 (at 320.3 feet bgs), and Zone 5 (at 292.0 feet bgs). These zones are within the relatively hydraulically conductive portions of the basalt formation, and Zone 5 is located near the basal aquifer water table.

A string of four sealed 250-milliliter sample containers was connected to the sampling probe, which was lowered to each monitoring zone, and the containers filled with groundwater from the formation through a sampling port in the central casing of the well. Once sampling containers were filled, the sampling port was closed, and the probe and container string were brought to the surface. The groundwater was then transferred to the appropriate laboratory-supplied containers. For the collection of groundwater quality parameters, the sample containers were flushed with nitrogen to remove air from within the containers prior to the collection of groundwater. The nitrogen flush was performed to minimize DO enrichment due to high water pressure in the formation, which would have forced the air in the sample containers to mix into the groundwater collected. Groundwater quality parameters were collected at least three times during the sampling of each multilevel monitoring well zone and recorded in the groundwater sampling logs (Appendix B.1). Observations of groundwater DO enrichment were presented in the *First Quarter 2018 Groundwater Monitoring Report* (DON 2018f).

Groundwater samples were collected in sampling containers that were pre-preserved (as necessary) and provided by the analytical laboratory. Samples collected for ferrous iron were filtered in the field using new, individual 0.45-micron filters attached at the end of the pump/probe discharge tubing.

Groundwater sampling at multilevel monitoring well zones takes a few hours for each zone due to the limited volume (1 liter) collected from each deployment of the sample container string. During the Second Quarter 2019 monitoring event, a one-time evaluation was conducted to evaluate whether the groundwater geochemistry changes during the sampling duration. Three additional aliquots of groundwater (from run #2, run #7, and run #13) were collected from RHMW11-05 and analyzed for anions and alkalinity. The results indicated that the groundwater geochemistry is consistent during the four-hour sampling duration at RHMW11-05. Data related to these samples were presented in the *Second Quarter 2019 Groundwater Monitoring Report* (DON 2019c).

The analytical program for the First Quarter 2020 groundwater monitoring event is shown in Table 2-1.

Table 2-1: Groundwater Sampling Program for the First Quarter 2020 Quarterly Monitoring Event

DOC dissolved organic carbon
[a] COPCs and associated screening criteria were provided in the February 4, 2016, AOC Statement of Work Sections 6 and 7 scoping completion letter from the Regulatory Agencies (EPA Region 9 and DOH 2016) and updated with the most current DOH Tier 1 EALs in Table D-1b (DOH 2017) where appropriate.
[b] Screening criterion is from EPA Tap Water Regional Screening Levels, target hazard quotient = 1.0, November 2019 (EPA 2019).

[c] TPH-d and TPH-o with SGC were analyzed only on samples with positive detections of TPH-d and TPH-o without SGC.
[d] Lead scavengers are collected only from newly installed monitoring wells for at least 1 year of sampling, and may be discontinued if sample results are below the Groundwater Action Levels established in the February 4, 2016, scoping completion letter (EPA Region 9 and DOH 2016). Lead scavenger analysis was only performed for RHMW14 Zones 1 to 3 and RHMW15 Zones 3 to 5, which have not yet been sampled for 1 year. The lead scavenger requirement has been completed for all other monitoring locations as of the Fourth Quarter 2018 monitoring event.
[e] General groundwater chemistry parameters are collected during at least one sampling event for all monitoring wells in accordance with SAP Revision 01 (DON 2017c). General groundwater chemistry parameters for all monitoring locations have been sampled in previous monitoring events.

2.2 FIELD QUALITY ASSURANCE/QUALITY CONTROL

A quality assurance/quality control (QA/QC) program was implemented in the field in accordance with the NAVFAC Pacific *Project Procedures Manual* (DON 2015b), DOH TGM (DOH 2018), the project WP (DON 2015c), AOC Statement of Work Sections 6 and 7 WP/SOW (DON 2017a), SAP (DON 2017b; 2017c), SAP Addendum 01 (DON 2017d), and SAP Addendum 03 (DON 2018e) to support generating data of known and defensible quality. The QA/QC program was designed to minimize error, provide early identification and correction of potential problems, and evaluate the performance of the sampling program.

Field instruments were calibrated each morning prior to starting field activities. The PID was calibrated with 100 parts per million (ppm) isobutylene calibration gas. The multi-gas monitor was calibrated with 100 ppm isobutylene calibration gas and a multi-gas monitor calibration gas composed of 50 ppm carbon monoxide, 25 ppm dihydrogen sulfide, 19 percent oxygen, and 50 percent of the lower explosive limit of methane. The water quality meter was calibrated with an auto-calibration solution prior to recording measurements.

To assess the effectiveness of the equipment decontamination process, one equipment blank sample was collected from the reusable sample container used during the multilevel monitoring well zone sampling. The equipment blank sample was collected on site by pouring distilled water into the decontaminated multilevel well sample container string and then into the sample containers. A field blank sample was also collected to assess the quality of the locally sourced Menehune Water Company distilled water used to collect the equipment blank. The field blank was collected by pouring distilled water directly into sample containers. The field blank and equipment blank samples were analyzed for the same COPCs as the groundwater samples.

As all non-multilevel monitoring locations have dedicated bladder pumps installed, no field and equipment blanks were collected from non-multilevel monitoring locations.

To assess the precision of the data collection activity, including sampling and analysis, field duplicates were collected at the same approximate time as their respective primary samples. One field duplicate each was collected from RHMW2254-01, RHMW02, and RHMW14 Zone 3.

During the First Quarter 2020 event, one trip blank was used at each sampling location to accurately represent the condition of the samples in each shipment. The hermetically sealed trip blank samples were supplied pre-filled by the analytical laboratory and remained with the associated groundwater sample in the cooler during the field event and transported to and from the site.

2.3 SAMPLE HANDLING AND ANALYSIS

The samples were labeled and logged in accordance with NAVFAC Pacific Environmental Restoration Program Project Procedure III-E, *Record Keeping, Sample Labeling, and Chain-of-Custody Procedures* (DON 2015b). Immediately after collection, all samples were labeled, logged in the field logbooks, custody sealed, sealed with tape, and placed in a resealable plastic bag. To meet the recommended holding time for nitrate analysis, efforts were made to ship samples to the laboratory on the day of collection. Samples not shipped on the day of collection were stored in secure and controlled cold storage overnight and shipped the following day.

Prior to shipping, the samples were logged in a chain-of-custody form and loaded into a cooler with double-bagged wet ice. Packed coolers were sent by field personnel via express-courier overnight shipping in custody-sealed coolers to Agriculture & Priority Pollutants Laboratories, Inc. in Clovis, California. Sample transport and custody details are provided in the chain-of-custody records in the laboratory reports in Appendix C.1.

2.4 DECONTAMINATION

Decontamination activities were performed in accordance with NAVFAC Pacific Environmental Restoration Program Project Procedure I-F, *Equipment Decontamination* (DON 2015b). A staging and decontamination area was established near each well location. Non-disposable sampling equipment (e.g., water level meter, oil/water interface probe, and multilevel monitoring well sample container string) was decontaminated at the beginning of each day and after purging and sampling each well. The decontamination process included washing and scrubbing the equipment with stiff-bristled nylon brushes and a non-phosphate detergent (e.g., Alconox) solution, followed by rinsing once with isopropyl alcohol and twice with distilled water. Liquid wastes generated during decontamination activities were captured and containerized in properly labeled, U.S. Department of Transportation-approved 55-gallon drums or other suitable temporary containers and managed as investigation-derived waste (IDW).

2.5 INVESTIGATION-DERIVED WASTE MANAGEMENT

IDW generated during the monitoring events consisted of purged groundwater from the monitoring wells and decontamination water. The IDW was handled, stored, and labeled in accordance with NAVFAC Pacific Environmental Restoration Program Project Procedure I-A-6, *Investigation-Derived Waste Management* (DON 2015b). Approximately 110 gallons of fluid from all wells were containerized in three clearly labeled, 55-gallon-capacity drums, covered with a tarp, and stored on site in an area designated by the Navy, pending disposal. Disposable personal protective equipment and sampling equipment and supplies were collected in plastic trash bags and disposed of as municipal waste.

3. Data Evaluation and Quality Assessment

Field observations and measurements and laboratory groundwater analytical results collected during the First Quarter 2020 groundwater monitoring event were evaluated along with available correction factors and historical groundwater concentrations. A data quality assessment consisting of a review of the overall groundwater sample collection and analysis process was performed to determine whether the analytical data generated met the quality objectives for the project. The data quality assessment was performed in accordance with the AOC Statement of Work Sections 6 and 7 WP/SOW (DON 2017a) and the SAP and addenda (DON 2017b; 2017c; 2017d; 2018e). The field QC program consisted of standardized sample collection and management procedures and the collection of field duplicate samples, matrix spike (MS) samples, and trip blank samples. The laboratory QA program consisted of the use of standard analytical methods and the preparation and analyses of MS/MS duplicate (MSD) samples, surrogate spikes, blanks, and laboratory control samples (LCSs)/LCS duplicates (LCSDs).

3.1 GROUNDWATER LEVEL MEASUREMENTS

Depths to groundwater were gauged from the notched and surveyed top of casing using calibrated water level measuring tapes at non-multilevel monitoring well locations prior to sampling (Table 3-1). Additionally, a Heron or Solinst oil/water interface probe was used to detect nonaqueous-phase liquid, which was measured if present.

The oil/water interface probe and water level measuring tapes were decontaminated between well measurements by washing with a non-phosphate detergent solution and rinsing with isopropyl alcohol and distilled water to prevent cross-contamination. Measuring points for all wells are detailed in three well elevation survey reports (DON 2019a) and presented in Table 3-1.

Table 3-1: Groundwater Elevations

btoc below top of casing
ft foot or feet
msl mean sea level

[a] Depth to water readings were taken using the calibrated water level measuring tapes.
[b] Water level measuring tape calibration information and correction factors are presented in Appendix B.3.
[c] Well horizontal displacement correction factor based on gyroscopic survey of the monitoring well's vertical plumbness. Correction factors are presented in the *Technical Memorandum, Gyroscopic Survey Results and Calculated Correction Factors for Groundwater Monitoring Network Wells at the Red Hill Bulk Fuel Storage Facility* (DON 2018d).
[d] *Well Elevation Survey Report, Red Hill Bulk Fuel Storage Facility* (DON 2018c).
[e] Particulates were noted during sampling causing variable groundwater turbidity.
[f] Depth to water is measured from the top of the gray plate at monitoring wells RHMW06, RHMW07, RHMW08, RHMW09, and RHMW10.
[g] Depth to water measurements are not applicable to the multilevel monitoring wells RHMW11, RHMW14, and RHMW15.
[h] Depth to water at the Red Hill Shaft sampling point was not measured due to safety concerns related to entering the shaft access manhole.
[i] The horizontal displacement correction factor for the zones in multilevel wells RHMW14 and RHMW15 are currently unavailable but will be published in a forthcoming deliverable.

Groundwater elevations beneath and near the site ranged from 18.84 to 22.98 feet above mean sea level during the First Quarter 2020 groundwater monitoring event. PID readings at the wellheads ranged from 0.0 to 1.3 ppm. No odor was noted during sampling at RHMW2254-01, RHMW05, RHMW11-05, RHMW14-02, and OWDFMW01. No sheen or nonaqueous-phase liquid was observed during the groundwater monitoring event. Graphs of cumulative historical depth to water readings are presented in Appendix A.4.

Because of safety concerns related to entering the Red Hill Shaft access manhole, depth to groundwater measurement at RHMW2254-01 is no longer collected starting from the Second Quarter 2019 groundwater monitoring event. Additionally, due to the design of the multilevel well monitoring zones, depths to groundwater were not measured at RHMW11, RHMW14, and RHMW15 zones.

3.2 ANALYTICAL RESULTS

The following chemicals were analyzed for during the monitoring event:

- TPH-d and TPH-o by EPA SW846 Test Method 8015B
- TPH-g, benzene, toluene, ethylbenzene, and xylenes by EPA Method 8260B
- 1-methylnaphthalene, 2-methylnaphthalene, and naphthalene by EPA Method 8270D SIM
- Phenol by EPA Method 8270D
- 2-(2-methoxyethoxy)-ethanol by a proprietary laboratory procedure
- Nitrate, chloride, and sulfate by EPA Method 300.0
- Nitrate-nitrite as nitrogen, methane, ferrous iron, and alkalinity by EPA 353.2, RSK175, SM 3500-Fe-B, and SM2320B, respectively
- Total organic carbon (TOC) by EPA Method 9060A

The chemicals analyzed and the respective analytical methods for each groundwater sample are identified in Table 3-2. Copies of the laboratory reports are presented in Appendix C.1. Copies of the third-party data validation reports are presented in Appendix C.2.

Analytical results were compared to the current LTM screening criteria as established by the February 4, 2016, AOC Statement of Work Sections 6 and 7 scoping completion letter (EPA Region 9 and DOH 2016) and updated with the most recent DOH (2017) Tier 1 EALs in Table D-1b (Section 1.2). The field and QC sample results of the First Quarter 2020 groundwater monitoring event are summarized in Table 3-2.

Figure 2 presents COPC detections, and Figure 3A and Figure 3B present the natural attenuation parameter (NAP) results at all monitoring locations. A description of laboratory data qualifiers and definitions and basic concepts of the terms detection limit (DL), limit of detection (LOD), and limit of quantitation (LOQ) are presented in the Department of Defense (DoD) Environmental Data Quality Workgroup Fact Sheet included as Appendix C.3.

Notes:
Bold text indicates detected value.
Bold and shaded text indicates analyte exceeds the screening criterion.
— = not analyzed or not applicable
µg/L = microgram per liter
CAS = Chemical Abstracts Service
COC = chain-of-custody
EB = equipment blank (rinsate)
FB = field blank (source water)
FD = field duplicate
ID = identification
J = estimated value
mg/L = milligram per liter
mV = millivolt
N = normal (primary) sample
no. = number
QC = quality control
SSRBL = Site-Specific Risk-Based Level
TB = trip blank
TPH-d = total petroleum hydrocarbons-diesel range organics
TPH-g = total petroleum hydrocarbons-gasoline range organics
TPH-o = total petroleum hydrocarbons-residual range organics (i.e., TPH-oil)
U = nondetect value
[a] SSRBL applies to RHMW01, RHMW02, and RHMW03.

Notes

1. Map projection: NAD 1983 UTM Zone 4N
2. Base Map: DigitalGlobe, Inc. (DG) and NRCS. Publication_Date: 2015
3. Only analytes with detections and associated SGC data (if applicable) are shown.
4. COPC screening criteria is based on DOH Tier 1 groundwater environmental action levels for sites where groundwater is a potential or current drinking water resource and the nearest surface water body is greater than 150 meters from the release site.
5. Low-level TPH-d/o laboratory contamination affected most samples during this monitoring event.

ABBREVIATIONS:

FD	field duplicate sample
ID	identification
J	estimated value
N	primary (normal) sample
SGC	silica gel cleanup
SSRBL	site-specific risk based level
TPH	total petroleum hydrocarbon
TPH-d	TPH-diesel range organics
TPH-g	TPH-gasoline range organics
TPH-o	TPH-oil/residual range organics
U	non-detect value (reported as less than the limit of detection)
µg/L	microgram per liter
1300	Exceeds screening criterion

Bold text indicates detected value.

This page intentionally left blank

Analytical results for the First Quarter 2020 (January) groundwater monitoring event are summarized as follows:

- *RHMW06, RHMW08, RHMW10, RHMW11-05, RHMW14-01, RHMW14-02, RHMW14-03 (primary and duplicate), RHMW15-03, RHMW15-04, RHMW15-05, and HDMW2253-03:* No COPCs were detected.
- *RHMW2254-01 (primary and duplicate):* TPH-d (100 and < 25 U µg/L) was detected at a concentration below the screening criterion (400 µg/L) in the primary sample but was not detected in the duplicate sample. However, the chromatogram displays a chemical signature not indicative of hydrocarbons related to petroleum products used at the Facility. Evaluation of the sample, field QC, and laboratory QC chromatograms shows similar chromatographic signatures present in the groundwater samples, field QC samples, and laboratory method blanks, indicating laboratory artifacts contribution. The TPH-d with SGC analysis result was non-detect, suggesting that the non-SGC TPH-d result consists entirely of non-petroleum hydrocarbons.
- *RHMW01:* TPH-d (180 J µg/L) was detected at a concentration below the screening criterion (400 µg/L). The TPH-d with SGC analysis result was 39 J µg/L, suggesting that the non-SGC TPH-d result is mostly biodegradation by-products.
- *RHMW02 (primary and duplicate):* TPH-d (1,500 J and 1,700 µg/L), 1-methylnaphthalene (23 and 24 µg/L), 2-methylnaphthalene (23 and 23 µg/L), and naphthalene (52 and 57 µg/L) were detected at concentrations exceeding their respective screening criteria (400, 10, 10, and 17 µg/L). TPH-d was also detected in the SGC analysis but at significantly lower concentrations (280 and 360 µg/L), suggesting that the majority of the non-SGC TPH-d results are biodegradation by-products. The concentrations of TPH-d did not exceed the SSRBL of 4,500 µg/L. TPH-g (58 and 49 µg/L) was detected at concentrations below the screening criterion (300 µg/L). No other COPCs were detected.
- *RHMW03:* TPH-d (260 µg/L) and TPH-o (250 µg/L) were detected at concentrations below their respective screening criteria (400 and 500 µg/L). The TPH-d and TPH-o with SGC analysis results were non-detect, suggesting that the non-SGC TPH-d result consists entirely of biodegradation by-products.
- *RHMW04, RHMW05, RHMW07, RHMW09, and OWDFMW01:* TPH-d and/or TPH-o were detected below their respective screening criteria (400 and 500 µg/L) in RHMW04 (120 and <40 U µg/L), RHMW05 (93 and 92 µg/L), RHMW07 (120 and 84 µg/L), RHMW09 (100 and 09 µg/L), and OWDFMW01 (120 and 120 µg/L). Evaluation of the sample, field QC, and laboratory QC chromatograms indicate laboratory artifacts contribution. TPH-d and TPH-o with SGC analysis results were non-detect except for TPH-o with SGC in RHMW09 (39 J µg/L). These results suggest that the non-SGC TPH-d and TPH-o results consist of non-petroleum hydrocarbons.

Consistent with previous monitoring events, no free product, visible sheen, or color was observed in the groundwater collected from all monitoring locations for the duration of the sampling.

3.3 GROUNDWATER CONTAMINANT CONCENTRATIONS

A table of cumulative historical groundwater results is included as Appendix A.1. The historical groundwater COPC concentrations for TPH-g; TPH-d; TPH-o; benzene, toluene, ethylbenzene, and xylenes; 1-methylnaphthalene; 2-methylnaphthalene; and naphthalene are illustrated in Appendix A.2. Cumulative NAP measurements starting from the Fourth Quarter 2016 event are illustrated in Appendix A.3.1, and current NAP measurements are illustrated in Appendix A.3.2. The only detections

of lead scavengers and other fuel additives in groundwater samples were below-screening-criteria concentrations of 1,2-dichloroethane from April 2015 to January 2016 at OWDFMW01 and phenol (one detection) during a December 2016 sampling event at RHMW09. No graphs were created for analytes that are no longer included as COPCs for the Red Hill groundwater LTM program (EPA Region 9 and DOH 2016).

3.4 DATA VALIDATION AND ASSESSMENT

The analytical laboratory data for the First Quarter 2020 groundwater monitoring event were submitted to a third-party data validator (Laboratory Data Consultants, Inc.) for data validation and assessment. Analytical data from monitoring events from 2005 to Third Quarter 2016 underwent a limited data verification for all events where a third-party data validation was not performed (DON 2018a). Analytical data from Fourth Quarter 2016 onward were validated by a third-party data validator.

The objective of data validation is to provide data of known quality for project decisions. Data quality is judged in terms of precision, accuracy, representativeness, comparability, completeness, and sensitivity. Data validation is performed in accordance with the data validation procedures in the NAVFAC Pacific Environmental Restoration Program, *Project Procedures Manual* (DON 2015b), and consistent with the protocol in the DoD *Quality Systems Manual (QSM) for Environmental Laboratories* Version 5.1 (DoD and DOE 2017), as presented in the SAP and addenda (DON 2017b; 2017c; 2017d; 2018e). A number of factors may affect the quality of data, including sample collection methods; sample analysis methods; and adherence to established procedures for sample collection, preservation, management, shipment, and analysis. Data validation reports are presented in Appendix C.2.

Precision

Precision is defined as the reproducibility of replicate measurements. Precision is evaluated by the relative percent difference (RPD) of field duplicates, LCS/LCSD, and MS/MSD results. Field duplicate and MS/MSD samples were collected at a rate of approximately 10 percent of primary samples. Field duplicates were sent to the laboratory along with the primary samples. Primary and field duplicate RPDs are presented in Table 3-3. When COPCs were not detected in the primary and field duplicate samples, no RPDs could be calculated.

All primary and field duplicate samples RPDs were within the 50 percent measurement performance criteria (Table 3-3) except for the TPH-d results for RHMW2254-01. The criterion exceedance in RHMW2254-01 is due to a detection in the primary sample that was not replicated in the field duplicate. No other COPCs besides those listed in Table 3-3 were detected in the primary and field duplicate samples collected during the First Quarter 2020 groundwater monitoring event.

Table 3-3: Field Duplicate Analyte RPDs

Sampling Location [a]	Analyte	Screening Criterion (µg/L)	Sample ID	Concentration (µg/L)	RPD [b]
RHMW2254-01	TPH-d	400	ERH971	100	200%
			ERH972	< 25	
RHMW02	TPH-g	300	ERH976	58	17%
			ERH977	49	
	TPH-d	400	ERH976	1,500	13%
			ERH977	1,700	
	TPH-d w/SGC	400	ERH976	280	25%
			ERH977	360	
	1-Methylnaphthalene	10	ERH976	23	4%
			ERH977	24	
	2-Methylnaphthalene	10	ERH976	23	0%
			ERH977	23	
	Naphthalene	17	ERH976	52	9%
			ERH977	57	

% percent
NC not calculable
U non-detect value
[a] No COPCs were detected in the primary and field duplicate samples collected from RHMW14-03.
[b] Field duplicate RPD measurement performance criterion for groundwater is 50 percent in accordance with the criteria presented in Table 5-1 of the SAP (DON 2017b, 2018c) and Table 3-2 of the SAP addenda (DON 2017d, 2018g).

LCS/LCSD RPDs exceeded the 20 percent criterion (see criteria in SAP Appendix D [DON 2017b, 2018c] and SAP addenda Appendix C [DON 2017d, 2018g]) for TPH-d and TPH-o in three groundwater samples. LCS/LCSD RPDs also exceeded the criterion for 2-(2-methoxyethoxy)-ethanol in 11 samples. Associated results were qualified as non-detect estimated (UJ).

The MS/MSD RPD also exceeded criterion for one chloride result, leading to the result being flagged as estimated (J).

No other precision concerns were identified during validation of sample results. Data usability of the samples is discussed in Section 3.5.

Accuracy

Accuracy is defined as the degree of conformity of a measurement to a standard or true value. Accuracy is evaluated through measurement of the percent recovery (%R) of an analyte in a reference standard or spiked sample. Accuracy limits for surrogates, LCS, MS, and MSD samples are either prescribed by the DoD or established by the individual laboratory. The acceptance criteria for accuracy are dependent on the analytical method and based on historical laboratory or DoD data.

One chloride and one nitrate-nitrite as N results were flagged as estimated (J) due to high MS and MSD %Rs, indicating possible high bias.

One chloride result was flagged estimated (J) due to the low MSD %Rs, indicating possible low bias.

TPH-d results for two groundwater samples were flagged as estimated (J) due to high surrogate %Rs indicating possible high bias.

TPH-d with SGC and TPH-o with SGC results for one groundwater sample and 1-methylnaphthalene, 2-methylnaphthalene, and naphthalene results for one groundwater sample were flagged as non-detect estimated (UJ) due to low surrogate %R, indicating possible low bias.

No other accuracy concerns identified during validation affected sample results. Data usability is discussed in Section 3.5.

Representativeness

Representativeness is the degree to which data accurately and precisely represent a characteristic of a population, parameter variations at a sampling point, or an environmental condition. Representativeness was achieved by conducting sampling in accordance with the sample collection procedures described in the AOC Statement of Work Sections 6 and 7 WP/SOW (DON 2017a) and the SAP (DON 2017b; 2017c; 2017d), including standardized sample collection methods identified in NAVFAC Pacific Environmental Restoration Program Project Procedure I-C-3, *Monitoring Well Sampling* (DON 2015b).

Representativeness is also evaluated through compliance with the method-recommended sample holding time and sample preservation methods and through the analysis of blank samples, including method blank, equipment blank, field blank, and trip blank samples. All sample holding times and sample preservation were evaluated in accordance with EPA SW-846 method recommendations and DoD Quality Systems Manual Version 5.1 (DoD and DOE 2017).

All samples were associated with a trip blank and laboratory blanks. Field and equipment blanks were collected and analyzed to demonstrate efficiency of field equipment decontamination. TPH-d, TPH-o, and TPH-o with SGC were detected in the field and equipment blanks associated with multilevel monitoring well sampling locations. Three TPH-d results, three TPH-o results, and two TPH-o with SGC results were flagged as non-detect (U) based on field and equipment blank contamination, indicating that sample detections are likely from field and/or laboratory artifacts. Notably, the laboratory method blanks also showed chromatographic signatures similar to those seen in the groundwater samples and field and equipment blanks.

TOC was detected in the laboratory method blank associated with eight groundwater samples. The results were qualified as non-detect (U) due to the laboratory method blank contamination.

Nine nitrate samples (RHMW03, RHMW05, RHMW07, RHMW09, RHMW14-01, RHMW14-02, RHMW14-03, RHMW15-04, and RHMW15-05) were analyzed beyond the method-recommended 48-hour holding time. These samples were analyzed between 51 and 58 hours from sample collection. The results were qualified as estimated (J). All groundwater samples were also analyzed for nitrate-nitrite as nitrogen, which can be used to confirm the nitrate results. Nitrate was recovered between 86 and 150 percent of the calculated equivalent nitrate concentration based on nitrate-nitrite as nitrogen results (Table 3-4). Of the nine detected results from samples analyzed for nitrate outside of the method-recommended holding time, the result for RHMW07 recovered below 90 percent of the calculated equivalent nitrate concentration, indicating possible low bias.

Table 3-4: Nitrate Result Confirmation

Location	Sample ID	Nitrate Result (mg/L)	Nitrate-Nitrite as Nitrogen Result (mg/L)	Calculated Equivalent Nitrate Concentration Based on Nitrate-Nitrite as Nitrogen Result (mg/L) [a]	%R
RHMW2254-01	ERH971	2.7	0.56	2.5	109%
RHMW01	ERH974	< 0.18 U	< 0.090 U	— [c]	— [c]

RHMW06	ERH985	2.0	0.63	2.8	72%
RHMW07 [b]	ERH987	4.2 J	1.1	4.9	86%
RHMW08	ERH989	5.6	1.3	5.8	97%
RHMW09 [b]	ERH991	2.3 J	0.45	2.0	115%
RHMW10	ERH993	2.3	0.46	2.0	113%
RHMW11-05	ERH1002	< 0.18 U	< 0.090 U	— [c]	— [c]
RHMW14-01 [b]	ERH1004	1.9 J	0.35	1.6	123%
RHMW14-02 [b]	ERH1006	1.9 J	0.29	1.3	148%
RHMW14-03 [b]	ERH1008	2.2 J	0.33	1.5	150%
RHMW15-03	ERH1011	2.0	0.41	1.8	110%
RHMW15-04 [b]	ERH1013	2.0 J	0.41	1.8	110%
RHMW15-05 [b]	ERH1015	1.9 J	0.34 J	1.5	126%
HDMW2253-03	ERH997	1.4	0.17	0.75	186%
OWDFMW01	ERH995	1.8	1.8	8.0	23%

— not calculable
% percent
J estimated value
U non-detect value
[a] Nitrate-nitrite as nitrogen result converted to nitrate by multiplying nitrate-nitrite as nitrogen result by a factor of 4.43 (CalEPA 2011).
[b] Groundwater samples from these locations were extracted outside of the holding time for nitrate analysis.
[c] No equivalent nitrate concentration or %R was calculated due to the nitrate or nitrate-nitrite results reported as non-detect(s).

The representativeness of the data is considered acceptable after qualification for recommended holding time. Data usability is discussed in Section 3.5.

Completeness

Completeness is defined as the overall percentage of valid analytical results (including estimated results) compared to the total number of analytical results reported by the analytical laboratory.

Of the 689 results reported, none of the results were rejected. The completeness of the data (100 percent) met the 90 percent completeness goal.

Comparability

Comparability expresses the confidence with which one data set can be compared to another. Comparability can be related to accuracy and precision because these quantities are measures of data reliability. Data with acceptable precision and accuracy are considered comparable if collection techniques, analytical procedures, methods, and reporting are equivalent.

Samples collected from 2005 through the current monitoring event have been analyzed by multiple laboratories (Table 1-3). Data comparability is complicated by differences in analytical methods and extraction and analysis protocols used. For example, TPH-g and naphthalene have been reported using different EPA methods (either or both EPA 8260 and EPA 8270 SIM), and TPH-d and TPH-o have been reported using the same method (EPA 8015) but with differing carbon ranges over time (e.g., C10–C28, C10–C24 for reporting TPH-d) and different extraction methods (i.e., separatory funnel liquid-liquid extraction [EPA 3510] versus continuous liquid-liquid extraction [EPA 3520]) yielding different TPH concentrations.

Current analytical methods used are aimed to have laboratory limits lower than the current screening criteria. Starting from the Fourth Quarter 2016 event, analytical method DLs, LODs, and LOQs have been lower for most analytes than they had been during previous events. The method used to analyze TPH-g was also changed from EPA Method 8015 to EPA Method 8260 to improve sensitivity. The improved reporting limits should be considered when results are compared to data from earlier events. An evaluation of data reported between laboratories is presented in the AOC Statement of Work Sections 6 and 7 *Conceptual Site Model* (CSM) report (DON 2019b) as part of the AOC Statement of Work Sections 6 and 7 investigation.

The laboratory used standard analytical methods for all analyses. In all cases, the DLs and LODs attained were below the specified LOQs. Target analytes detected below the LOQs flagged (J) by the laboratory should be considered estimated.

Sensitivity

The LOQs are established by the laboratory based on the LODs or instrument DLs, historical data, and limits established for the various methods. The LOQs and LODs for samples may require adjustment by the laboratory due to matrix interference or when high levels of target analytes necessitate dilution before analysis. Matrix interference and sample dilutions decrease sensitivity and increase the LOQs/LODs. No results in this data set had increased LOQs or LODs that impacted sensitivity and data usability.

3.5 DATA ASSESSMENT AND USABILITY CONCLUSIONS

The precision, accuracy, representativeness, comparability, completeness, and sensitivity criteria were evaluated, and with some exceptions, the criteria were met. Results associated with QC data that failed acceptance criteria are discussed in Section 3.4. Data quality issues that need to be taken into account for project decisions are summarized below.

The LCS/LCSD RPD exceedances indicate indeterminate bias in the associated results: TPH-d and TPH-o (RHMW14-03 [primary and duplicate] and HDMW2253-03); and, 2-(2-methoxyethoxy)-ethanol (RHMW01, RHMW02 [primary and duplicate], RHMW03, RHMW06, RHMW07, RHMW08, RHMW14-03 [primary and duplicate], RHMW15-03, and HDMW2253-03). However, the above-mentioned results are non-detect; thus, the results are likely not affected by possible bias.

The MS/MSD RPD exceedance for chloride (RHMW2254-01) also indicate indeterminate bias. The results are likely unaffected by the bias as the chloride results are similar to results from the previous several monitoring events.

The high MS and MSD %Rs associated with one chloride (RHMW05) and one nitrate-nitrite as N (RHMW15-05) results indicate possible high bias. The low MSD %R associated with one chloride

result (RHMW2254-01) indicates possible low bias. Since the current monitoring event results are consistent with previous events' results, the results are likely not affected by the possible biases.

The high surrogate %Rs for two TPH-d results (RHMW01 and RHMW02 [primary sample]) indicate possible high bias. A comparison with previous events' results shows similar concentrations; thus the results are likely not affected by the bias.

The low surrogate %Rs for TPH-d with SGC and TPH-o with SGC (RHMW05) and 1-methylnaphthalene, 2-methylnaphthalene, and naphthalene (RHMW15-03) results indicate possible low bias. The RHMW05 TPH without SGC analysis had passing surrogate %Rs, and the non-SGC results are also attributable to laboratory artifacts based on the groundwater samples, field QC, and laboratory method blanks showing similar chromatographic signatures of non-petroleum-like hydrocarbons; thus the SGC results are likely not affected by the bias. Additionally, comparison with previous events' PAH results for RHMW15-03 show similar non-detect concentrations; thus, the results are likely not affected by the bias.

The TOC (RHMW2254-01 [primary sample], RHMW04, RHMW06, RHMW07, RHMW14-01, RHMW14-03 [primary sample], RHMW15-04, and HDMW2253-03) detections in the laboratory method blanks led to the sample results being qualified as non-detect (U). The TOC contamination does not present a significant impact since the TOC results are similar to previous events.

The TPH-d (RHMW14-01, RHMW14-02, and RHMW15-05), TPH-o (RHMW14-01, RHMW14-02, and RHMW14-03 [duplicate sample]), and TPH-o with SGC (RHMW14-01 and RHMW14-03 [duplicate sample]) results were qualified as non-detect (U). The sample detections are likely from laboratory artifacts based on the groundwater sample, field blank and equipment blank, and laboratory method blank sample chromatograms showing similar TPH signatures.

The holding time exceedances for nitrate indicate possible low bias for results from RHMW03, RHMW05, RHMW07, RHMW09, RHMW14-01, RHMW14-02, RHMW14-03, RHMW15-04, and RHMW15-05. A comparison of the nitrate and nitrate-nitrite as nitrogen results (Table 3-4) for these samples indicates that the RHMW07 result may be biased low based on the nitrate results recovering less than 90 percent of the calculated equivalent nitrate concentrations. The results were likely not affected by the bias since a comparison of the current RHMW07 results to previous monitoring events shows that the current results are consistent with historical nitrate values.

Additionally, though the OWDFMW01 nitrate sample was analyzed within the holding time, the nitrate result recovery was only 23 percent of the calculated equivalent nitrate concentration indicating possible low bias on the nitrate result. Current OWDFMW01 nitrate results are also lower than historical nitrate values. Additional nitrate data from OWDFMW01 from future monitoring events will be used to evaluate whether there is a decreasing trend in nitrate concentration at this location.

The third-party data assessment (Appendix C.2) concludes that all data generated during the monitoring events reported herein are usable for the intended purpose with the limitations described above.

4. Natural Attenuation Evaluation

The natural attenuation evaluation uses the following lines of evidence:

- The use of historical groundwater primary indicators (COPC data) to demonstrate contaminant concentration over time.

- The use of secondary lines of evidence (hydrogeologic and geochemical data) to evaluate whether natural attenuation processes are active at the site and the rate at which such processes can reduce contaminant concentrations to below screening levels.
- Comparison of TPH-d and TPH-o with and without SGC can be used to evaluate the degree of weathering of the dissolved fuel hydrocarbons based on the fraction of polar-weathered hydrocarbons and total recoverable hydrocarbons.

Two objectives for analyzing NAPs are to assess whether natural attenuation is occurring on site and to evaluate the potential for natural attenuation to reduce the concentrations of petroleum-related constituents in groundwater. Secondary lines of evidence for natural attenuation are based on additional information collected during the groundwater monitoring events and include DO, ORP, pH, specific conductance, dissolved ferrous iron, methane, nitrate, and sulfate.

Fuel hydrocarbons can be biodegraded by microorganisms in the subsurface under aerobic or anaerobic conditions. Biodegradation is the result of microbial-mediated reduction-oxidation reactions in which the simultaneous oxidation of an electron donor and reduction of an electron acceptor occur.

Biodegradation of fuel hydrocarbons causes changes to the groundwater geochemistry. During aerobic biodegradation of hydrocarbons, DO concentrations are depleted as aerobic respiration occurs because DO is the most thermodynamically favored electron acceptor used in biodegradation. ORP is a measure of electron activity and an indicator of the relative tendency of a solute species to gain or lose electrons. Higher ORP measurements suggest that aerobic respiration is occurring.

After DO is depleted in aerobic respiration, anaerobic respiration ensues, and the potential electron acceptors, namely nitrate, ferric iron, sulfate, and carbon dioxide, are used in biodegradation. Use of these electron acceptors proceeds along a natural succession in the order as listed above because of decreasing energetic efficiency (Leeson et al. 2004). Nitrate is the most thermodynamically favored electron acceptor of the anaerobic pathways, biodegrading to nitrite (followed by nitrogen gas) and carbon dioxide. Ferric iron in soil can be consumed by anaerobic biodegradation when both DO and nitrate have been depleted in anaerobic groundwater, yielding dissolved ferrous iron in groundwater. Sulfate can be consumed by anaerobic degradation after DO, nitrate, and ferric iron are depleted, yielding precipitated iron sulfides. Lower concentrations of sulfate in groundwater compared to background levels indicate that sulfate reduction is an ongoing biological process for petroleum hydrocarbon degradation within plume areas. When all the soluble electron acceptors (i.e., DO, nitrate, ferric iron, and sulfate) are depleted, groundwater conditions can become conducive to fermentation, and methane can be generated.

Alkalinity is a general indicator of the buffering capacity of an aquifer system against pH changes due to attenuation processes in the groundwater. Production of carbon dioxide during biodegradation causes carbonate minerals to dissolve, increasing alkalinity concentrations in the groundwater. Alkalinity is used in conjunction with pH measurements to evaluate the groundwater's capacity to neutralize metabolic acids produced by biodegradation.

Both aerobic and anaerobic biodegradation may be occurring at the site. COPCs such as naphthalene are known to degrade both aerobically and anaerobically, and geochemical parameters indicative of biodegradation may vary with location and with time (Wiedemeier et al. 1999). A more detailed evaluation of natural attenuation at the Red Hill groundwater monitoring locations is presented in the AOC Statement of Work Sections 6 and 7 CSM report (DON 2019b).

The field water quality data parameters for the First Quarter 2020 groundwater monitoring event are included in the field sampling logs (Appendix B.1). Table 3-2 and Figure 3A and Figure 3B summarize DO, ORP, and other NAPs. Graphs of the DO, ORP, and NAP results are presented in Appendix A.3.

Unweathered petroleum contains hydrocarbons (non-polar) that, when weathered in the environment, create polar compounds as byproducts of biological sources and processes. SGC is commonly used to separate polar from nonpolar compounds. Polar compounds will preferentially adsorb to silica, while non-polar compounds will not. DOH TGM Section 9.3.1.2, Total Petroleum Hydrocarbons, discusses the use of SGC to separate out the polar TPH fraction and compare the remaining non-polar TPH fraction to the screening criteria: "*Comparison of data for groundwater samples tested with and without silica gel cleanup could be useful for assessing the state of natural biodegradation within a plume of petroleum-contaminated groundwater and optimizing remedial and monitoring actions*" (DOH 2018). Analysis of SGC TPH-d or SGC TPH-o was performed on samples with detected concentrations of TPH-d or TPH-o without SGC (see Section 4.1.8 for additional discussion).

4.1 EVALUATION USING NATURAL ATTENUATION PARAMETERS

NAPs were collected during the groundwater monitoring field activities and include DO and ORP, nitrate, ferrous iron, methane, sulfate, and chloride. These parameters indicate the conditions under which natural attenuation is likely occurring.

4.1.1 Dissolved Oxygen and Oxidation-Reduction Potential

DO and ORP concentrations for the First Quarter 2020 groundwater monitoring event were generally consistent with previous measurements. The background (RHMW04) DO measurement for the monitoring event was 8.45 mg/L, which is consistent with literature values for O'ahu groundwater (Hunt Jr. 2004). Similar to previous events, the monitoring locations with consistent COPC detections had depressed DO measurements (0.34 to 1.03 mg/L at RHMW01, RHMW02, and RHMW03) and low ORP values (-5.4 to 85.4 millivolts).

In RHMW01, RHMW02, and RHMW03, the depleted DO in conjunction with the presence of dissolved-phase COPCs and other NAP results such as the dissolved methane concentrations (230 and 8,300 µg/L at RHMW01 and RHMW02, respectively) indicate that both aerobic and anaerobic respirations are likely occurring. The presence of dissolved-phase COPCs and the DO depletion at RHMW03 are indicative of aerobic biodegradation, but the absence of methane indicates that methanogenesis is likely not occurring at RHMW03.

RHMW11-05, RHMW14 (Zones 1 to 3), RHMW15 (Zones 3 to 5), and HDMW2253-03 also had low DO measurements (ranging from 0.53 to 2.88 mg/L), consistent with previous events. The consistently low DO, high ORP, and lack of COPC detections indicate that the low DO values are the baseline for these monitoring locations and are not related to attenuation of the COPCs.

Unlike RHMW11 (all sampled zones), RHMW14 (all sampled zones), and the deeper zones of RHMW15 (Zones 1 to 4), RHMW15-05 is located near the approximate elevation of the regional basal aquifer within high hydraulic conductivity portions of unweathered basalt. However, DO at RHMW15-05 is depleted compared to background (8.45 mg/L). Consistent low DO concentrations during the Fourth Quarter 2019 and First Quarter 2020 events (0.39 and 0.53 mg/L, respectively) indicate that the low DO may be inherent to the subsurface conditions at this zone, and may warrant additional evaluation.

4.1.2 Nitrate

Of the known anaerobic pathways for hydrocarbon biodegradation, nitrate is the most thermodynamically favored electron acceptor; decreased nitrate concentrations suggest that anaerobic respiration may be occurring. For the First Quarter 2020 monitoring event, RHMW01, RHMW02, and RHMW11-05 had non-detect or very low nitrate concentrations. These results are in line with previously measured nitrate concentrations at these locations. The low nitrate results in RHMW01 and RHMW02 in conjunction with the DO and ORP measurements suggest that anaerobic respiration is likely occurring at these two wells. Based on previous NAP measurements at RHMW11-05, the very low nitrate concentrations are baselines for these locations and not related to attenuation of the COPCs.

The remaining wells had nitrate at concentrations that were similar to or greater than the historical background nitrate levels for the site. Evaluation of the nitrate results at these locations in conjunction with the DO and ORP results suggest that attenuation is likely not occurring (for wells that show no TPH detections) or that aerobic conditions are likely occurring, such as at RHMW03 where DO was lower than background but nitrate was higher than background.

4.1.3 Ferrous Iron

Bacteria will typically break down ferric iron in soil once oxygen is depleted, which causes ferrous iron to be released to groundwater. Elevated levels of ferrous iron indicate that the groundwater environment has undergone iron reduction for anaerobic respiration. Ferrous iron was detected in: RHMW01 (0.65 J mg/L), RHMW02 (2.2 mg/L), RHMW04 (0.16 J mg/L), RHMW15-04 (0.17 J mg/L), and HDMW2253-03 (1.2 mg/L). When compared to the other monitoring locations and evaluated with other NAPs discussed above, the ferrous iron results for RHMW01 and RHMW02 also suggest that anaerobic biodegradation is likely occurring at these wells. Though ferrous iron was detected in the other locations, the COPC and other NAP results do not indicate anaerobic biodegradation at those locations.

4.1.4 Methane

An additional line of evidence for biological degradation of petroleum hydrocarbons includes the presence of methane, a reaction byproduct of fermentative biological reactions that can occur after oxygen is depleted by aerobic digestion. Methane was again detected in the samples from RHMW01 (230 µg/L) and RHMW02 (8,300 µg/L). These methane concentrations suggest that methanogenic biodegradation is occurring in these wells. Methane was not detected in any other location with the exception of very low concentrations in HDMW2253-03 (0.78 J µg/L).

4.1.5 Sulfate

Sulfate is normally consumed by bacteria only after DO, nitrate, and ferric iron have been depleted. Concentrations of sulfate lower than background concentrations, when evaluated in conjunction with depressed DO and nitrate concentrations, suggest that anaerobic activity is occurring. The concentration of sulfate in groundwater at RHMW01 and RHMW02 (5.0 and 1.9 mg/L, respectively) were much lower than the background sulfate concentrations in RHMW04 (10.6 mg/L). The sulfate results in RHMW01 and RHMW02 suggest that anaerobic activity is likely actively occurring there. The RHMW02 sulfate results are similar to historical results at this location, indicating that the high sulfate concentration during the Fourth Quarter 2019 event was anomalous and not representative of subsurface conditions.

Sulfate concentrations at RHMW09, RHMW10, RHMW14 (Zones 1 to 3), and RHMW15 (Zones 4 and 5) were also less than the background. Based on the consistently low historical sulfate concentrations, lack of TPH detections, and lack of other NAP results indicative of biodegradation,

the lower-than-background sulfate concentrations at these locations are the baseline for these monitoring locations.

4.1.6 Chloride

Chloride is a general water quality parameter, and background concentrations of chloride in the aquifer are a result of mineral dissolution. An evaluation of NAP data from the Fourth Quarter 2016 monitoring event onward and the groundwater geochemistry parameters indicates that the chloride concentrations at the site are due to the aquifer geochemistry and are not related to anaerobic dechlorination.

Chloride concentrations at RHMW01, RHMW02, RHMW03, RHMW09, RHMW10, RHMW11-05, RHMW14 (Zones 1 to 3), and RHMW15 (Zones 3 to 5) were below the background (RHMW04) concentration of 74.4 mg/L. All other locations had chloride concentrations higher than background.

4.1.7 Alkalinity

The alkalinity concentrations in RHMW01, RHMW02, RHMW03, RHMW05, RHMW06, RHMW07, RHMW08, RHMW11-05, and OWDFMW01 were greater than the background concentration (RHMW04) of 74.4 mg/L. The elevated alkalinity in RHMW01, RHMW02, and RHMW03 may be attributable to natural attenuation processes occurring at these locations; the elevated alkalinity at the other monitoring locations may be attributable to aquifer geochemistry, based on the lack of COPC detections and lack of other NAP results indicative of biodegradation.

4.1.8 TPH with Silica Gel Cleanup

SGC TPH-d and TPH-o results for RHMW01, RHMW02, and RHMW03 showed reduced or non-detect concentrations compared to non-SGC TPH-d and TPH-o results (Table 4-1). The SGC TPH-d and TPH-o results suggest that petroleum weathering is occurring at RHMW01, RHMW02, and RHMW03, especially when evaluated in conjunction with the other NAPs.

For RHMW02, the SGC TPH-d concentrations for the primary and field duplicate samples were 280 and 360 µg/L (with non-SGC TPH-d concentrations of 1,500 and 1,700 µg/L), respectively. The SGC TPH-d results indicate that biodegradation is occurring. The recoveries of SGC TPH-d to non-SGC TPH-d for RHMW02 have ranged from 14 to 57 percent, indicating that 43–86 percent of the reported non-SGC TPH mass is likely biodegradation by-products.

Non-SGC chromatograms for the RHMW02 sample show signal evidence of soluble components of degraded jet fuel, with a large portion of the mass showing a signature indicative of polar metabolites from petroleum degradation. The corresponding SGC chromatogram for RHMW02 is characteristic of dissolved aromatic hydrocarbons expected from jet fuel. Further evaluation of the SGC TPH results and natural attenuation, along with the potential role of other site-specific factors (e.g., complex geology, surface water recharge, infiltration rates), was included in the AOC Statement of Work Sections 6 and 7 CSM report (DON 2019b).

Table 4-1 presents a comparison of TPH-d and TPH-o concentrations without and with SGC for RHMW01, RHMW02, and RHMW03 from the Fourth Quarter 2016 monitoring event onward.

Table 4-1: Comparison of TPH Concentrations Without and With Silica Gel Cleanup, First Quarter 2020 Quarterly Groundwater Monitoring Event, Red Hill Bulk Fuel Storage Facility, JBPHH, O'ahu, Hawai'i

Monitoring Well	Monitoring Event [a]	TPH-d (non-SGC) (µg/L)	TPH-d w/ SGC (µg/L)	Percent of Polar Compounds (SGC Result) in Non-SGC TPH-d Result	TPH-o (non-SGC) (µg/L)	TPH-o w/ SGC (µg/L)	Percent of Polar Compounds (SGC Result) in Non-SGC TPH-o Result

Note: **Bold text** indicates concentrations exceeding the TPH-d screening criterion of 400 µg/L.

% = percent

µg/L = microgram per liter

TPH-d = total petroleum hydrocarbons – diesel range organics

TPH-o = total petroleum hydrocarbons – residual range organics (i.e., TPH-oil)

Qtr = quarter

SGC = silica gel cleanup

J = estimated value

U = non-detect value

[a] Table presents only quarterly and monthly monitoring events during which TPH with SGC is analyzed.

[b] Primary and field duplicate samples.

[c] Result was flagged as non-detect during data validation due to laboratory method blank contamination.

4.1.9 Total Organic Carbon

TOC concentrations in groundwater samples include all volatile, non-volatile, soluble, and insoluble forms of carbon present in the sample. TOC concentrations are useful especially for samples with known high concentrations of polar hydrocarbons and metabolites, which are not efficiently extracted and analyzed using the TPH-d and TPH-o analysis. However, as the TOC method (EPA 9060) does not discriminate between petroleum and non-petroleum hydrocarbons, TOC must be evaluated in conjunction with TPH and other NAP results to determine if the TOC concentrations found in groundwater samples may be contributed by petroleum constituents in groundwater.

TOC results in RHMW01, RHMW02, and RHMW03 are in line with historical TPH, SGC TPH, and NAP data, indicating that petroleum constituents and petroleum biodegradation by-products are present at these wells, contributing to TOC concentrations. Additionally, the TOC concentrations were higher than corresponding TPH concentrations (e.g., for RHMW02, TOC was 3.6 mg/L and TPH-d was 1.5 mg/L [1,700 µg/L]), confirming that the TPH method does not capture all polar hydrocarbons and metabolites present in the groundwater and supporting evidence of natural attenuation occurring at these locations. Additionally, the TOC concentrations at other locations may also indicate the presence of polar hydrocarbons and metabolites that are not captured in the TPH extraction; however, NAP concentrations at these locations do not indicate that biodegradation is currently occurring at these locations and, instead, suggest a non-petroleum source of carbon.

4.2 NAP CONCENTRATIONS

Graphs of cumulative groundwater NAP results are presented in Appendix A.3.1, and graphs of NAP results for the First Quarter 2020 are presented in Appendix A.3.2. Evaluation of the NAP data from the Fourth Quarter 2016 monitoring event onward indicates there is no evidence that seasonal variations (i.e., wet- and dry-season effects) influence NAP concentrations (and thus biodegradation) in the groundwater at the Red Hill monitoring well network.

The NAP concentrations at RHMW01, RHMW02, and RHMW03 indicate that aerobic or anaerobic biodegradation may be occurring at these locations. This is confirmed by the SGC TPH results, which generally present a relatively low ratio of non-biodegraded (non-polar) hydrocarbons to biodegradation by-product hydrocarbons (polar hydrocarbons and metabolites). However, evaluation of NAPs along with TPH trends (based on numerical TPH results alone) must be conducted with caution. The variability of TPH-d procedures and results from one laboratory to another precludes reliable trend analyses, such that higher or lower results over time may be due not to changing conditions in the groundwater at the Facility but rather to changes in the laboratory's TPH extraction and analysis protocols. Nonetheless, the RHMW03 NAP results (i.e., depleted DO and relatively high concentrations of other electron acceptors) indicate that continuous aerobic biodegradation is occurring at this location, possibly due to an influx of oxygenated water at this location providing sufficient DO that anaerobic biodegradation is not evident. Similarly, continuous aerobic and anaerobic biodegradation is occurring at RHMW01 and RHMW02 based on the depleted electron acceptors and presence of dissolved methane. Notably, methane concentrations at RHMW01 and RHMW02 have generally decreased over time, which may be an indicator of reduced available biodegradable fuel at the subsurface from various natural source-zone depletion processes and natural attenuation.

Additional evaluation of the 2014 fuel release, natural source-zone depletion, and natural attenuation at the Facility is discussed in the AOC Statement of Work Sections 6 and 7 CSM report (DON 2019b).

5. Summary, Conclusions, and Recommendations

5.1 SUMMARY

During the First Quarter 2020 groundwater monitoring event, AECOM Technical Services, Inc. personnel collected groundwater samples from 20 monitoring locations within the Red Hill groundwater monitoring network. These include: the sampling point at Red Hill Shaft (RHMW2254-01); 11 single-screen monitoring wells located within the Facility boundary (RHMW01 through RHMW10 and OWDFMW01); 1 deep monitor well located outside of the Facility at the Hālawa Correctional Facility (Hālawa Deep Monitor Well [HDMW2253-03]); 1 sampling zone at multilevel monitoring well RHMW11 and 3 sampling zones at multilevel monitoring well RHMW14, both located at the Hālawa Correctional Facility; and 3 sampling zones at multilevel monitoring well RHMW15, located within the Facility boundary. Multilevel monitoring well zones sampled during this event were RHMW11 Zone 5, RHMW14 Zones 1 to 3, and RHMW15 Zones 3 to 5. The following multilevel monitoring zones were not included in this monitoring event: RHMW11 Zones 1 to 4 and RHMW15 Zones 1 and 2 due to lack of detections of COPCs in previous monitoring events, and RHMW11 Zones 6 to 8 and RHMW14 Zones 4 to 8 due to the low hydraulic conductivity of the aquifer in these zones. This groundwater sampling event was conducted as part of the Red Hill groundwater LTM program.

A table of cumulative historical groundwater results is presented in Appendix A.1, and historical groundwater COPC concentration graphs are presented in Appendix A.2. No detectable amounts of free product, sheen, or color were present in groundwater from any monitoring well. During the First Quarter (January) 2020 event, COPCs were detected at RHMW2254–01, RHMW01, RHMW02, RHMW03, RHMW04, RHMW05, RHMW07, RHMW09, and OWDFMW01, and no SSRBL exceedances were reported; no COPCs were detected in any other monitoring well or zone sampled during this event. Analytical results for the groundwater monitoring event are summarized as follows:

- *RHMW06, RHMW08, RHMW10, RHMW11-05, RHMW14-01, RHMW14-02, RHMW14-03 (primary and duplicate), RHMW15-03, RHMW15-04, RHMW15-05, and HDMW2253-03:* No COPCs were detected.
- *RHMW2254-01 (primary and duplicate):* TPH-d (100 and < 25 U µg/L) was detected at a concentration below screening criterion (400 µg/L) in the primary sample but was not detected in the duplicate sample. Evaluation of the sample, field QC, and laboratory QC chromatograms indicate laboratory artifacts contribution. The TPH-d with SGC analysis result was non-detect, suggesting that the non-SGC TPH-d result consists entirely of non-petroleum hydrocarbons.
- *RHMW01:* TPH-d (180 J µg/L) was detected at a concentration below the screening criterion (400 µg/L). The TPH-d with SGC analysis result was 39 J µg/L, suggesting that the non-SGC TPH-d result is mostly biodegradation by-products.
- *RHMW02 (primary and duplicate):* TPH-d (1,500 J and 1,700 µg/L), 1-methylnaphthalene (23 and 24 µg/L), 2-methylnaphthalene (23 and 23 µg/L), and naphthalene (52 and 57 µg/L) were detected at concentrations exceeding their respective screening criteria (400, 10, 10, and 17 µg/L). TPH-d was also detected in the SGC analysis but at significantly lower concentrations (280 and 360 µg/L), suggesting that the majority of the non-SGC TPH-d results are biodegradation by-products. The concentrations of TPH-d did not exceed the SSRBL of 4,500 µg/L. TPH-g (58 and 49 µg/L) was detected at concentrations below the screening criterion (300 µg/L). No other COPCs were detected.
- *RHMW03:* TPH-d (260 µg/L) and TPH-o (250 µg/L) were detected at concentrations below their respective screening criteria (400 and 500 µg/L). The TPH-d and TPH-o with SGC

analysis results were non-detect, suggesting that the non-SGC TPH-d result consists entirely of biodegradation by-products.

- *RHMW04, RHMW05, RHMW07, RHMW09, and OWDFMW01:* TPH-d and/or TPH-o were detected below their respective screening criteria (400 and 500 µg/L) in RHMW04 (120 and < 40 U µg/L), RHMW05 (93 and 92 µg/L), RHMW07 (120 and 84 µg/L), RHMW09 (100 and 98 µg/L), and OWDFMW01 (120 and 120 µg/L). Evaluation of the sample, field QC, and laboratory QC chromatograms indicate laboratory artifacts contribution. TPH-d and TPH-o with SGC analysis results were non-detect except for TPH-o with SGC in RHMW07 (39 J µg/L). These results suggest that the non-SGC TPH-d and TPH-o results consist of non-petroleum hydrocarbons.

The NAP and SGC TPH data present evidence of aerobic and anaerobic biodegradation occurring in the vicinity of RHMW02 based on depleted DO, elevated dissolved methane concentrations, depleted nitrate and sulfate concentrations, high alkalinity concentrations compared to other monitoring wells in the network, and SGC TPH-d concentrations indicating that the majority of the reported non-SGC TPH mass is likely biodegradation by-products. The concentrations of NAPs and depressed SGC TPH at RHMW01 and RHMW03 suggest that biodegradation is also occurring there.

5.2 CONCLUSIONS AND RECOMMENDATIONS

During the First Quarter 2020 groundwater monitoring event, TPH-d was detected in the primary sample (but not the field duplicate sample) at sampling point RHMW2254-01 inside the shaft of Navy Supply Well 2254-01, and evaluation of chromatograms of all groundwater, field QC, and laboratory QC samples indicated that the detection was due to contribution from laboratory artifacts. Additionally, no SSRBL exceedances occurred at RHMW01, RHMW02, and RHMW03, and screening criteria exceedances (TPH-d, 1-methylnaphthalene, 2-methylnaphthalene, and naphthalene only) occurred only at RHMW02.

Based on the groundwater monitoring results, pursuant to the *Groundwater Protection Plan* (DON 2014), and in accordance with AOC Statement of Work Sections 6 and 7 (EPA Region 9 and DOH 2015), groundwater monitoring at locations within the Red Hill groundwater monitoring network will continue.

It is recommended that the Red Hill groundwater LTM program continue testing for NAPs at each monitoring event and continue SGC TPH-d and TPH-o analysis for all locations with non-SGC TPH-d or TPH-o detections.

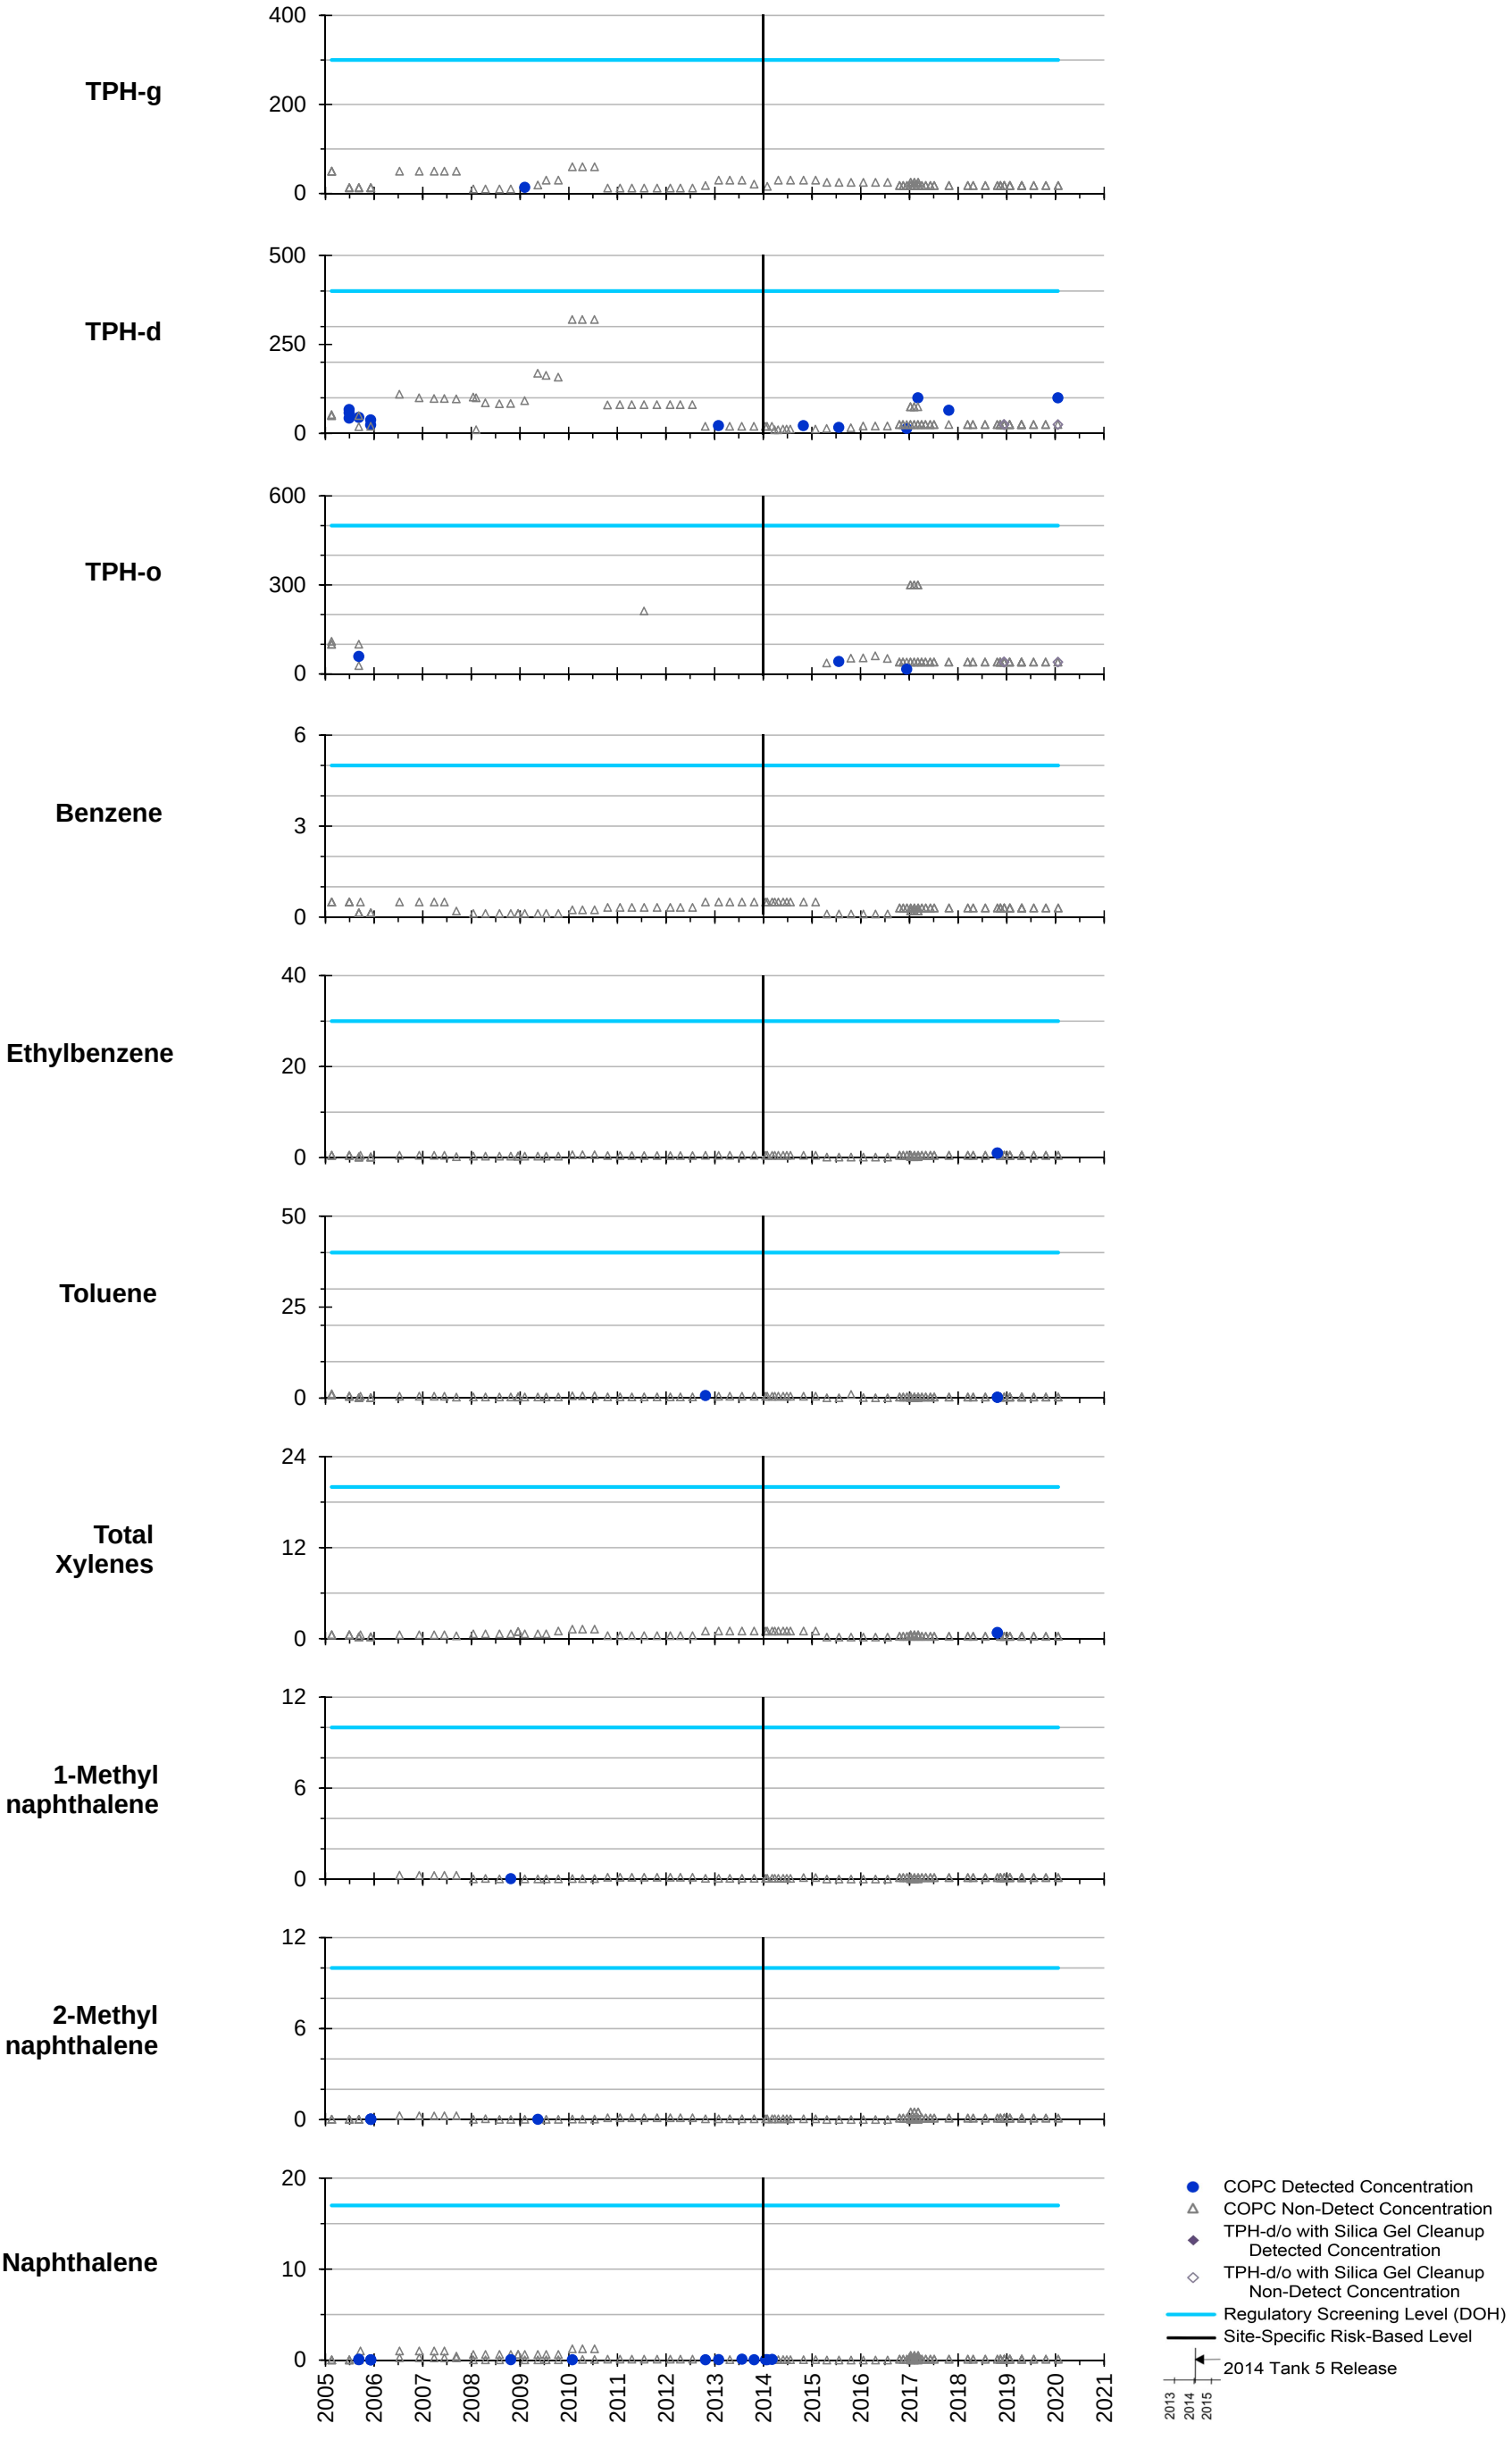
Appendix A.2 Groundwater Concentration Graphs

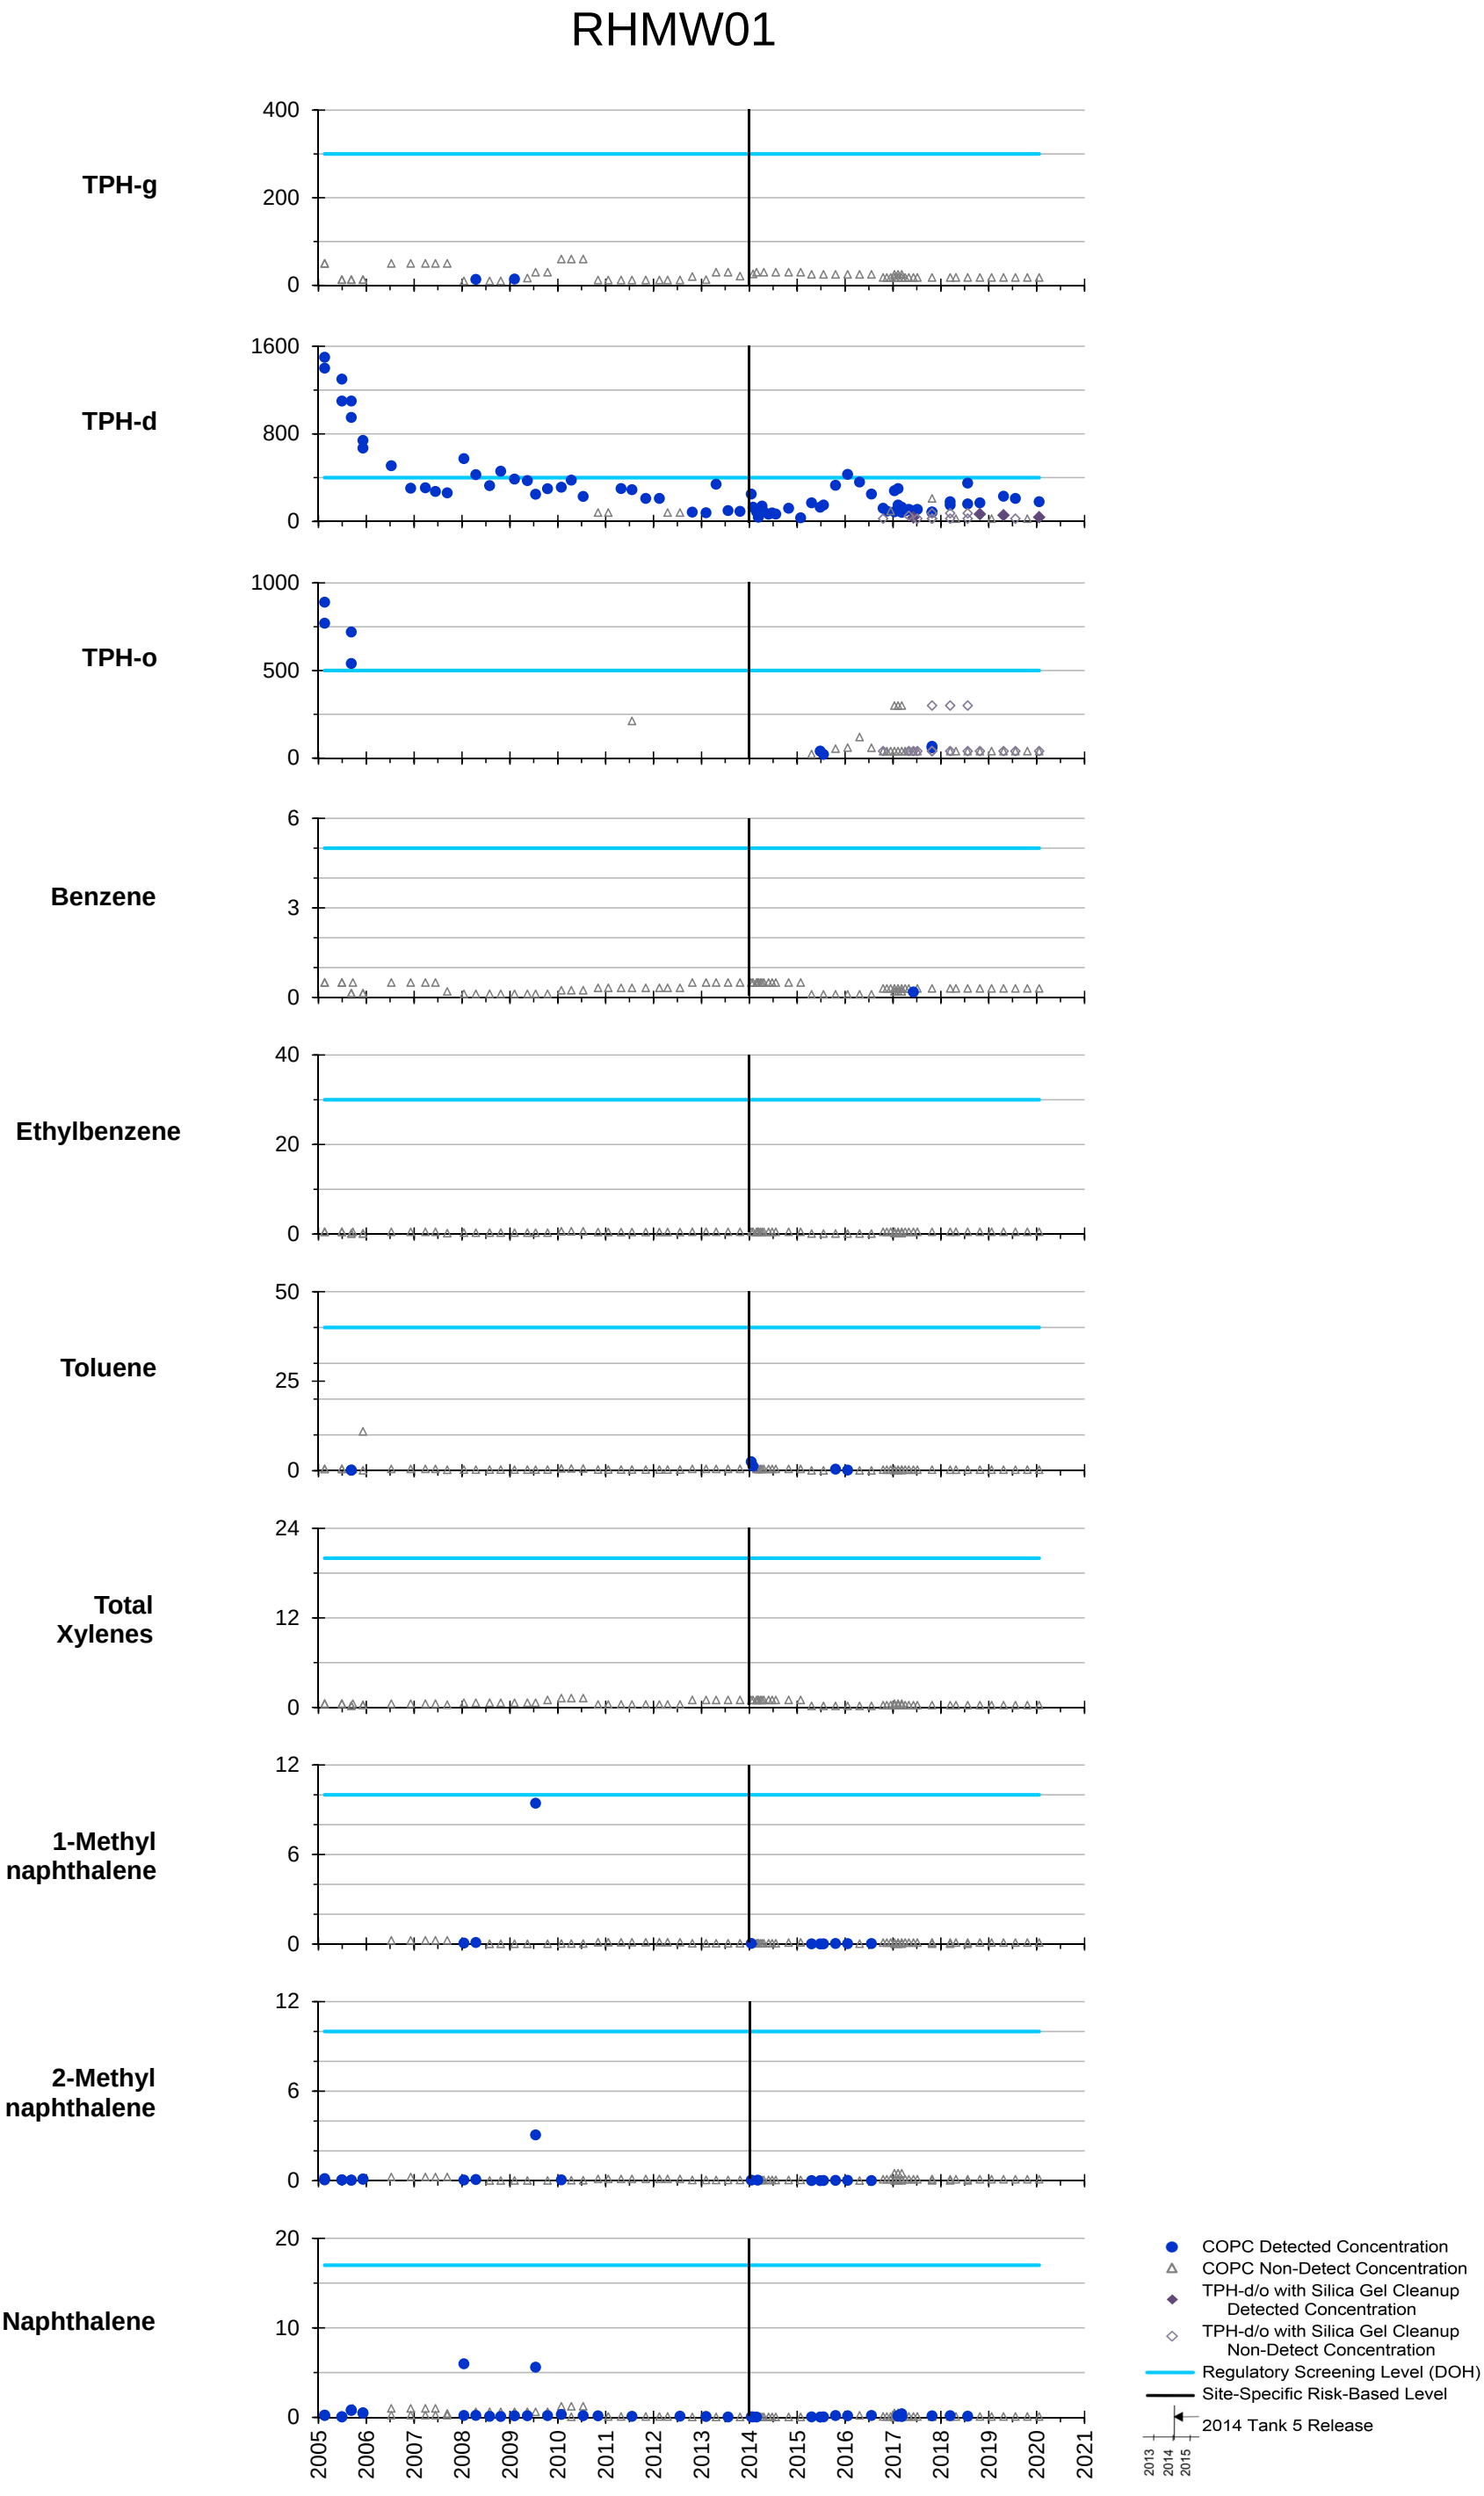
RHMW2254-01



All results in micrograms per liter (µg/L or parts per billion).

EPA Region 9 Laboratory split sampling data from First to Third Quarters 2017 included in the graphs.

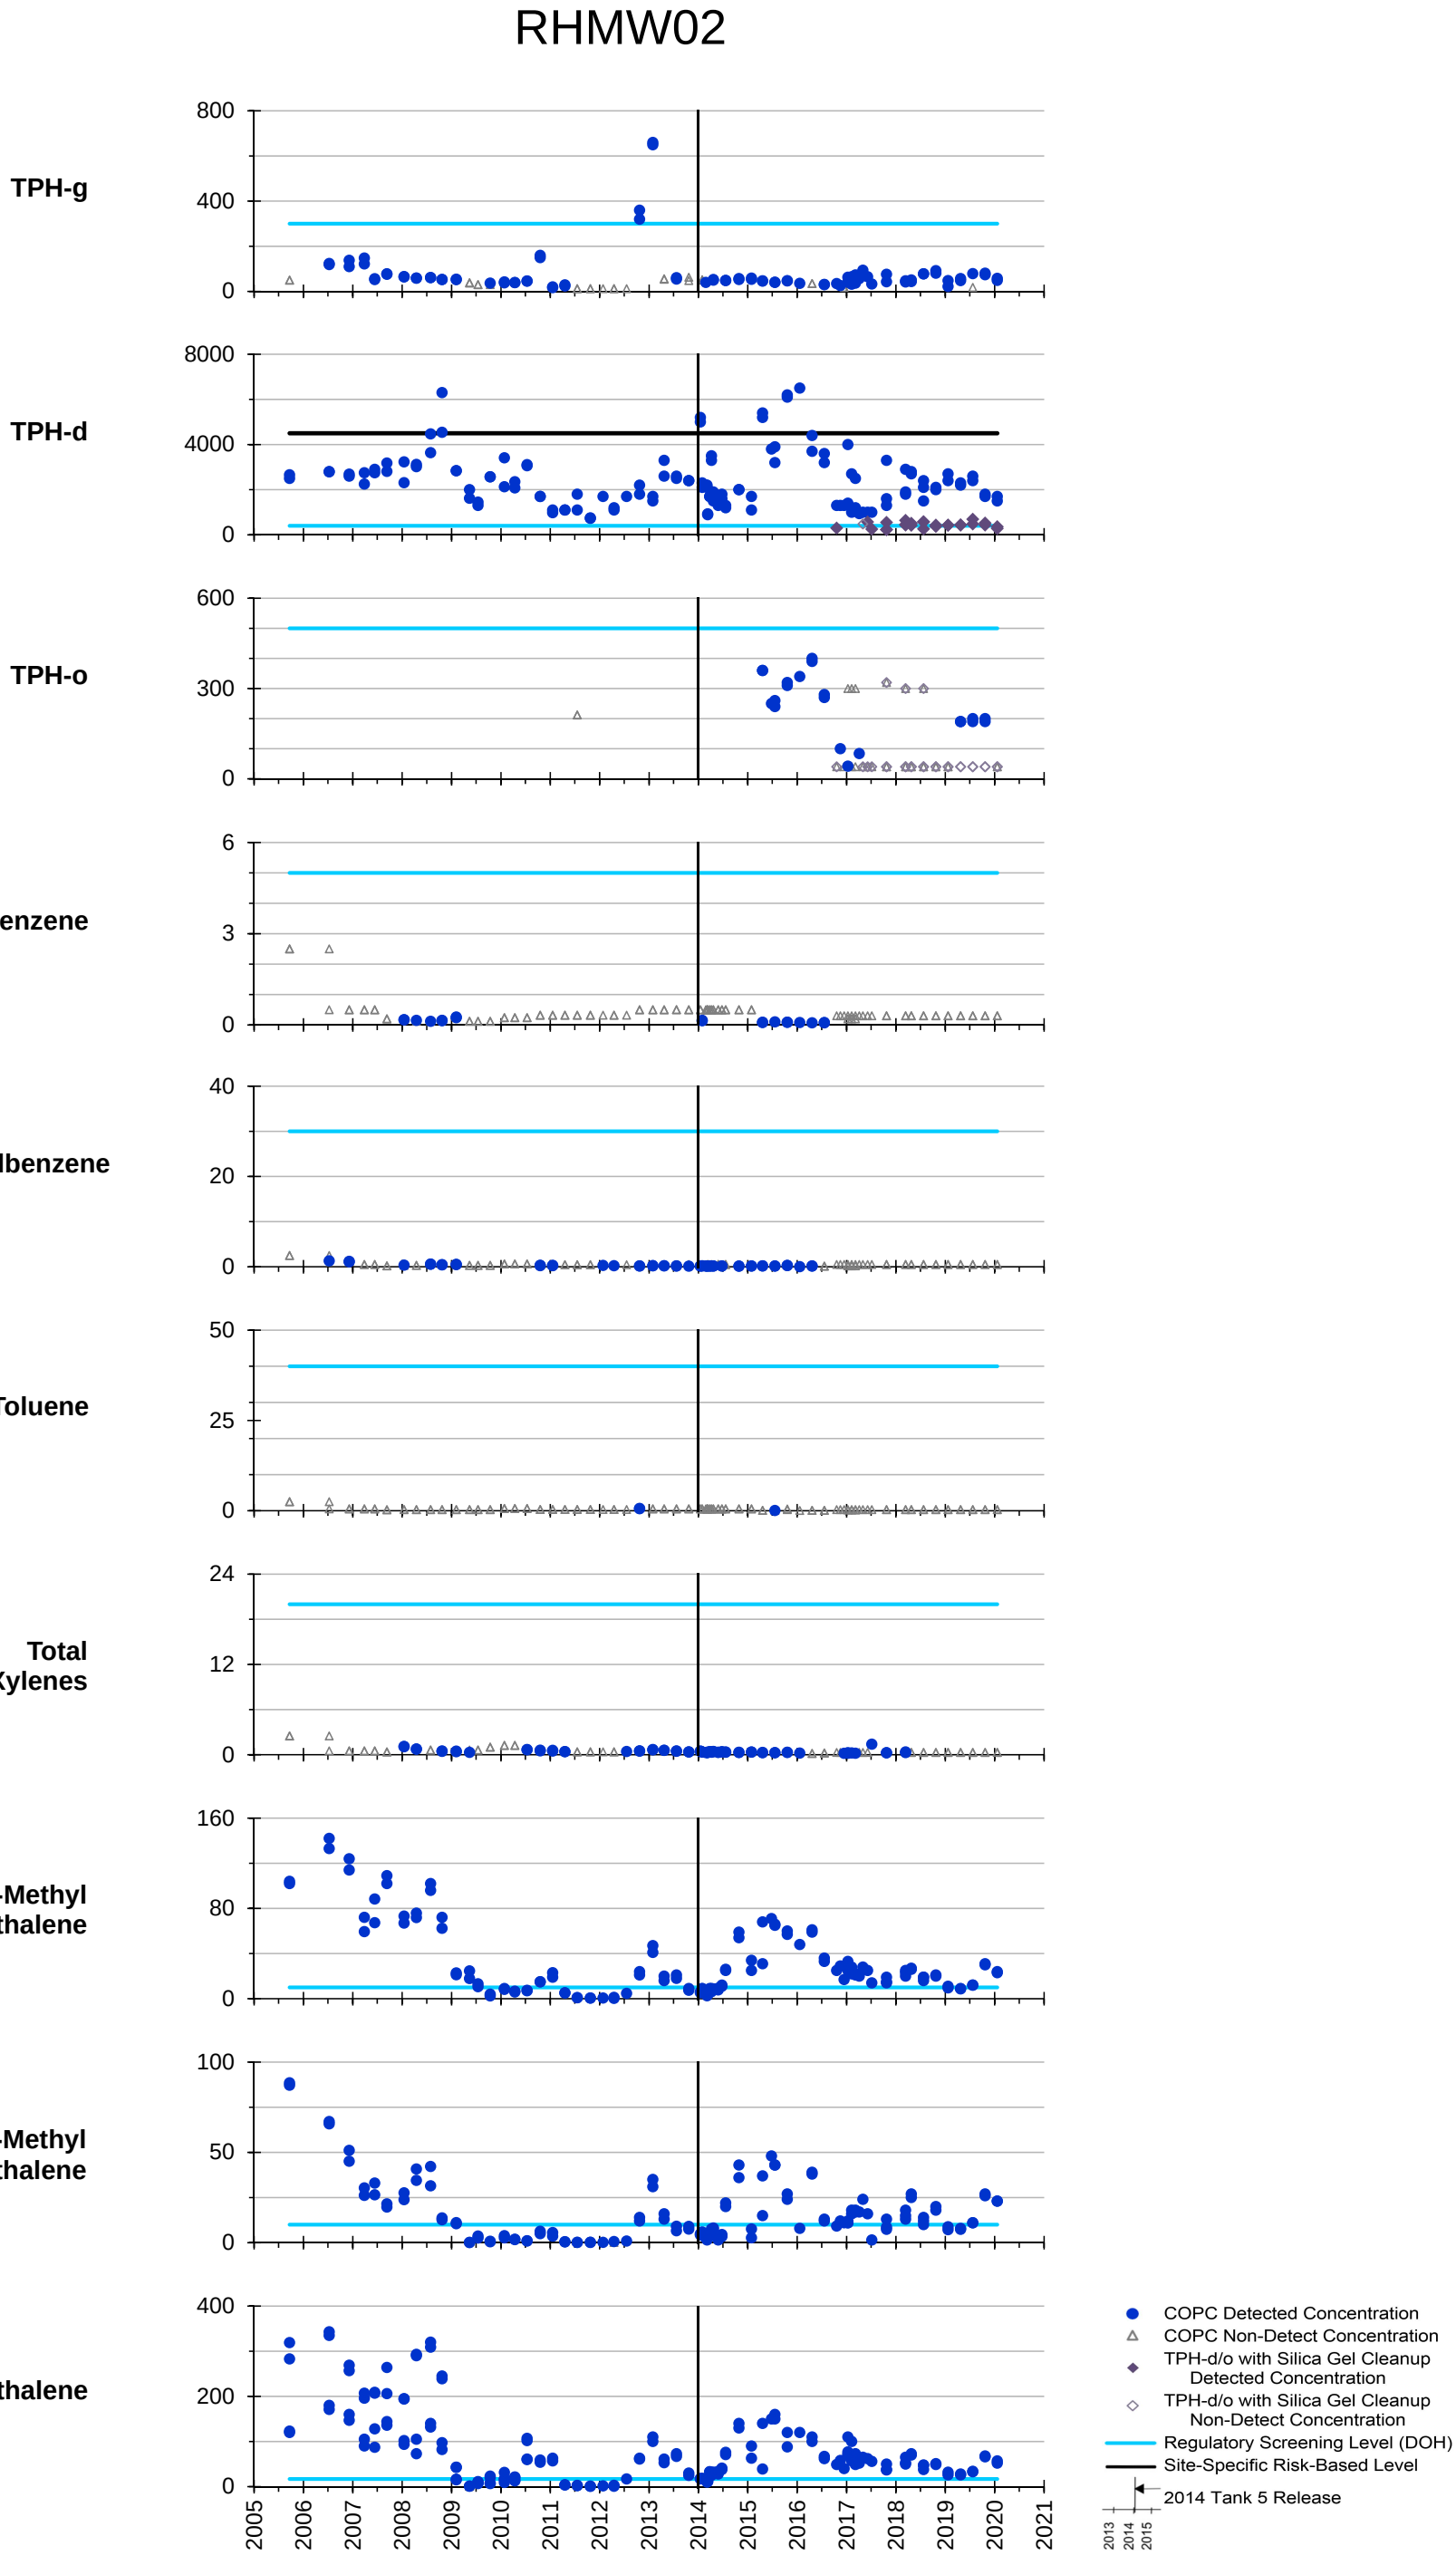
Appendix A.2 Groundwater Concentration Graphs



All results in micrograms per liter (µg/L or parts per billion).

EPA Region 9 Laboratory split sampling data from First to Fourth Quarters 2017, First Quarter 2018, and Third Quarter 2018 included in the graphs.

Appendix A.2 Groundwater Concentration Graphs

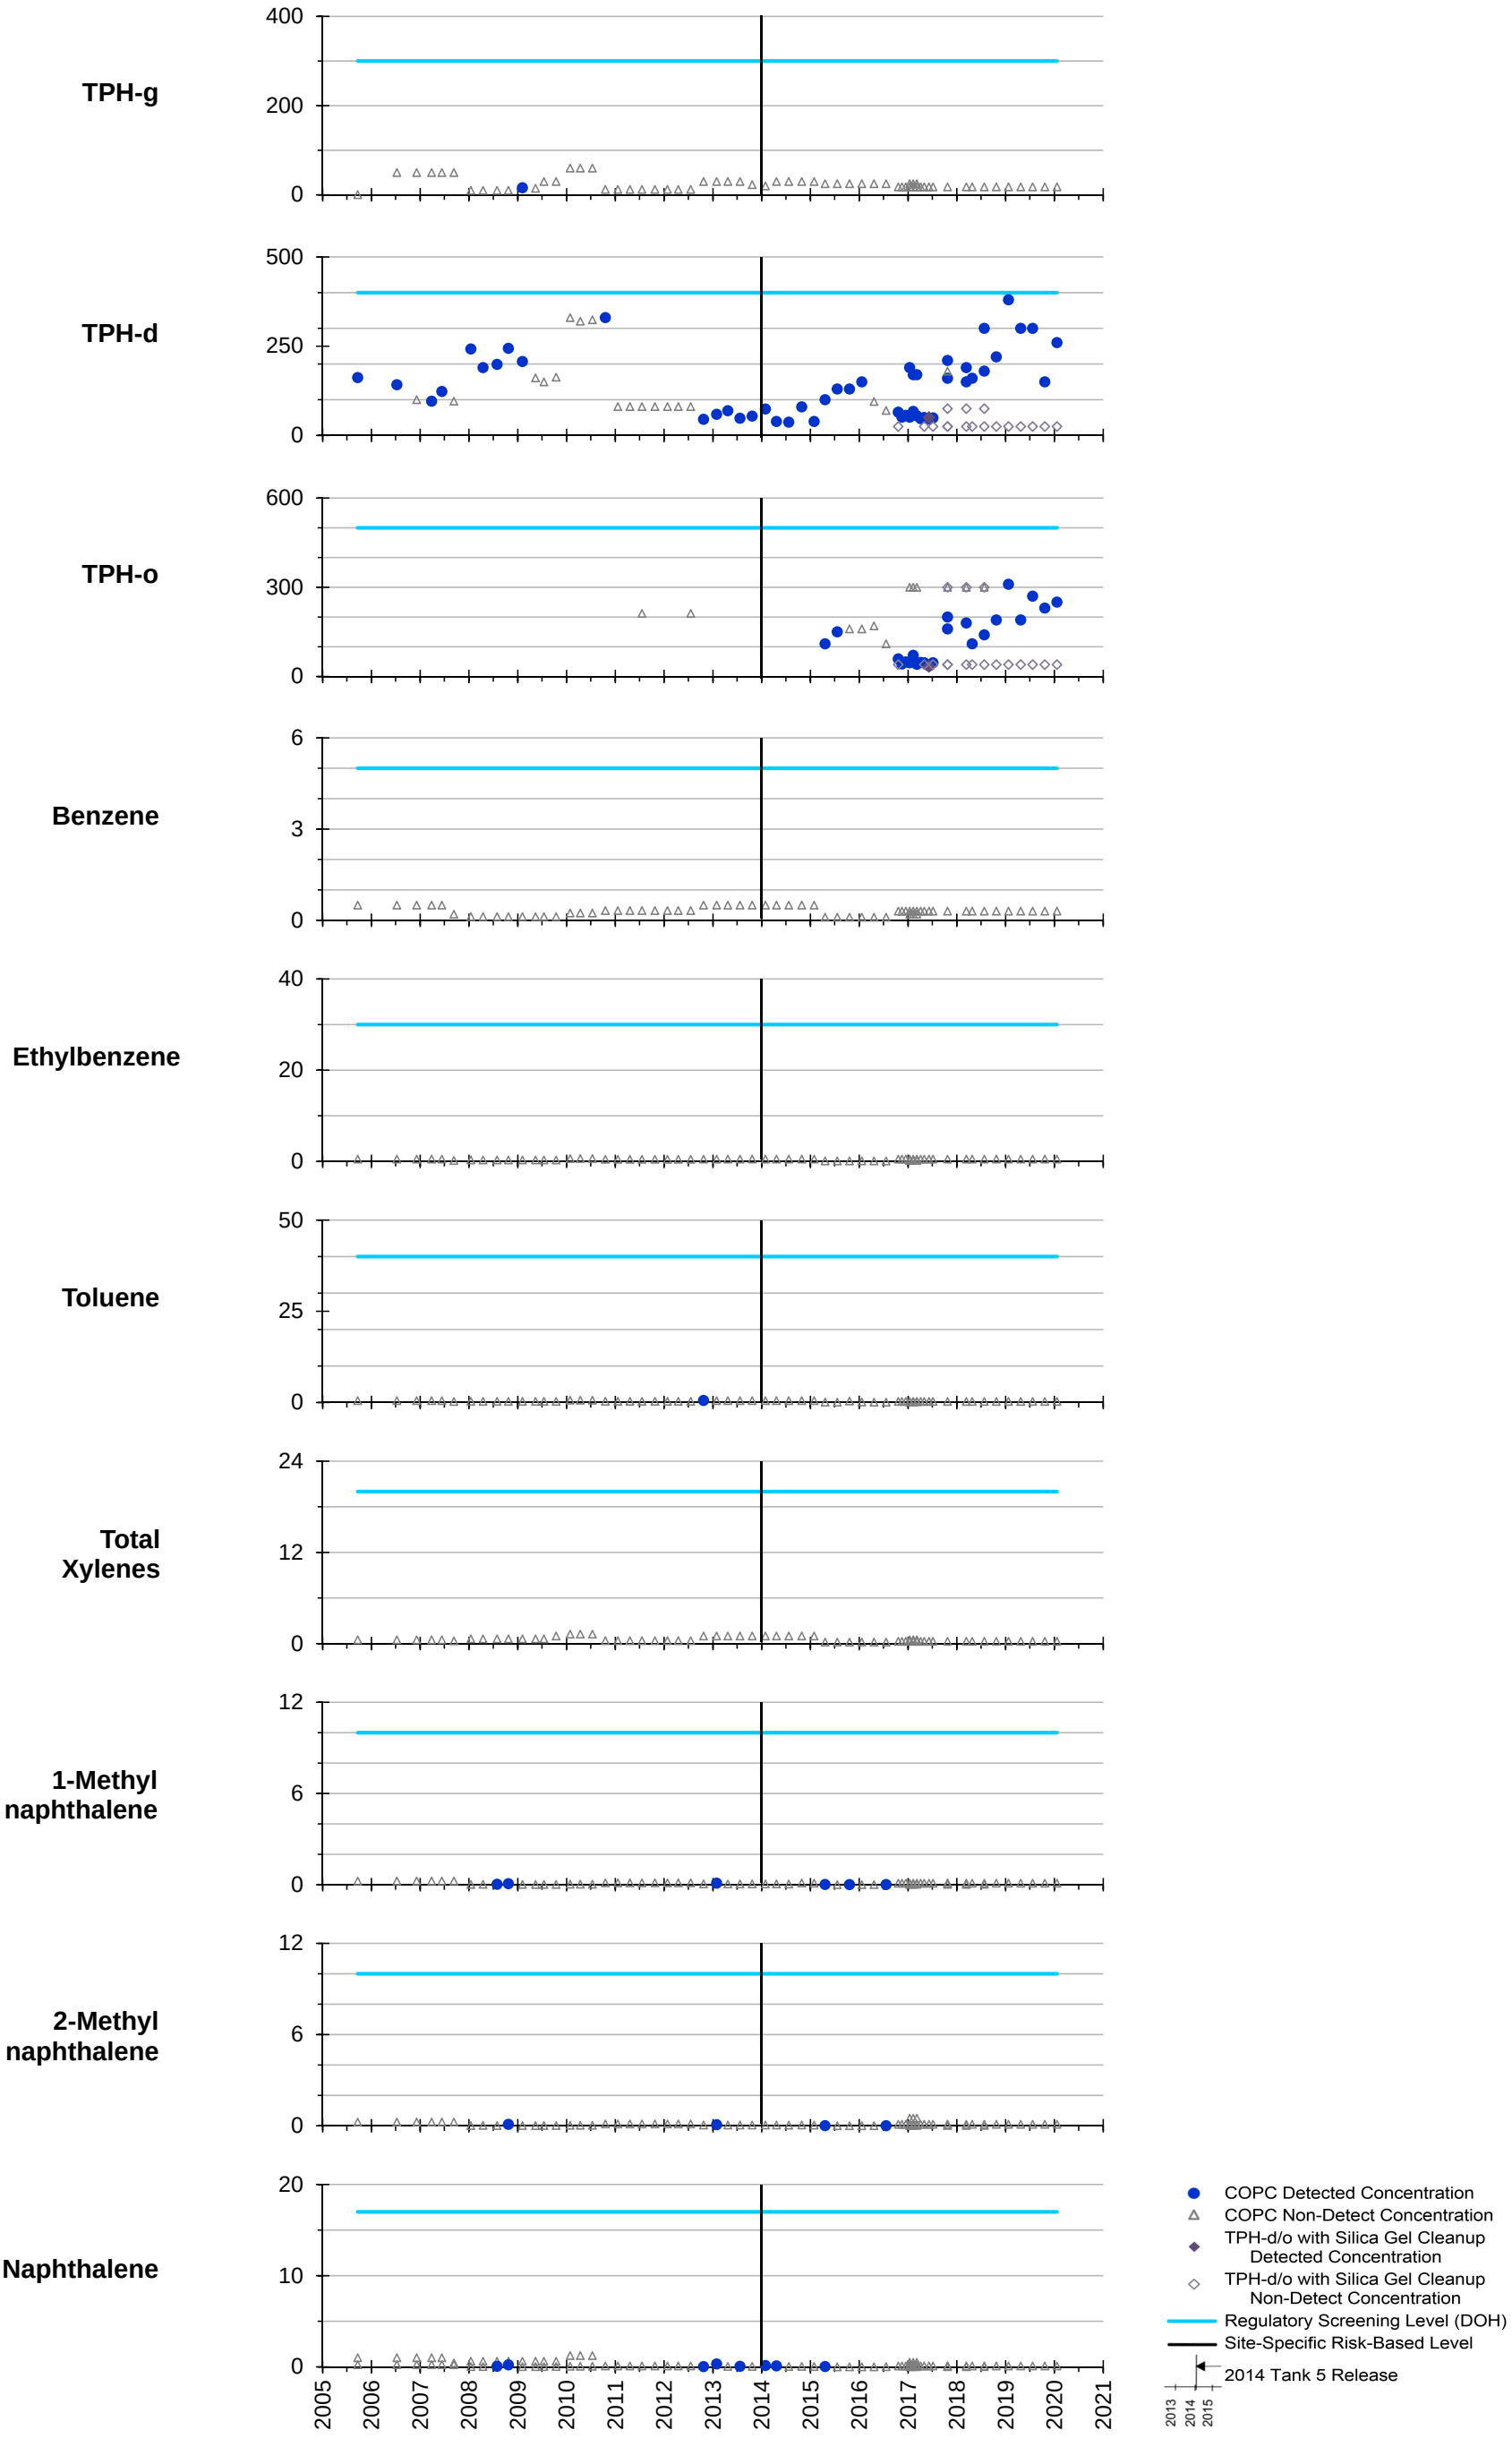


All results in micrograms per liter (µg/L or parts per billion).

EPA Region 9 Laboratory split sampling data from First to Fourth Quarters 2017, First Quarter 2018, and Third Quarter 2018 included in the graphs.

Appendix A.2 Groundwater Concentration Graphs

RHMW03

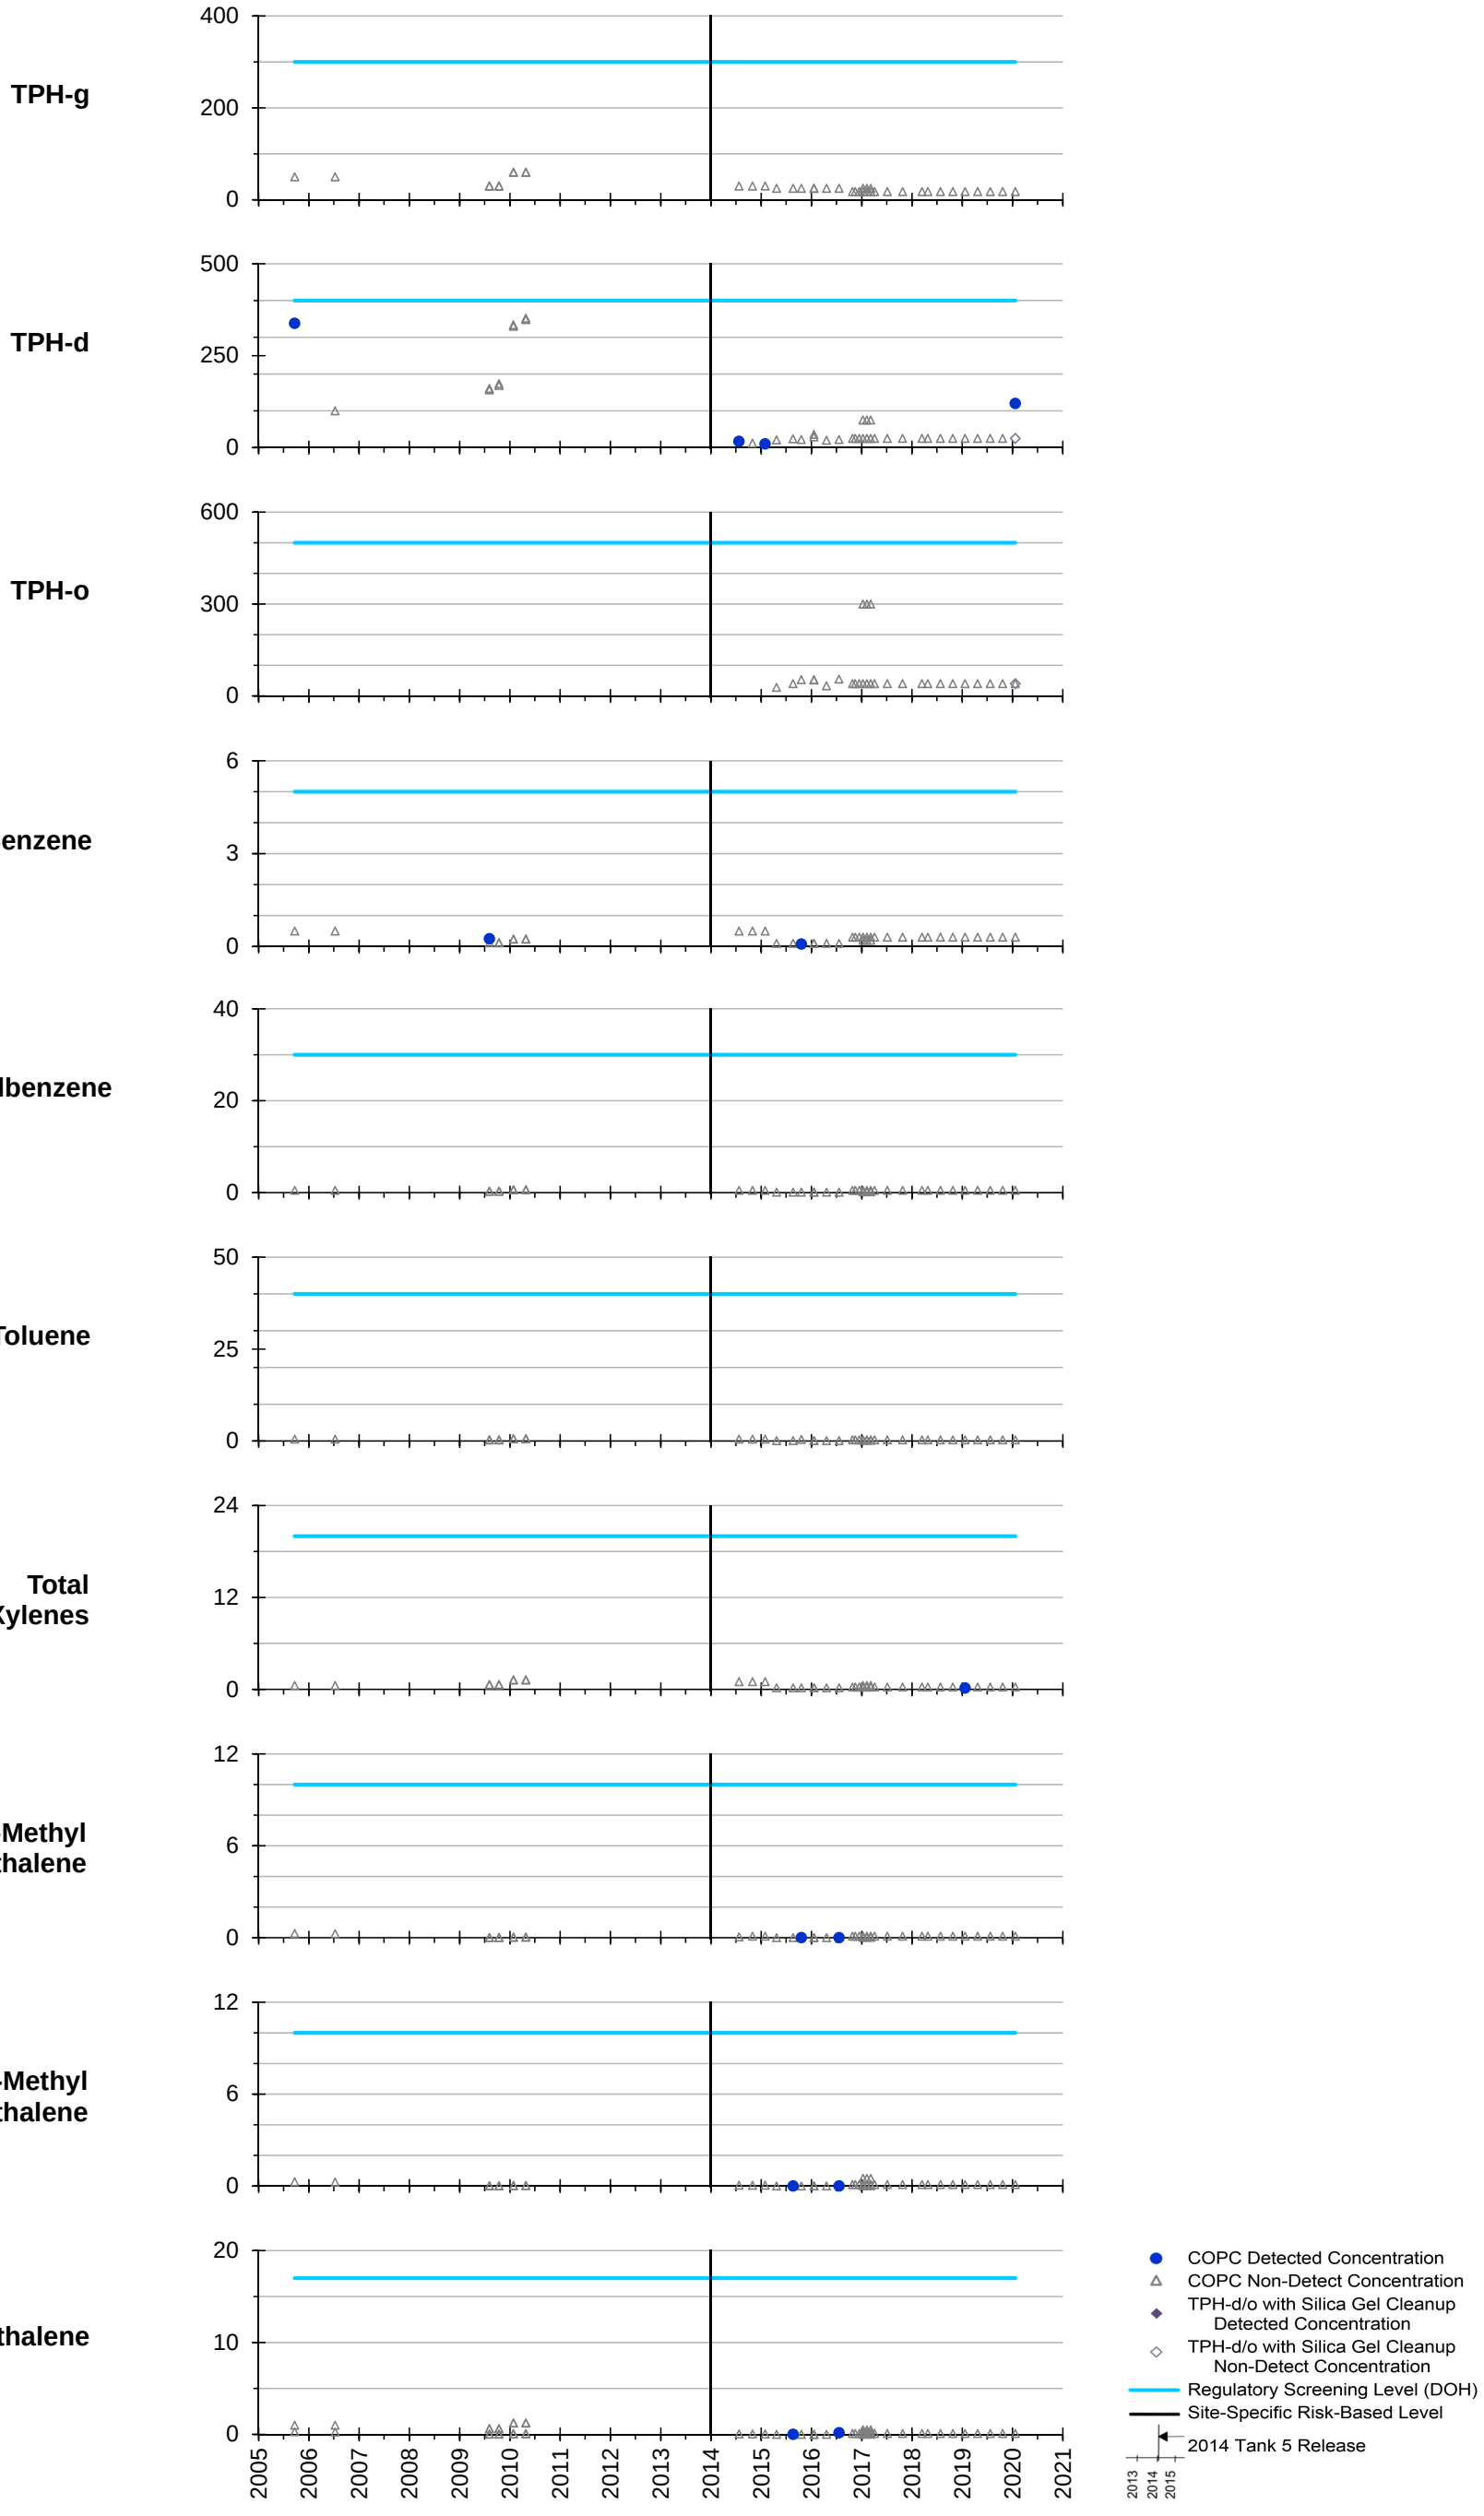


All results in micrograms per liter (µg/L or parts per billion).

EPA Region 9 Laboratory split sampling data from First to Fourth Quarters 2017, First Quarter 2018, and Third Quarter 2018 included in the graphs.

Appendix A.2 Groundwater Concentration Graphs

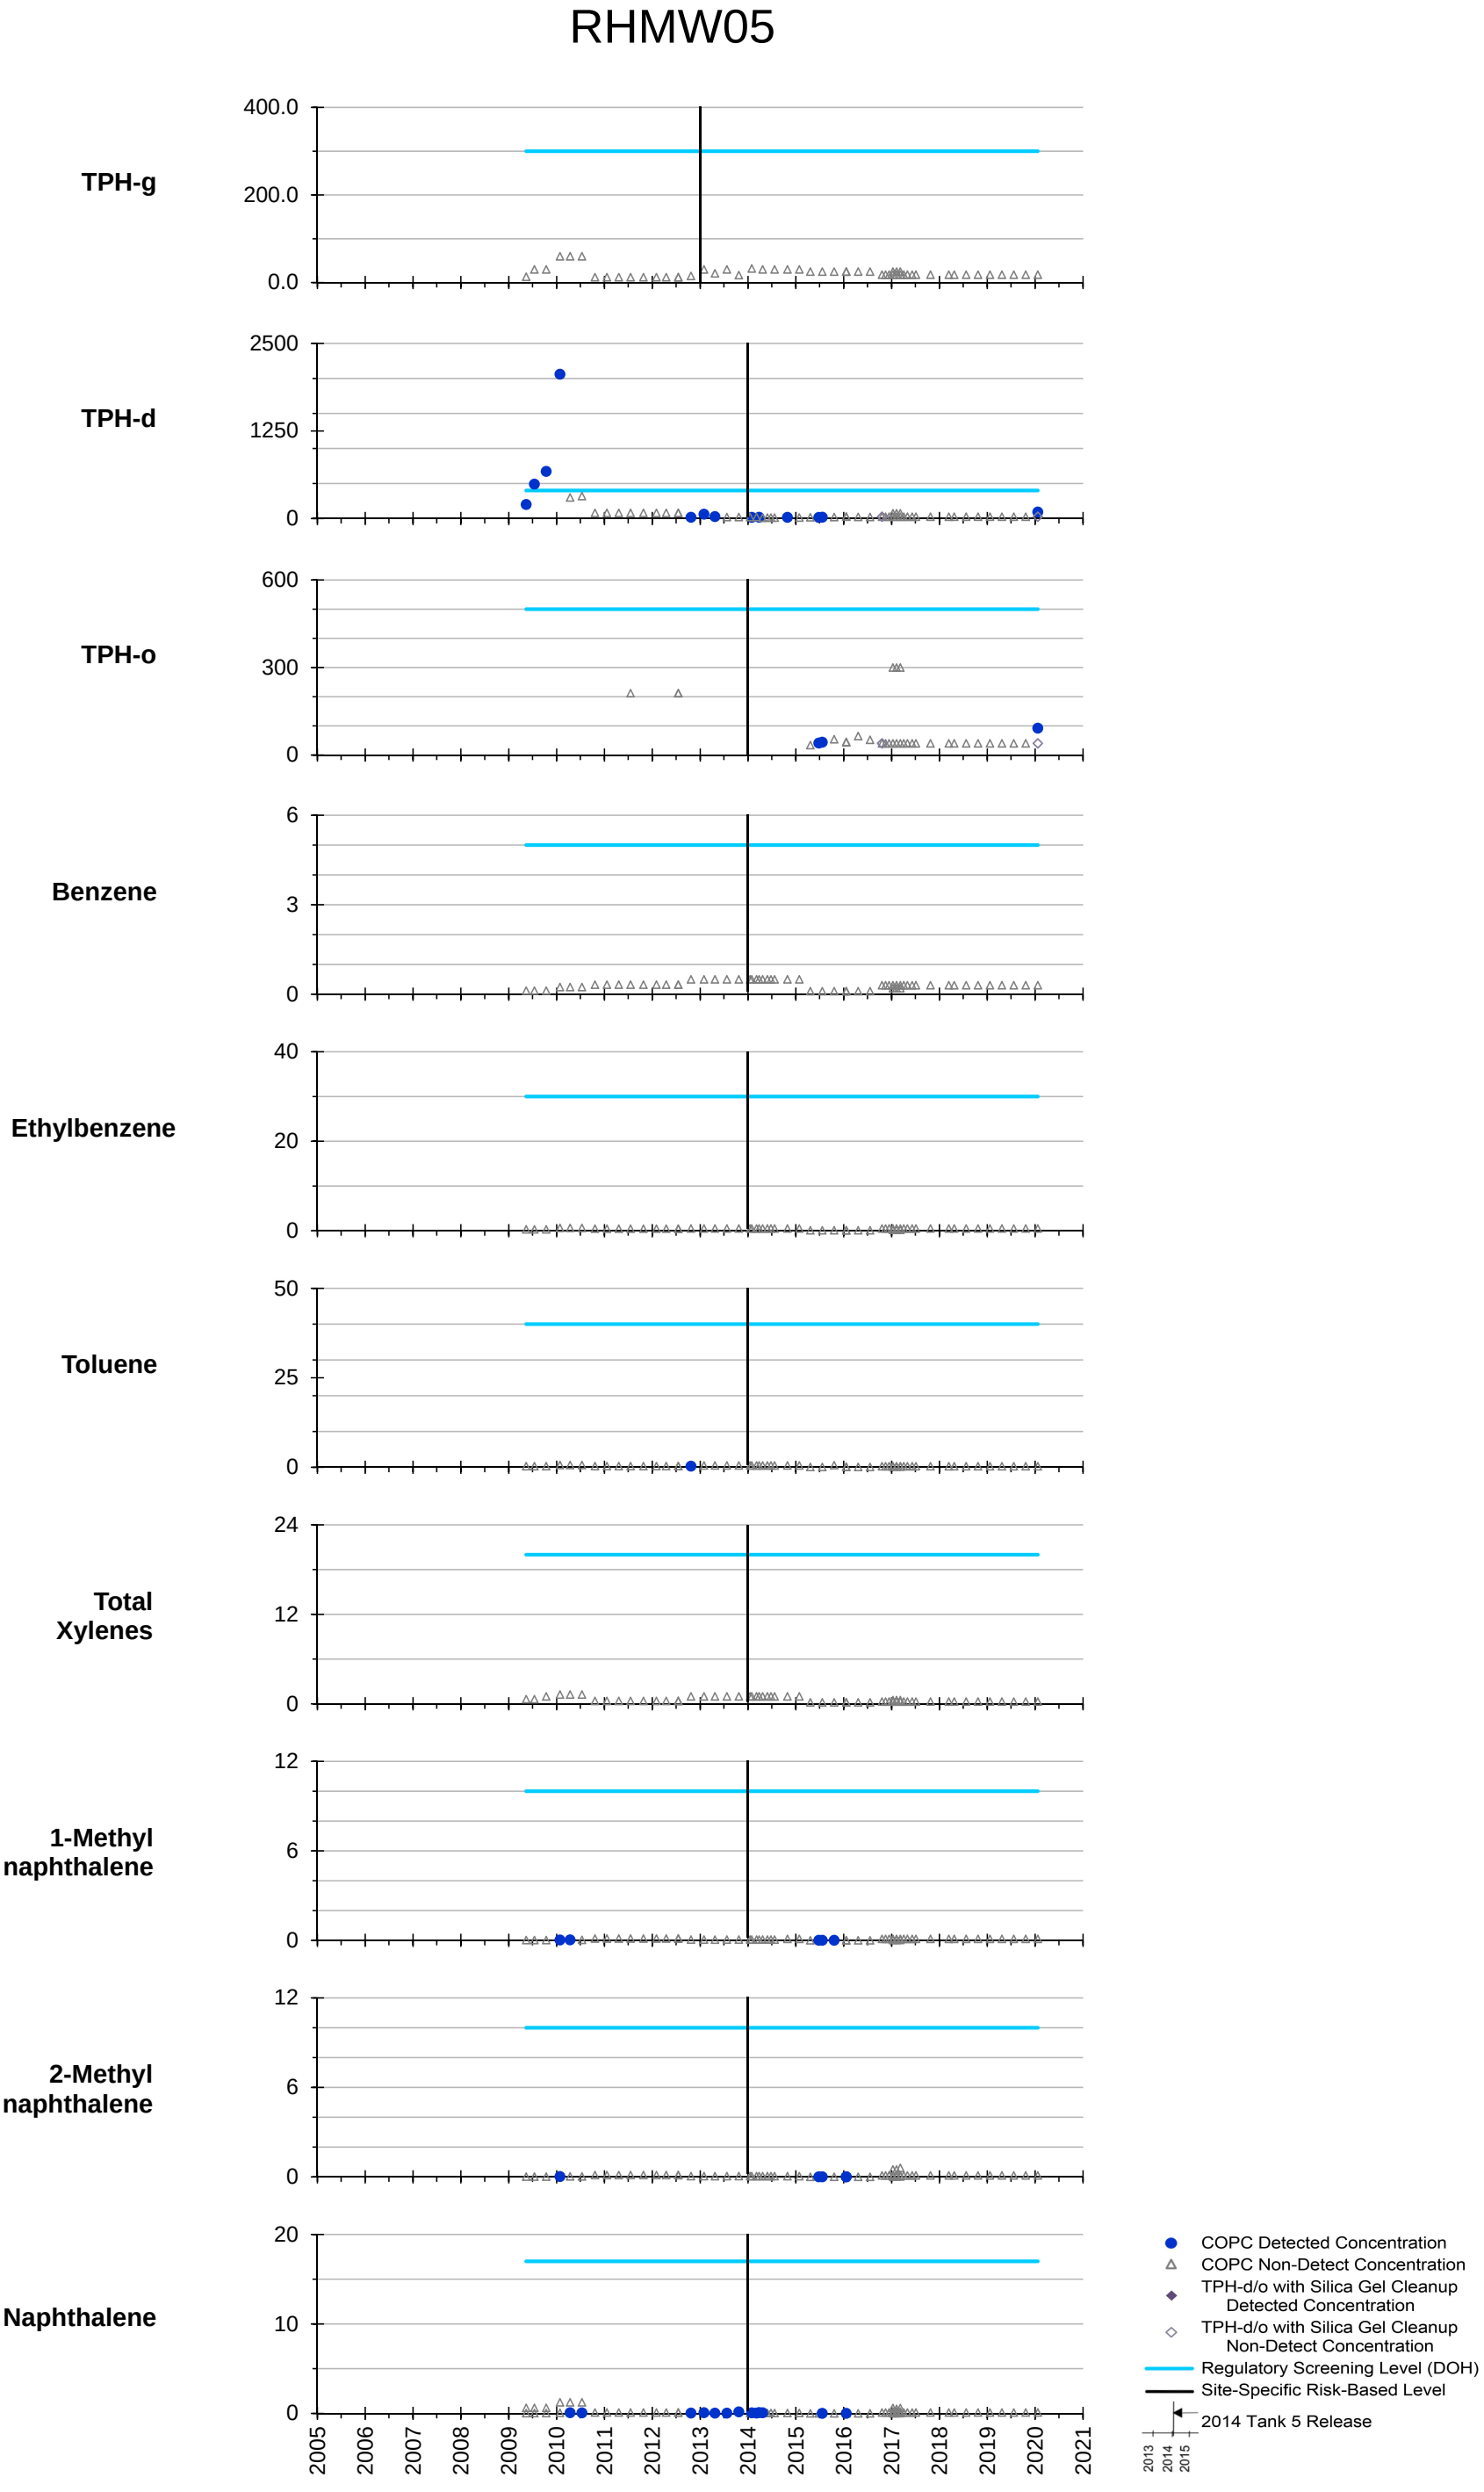
RHMW04



All results in micrograms per liter (µg/L or parts per billion).

EPA Region 9 Laboratory split sampling data from First to Third Quarters 2017 included in the graphs.

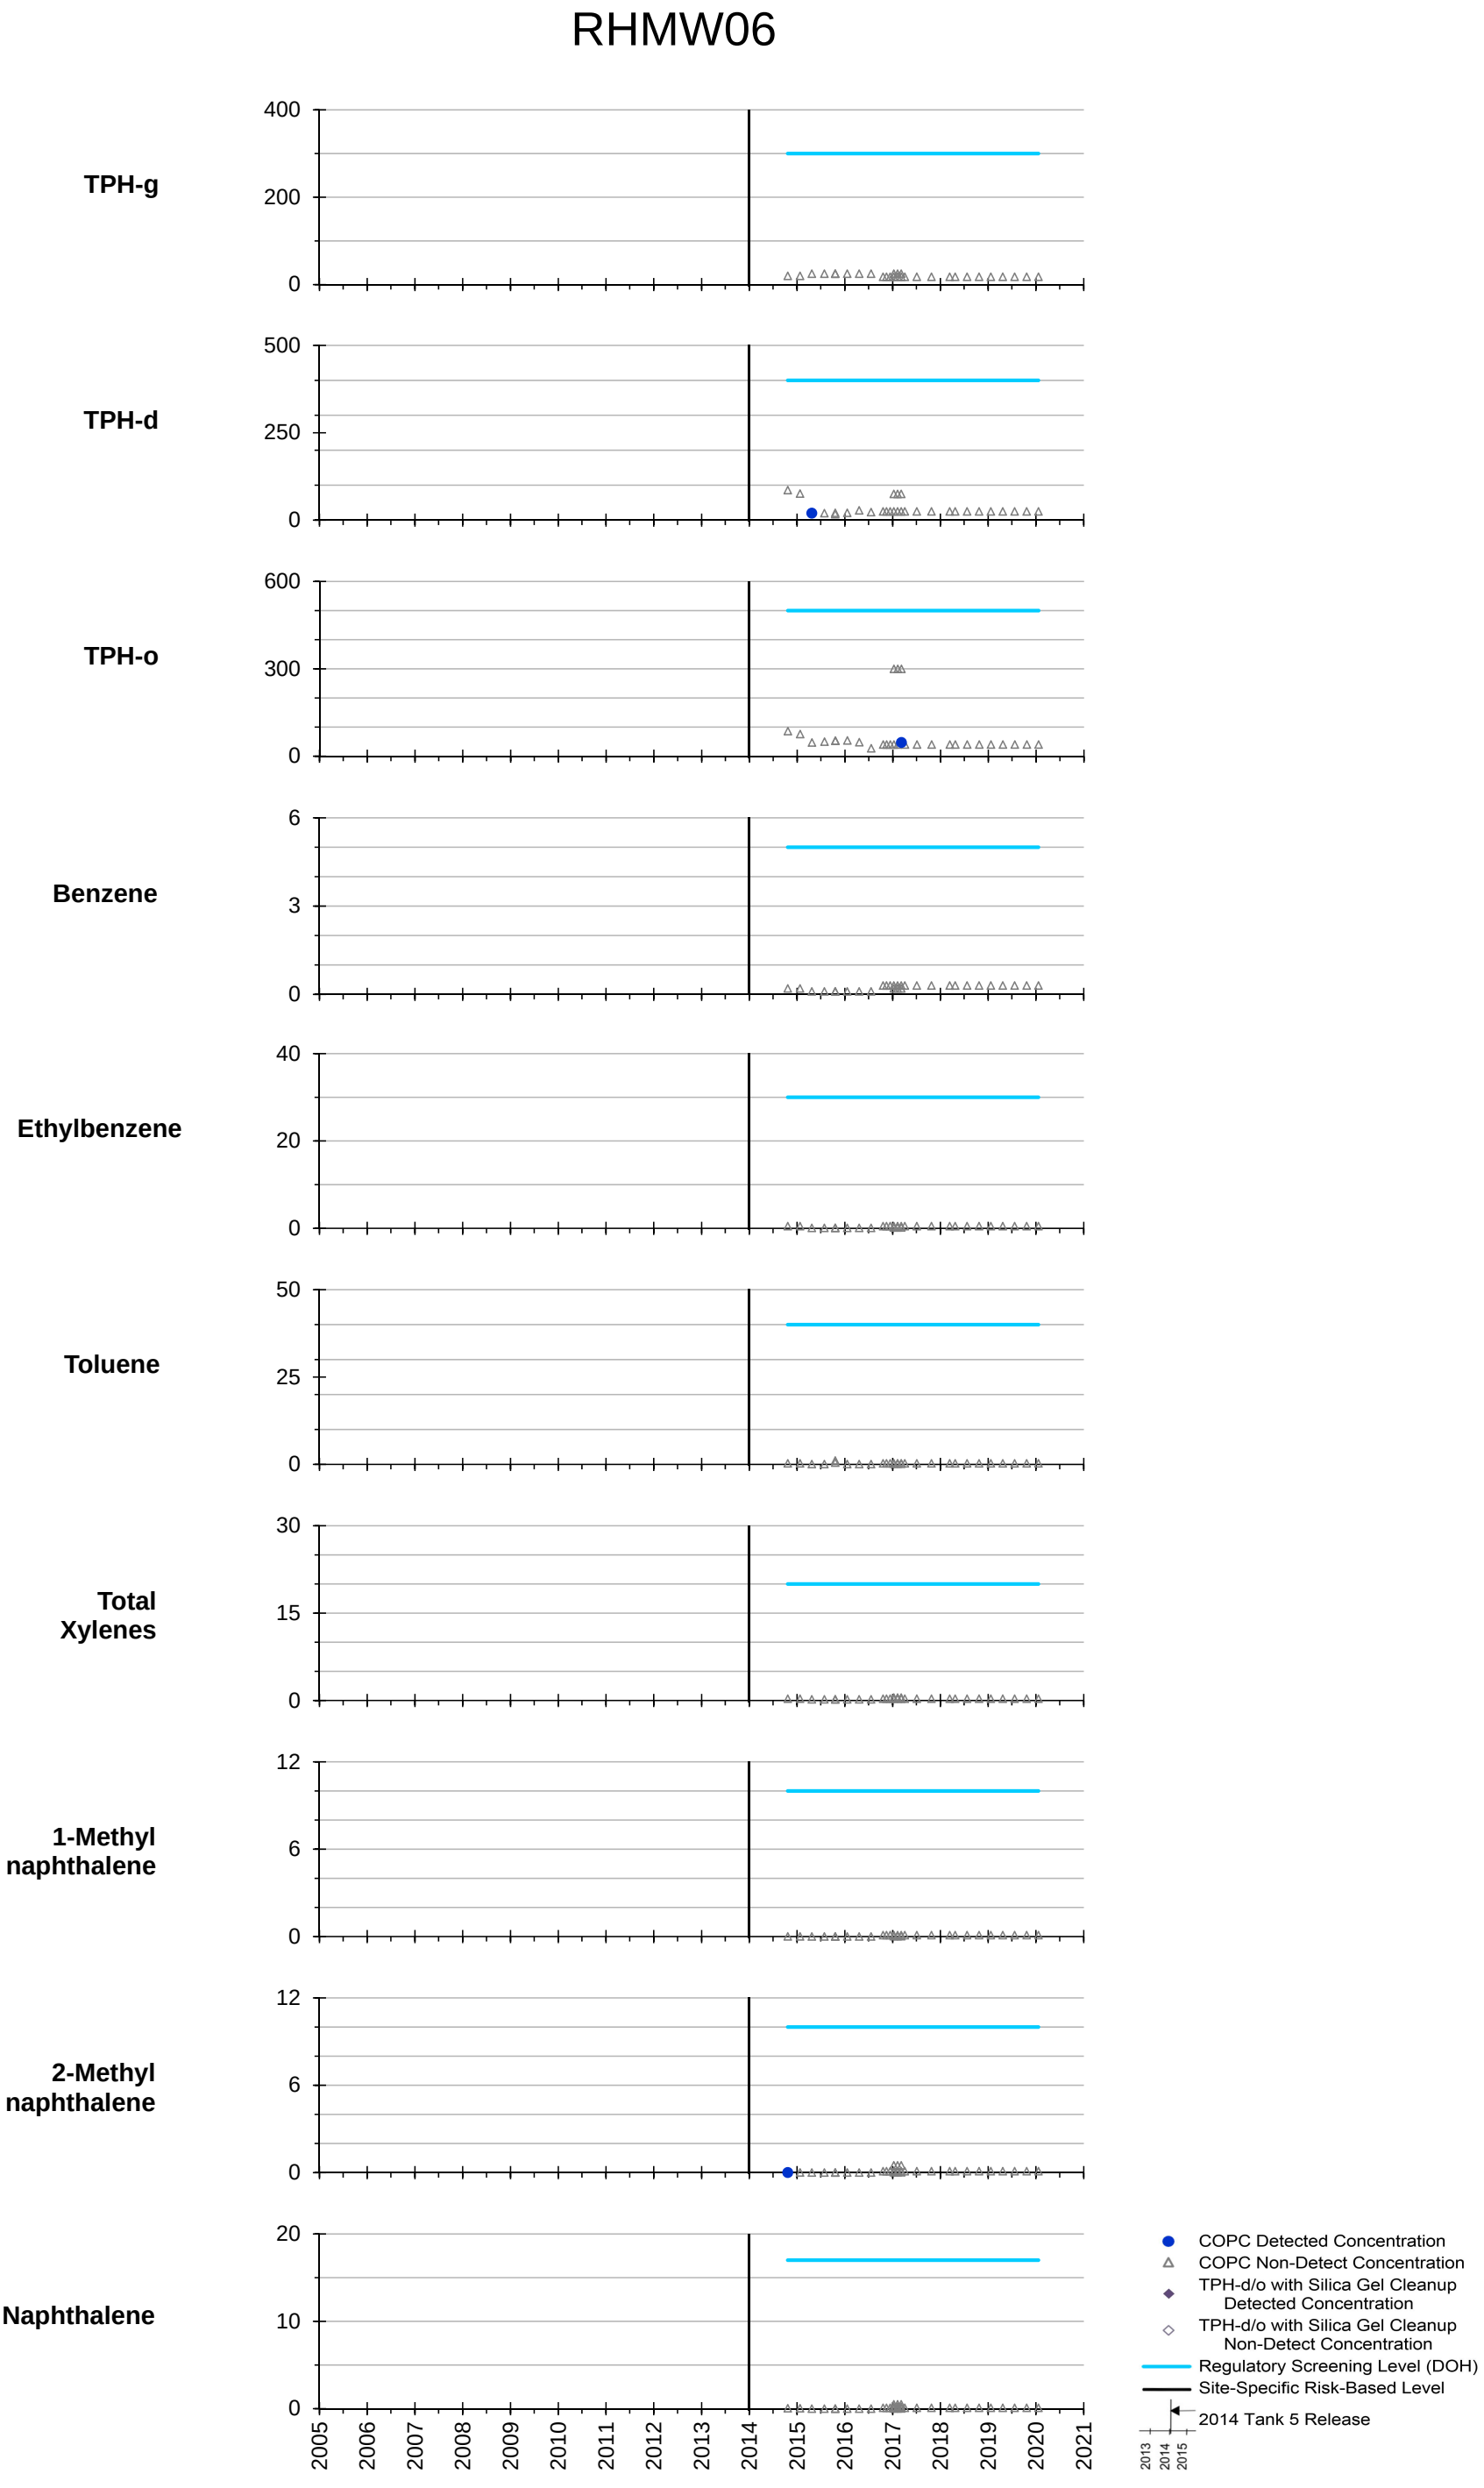
Appendix A.2 Groundwater Concentration Graphs



All results in micrograms per liter (µg/L or parts per billion).

EPA Region 9 Laboratory split sampling data from First to Third Quarters 2017 included in the graphs.

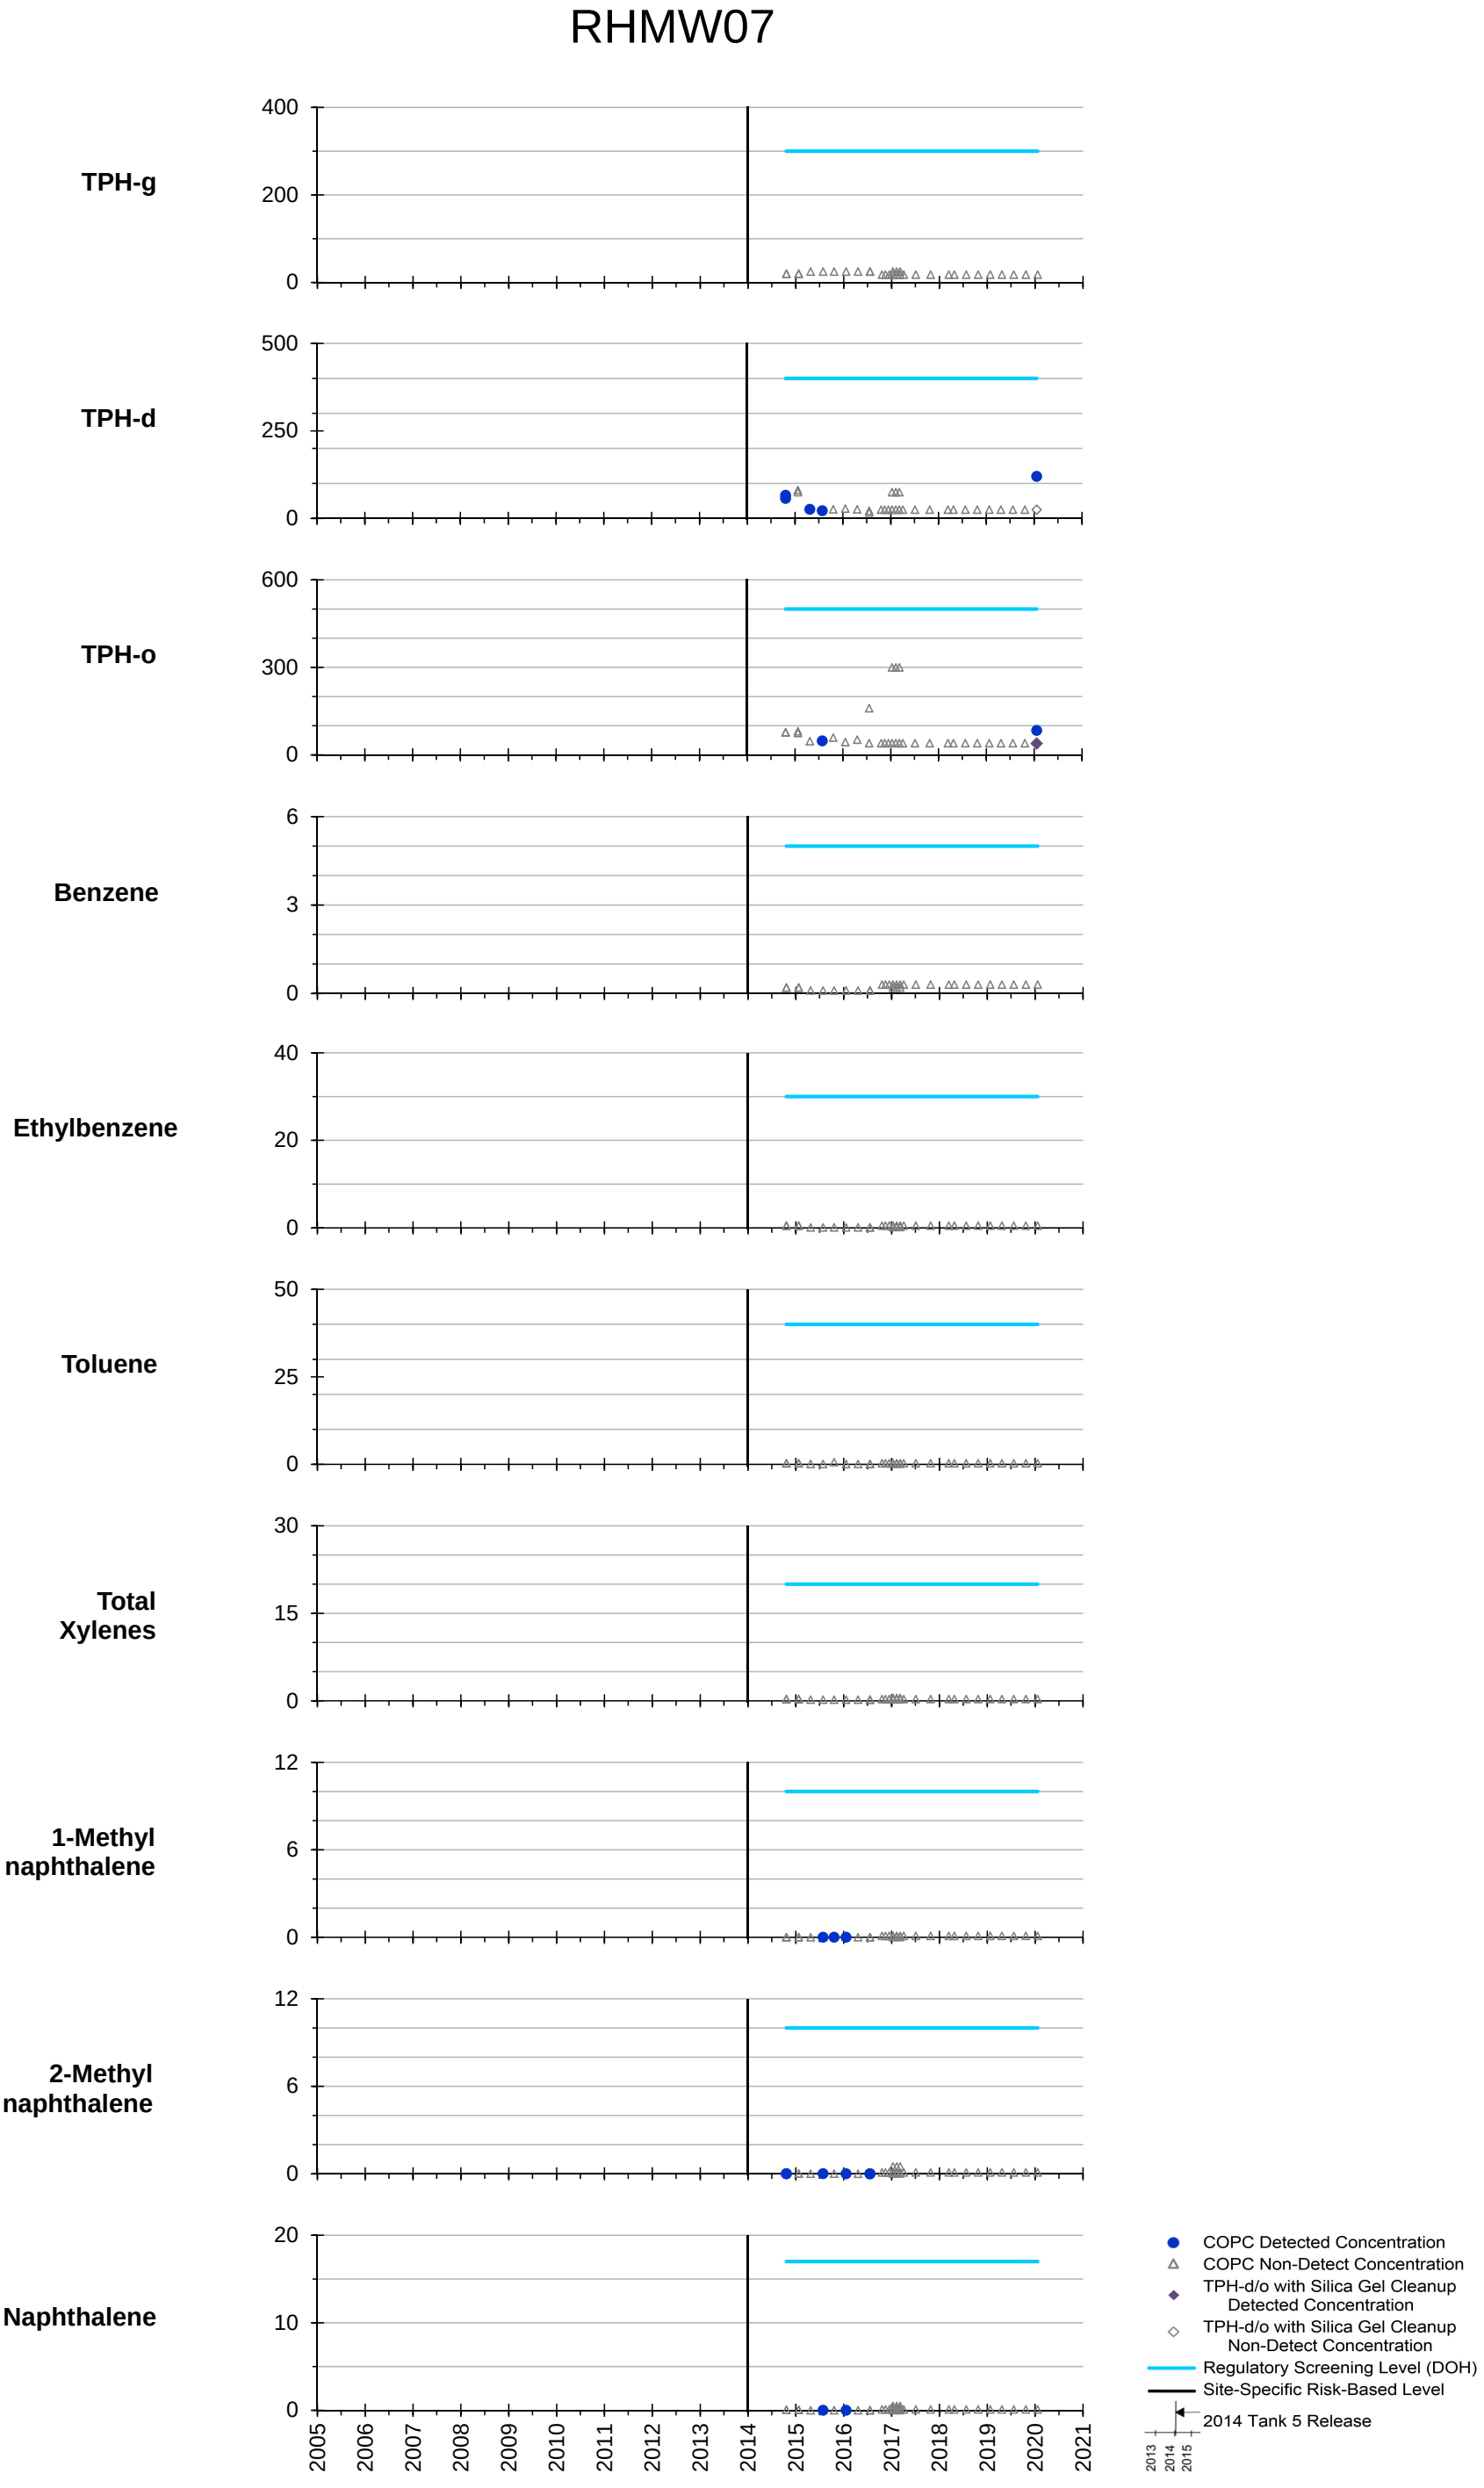
Appendix A.2 Groundwater Concentration Graphs



All results in micrograms per liter (µg/L or parts per billion).

EPA Region 9 Laboratory split sampling data from First to Third Quarters 2017 included in the graphs.

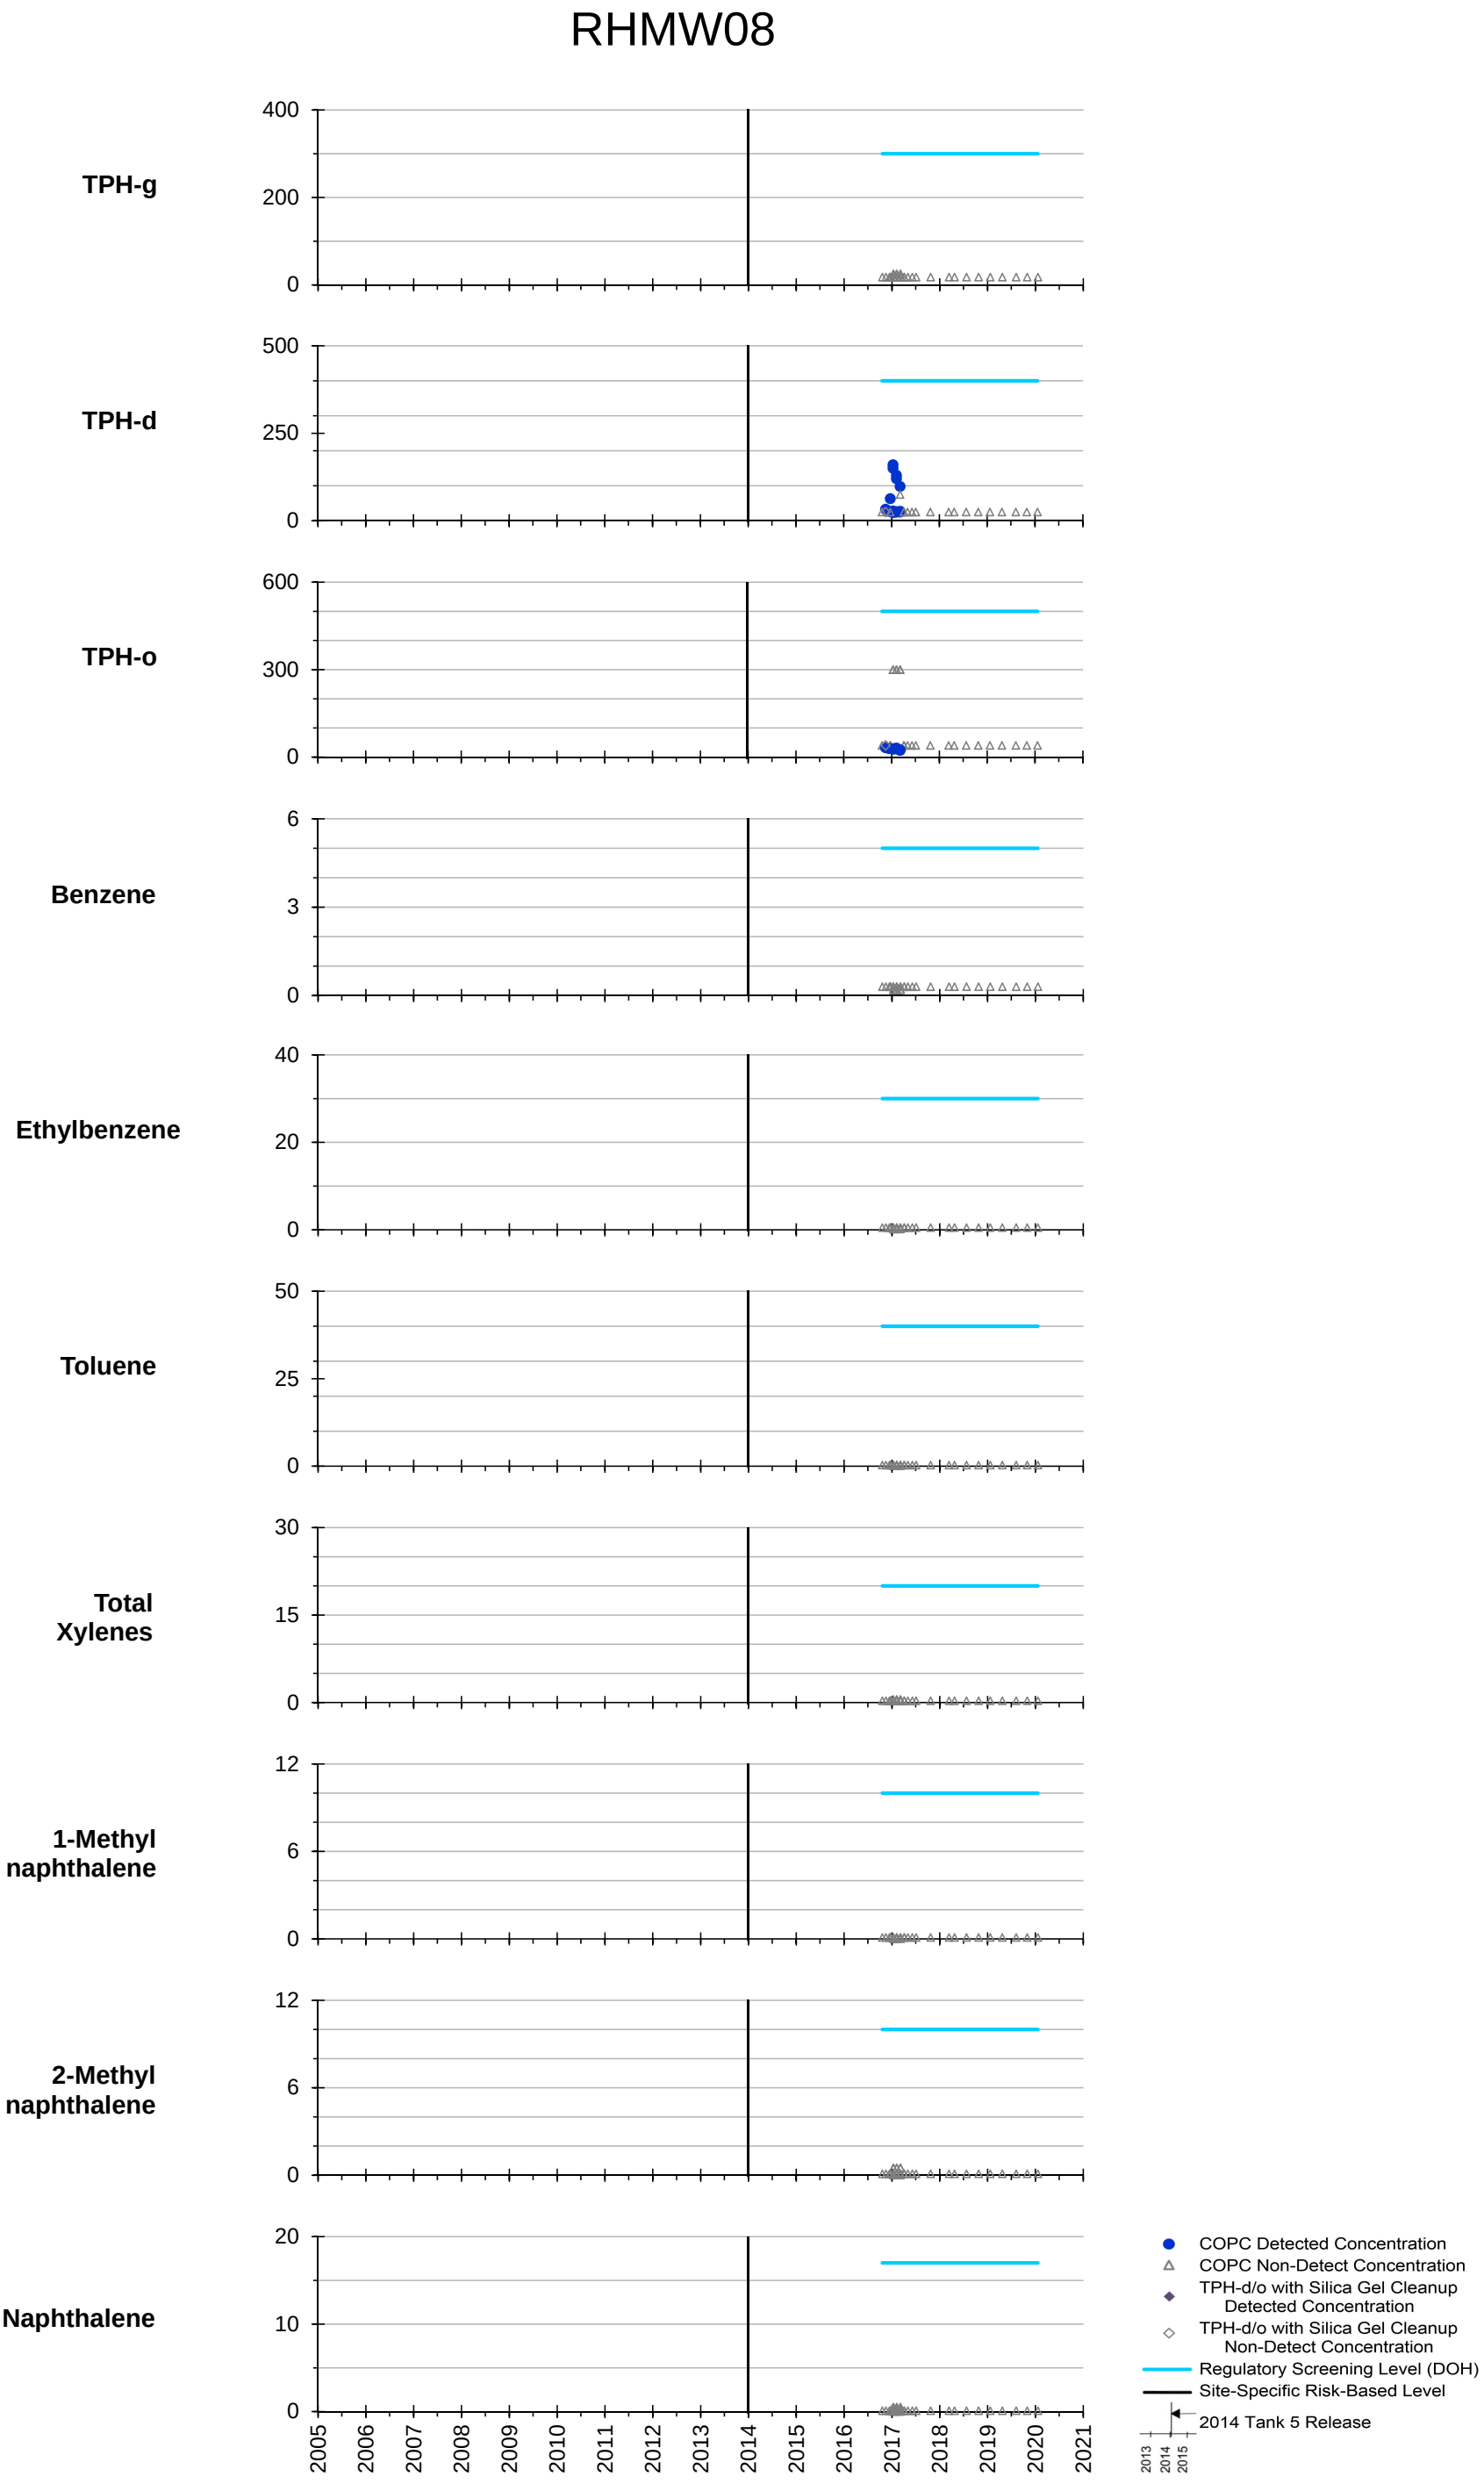
Appendix A.2 Groundwater Concentration Graphs



All results in micrograms per liter (µg/L or parts per billion).

EPA Region 9 Laboratory split sampling data from First to Third Quarters 2017 included in the graphs.

Appendix A.2 Groundwater Concentration Graphs

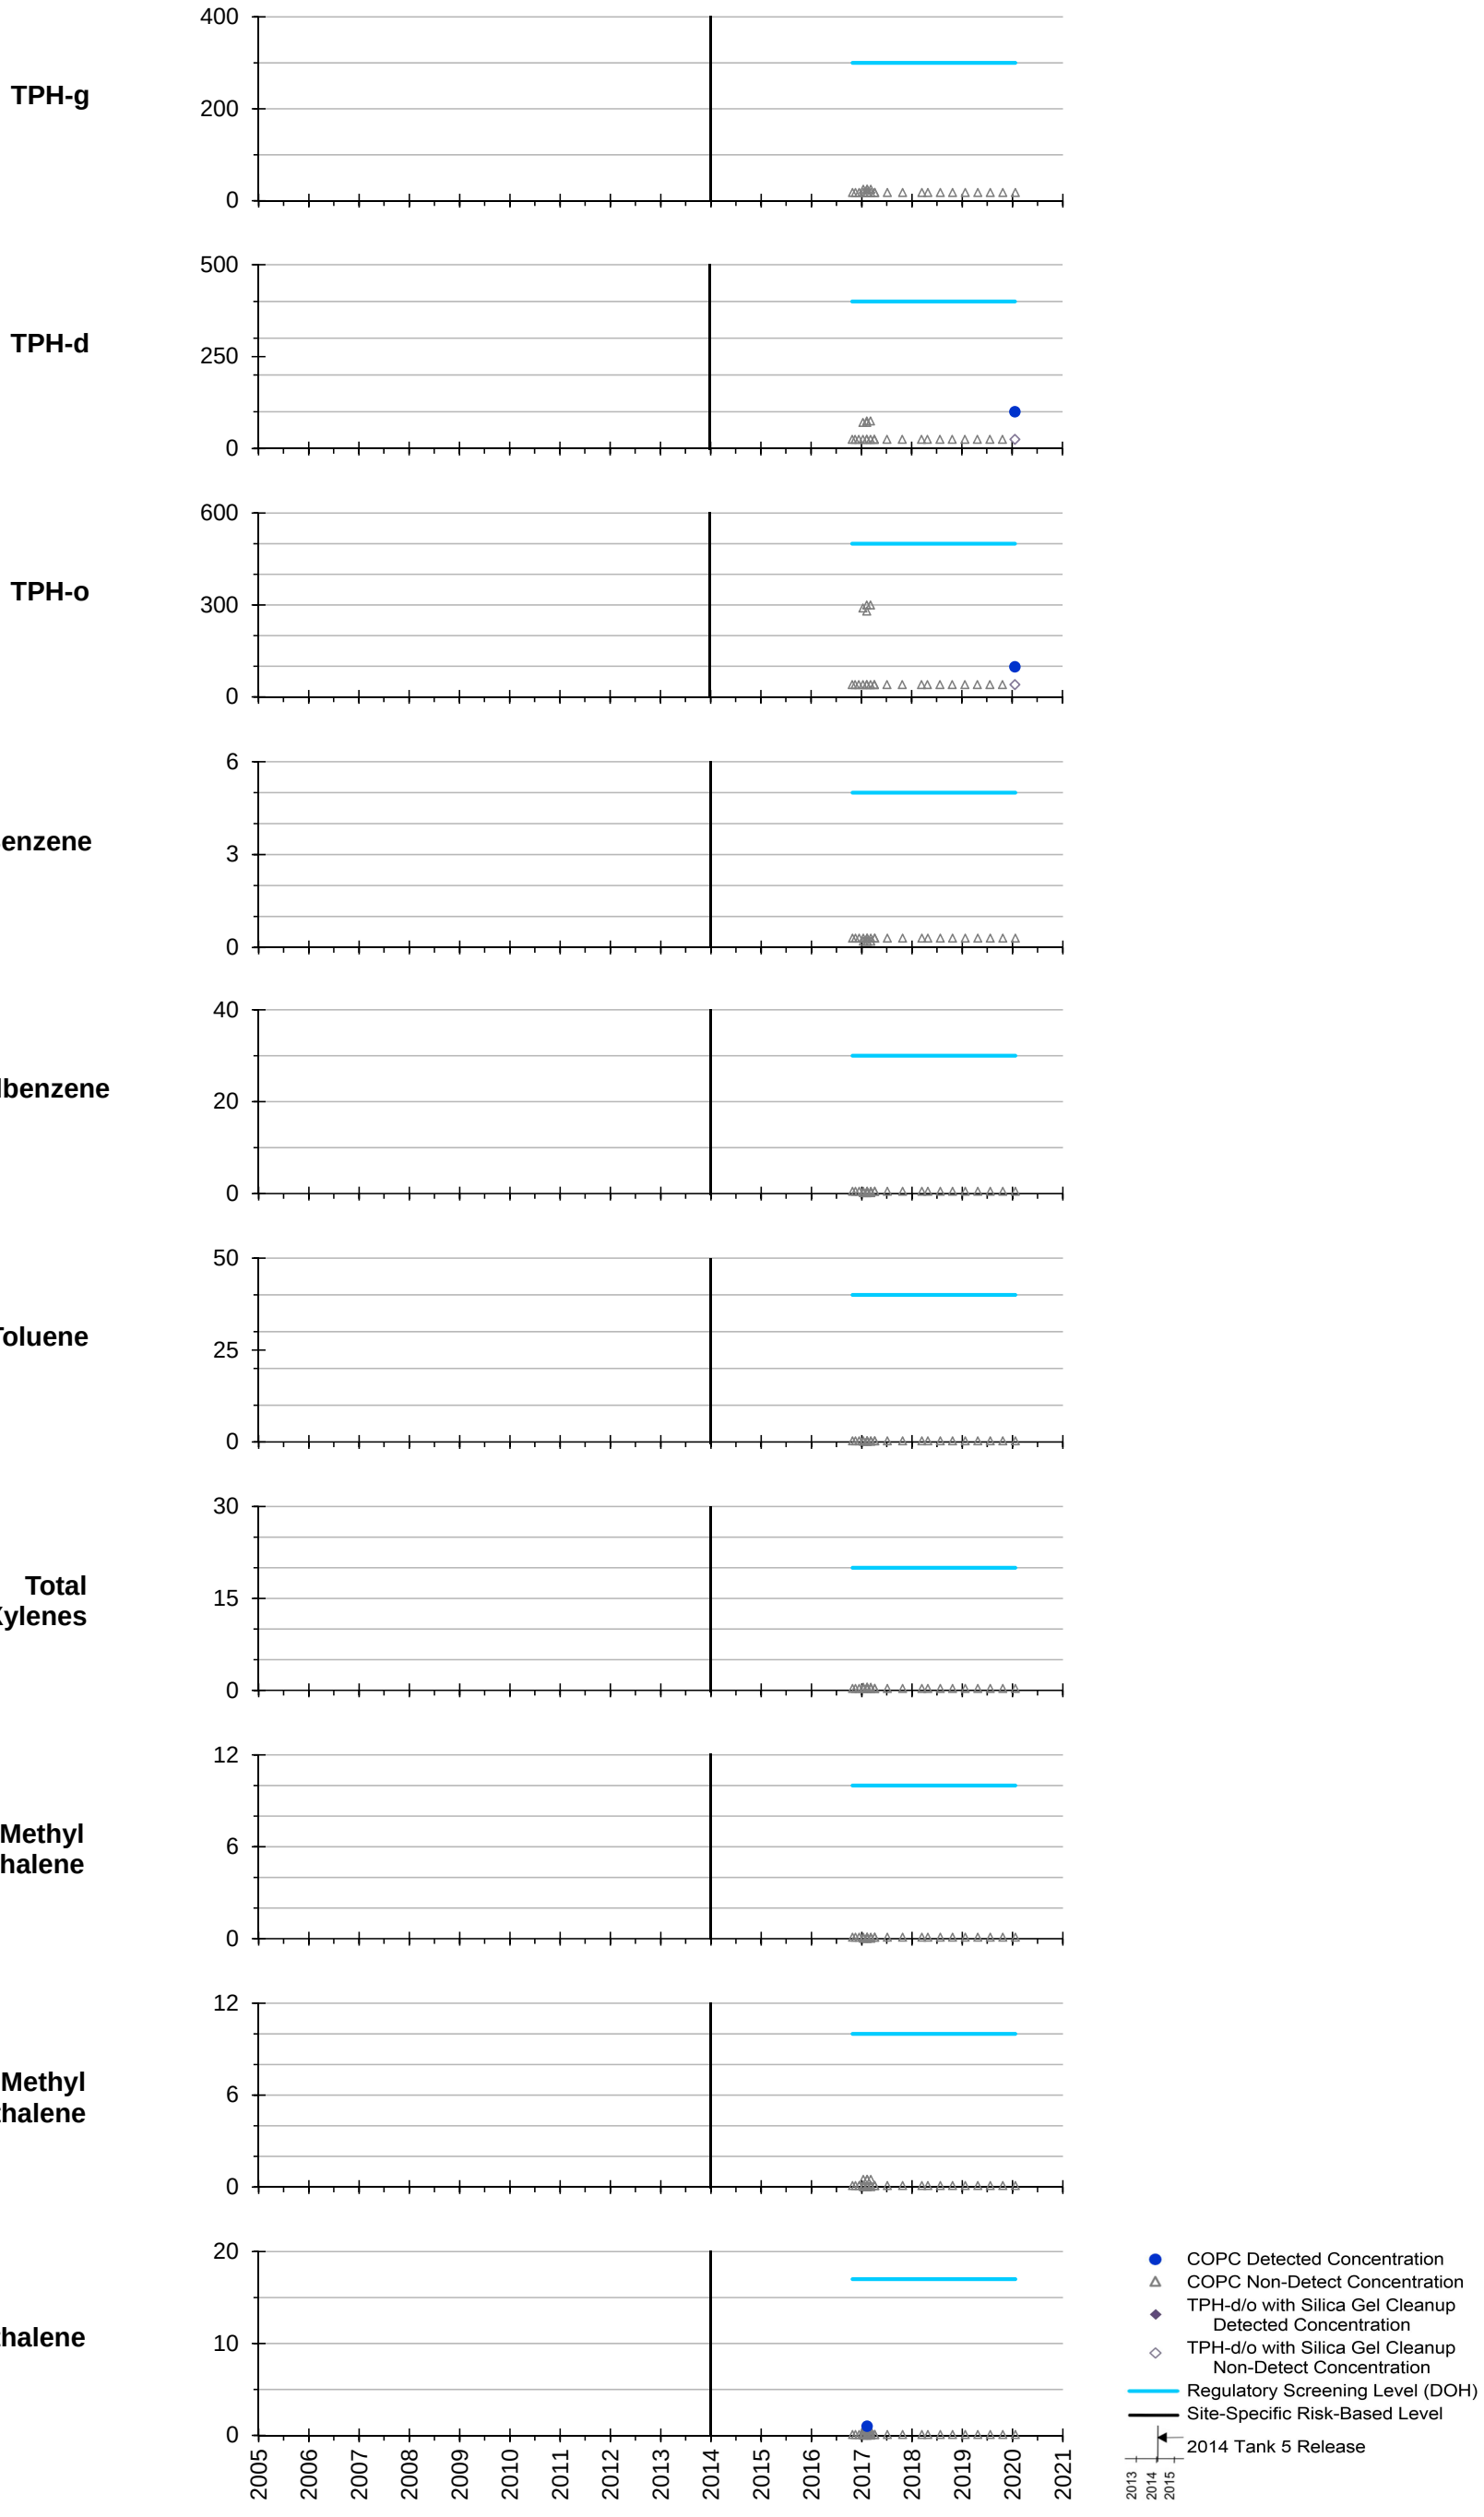


All results in micrograms per liter (µg/L or parts per billion).

EPA Region 9 Laboratory split sampling data from First to Third Quarters 2017 included in the graphs.

Appendix A.2 Groundwater Concentration Graphs

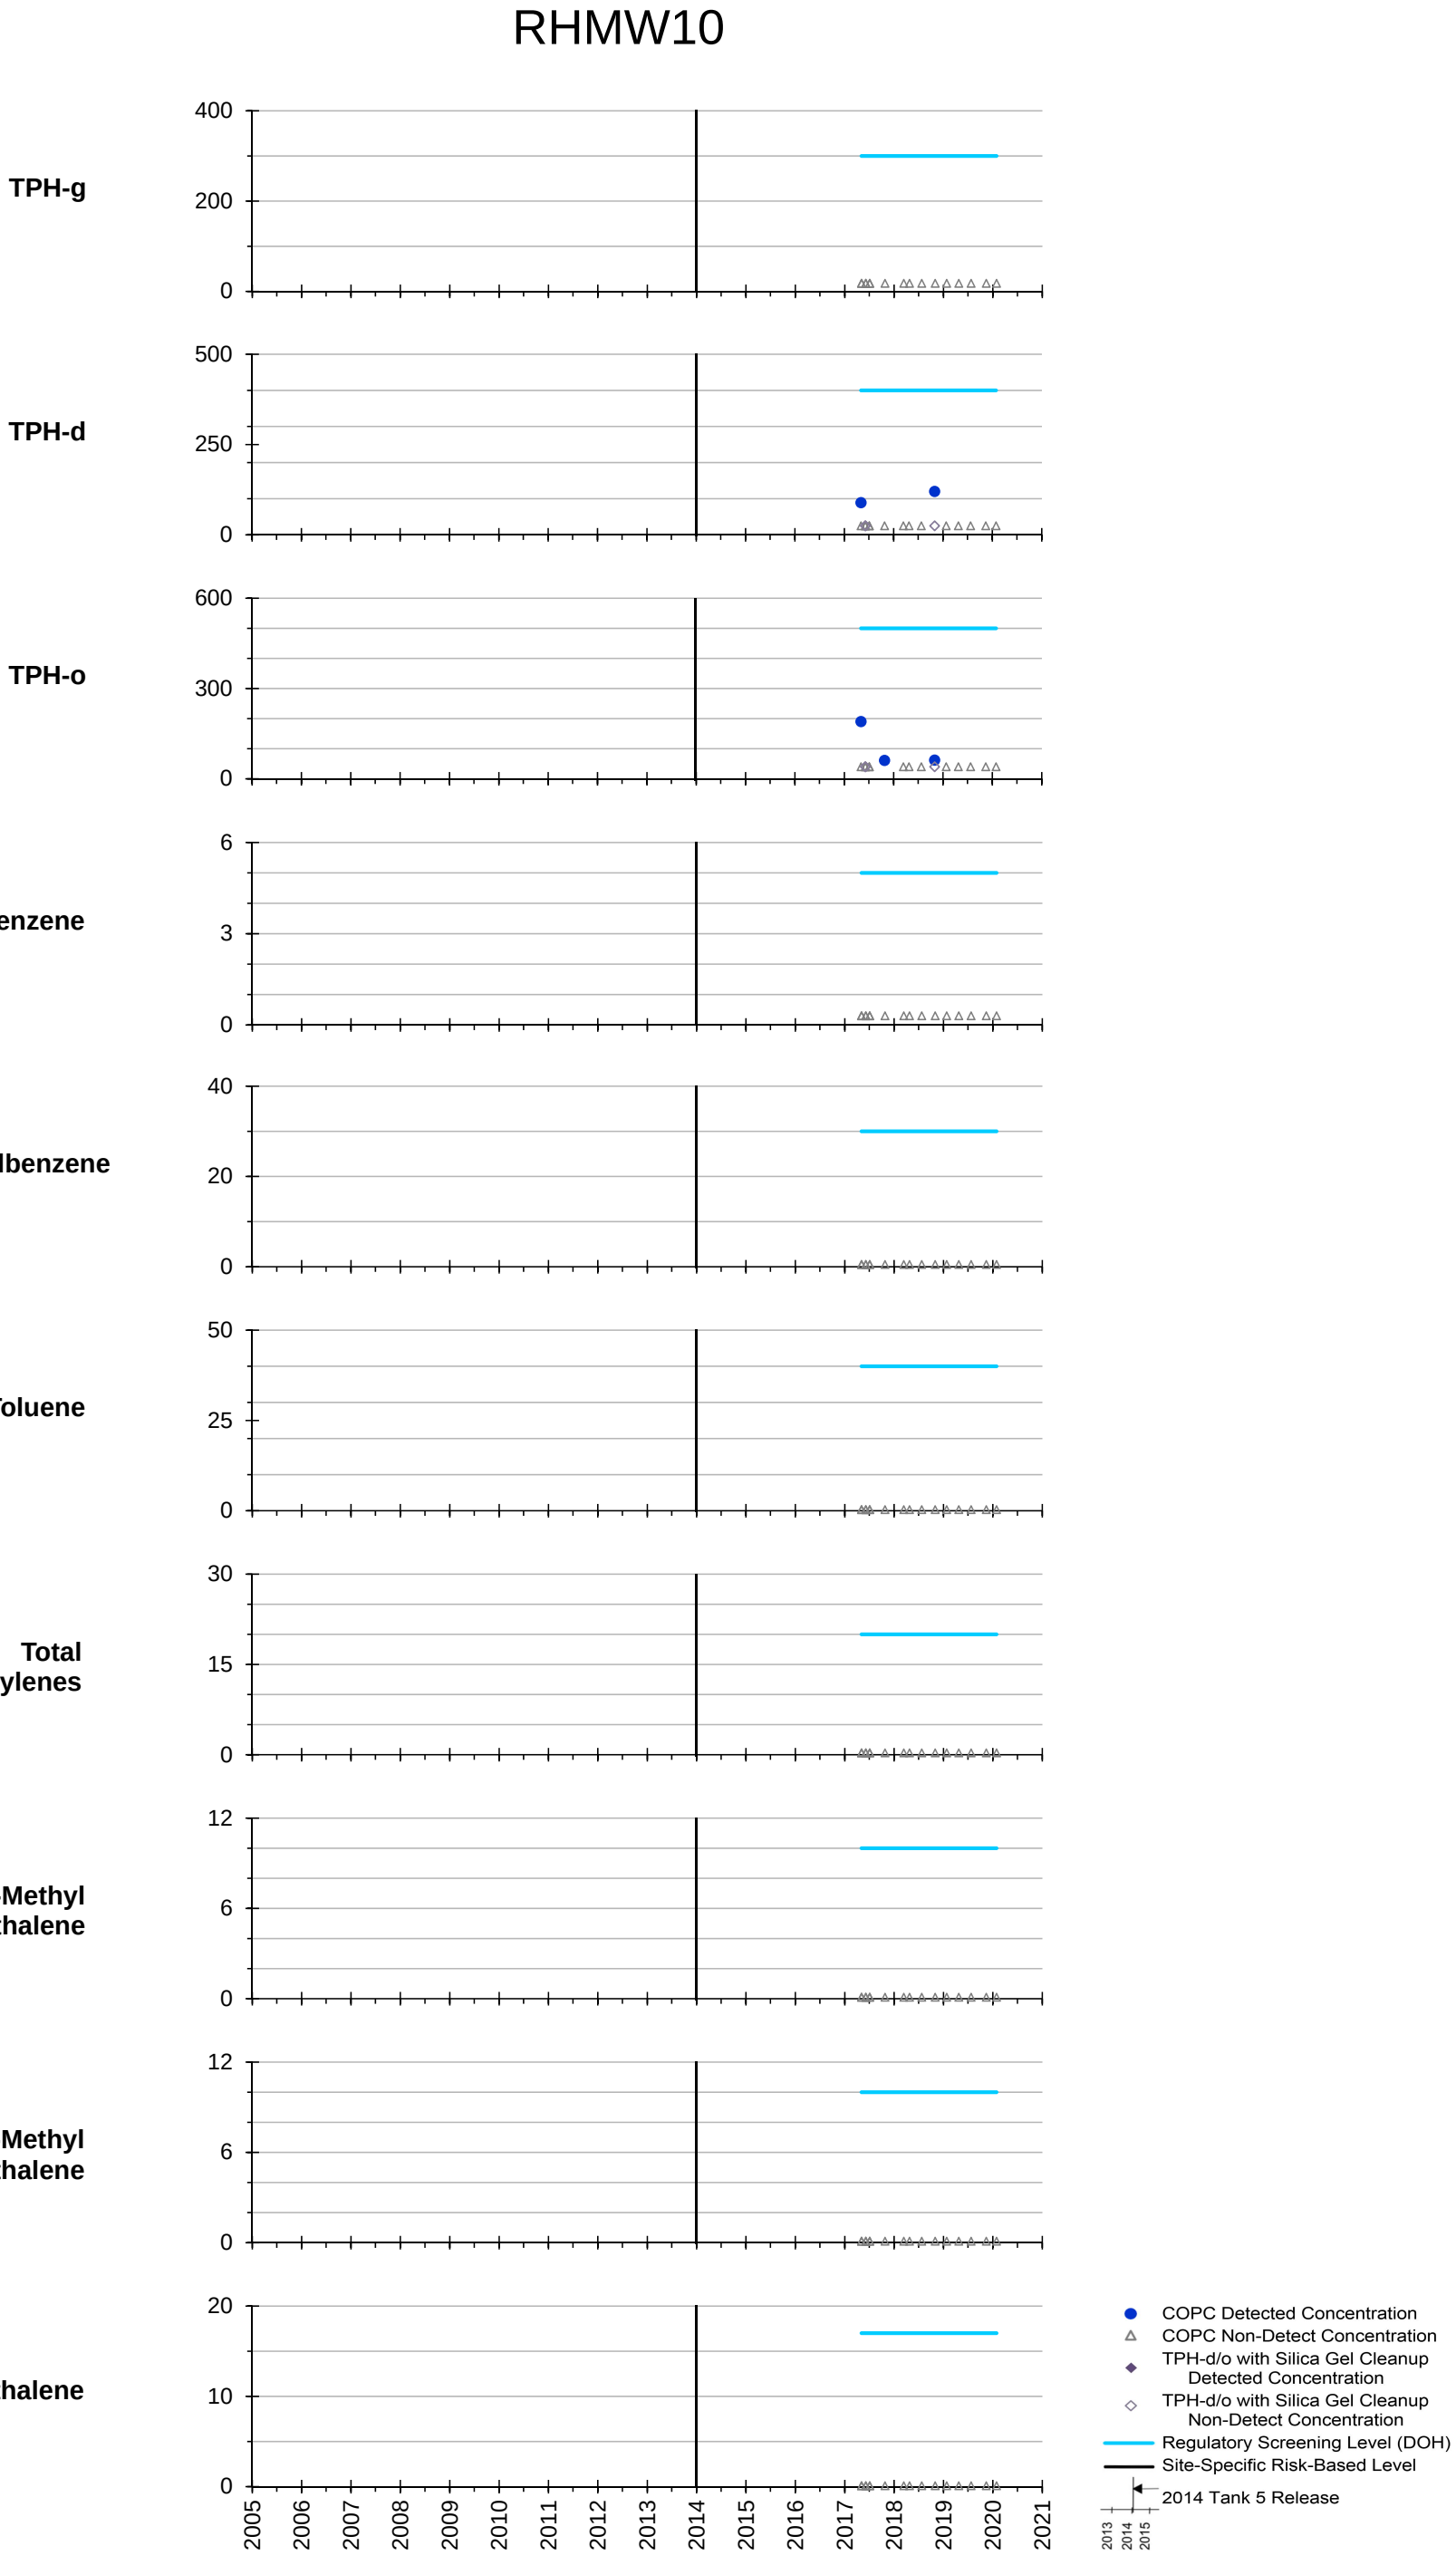
RHMW09



All results in micrograms per liter (µg/L or parts per billion).

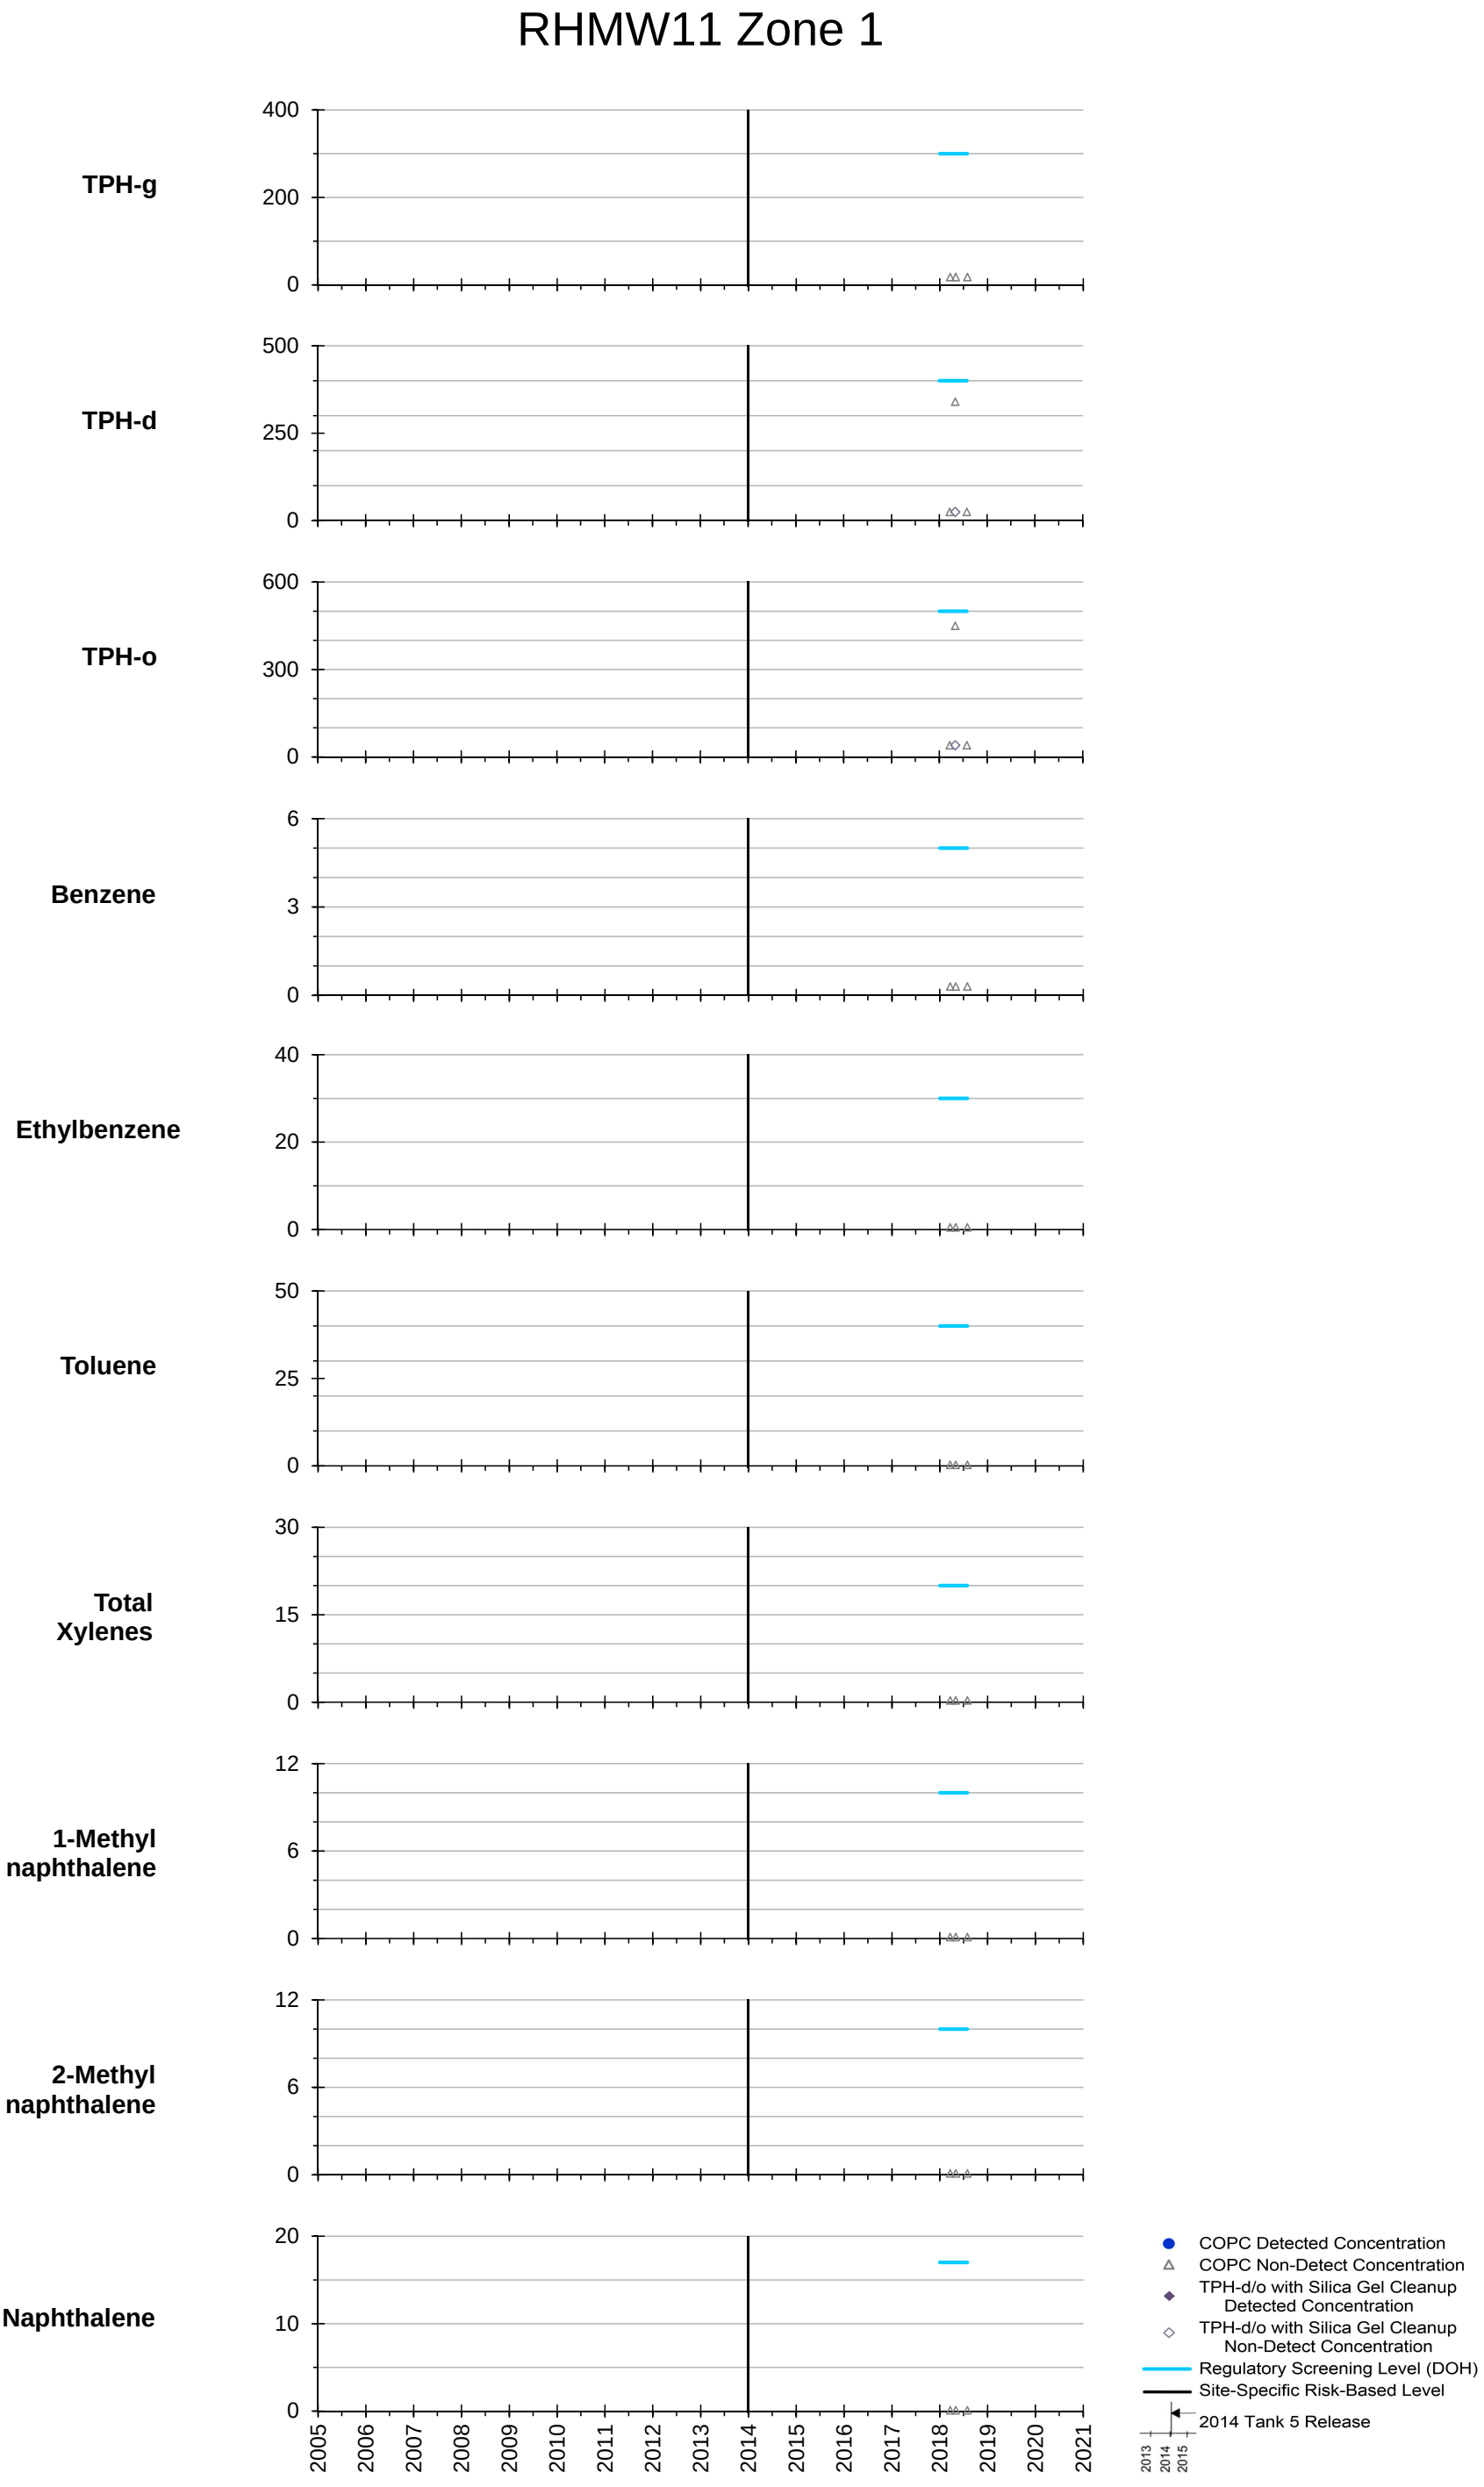
EPA Region 9 Laboratory split sampling data from First to Third Quarters 2017 included in the graphs.

Appendix A.2 Groundwater Concentration Graphs



All results in micrograms per liter (µg/L or parts per billion).

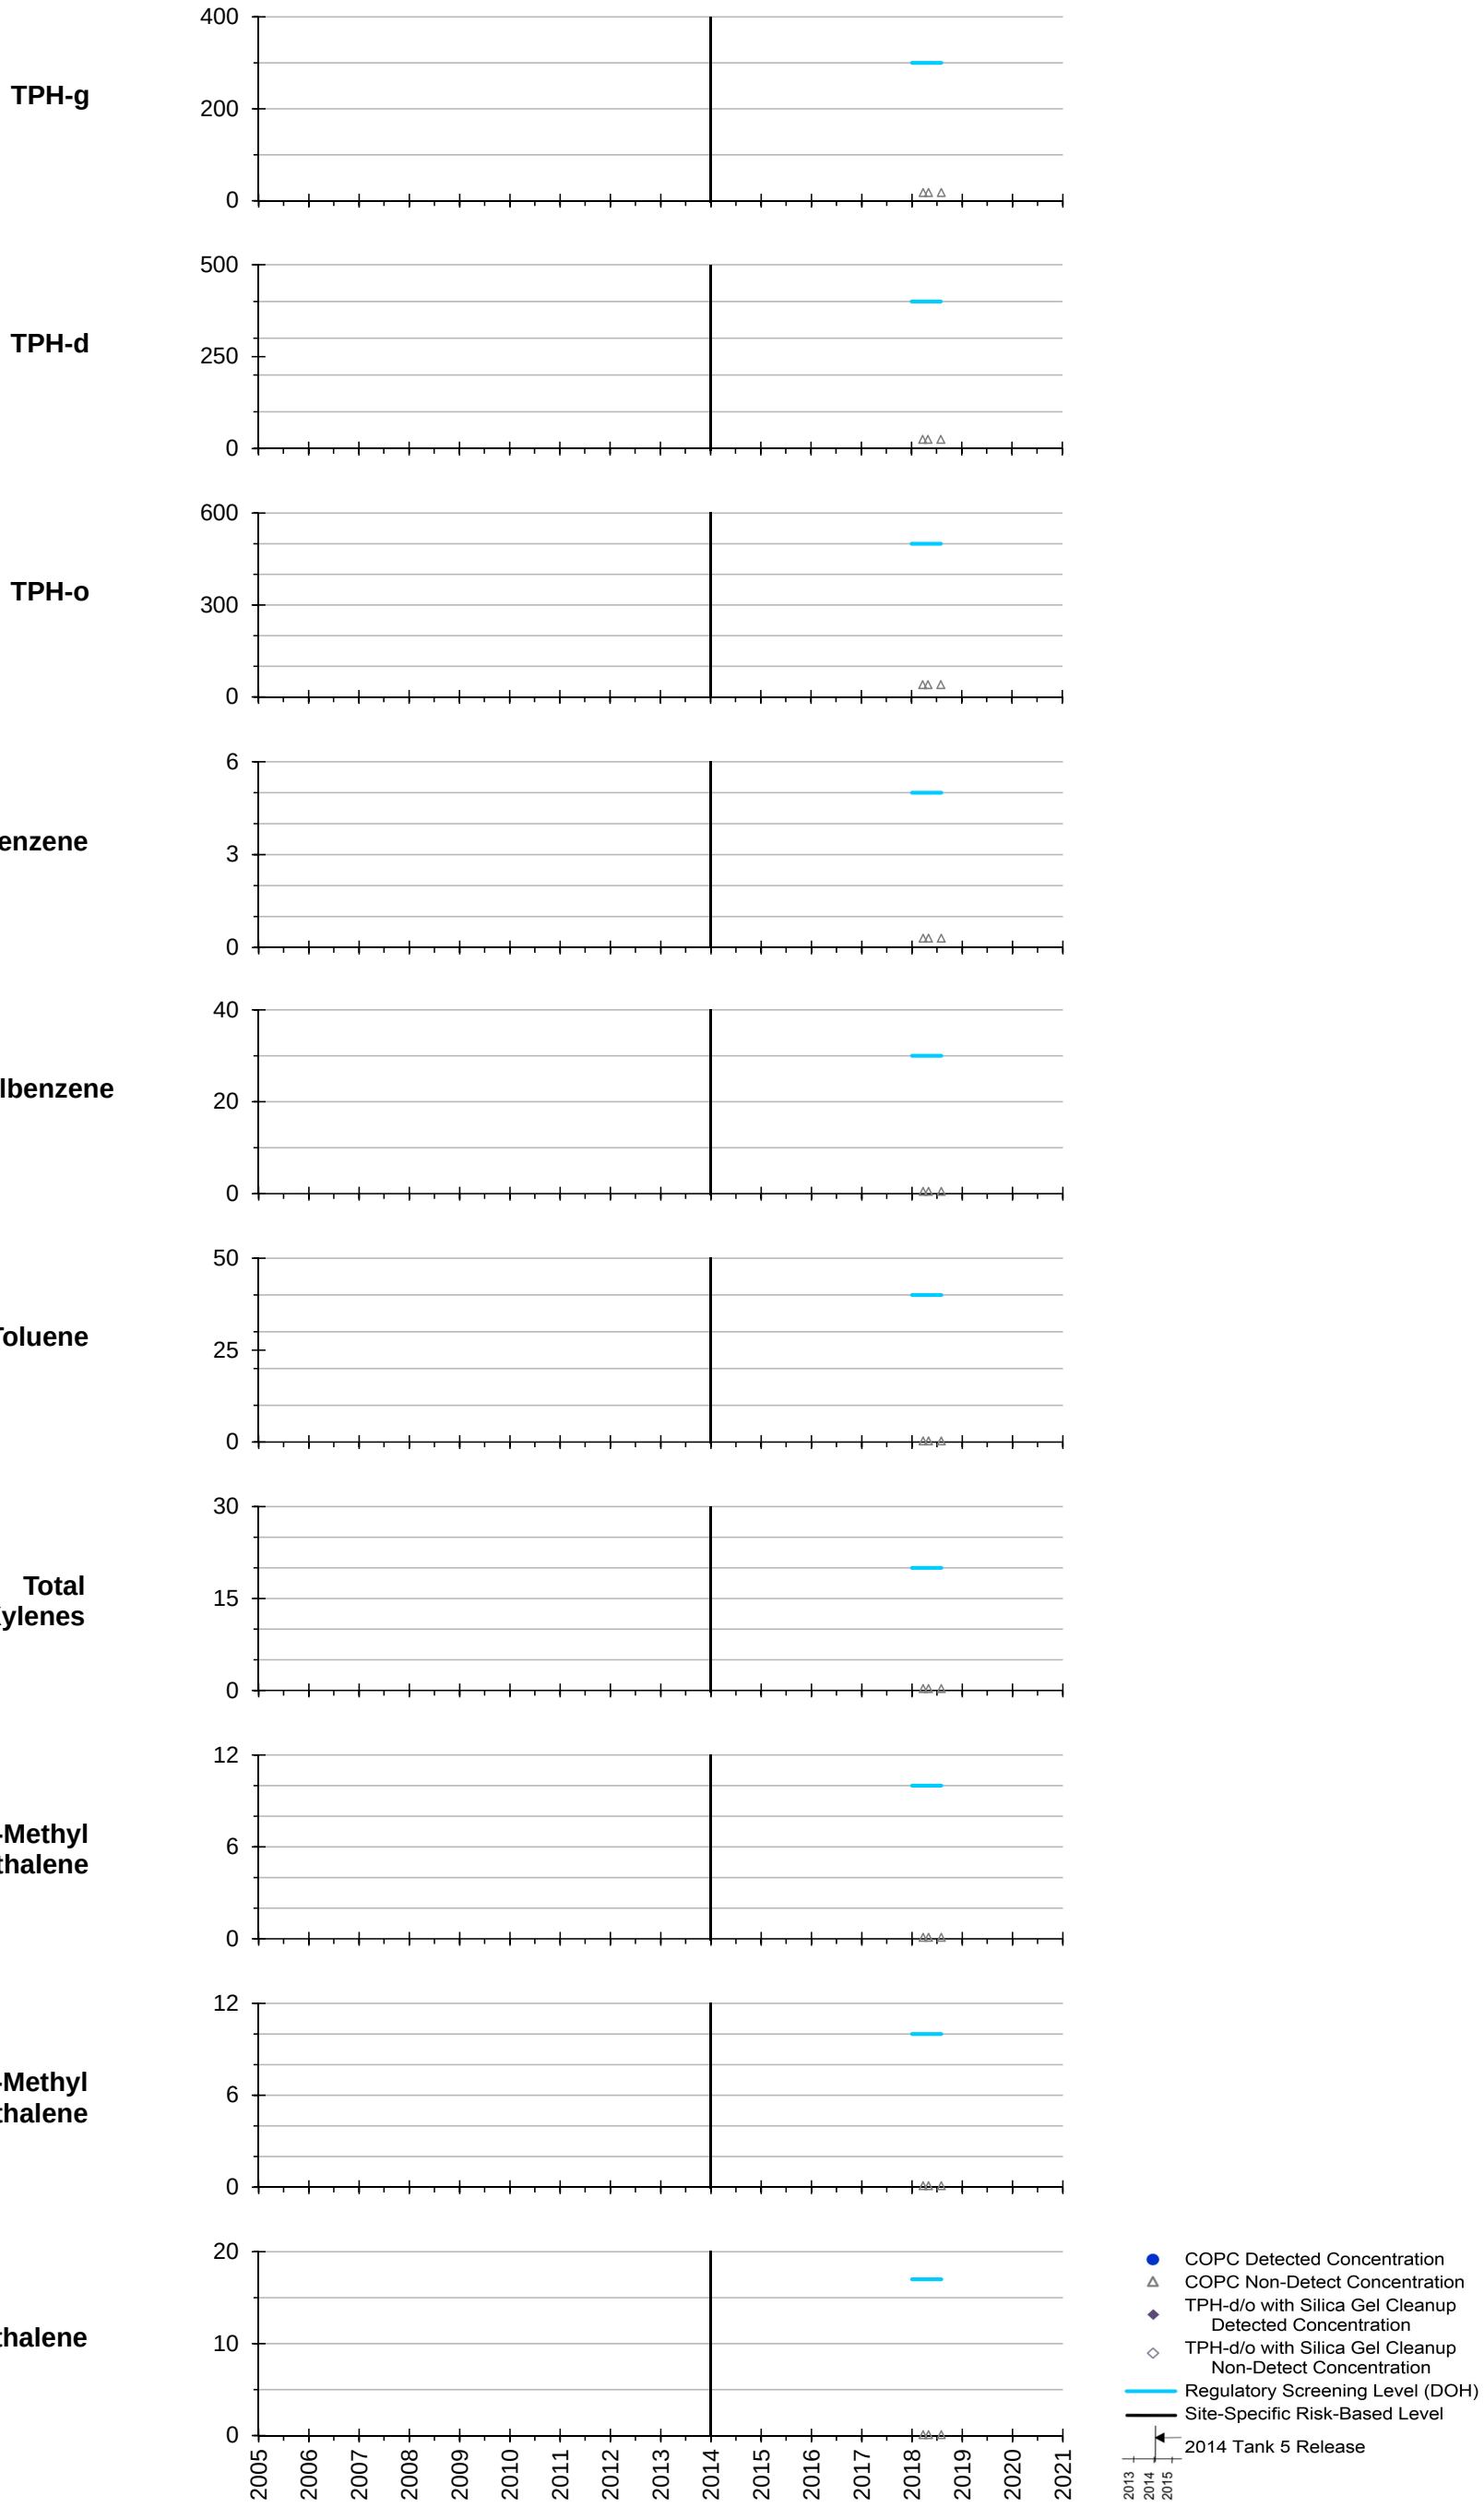
Appendix A.2 Groundwater Concentration Graphs



All results in micrograms per liter (µg/L or parts per billion).

Appendix A.2 Groundwater Concentration Graphs

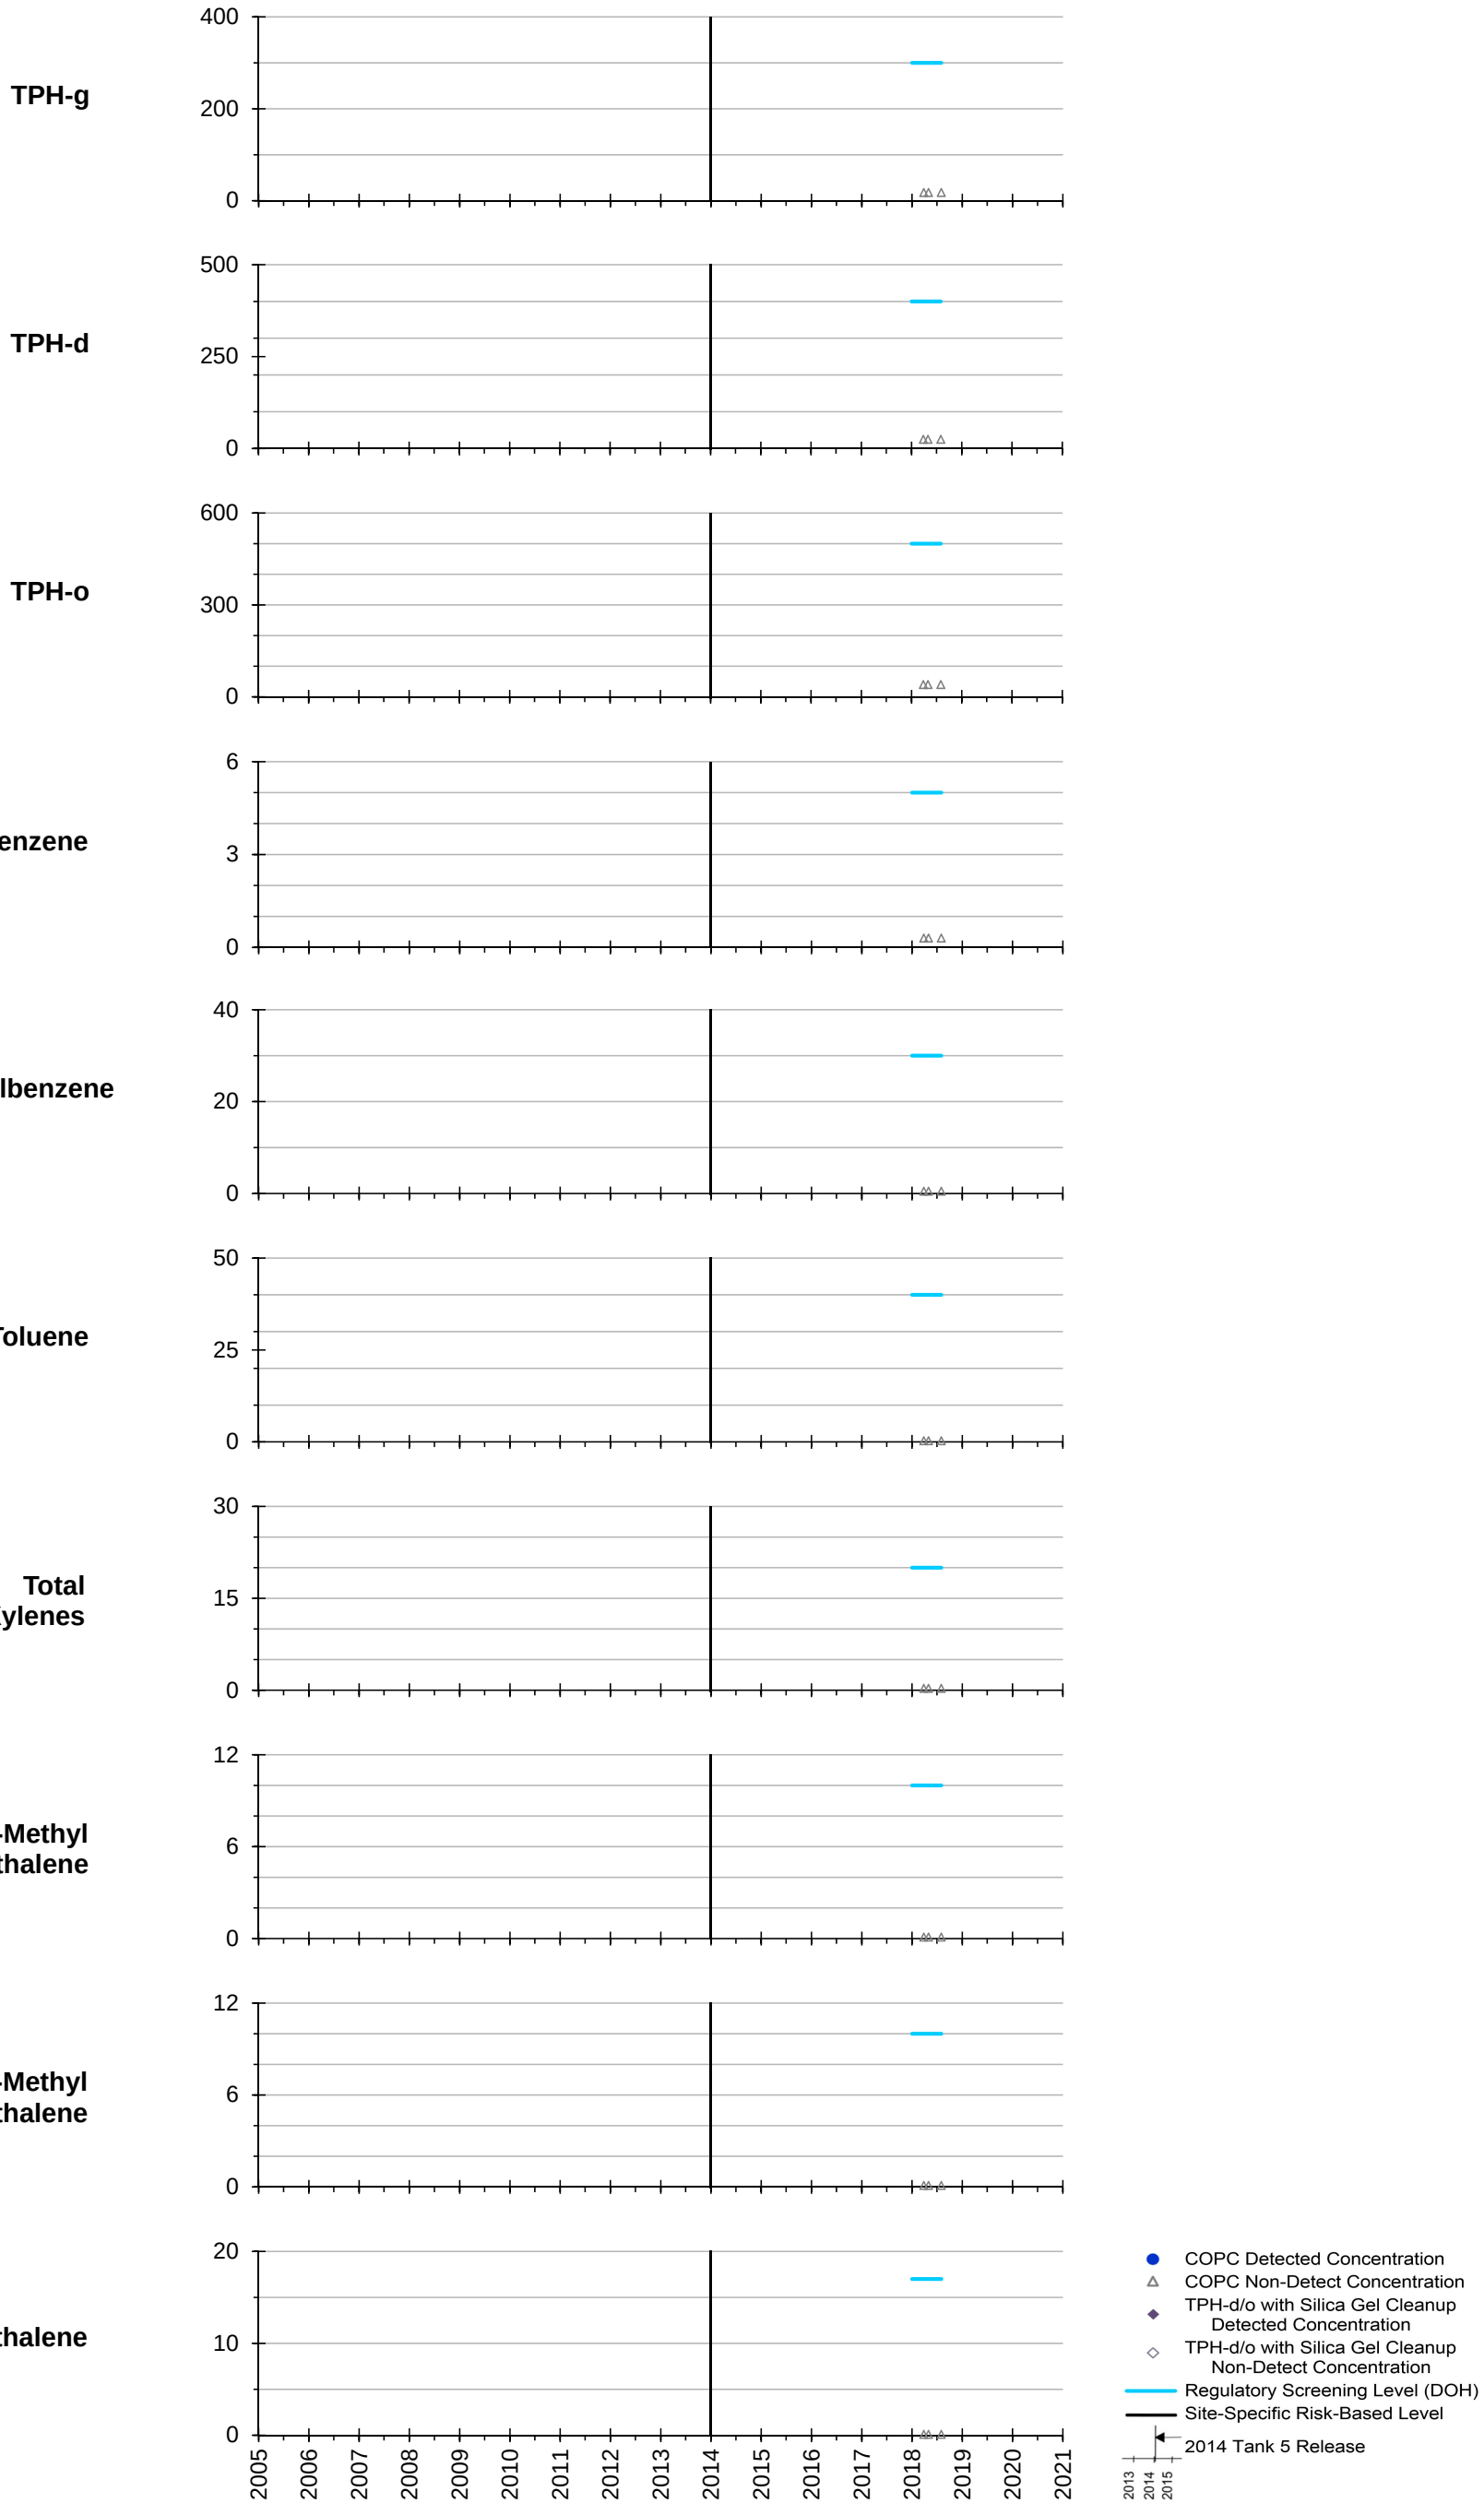
RHMW11 Zone 2



All results in micrograms per liter (µg/L or parts per billion).

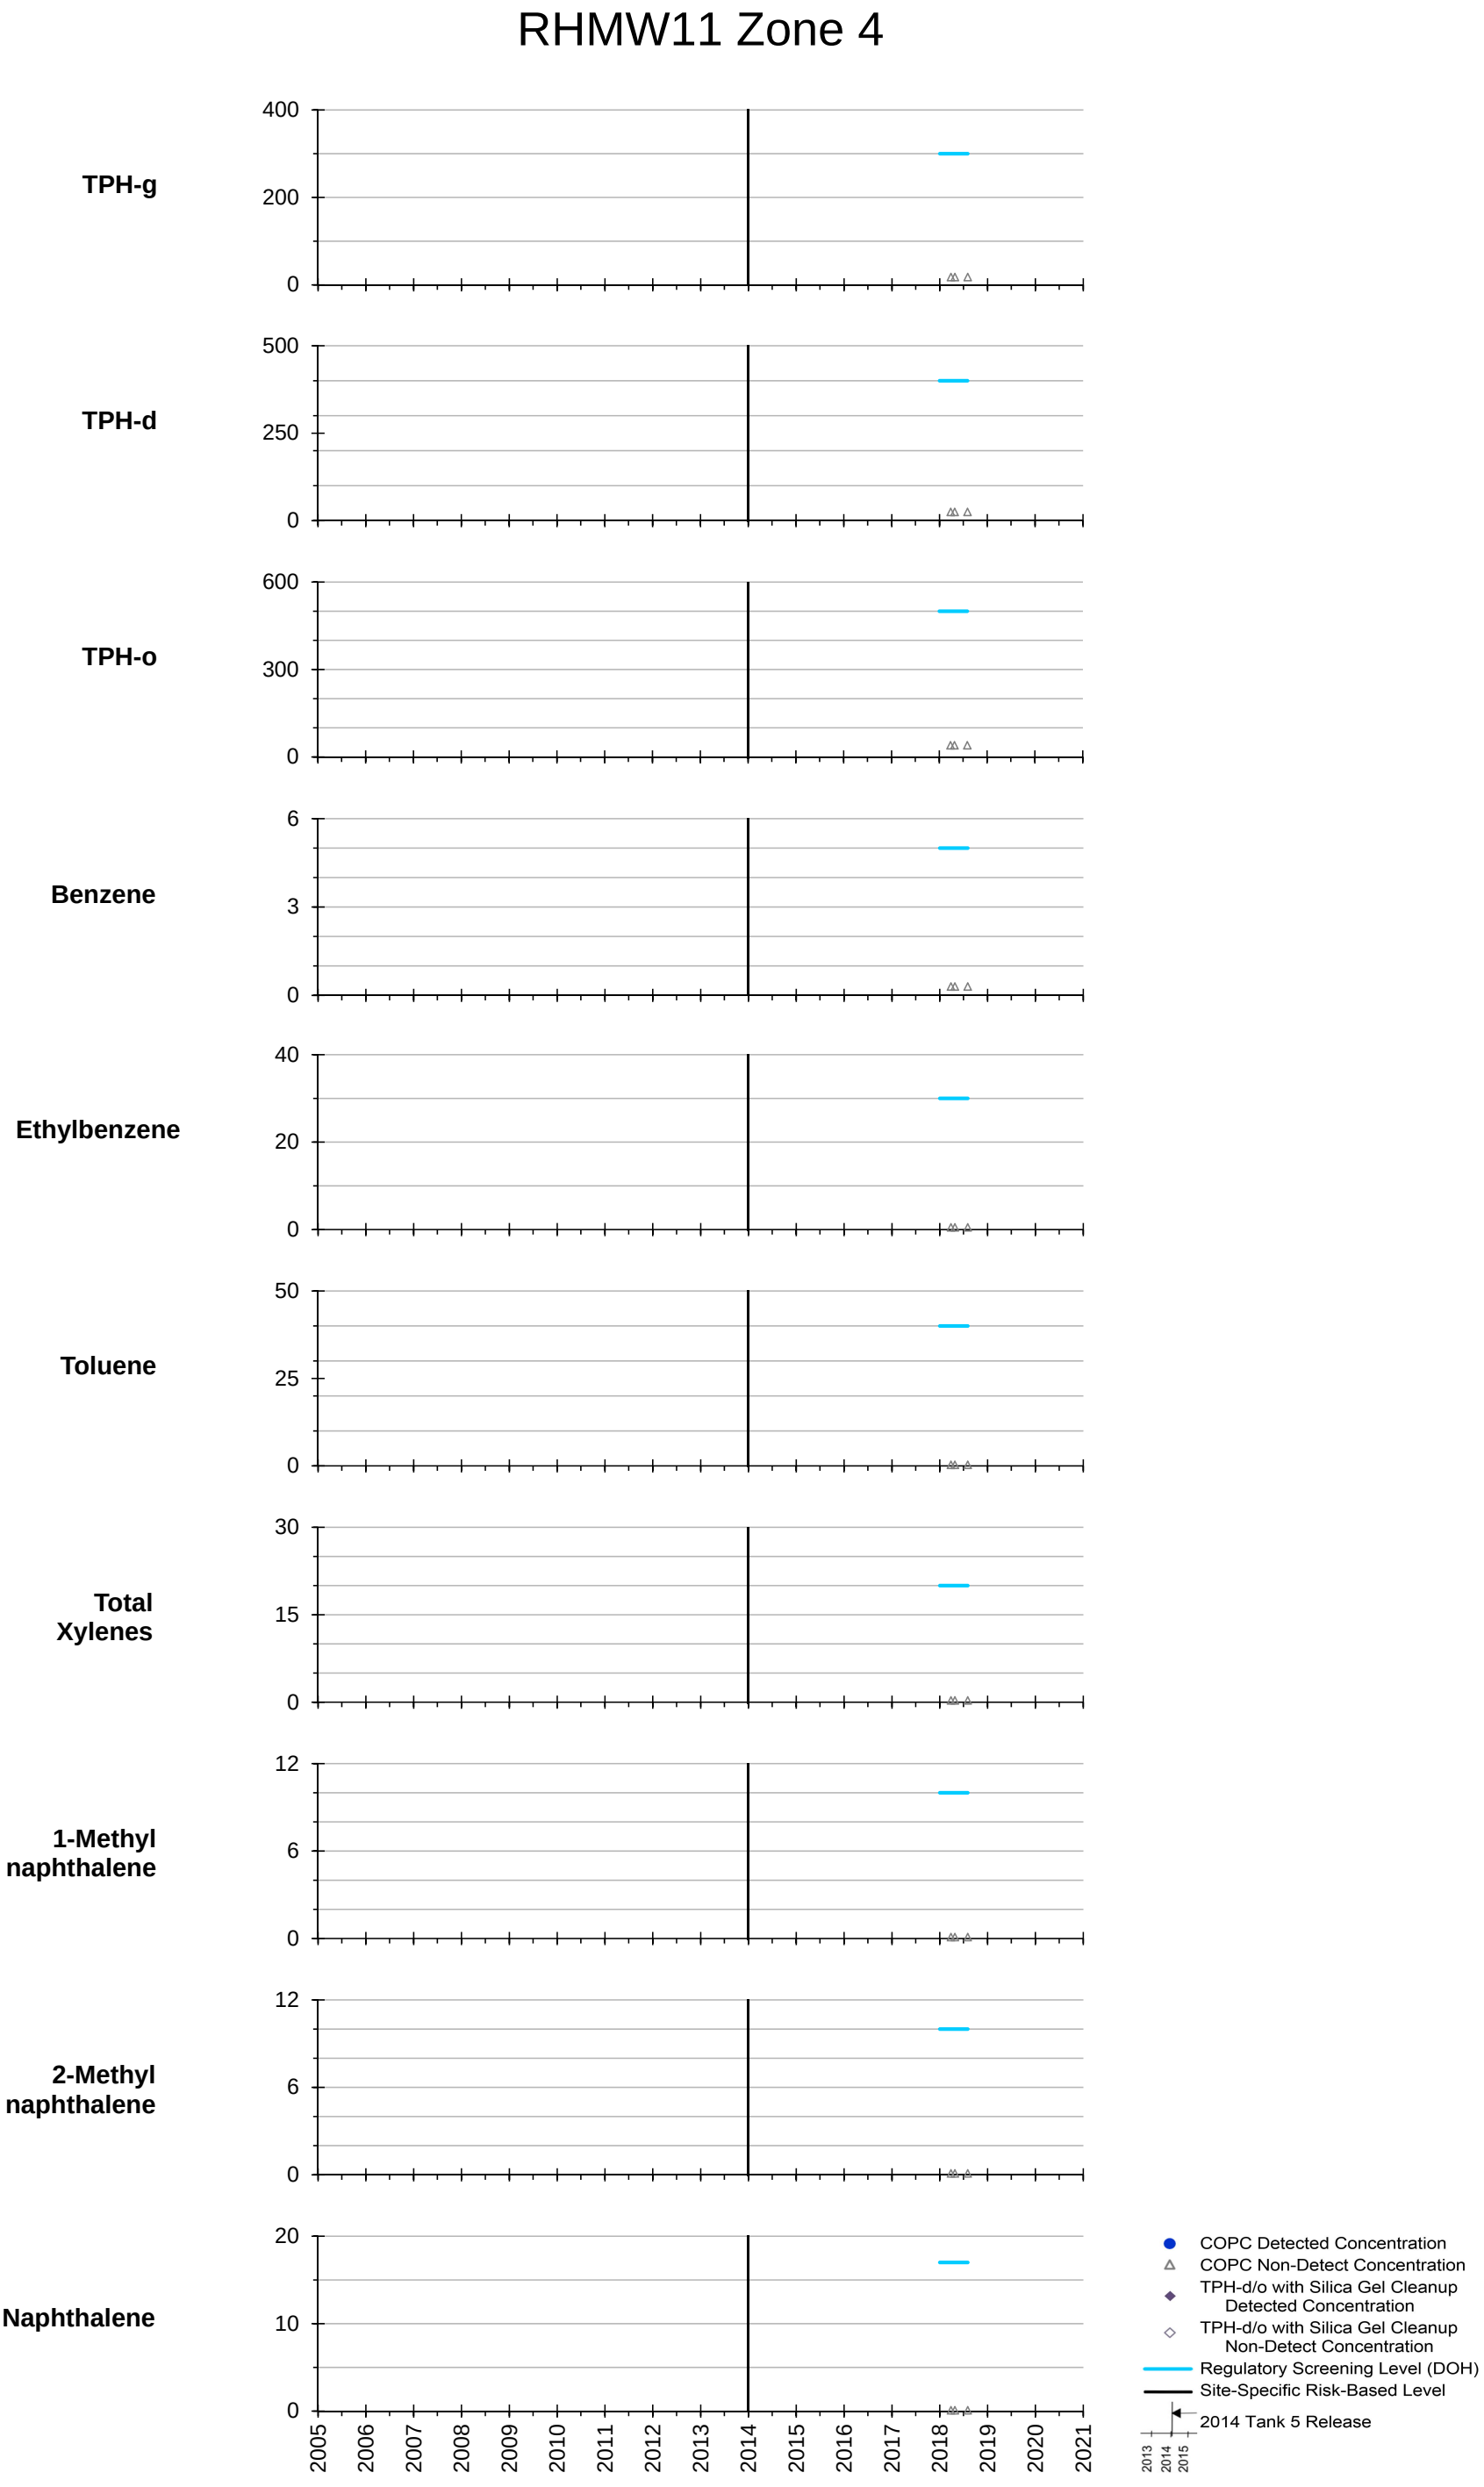
Appendix A.2 Groundwater Concentration Graphs

RHMW11 Zone 3



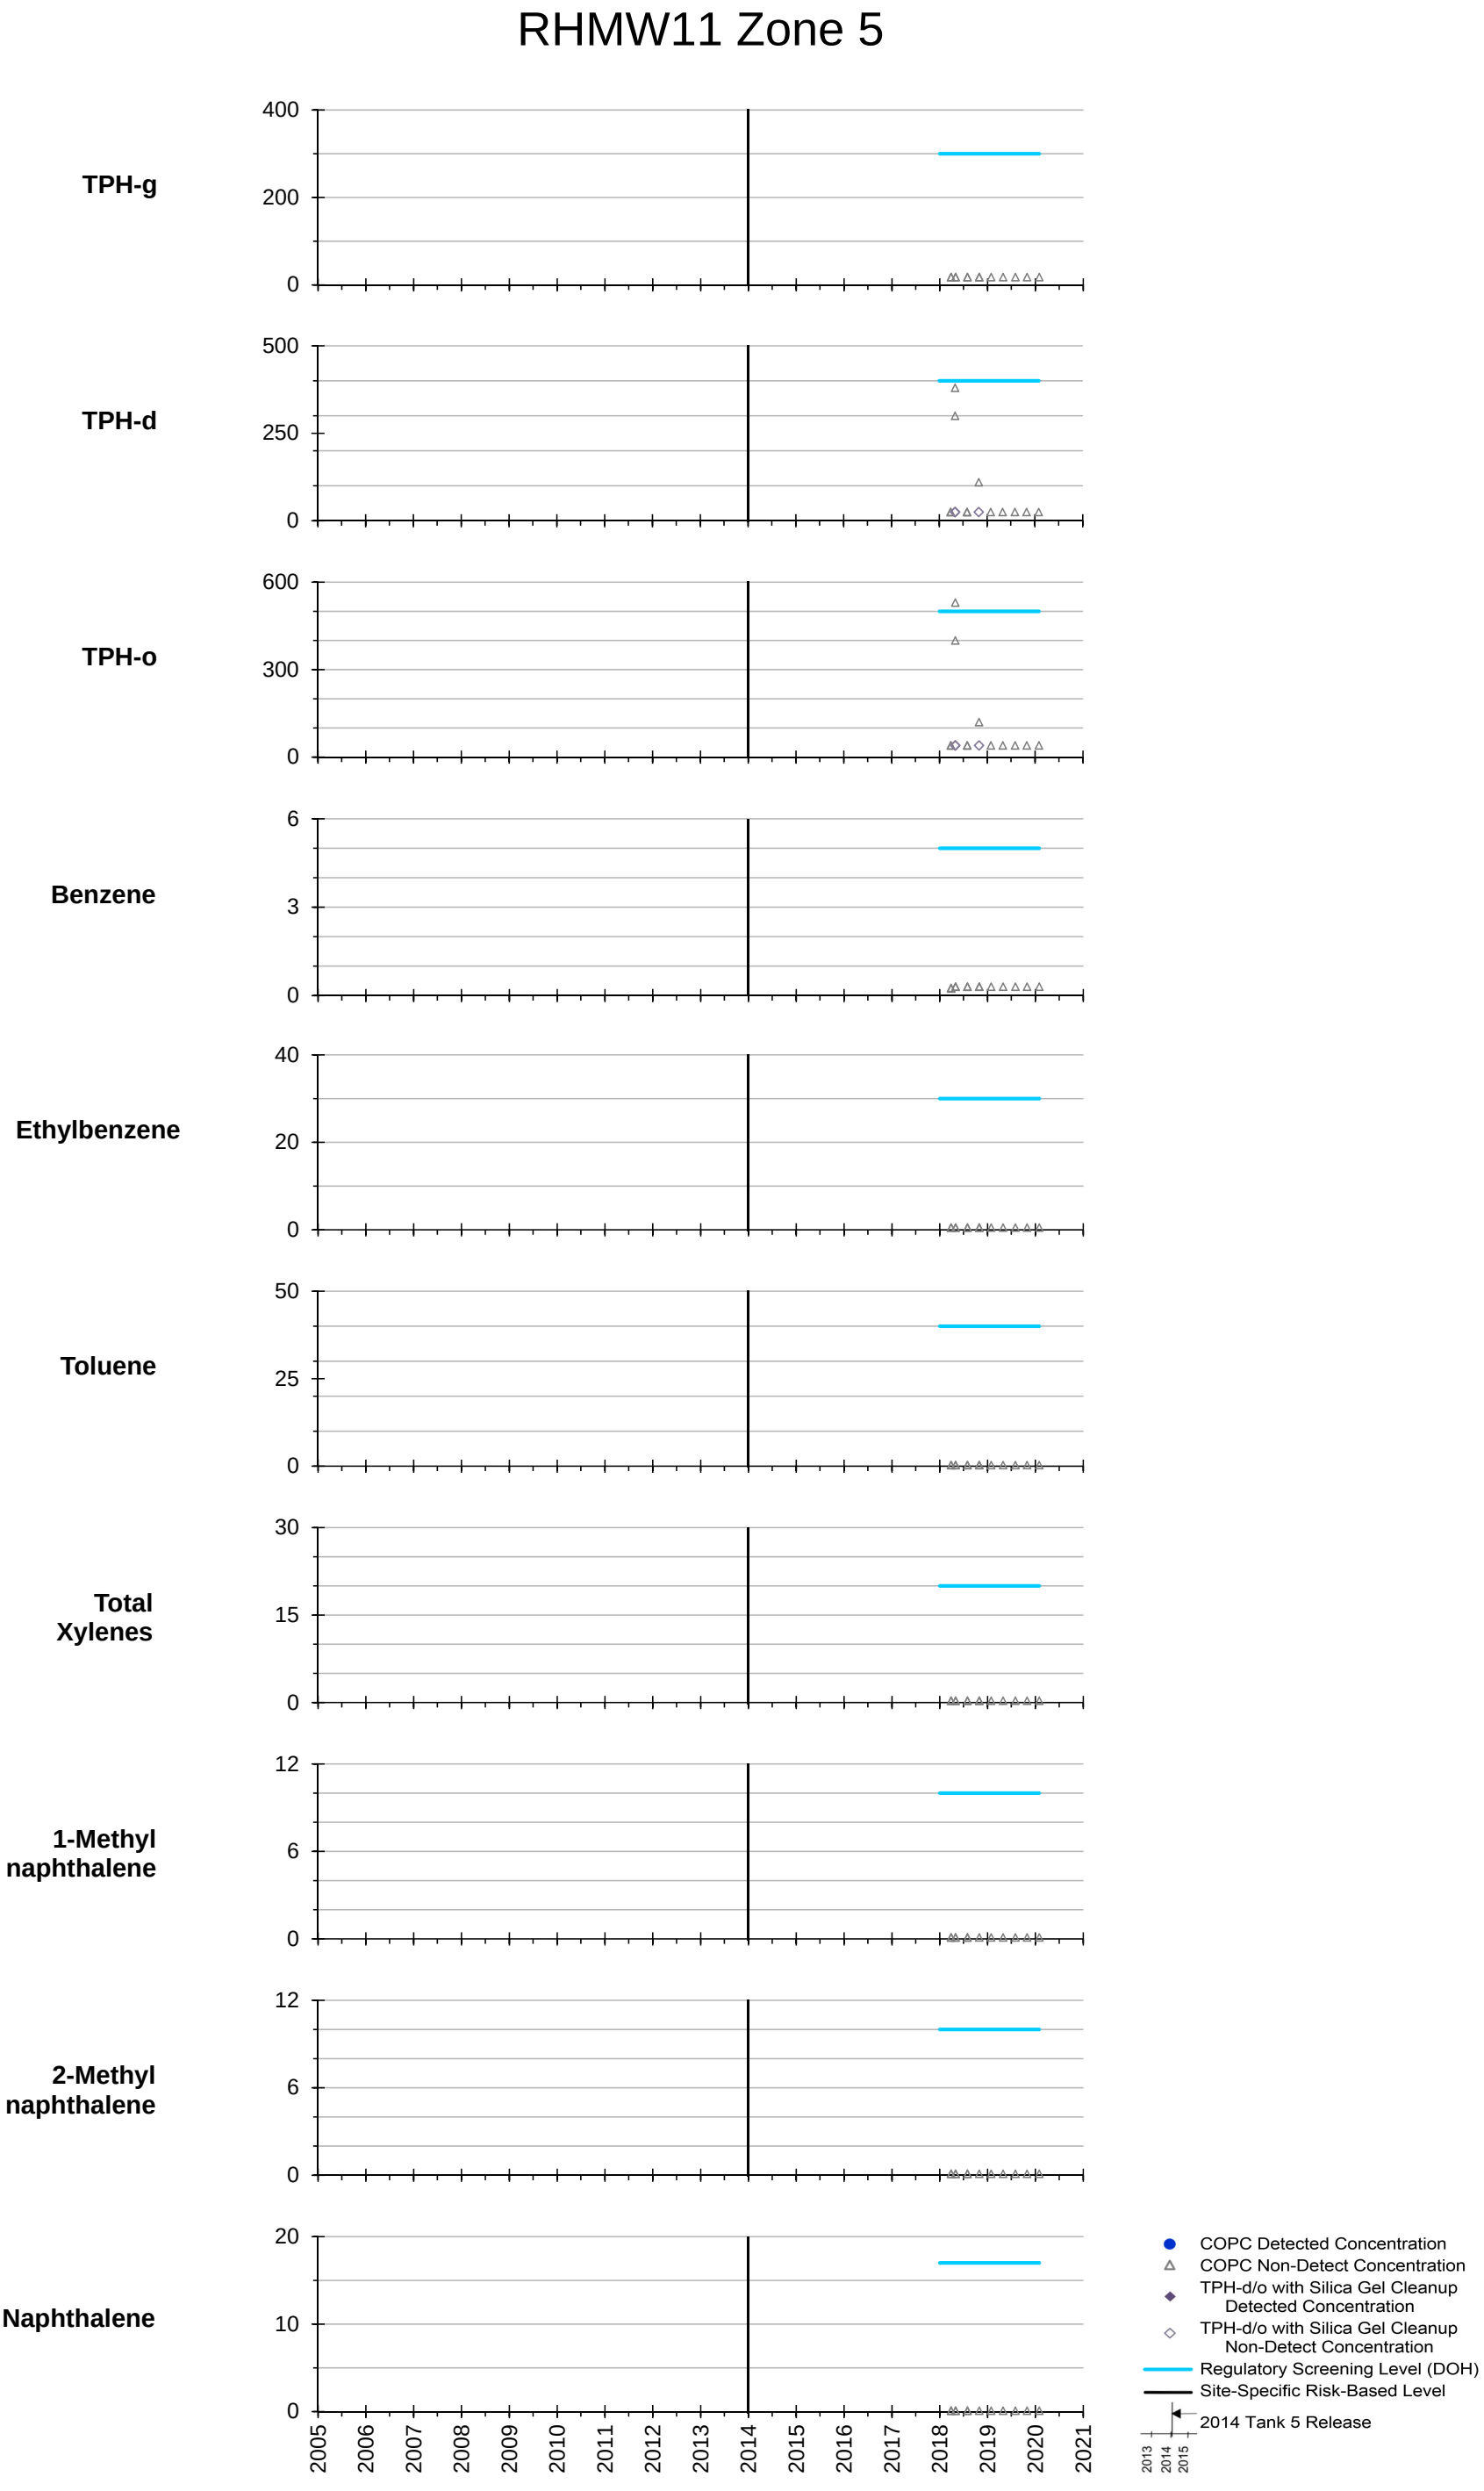
All results in micrograms per liter (µg/L or parts per billion).

Appendix A.2 Groundwater Concentration Graphs



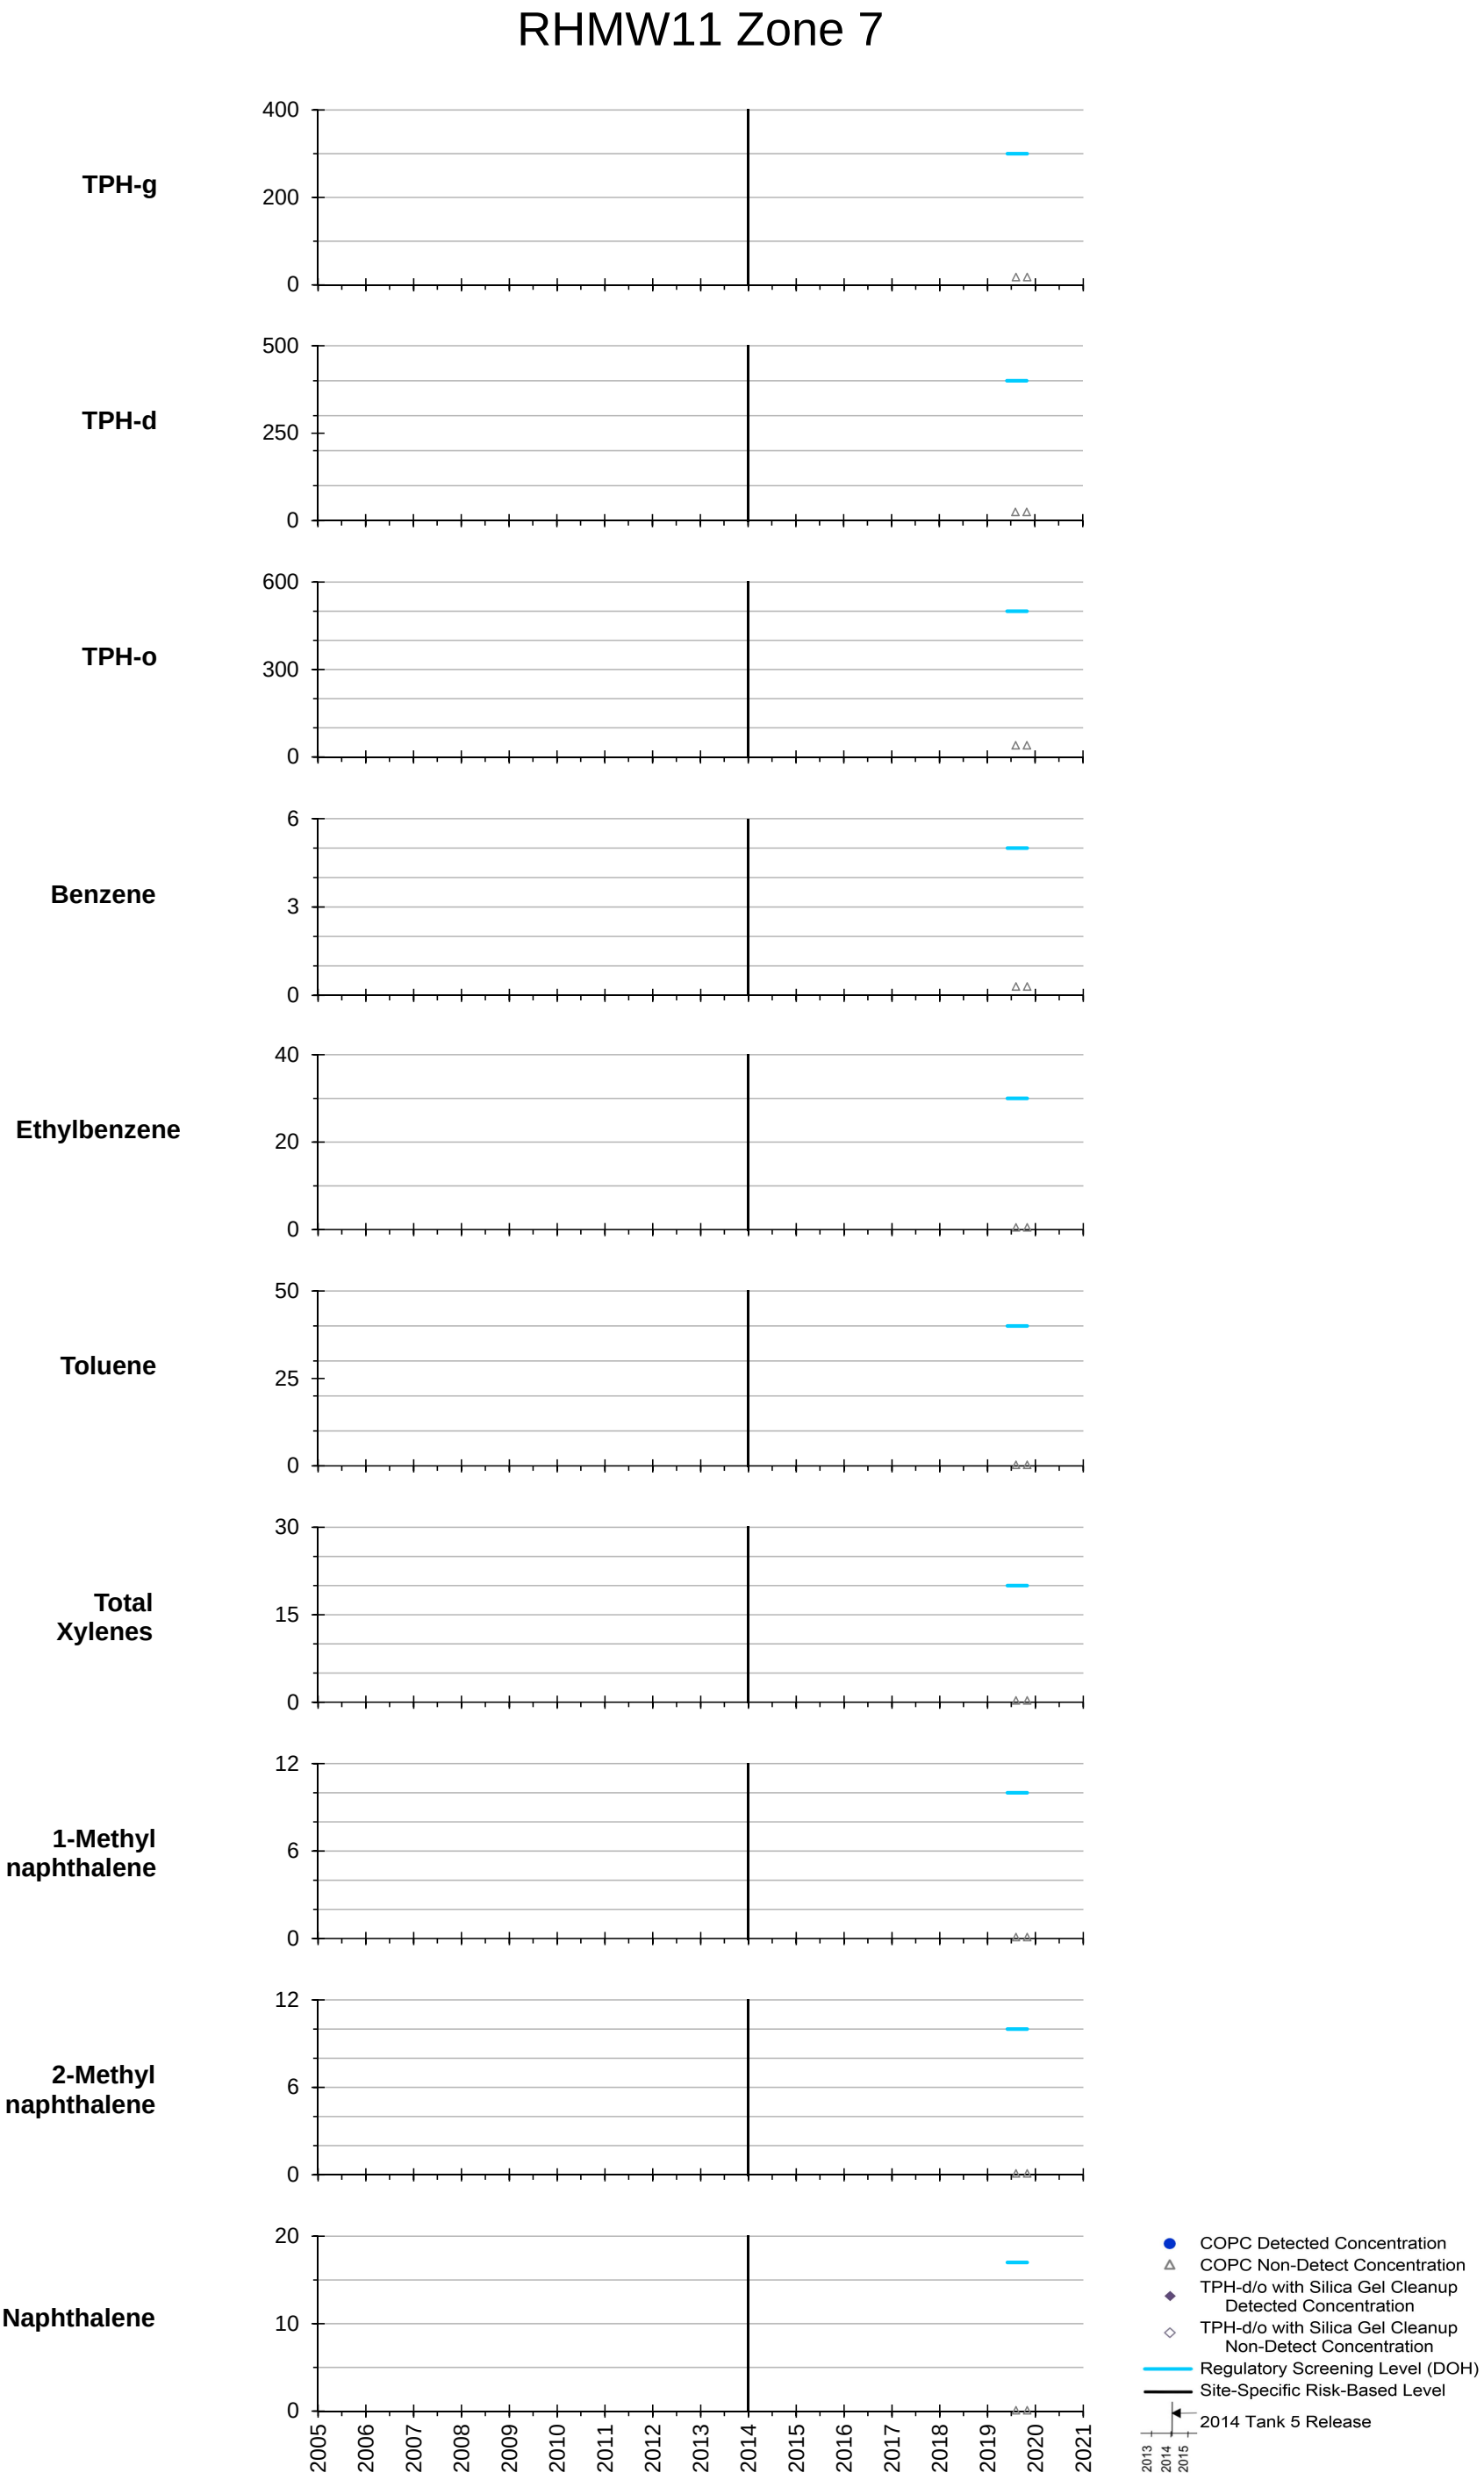
All results in micrograms per liter (µg/L or parts per billion).

Appendix A.2 Groundwater Concentration Graphs



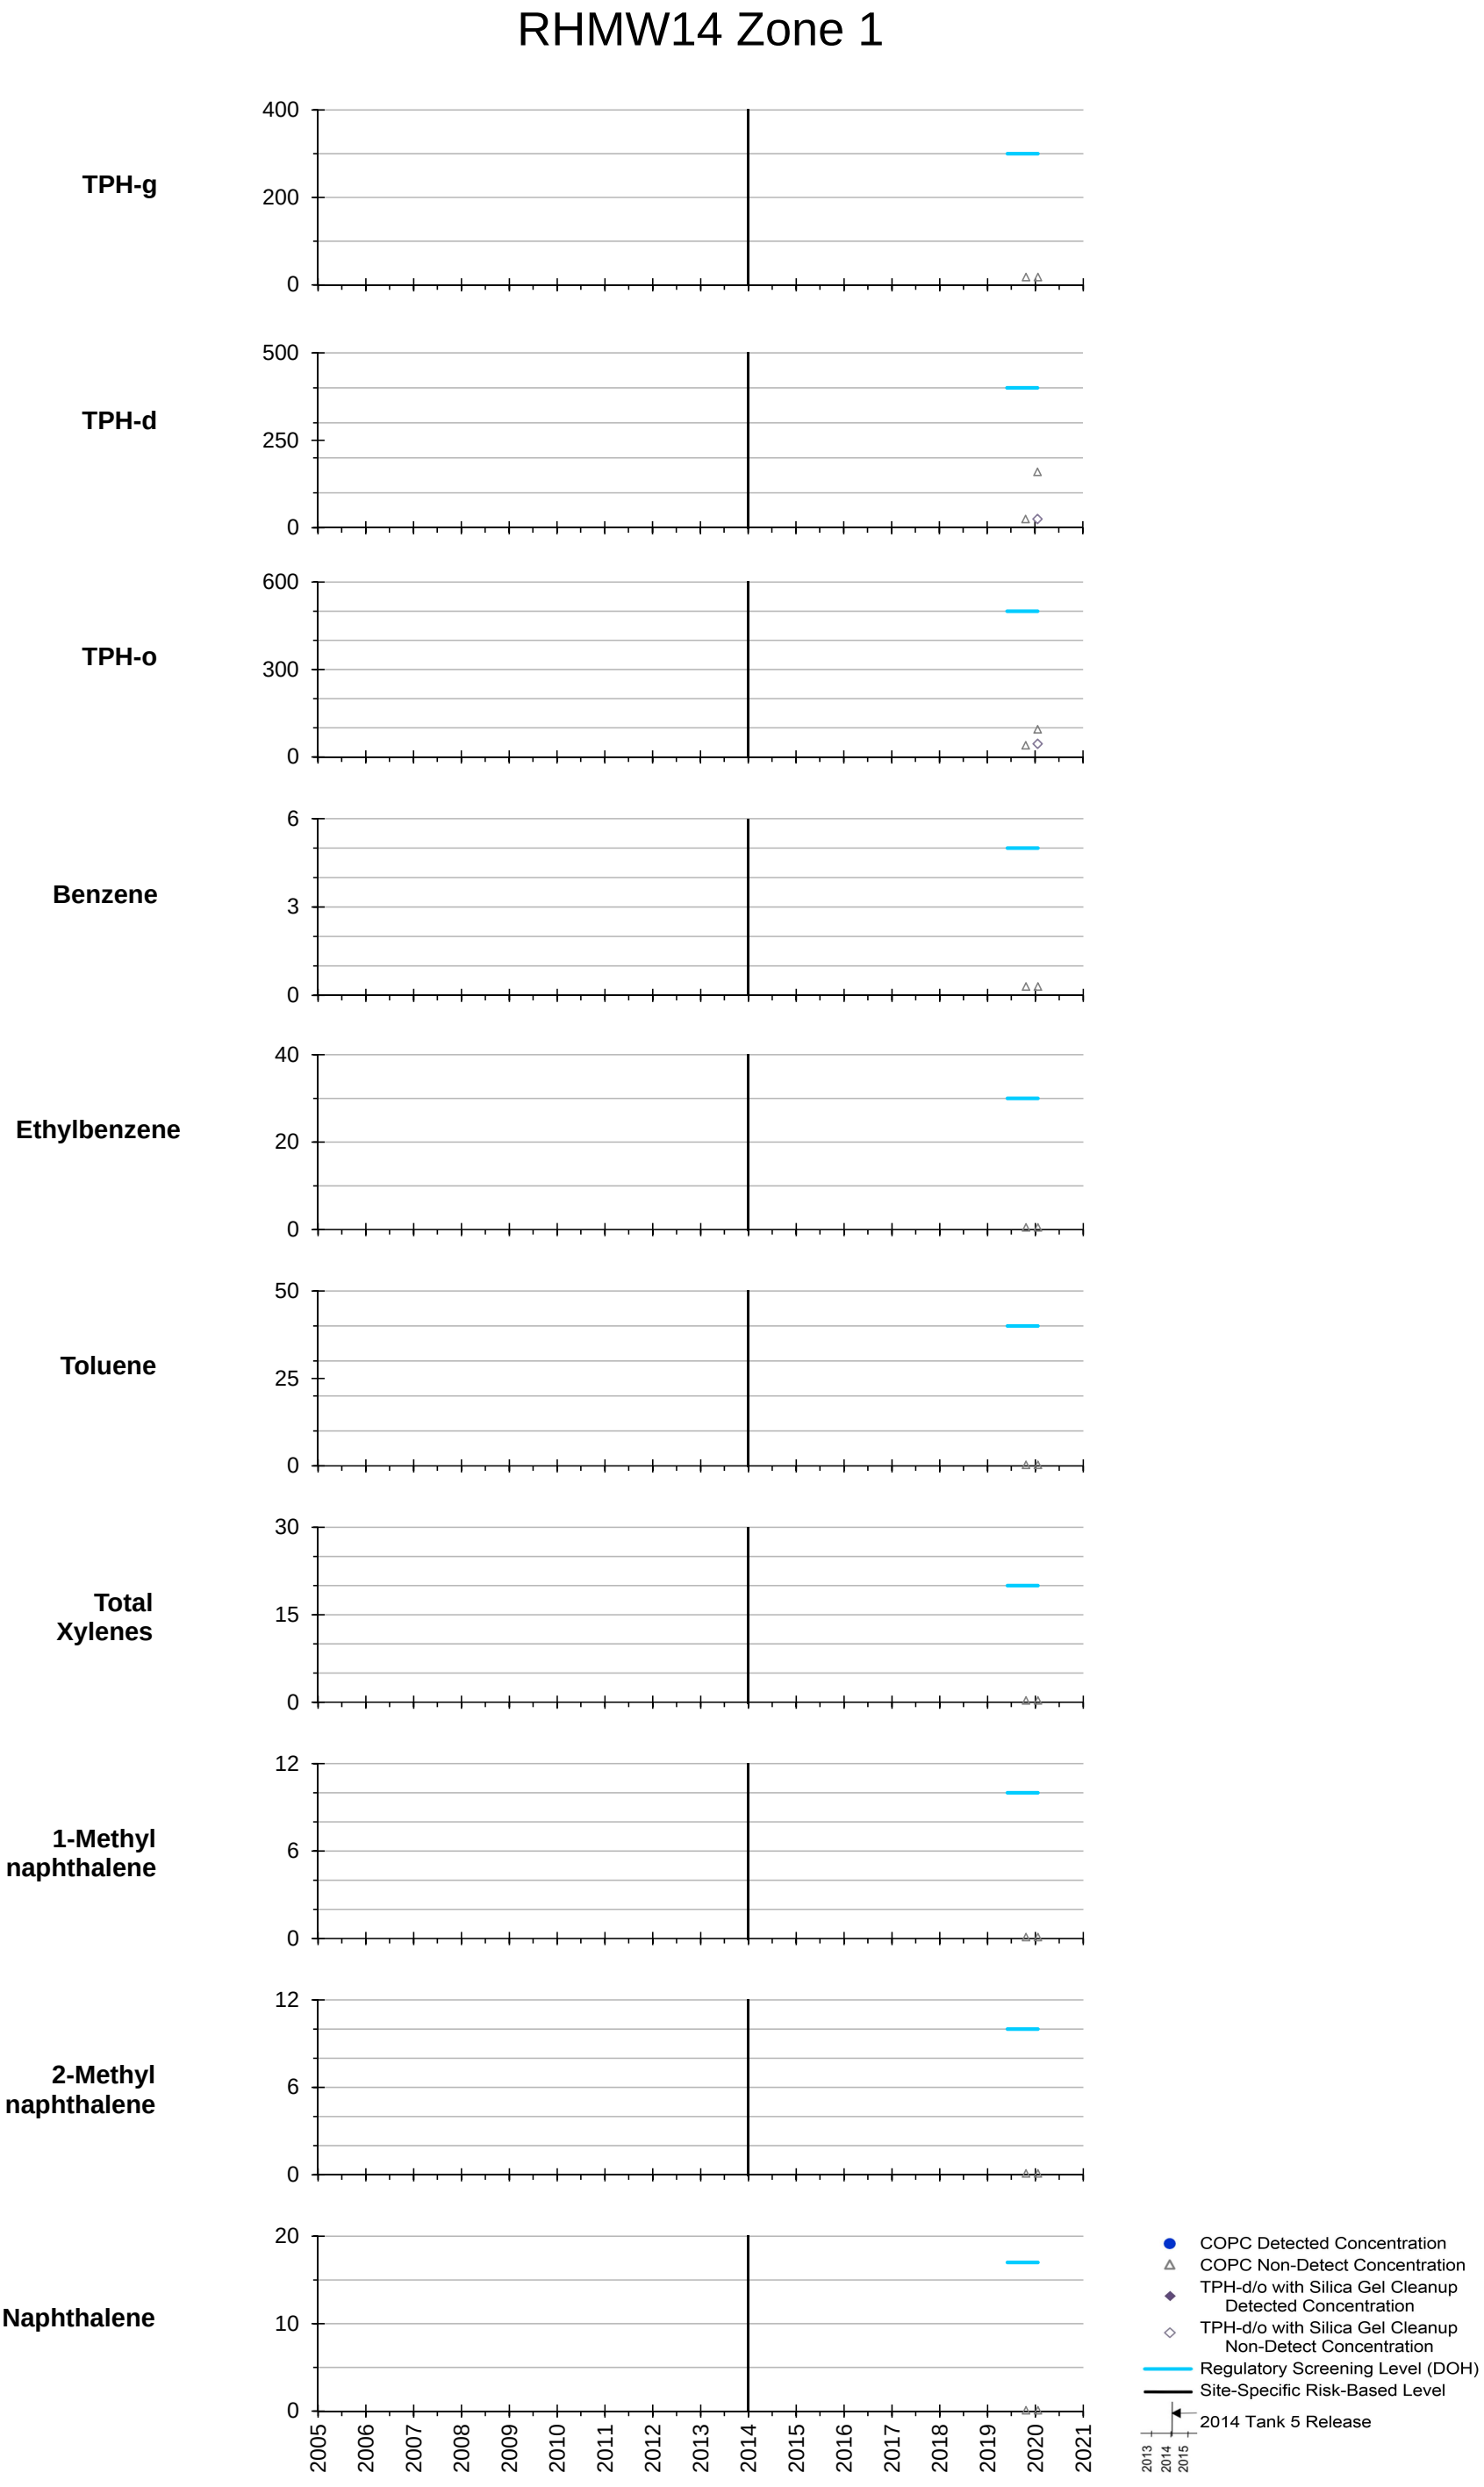
All results in micrograms per liter (µg/L or parts per billion).

Appendix A.2 Groundwater Concentration Graphs



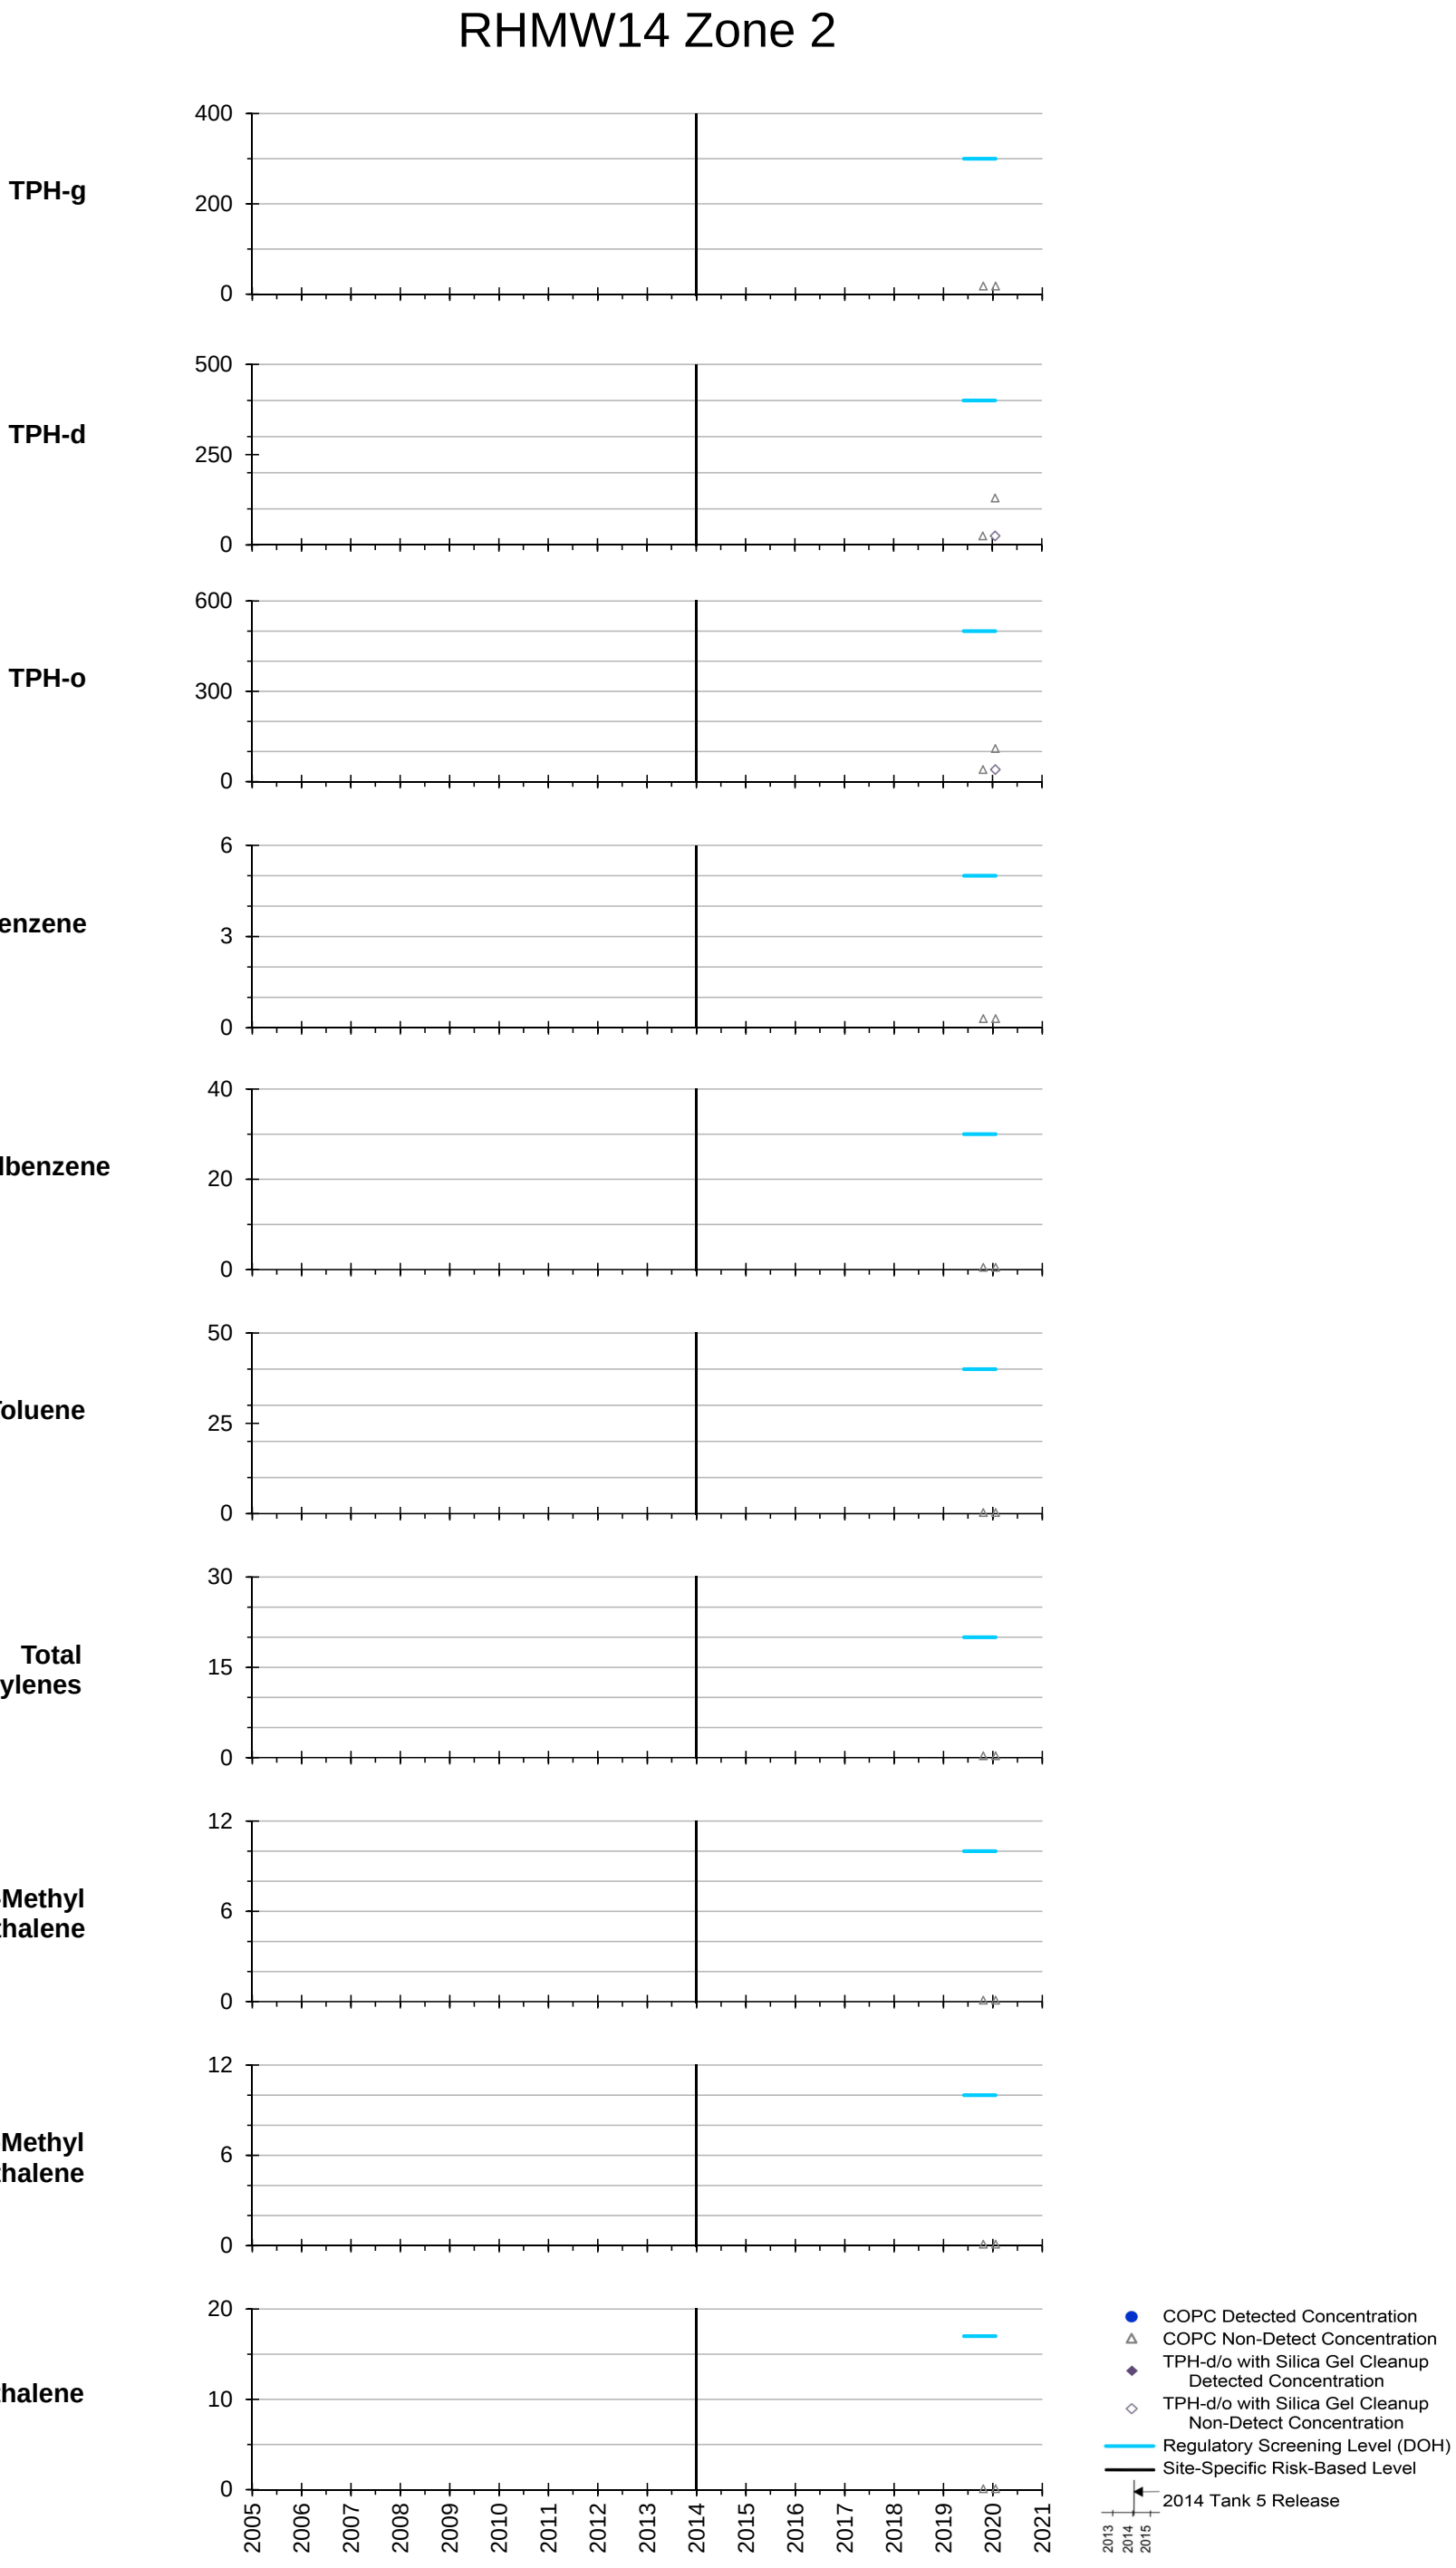
All results in micrograms per liter (µg/L or parts per billion).

Appendix A.2 Groundwater Concentration Graphs



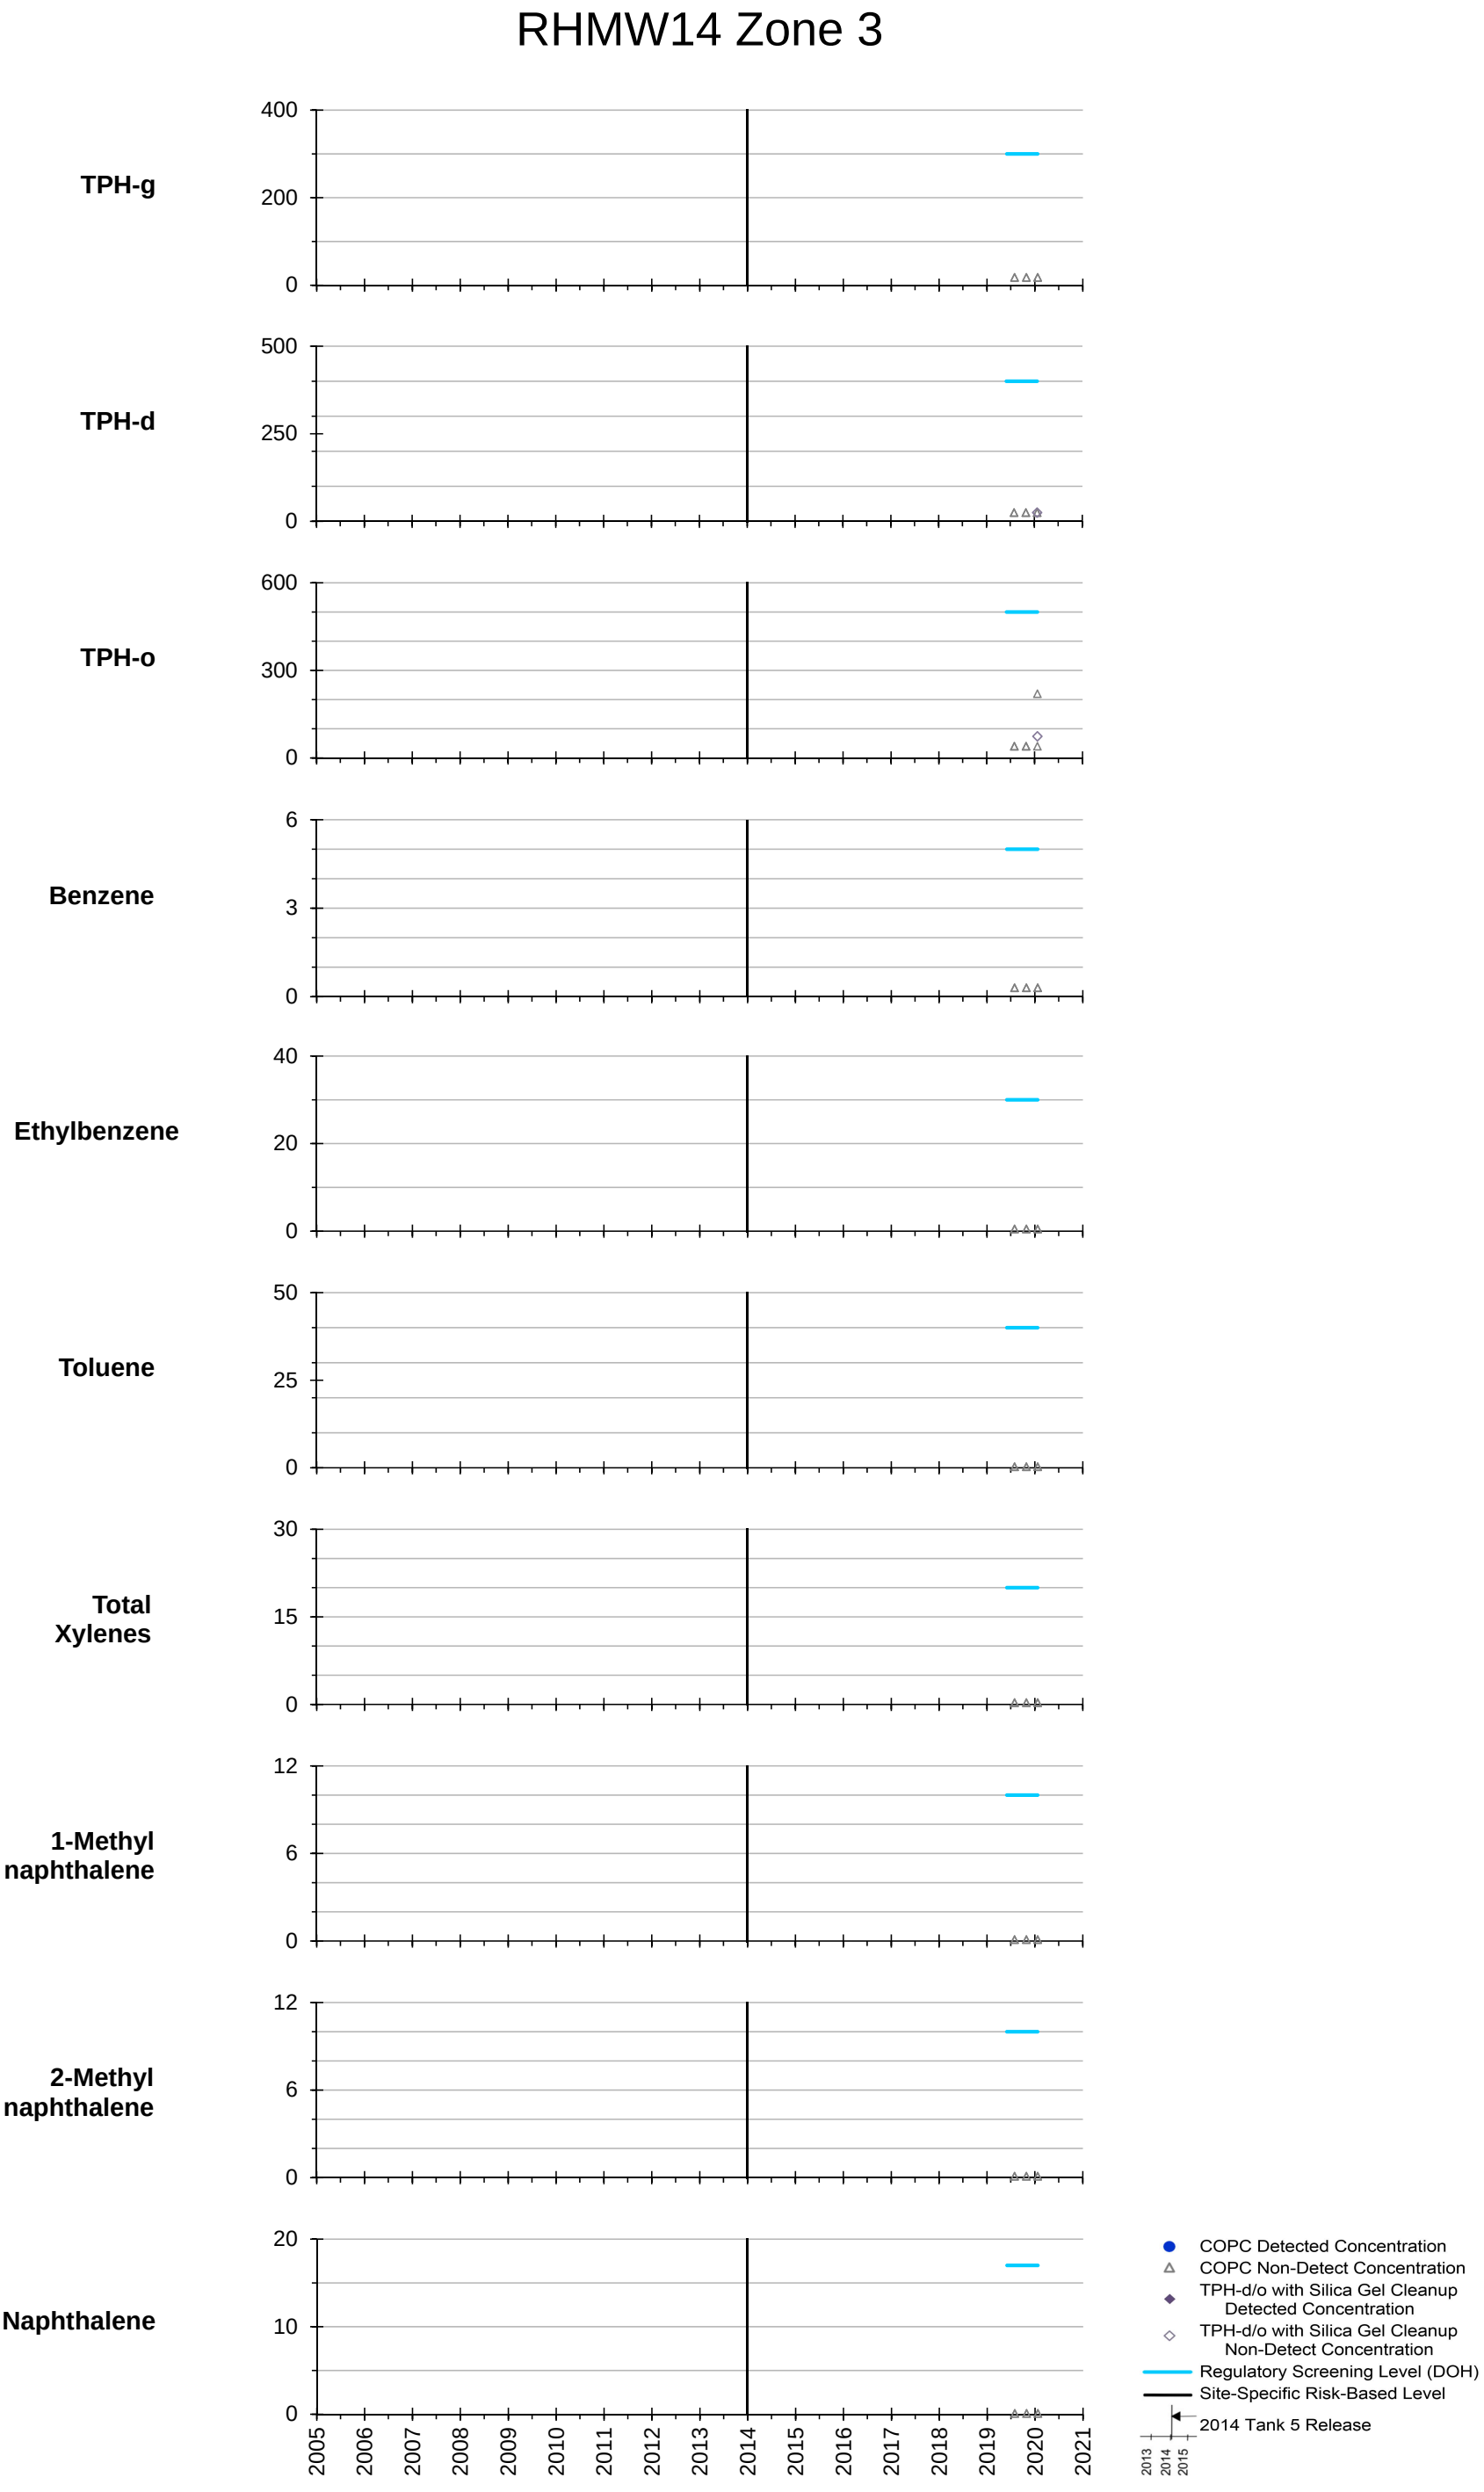
All results in micrograms per liter (µg/L or parts per billion).

Appendix A.2 Groundwater Concentration Graphs



All results in micrograms per liter (µg/L or parts per billion).

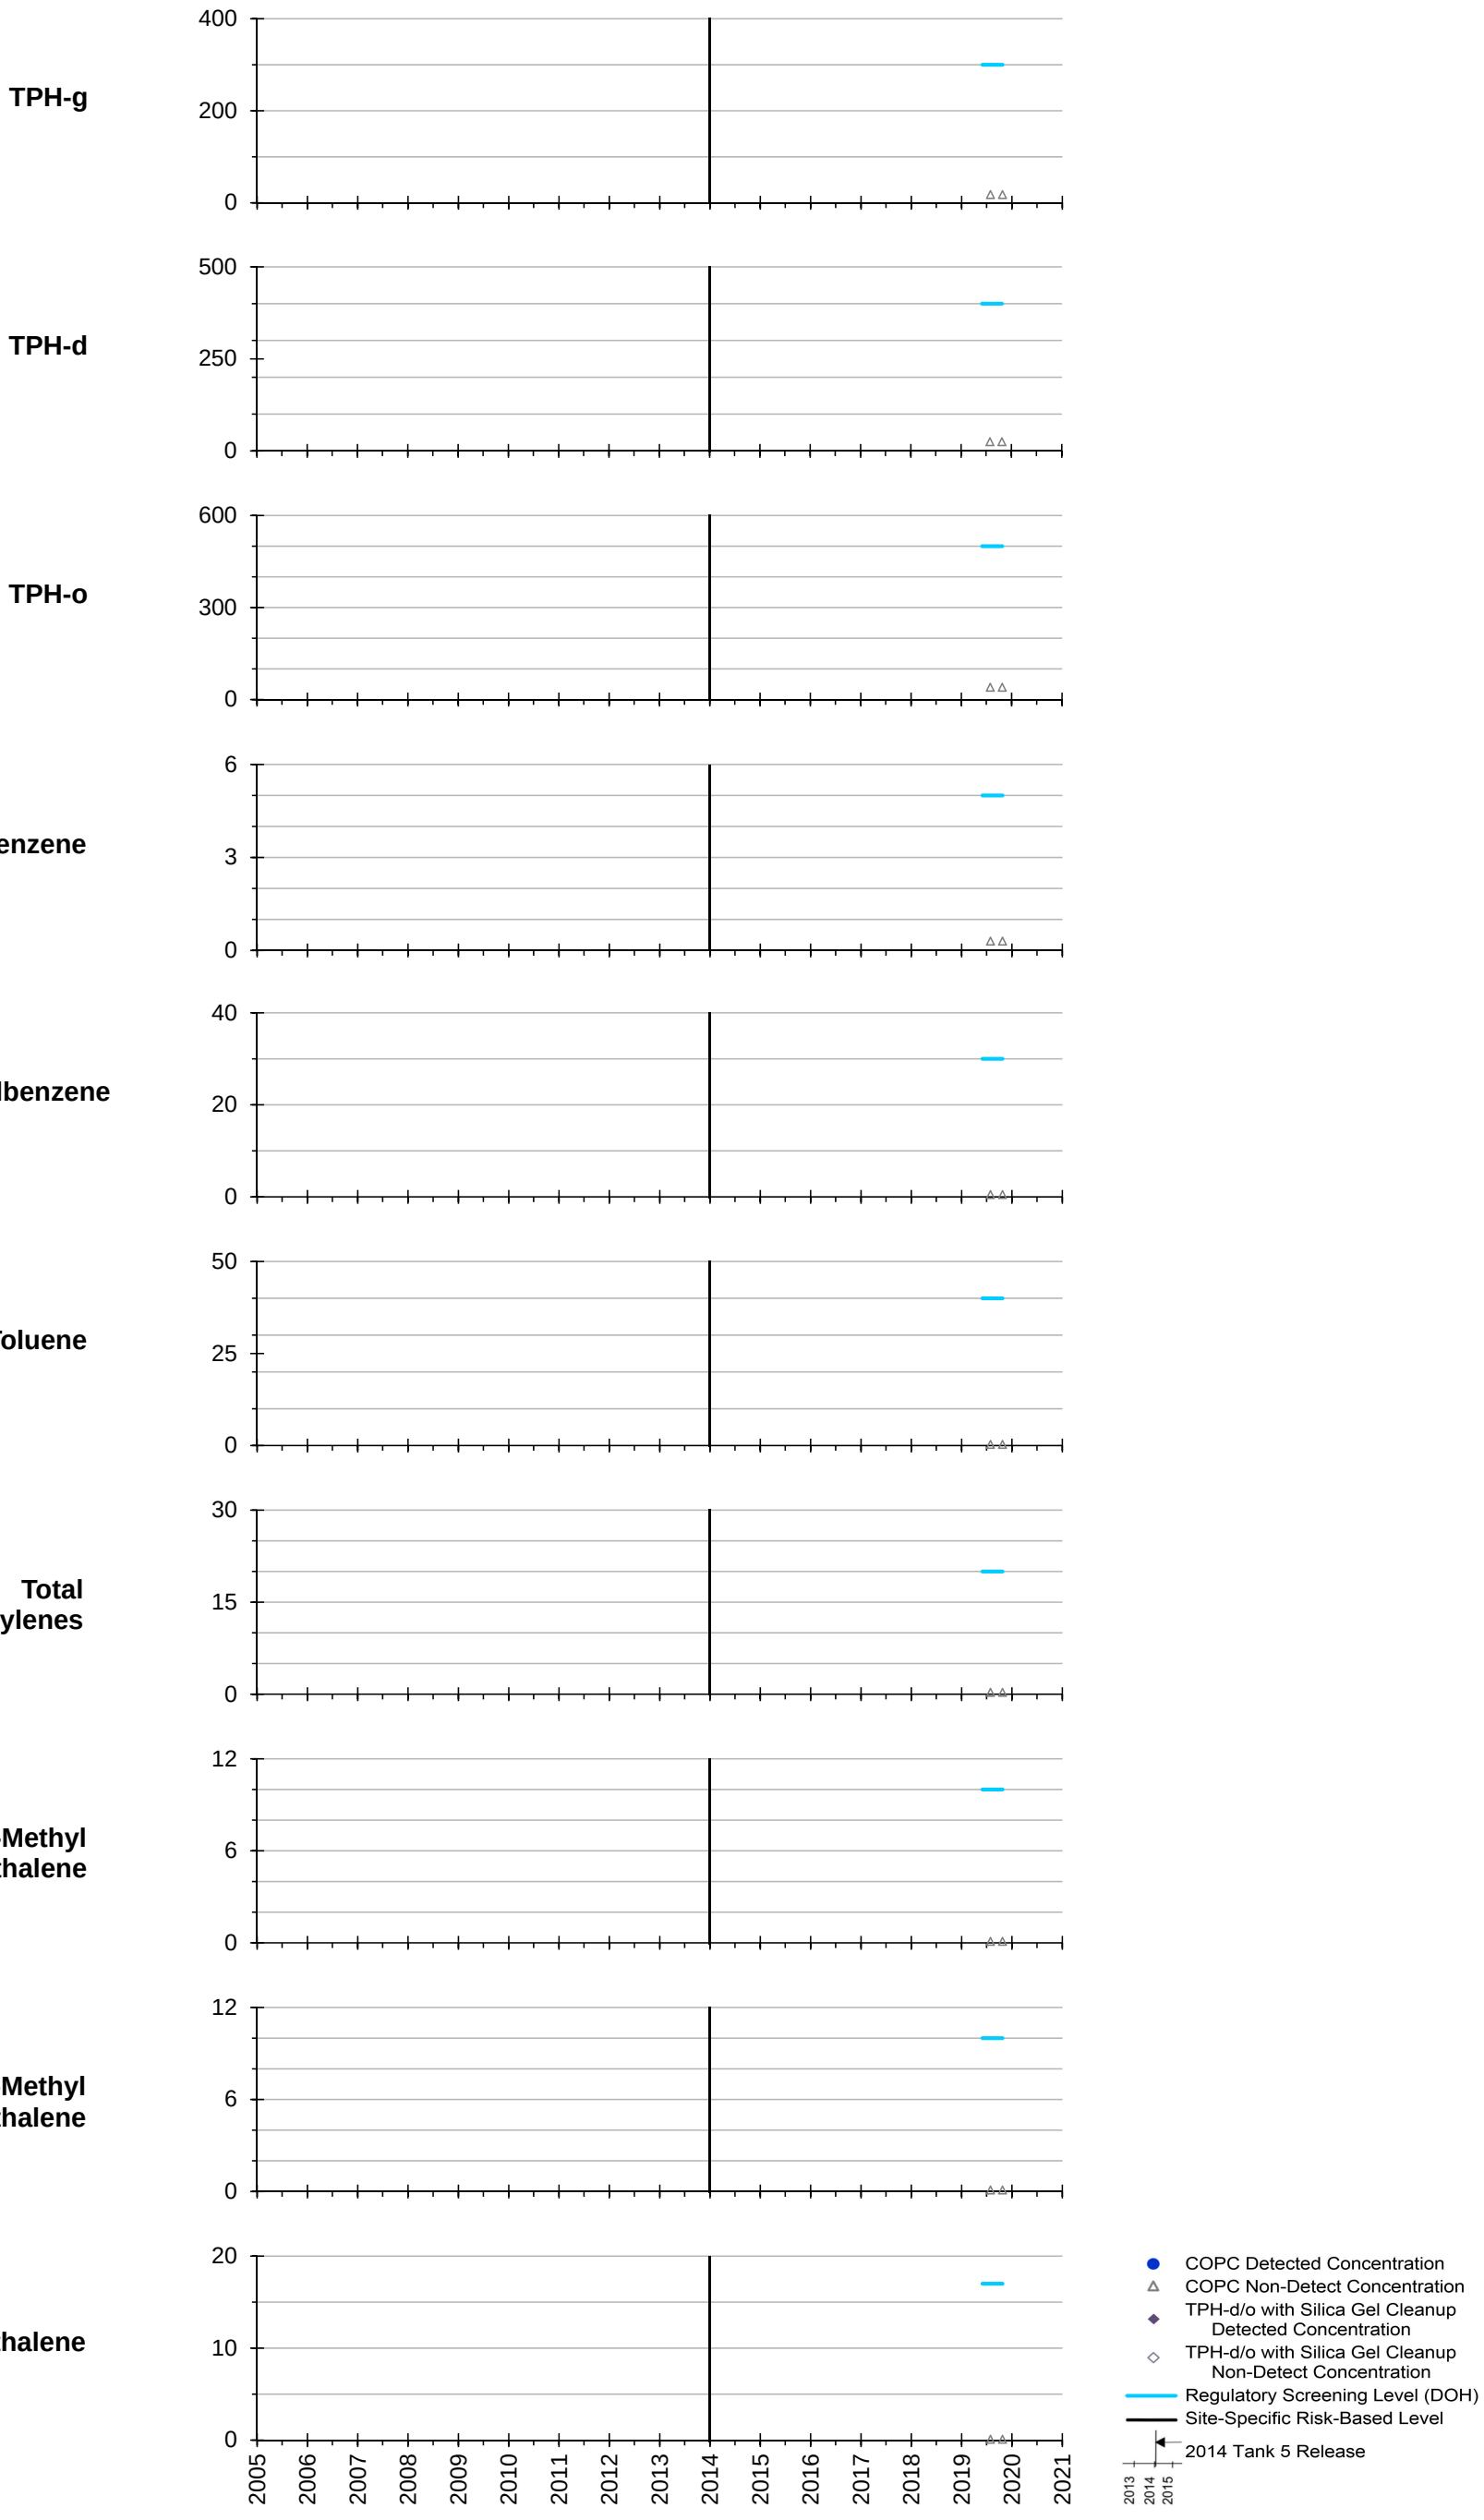
Appendix A.2 Groundwater Concentration Graphs



All results in micrograms per liter (µg/L or parts per billion).

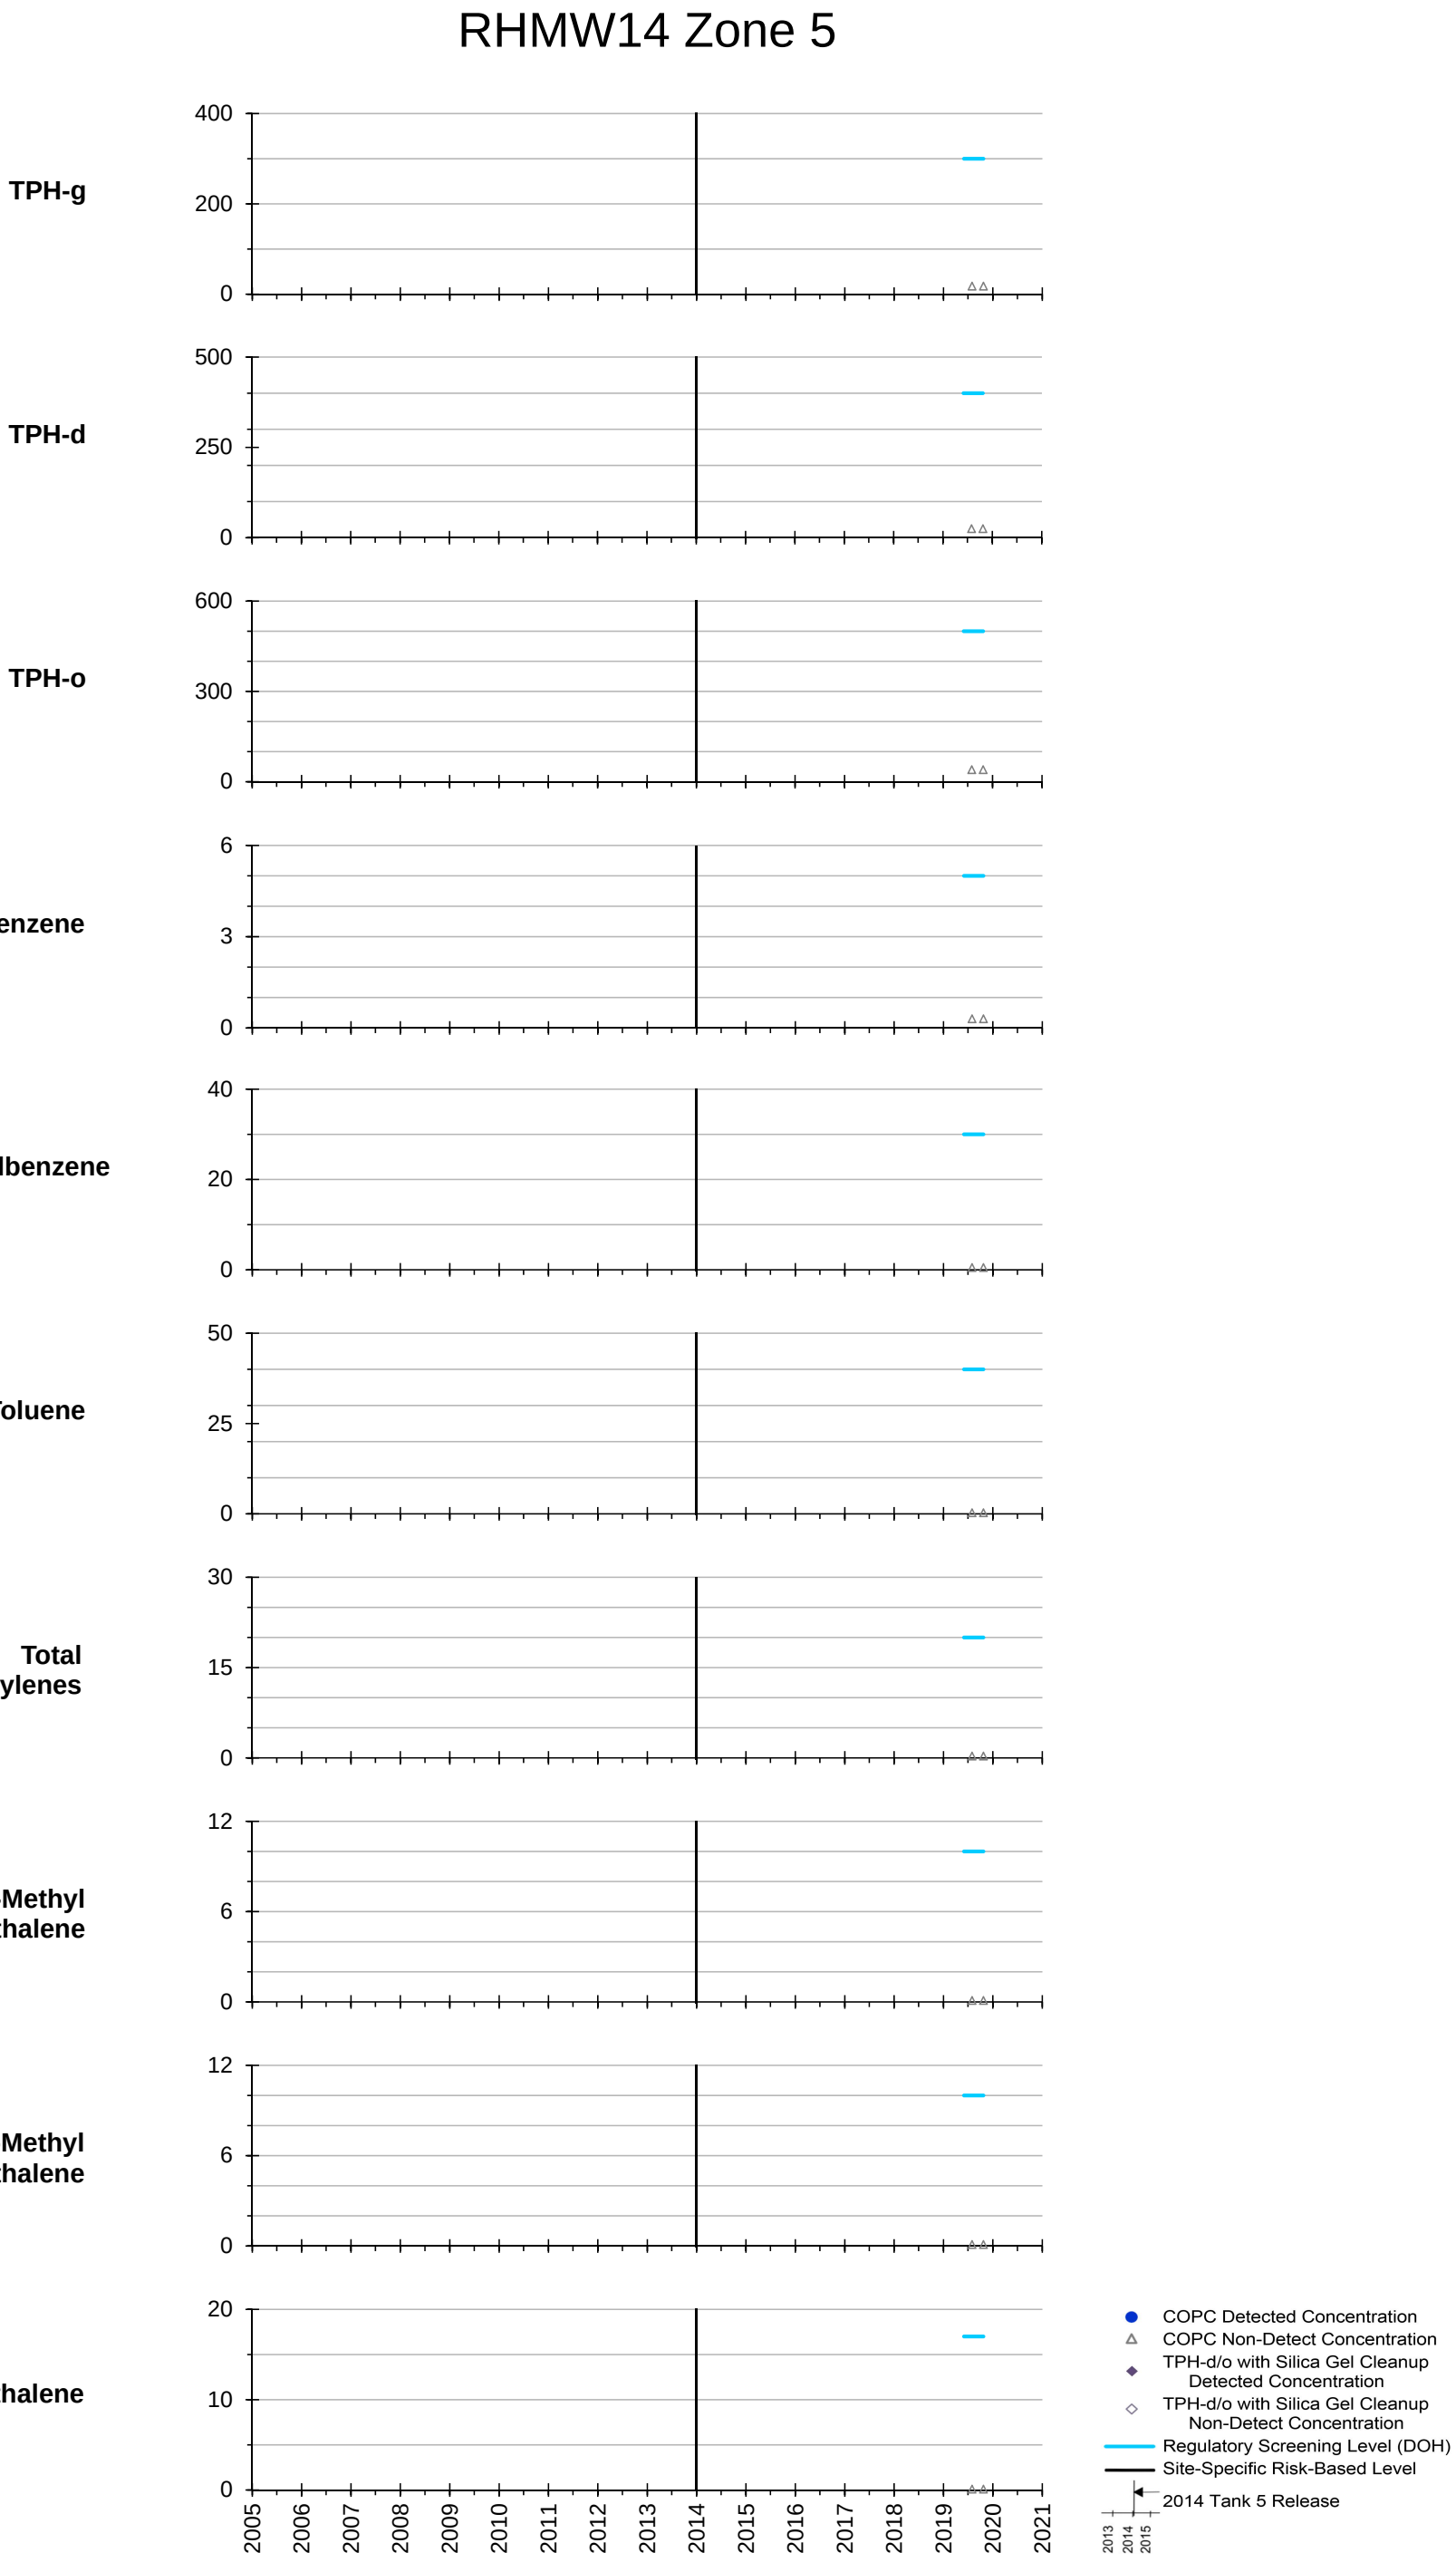
Appendix A.2 Groundwater Concentration Graphs

RHMW14 Zone 4



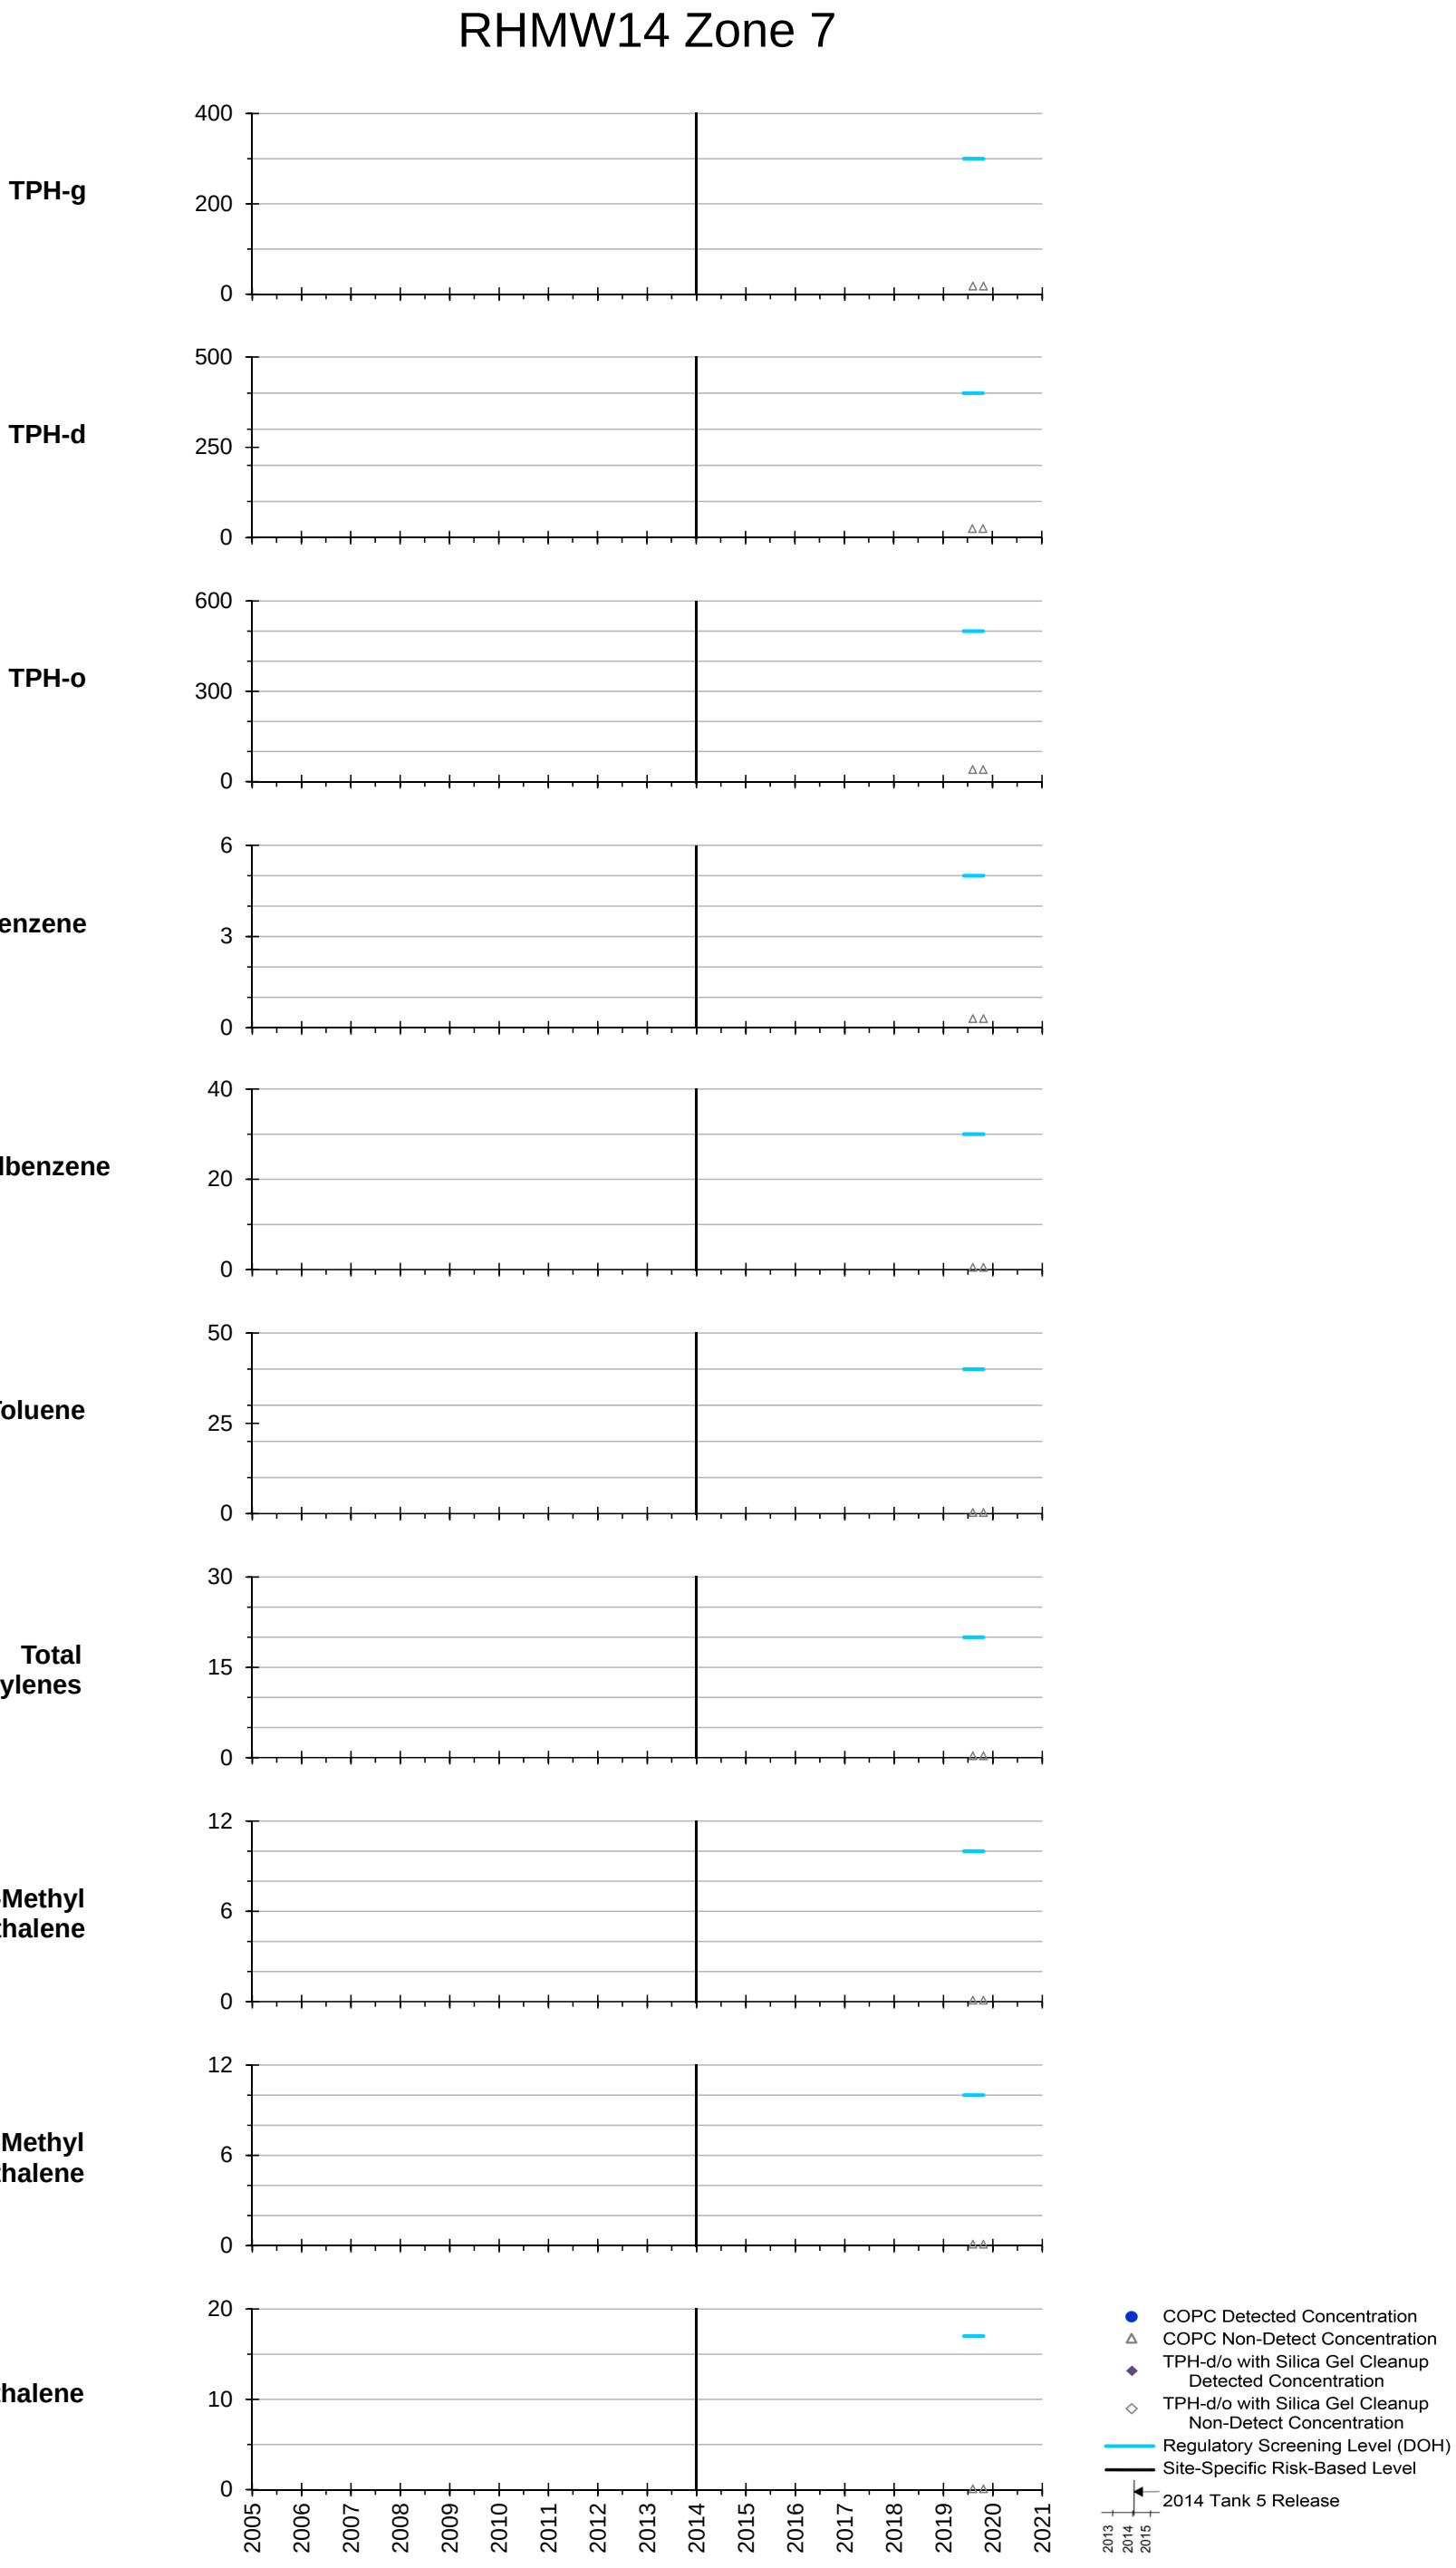
All results in micrograms per liter (µg/L or parts per billion).

Appendix A.2 Groundwater Concentration Graphs



All results in micrograms per liter (µg/L or parts per billion).

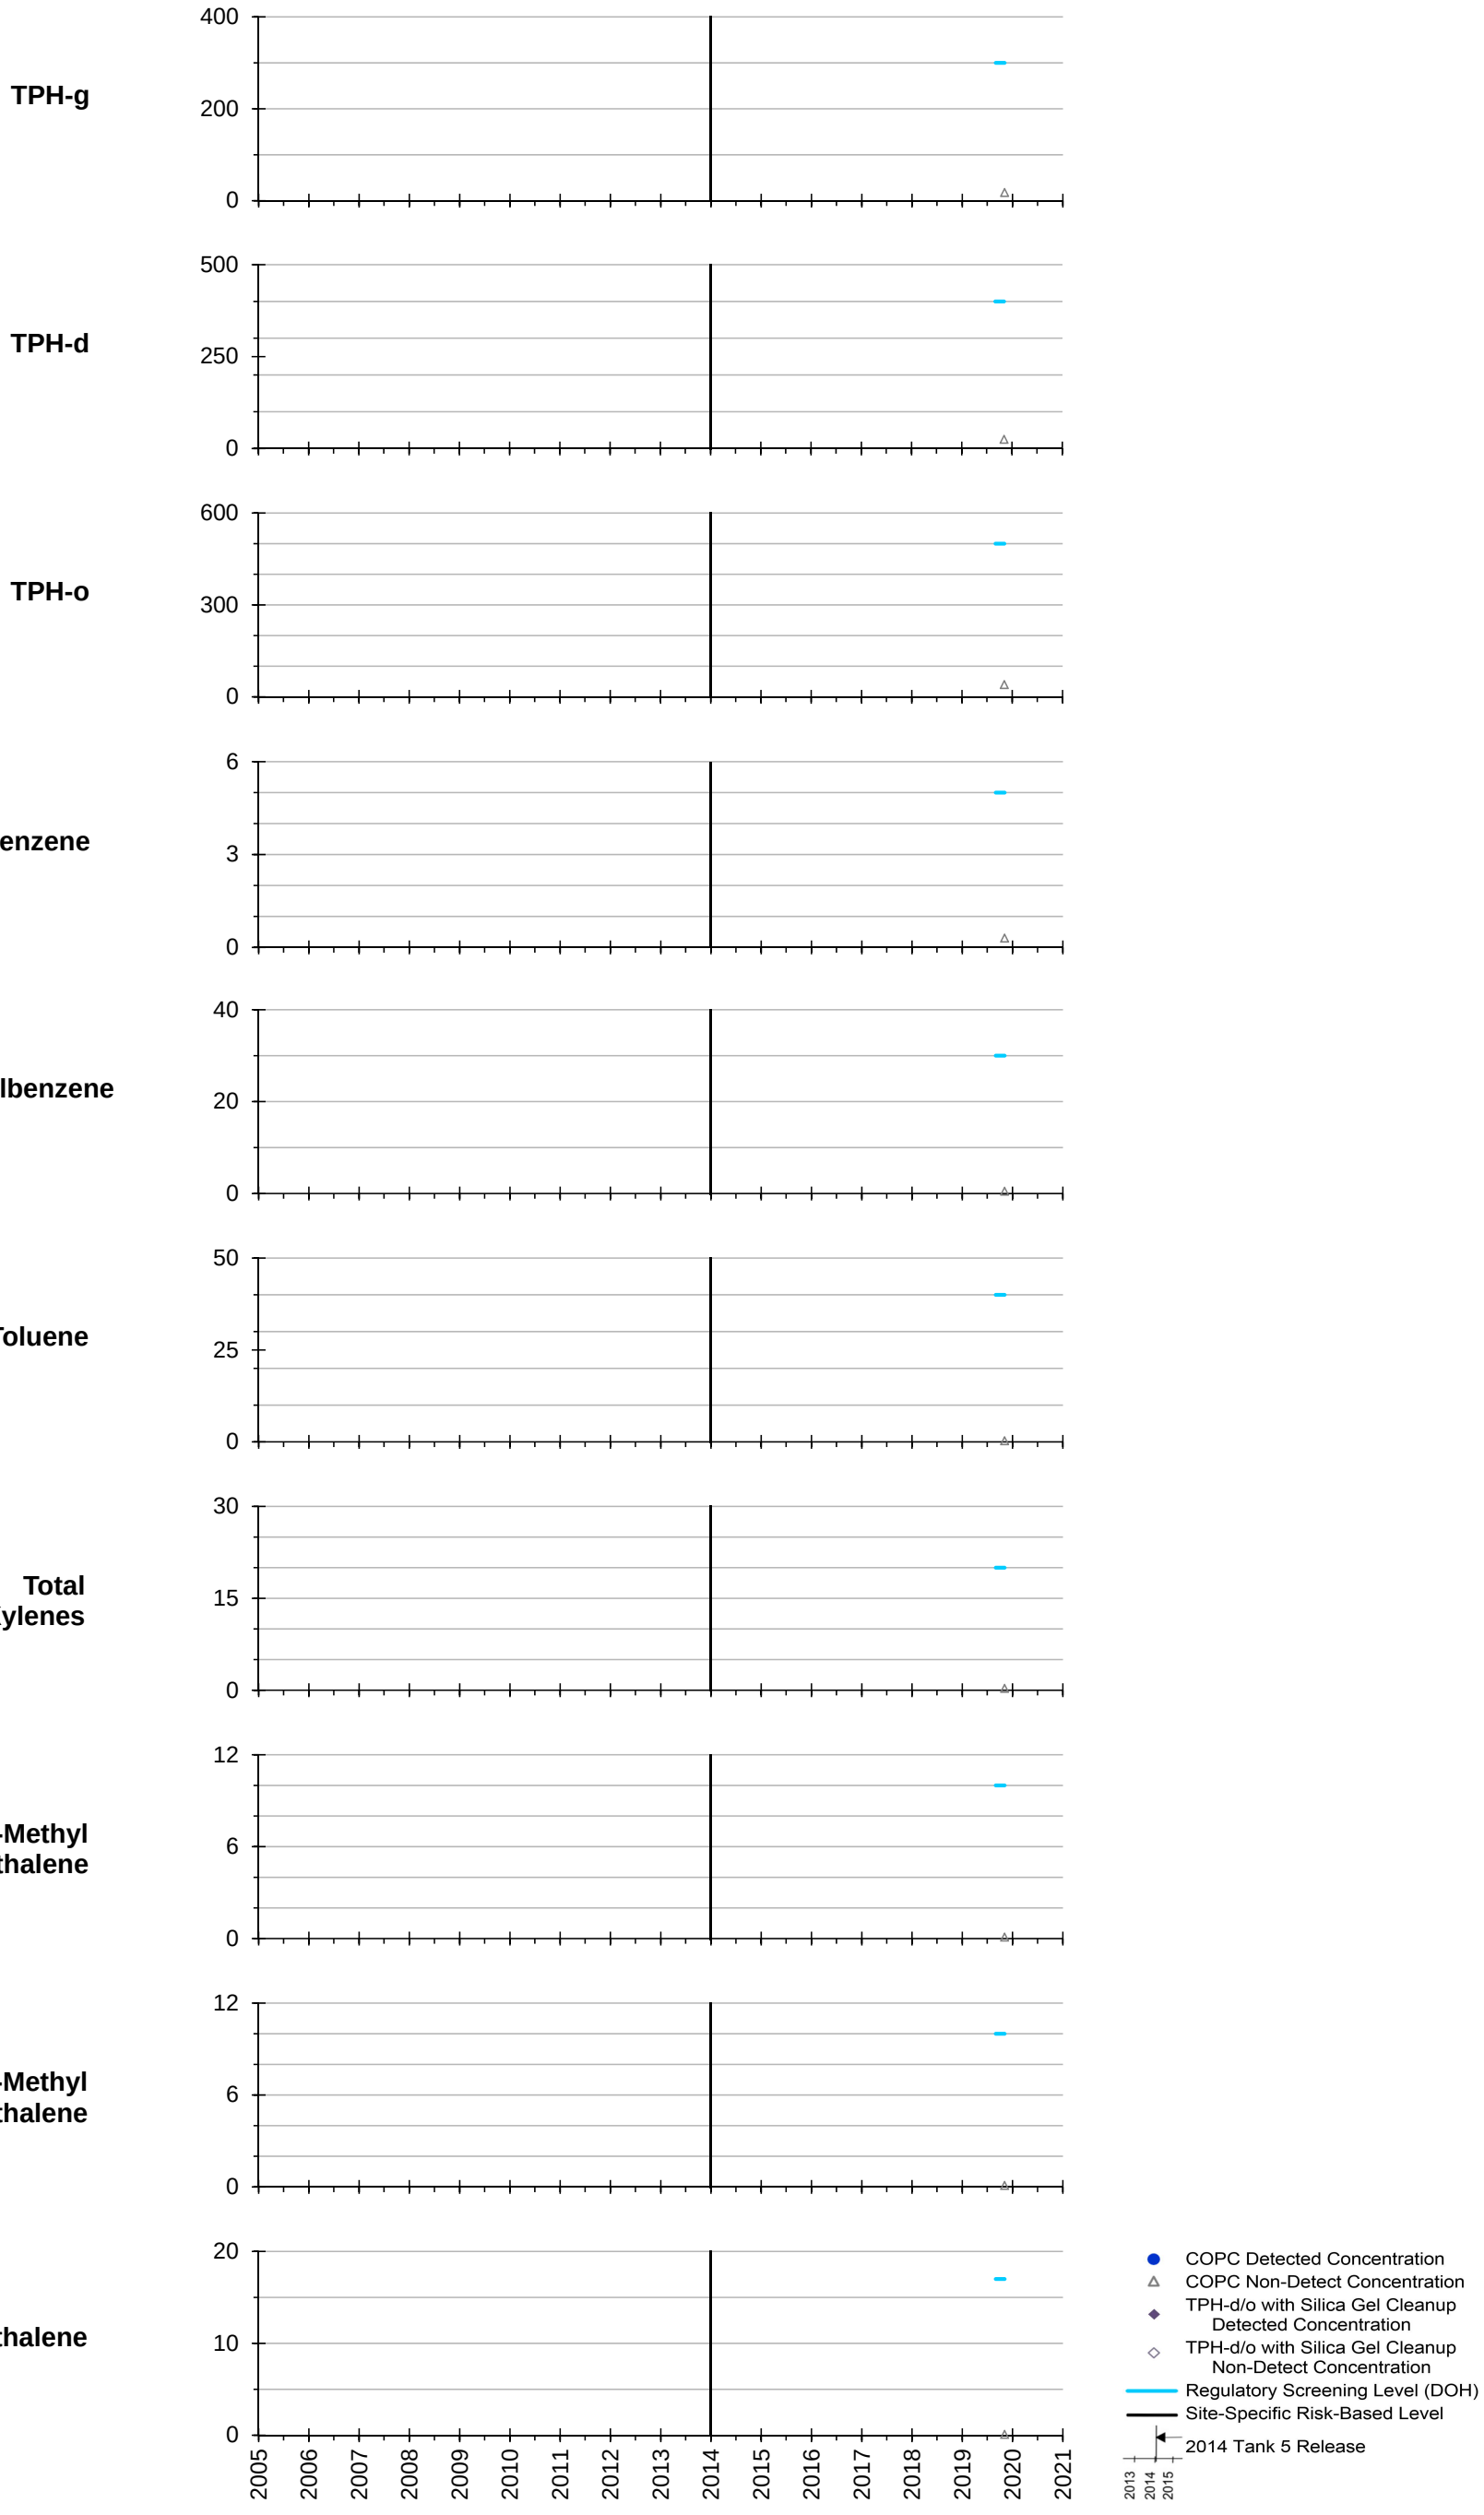
Appendix A.2 Groundwater Concentration Graphs



All results in micrograms per liter (µg/L or parts per billion).

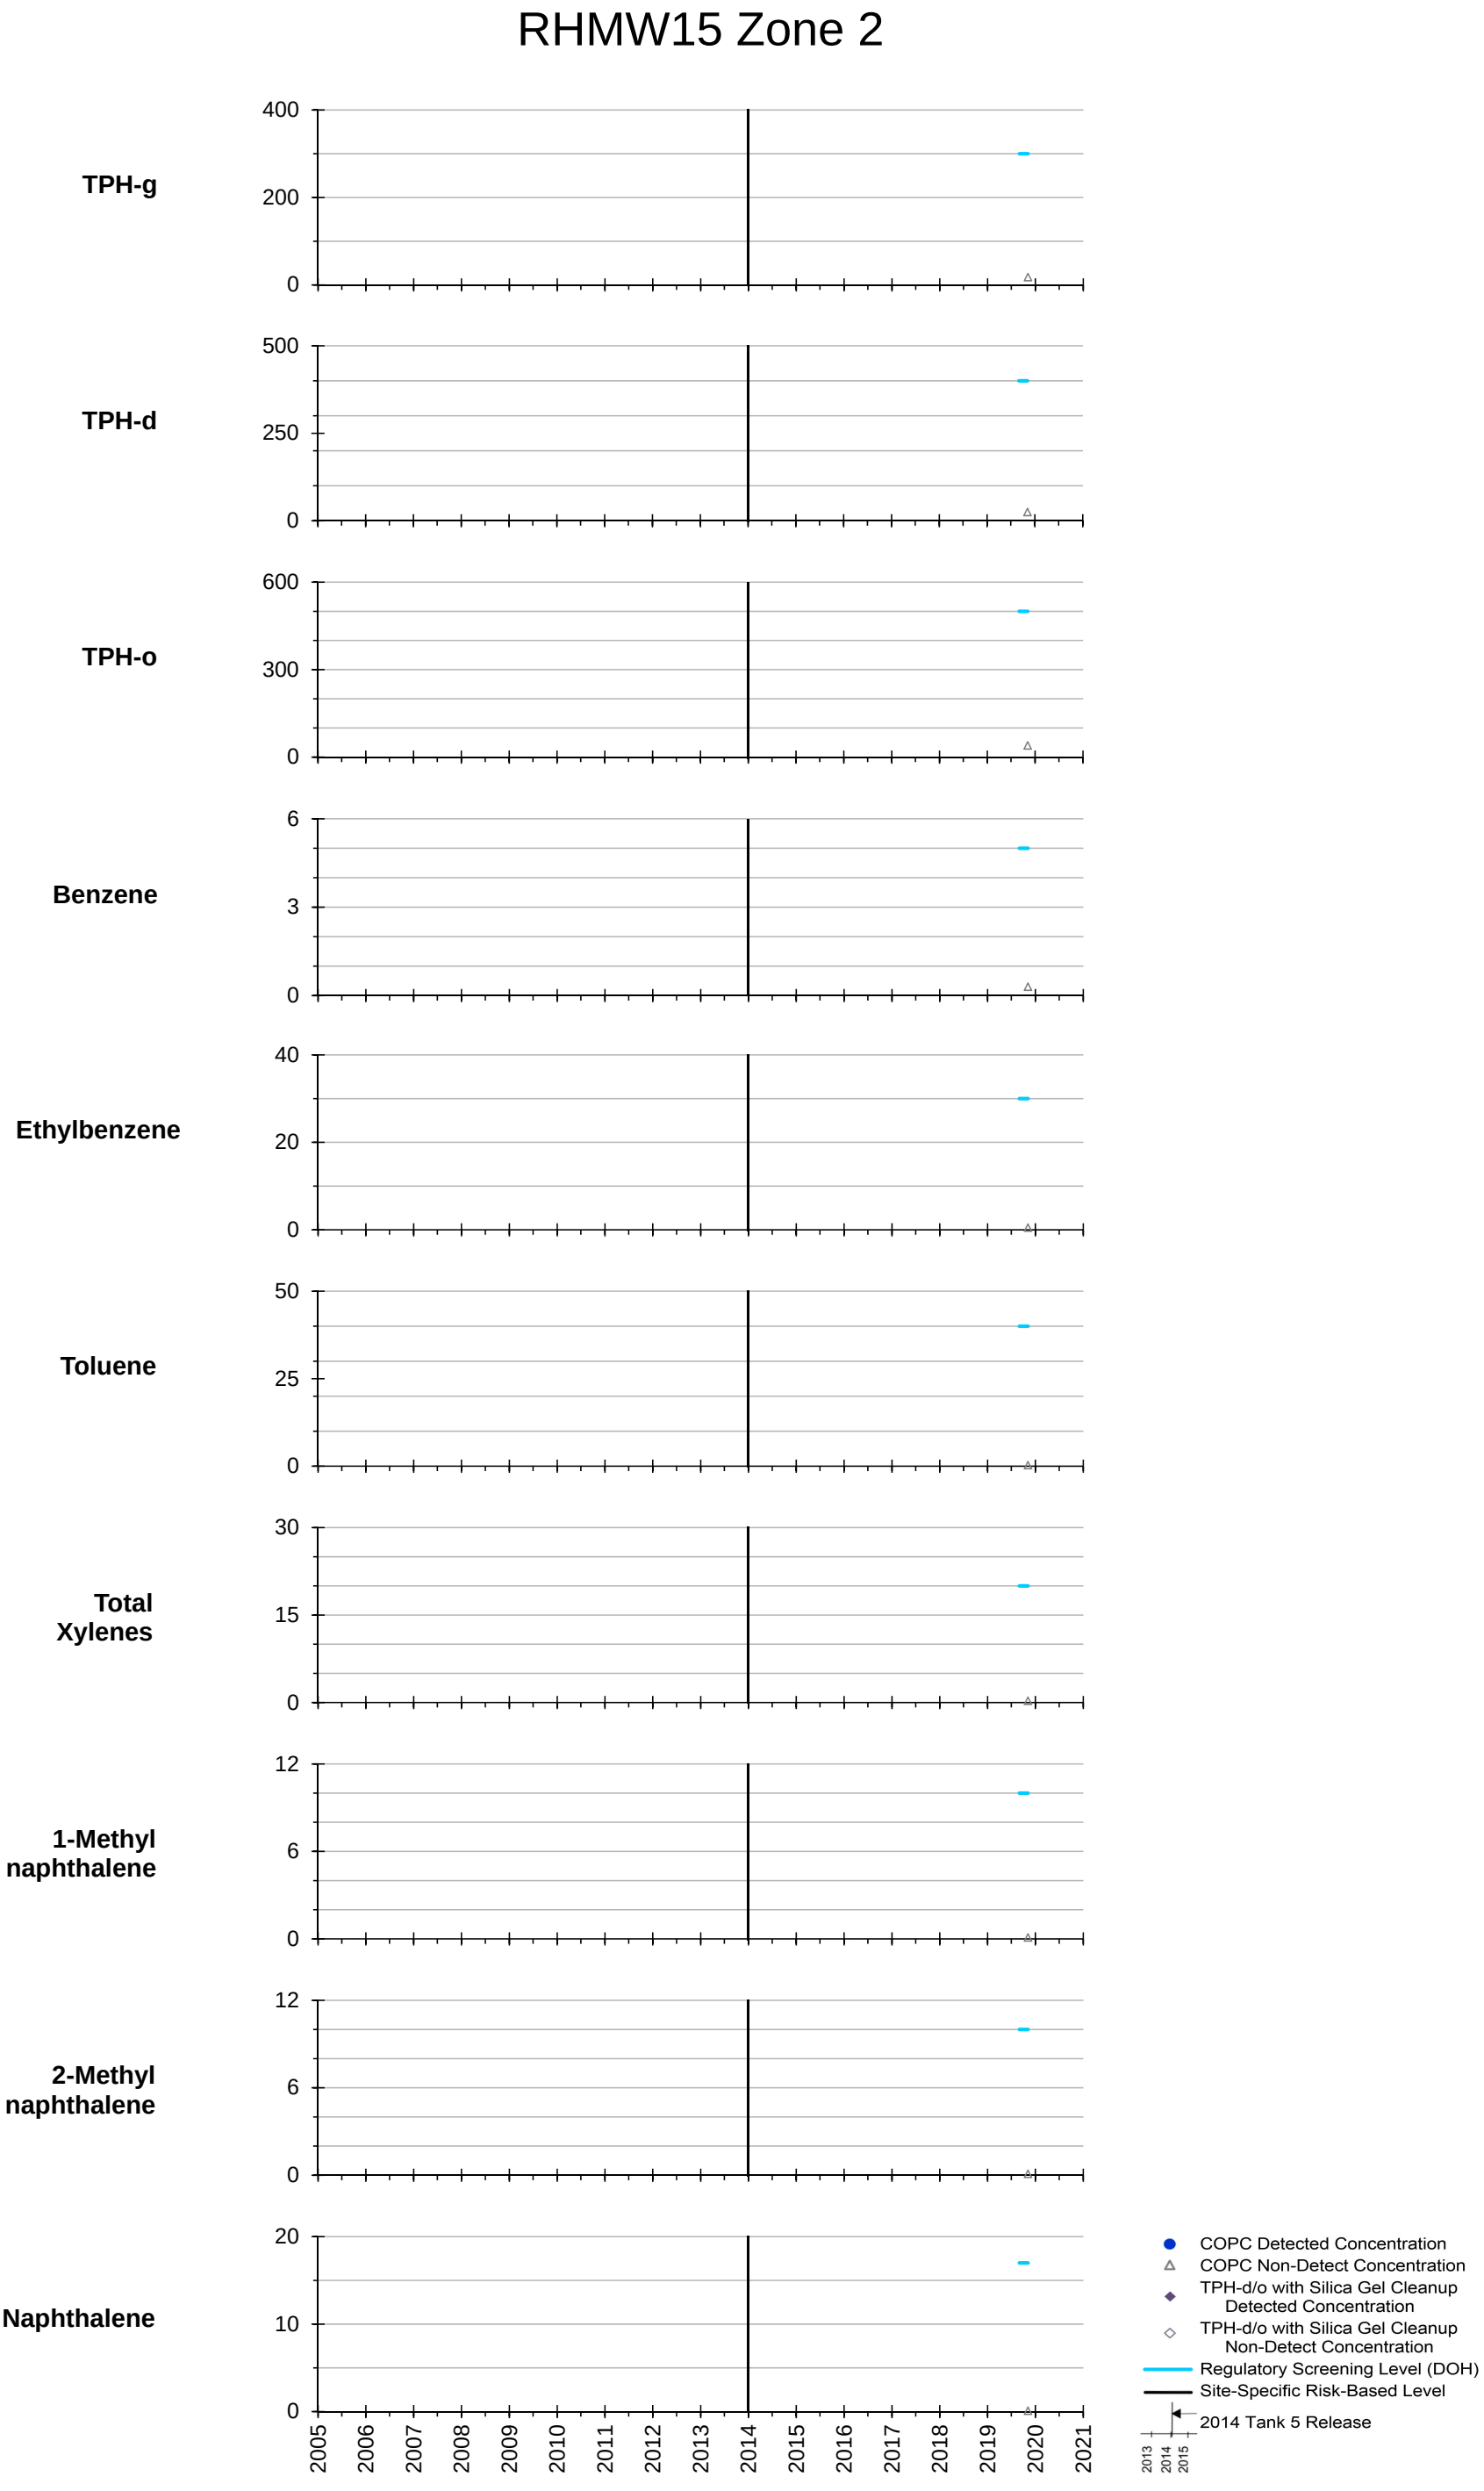
Appendix A.2 Groundwater Concentration Graphs

RHMW15 Zone 1



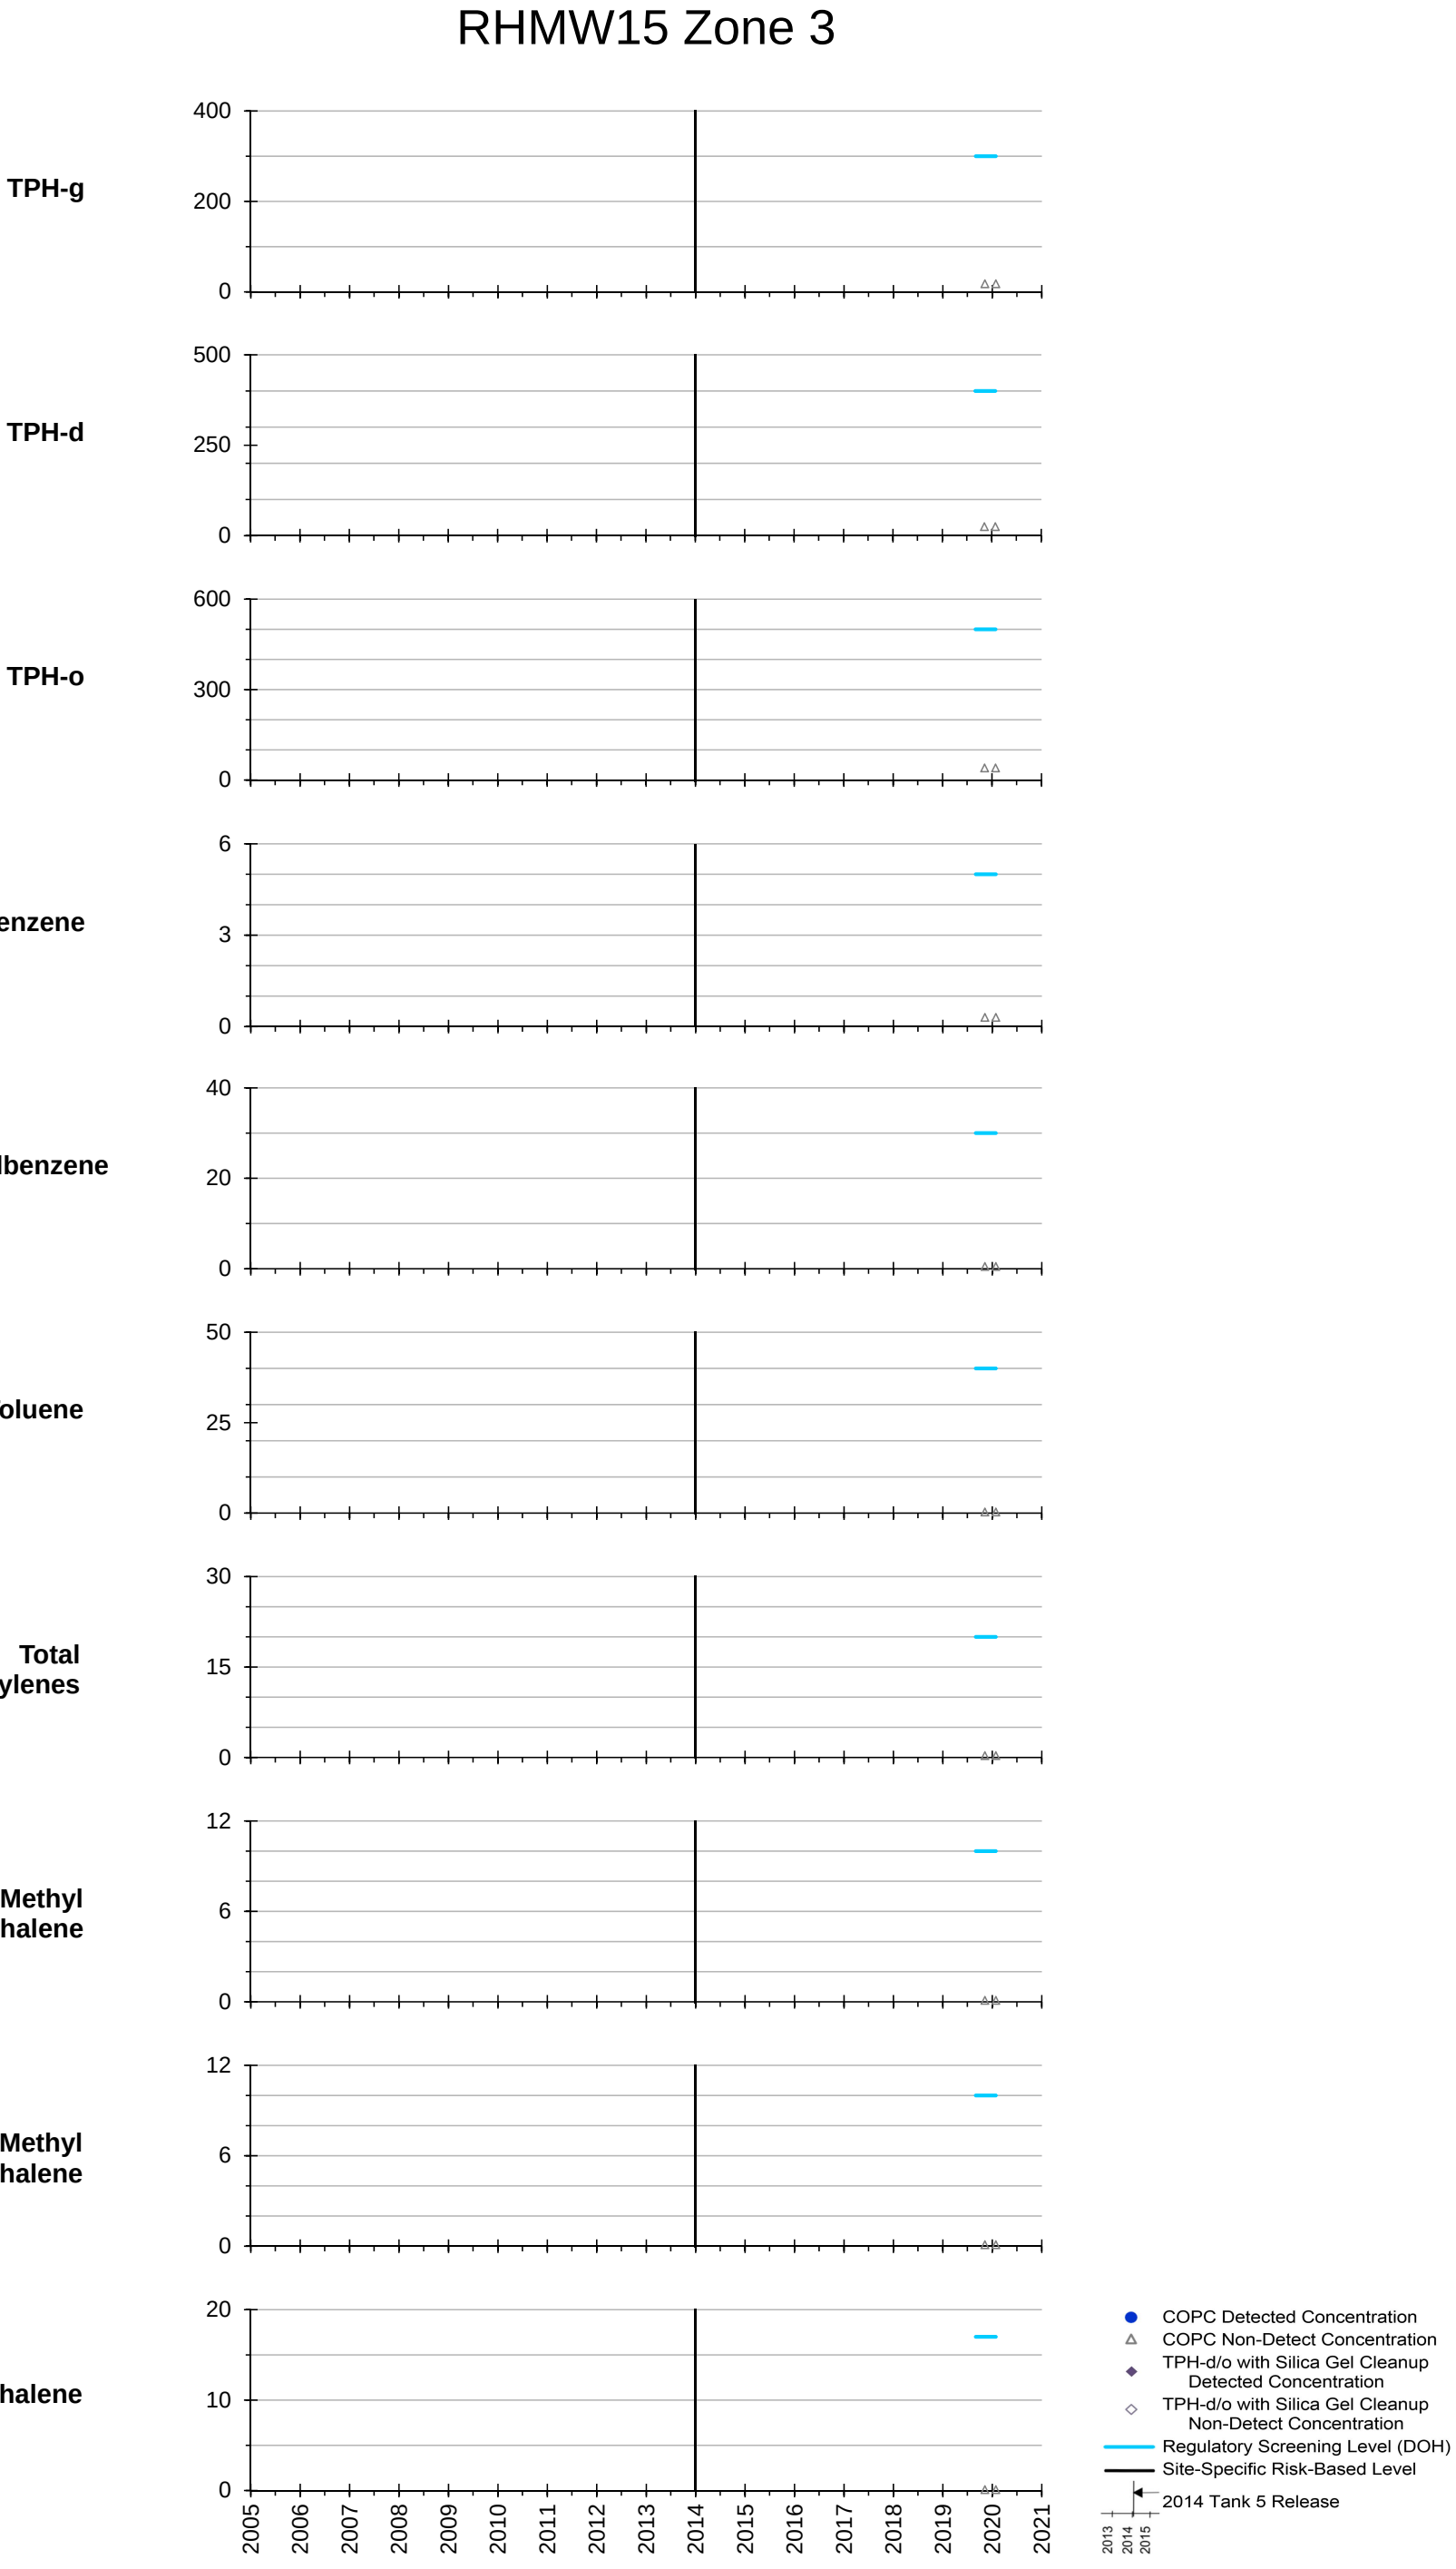
All results in micrograms per liter (µg/L or parts per billion).

Appendix A.2 Groundwater Concentration Graphs



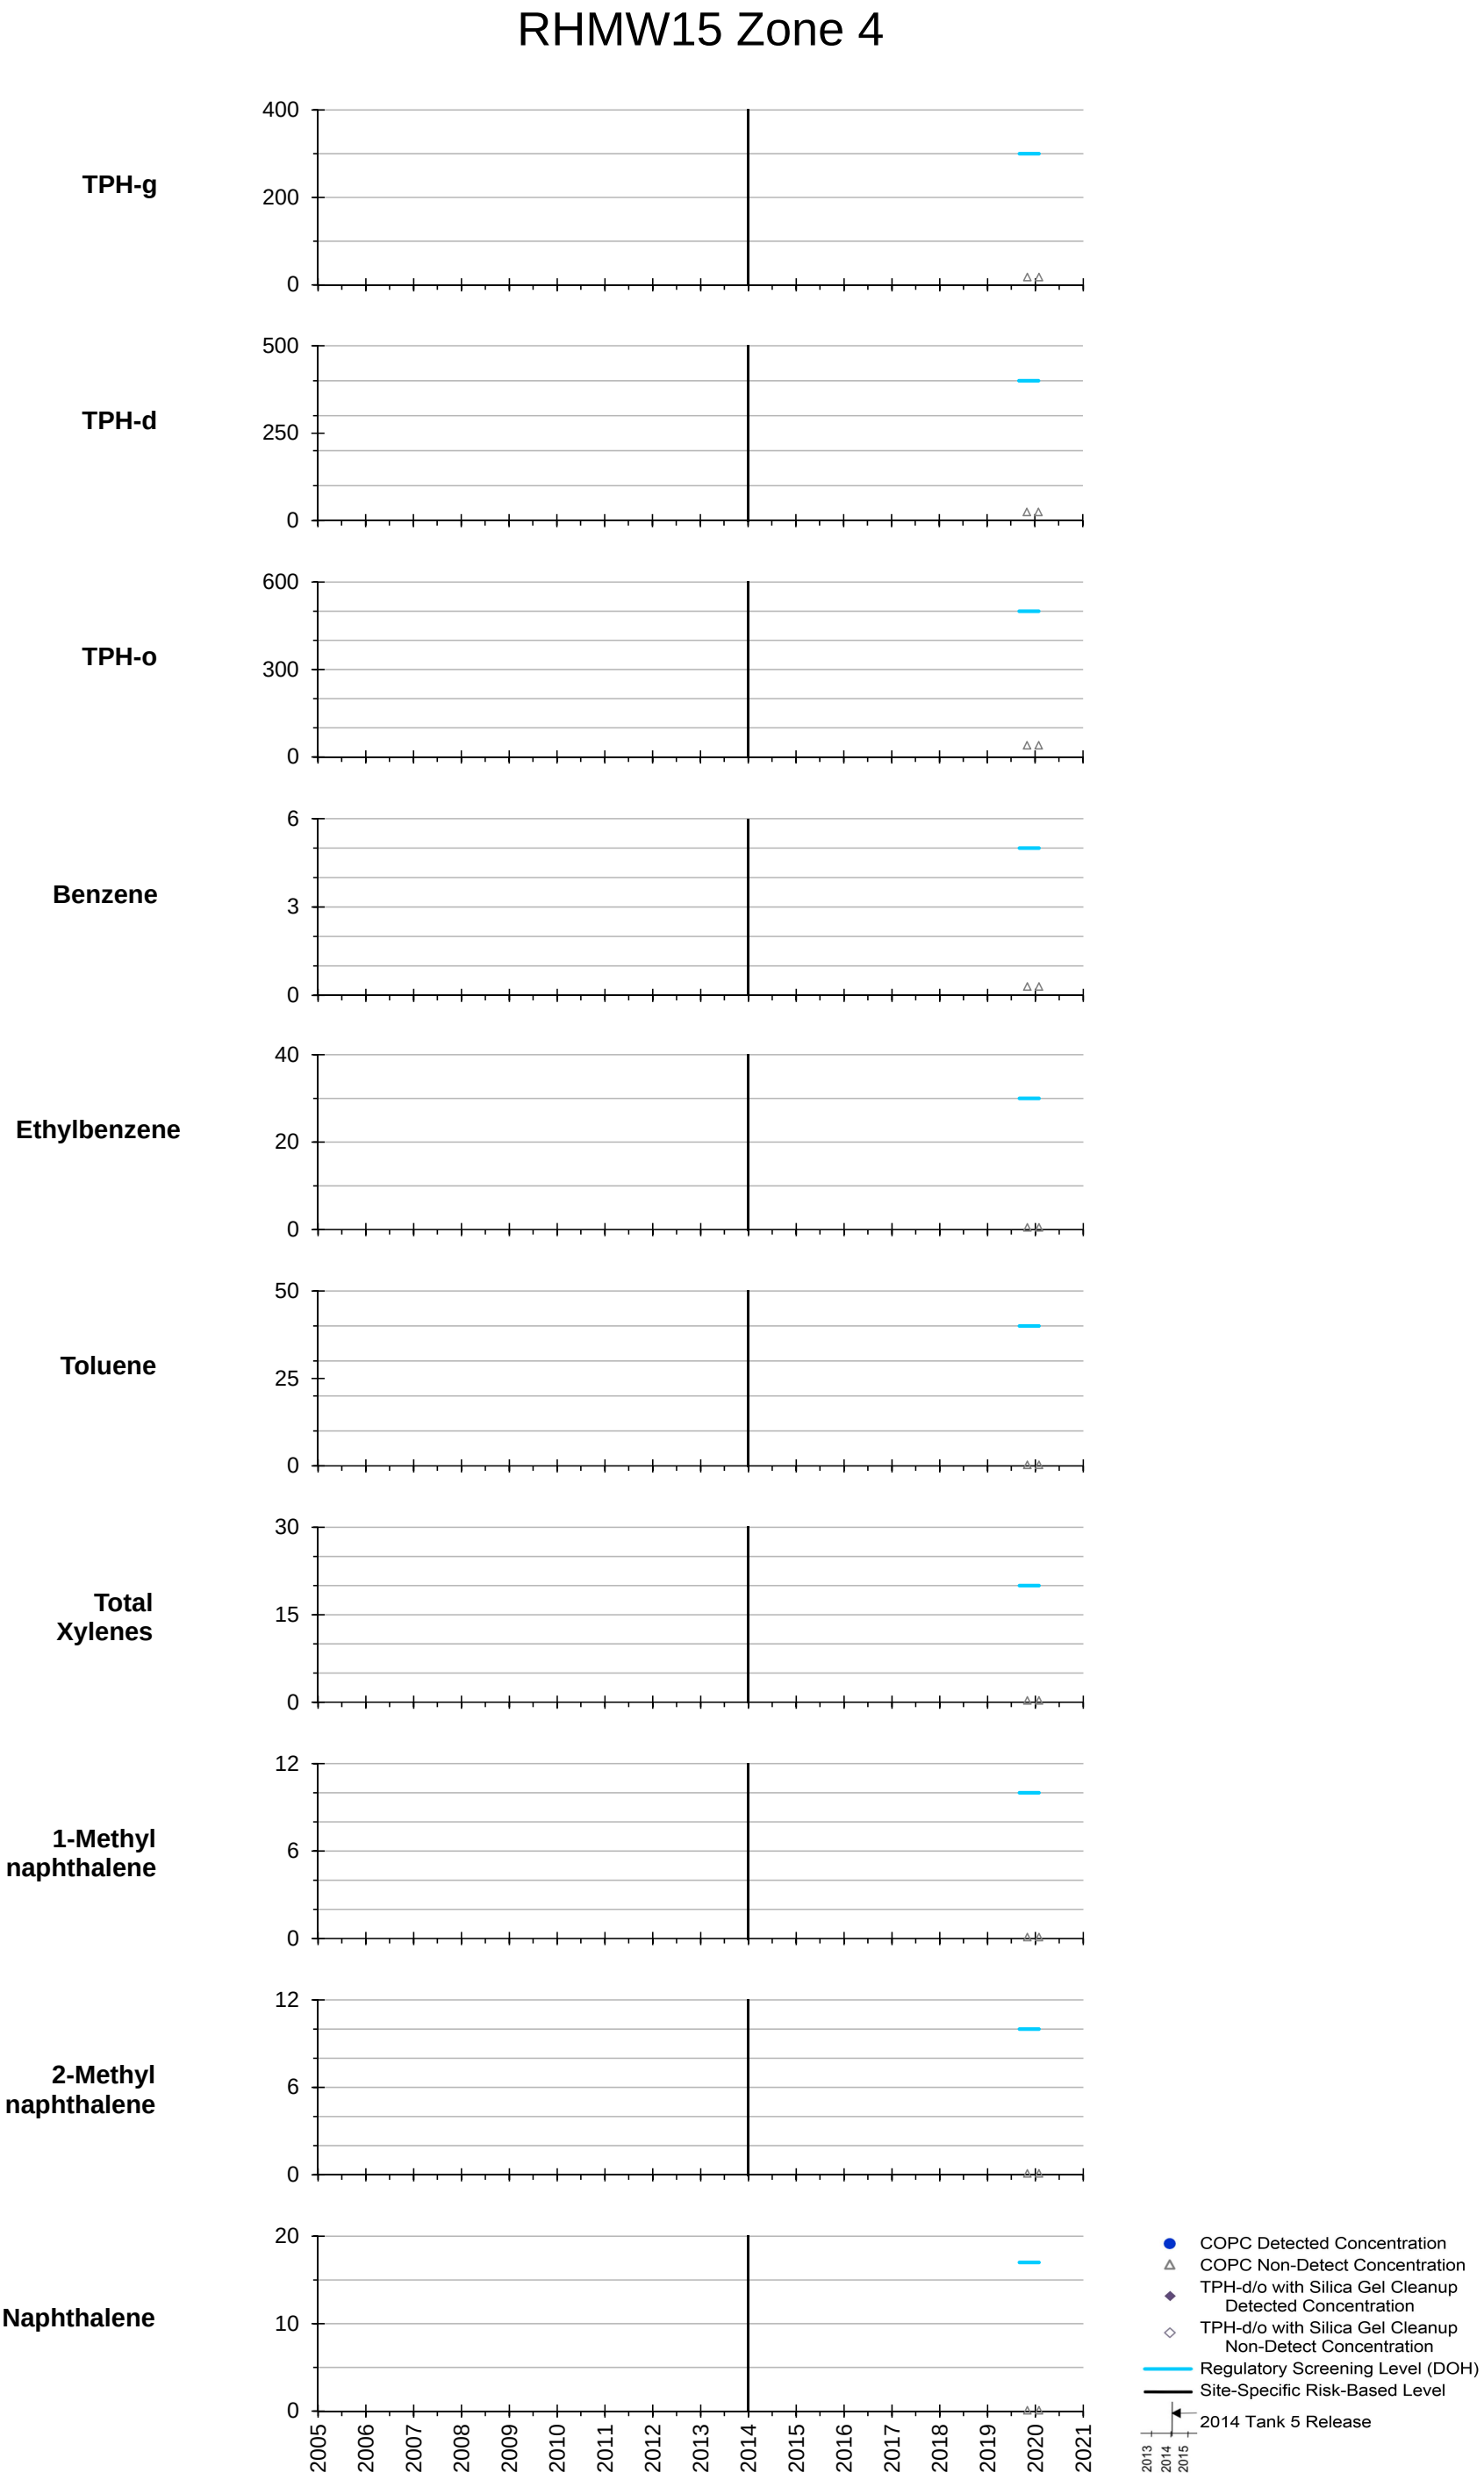
All results in micrograms per liter (µg/L or parts per billion).

Appendix A.2 Groundwater Concentration Graphs



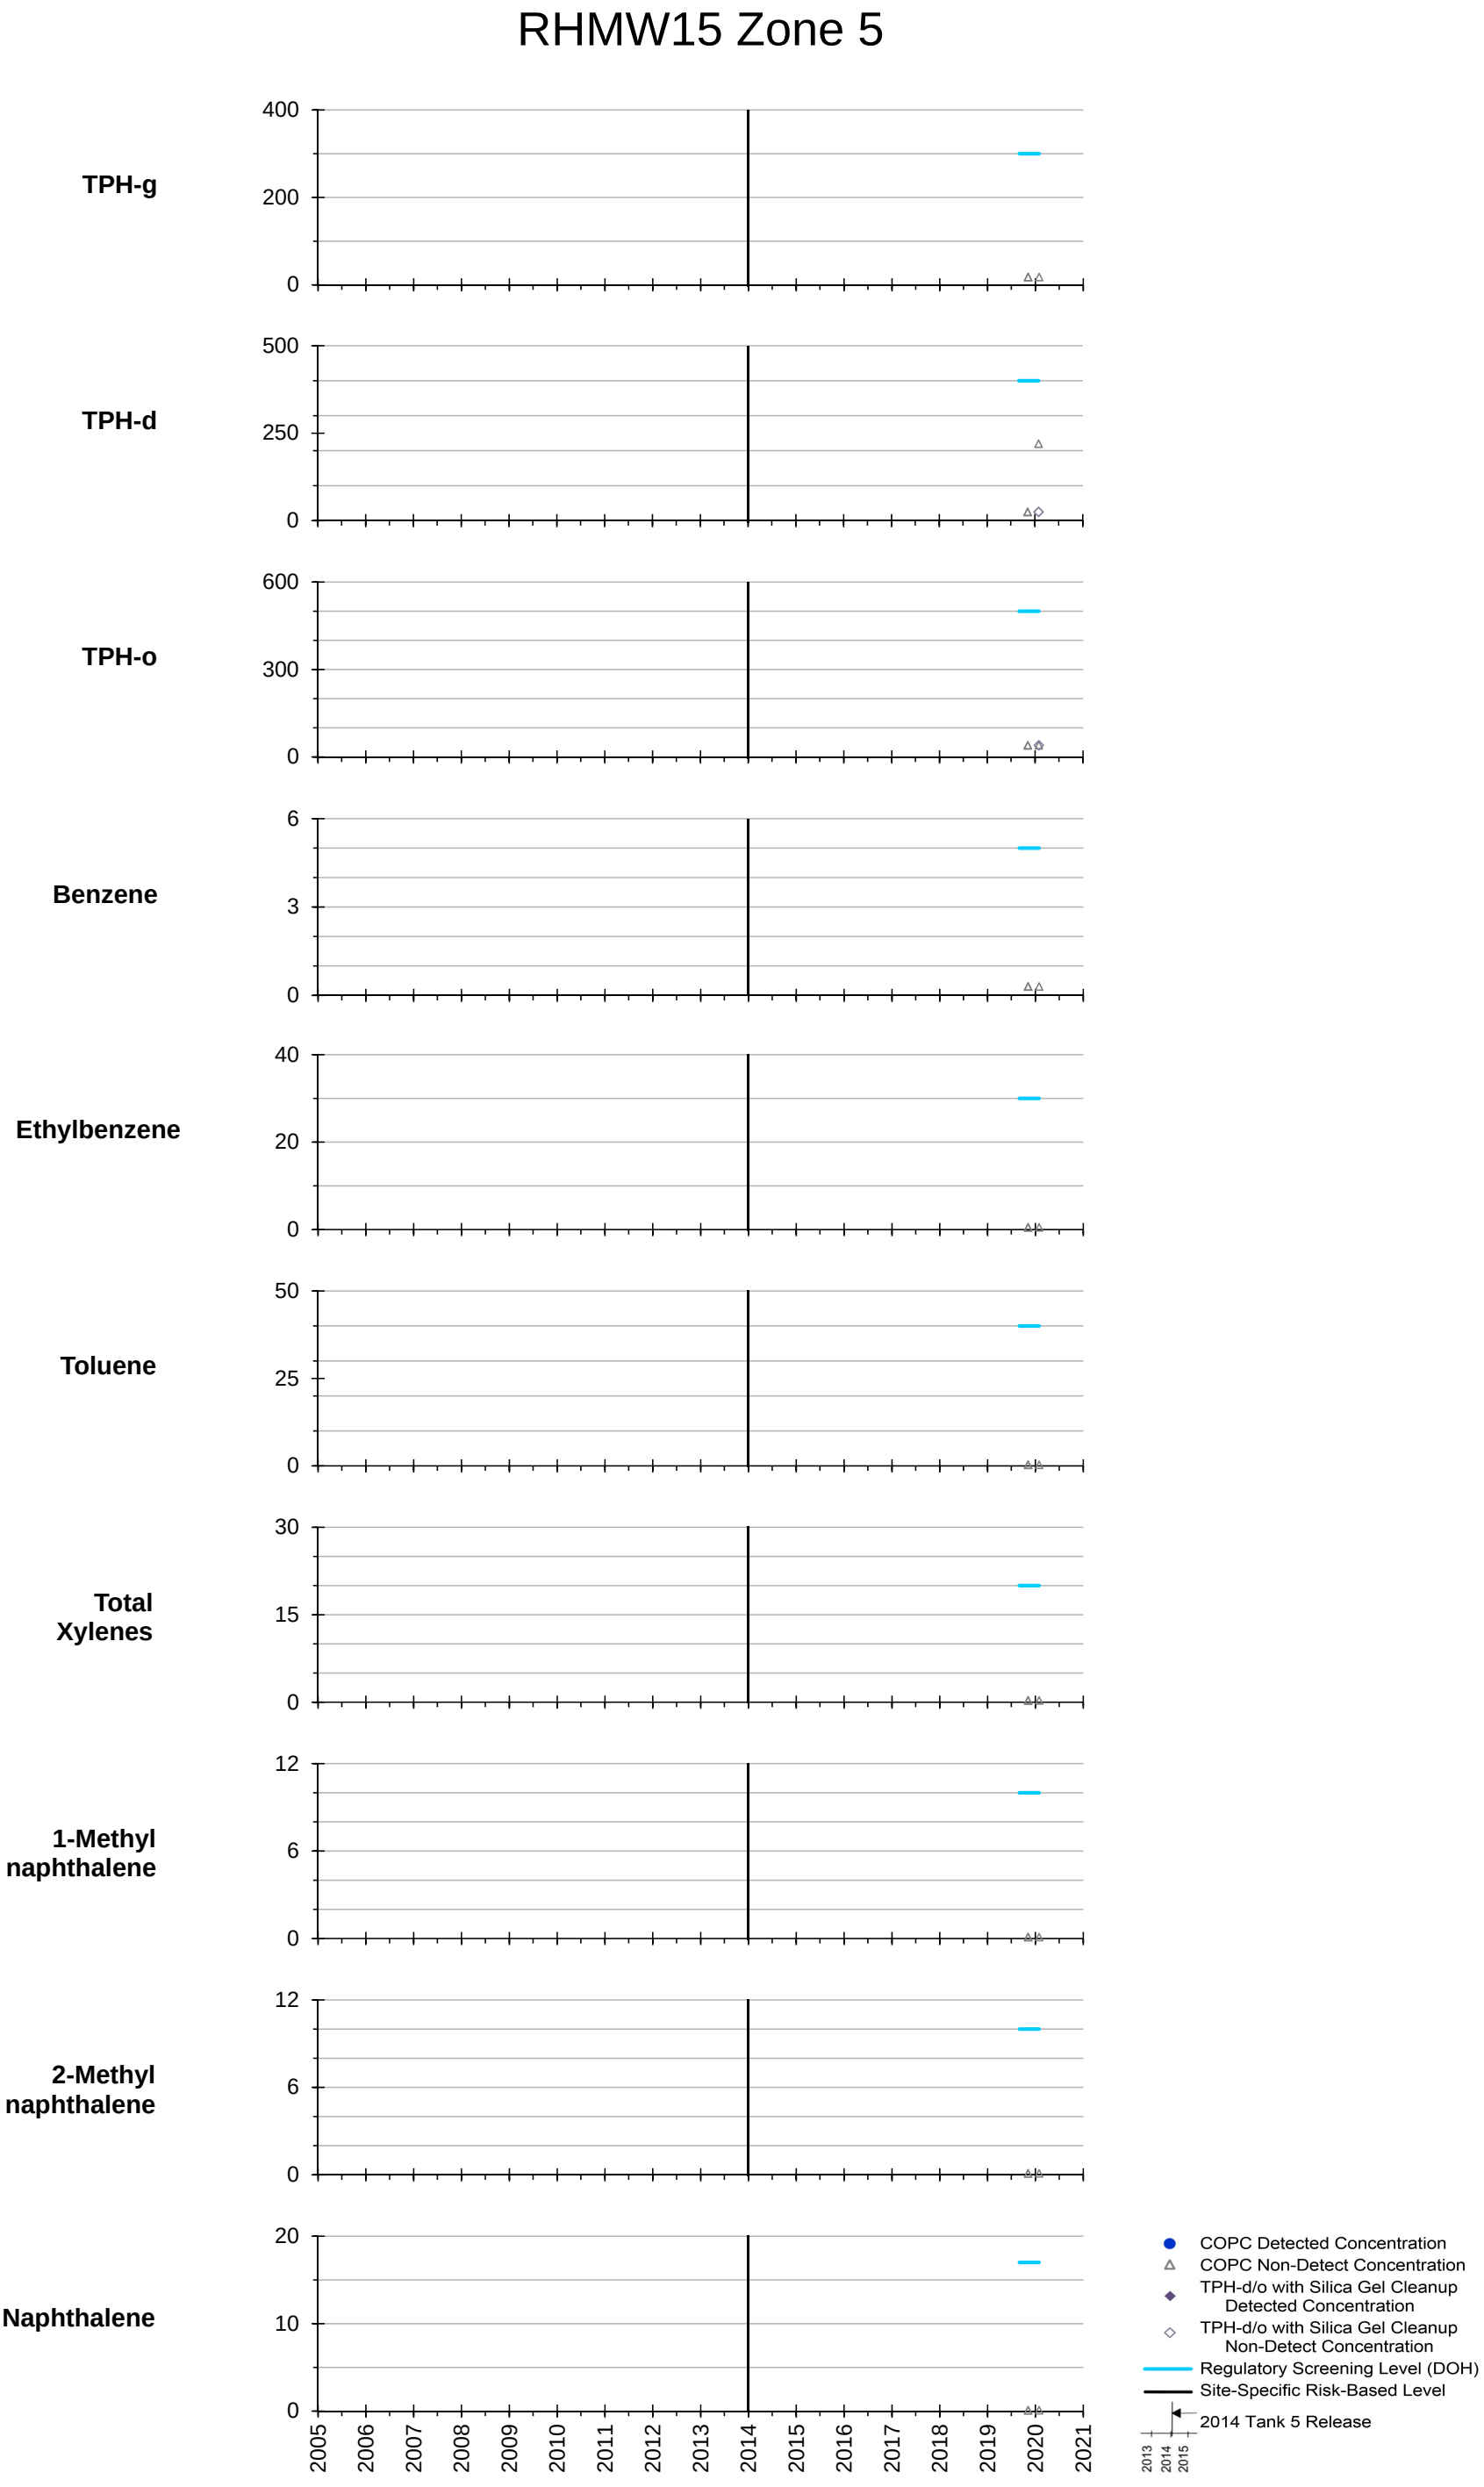
All results in micrograms per liter (µg/L or parts per billion).

Appendix A.2 Groundwater Concentration Graphs



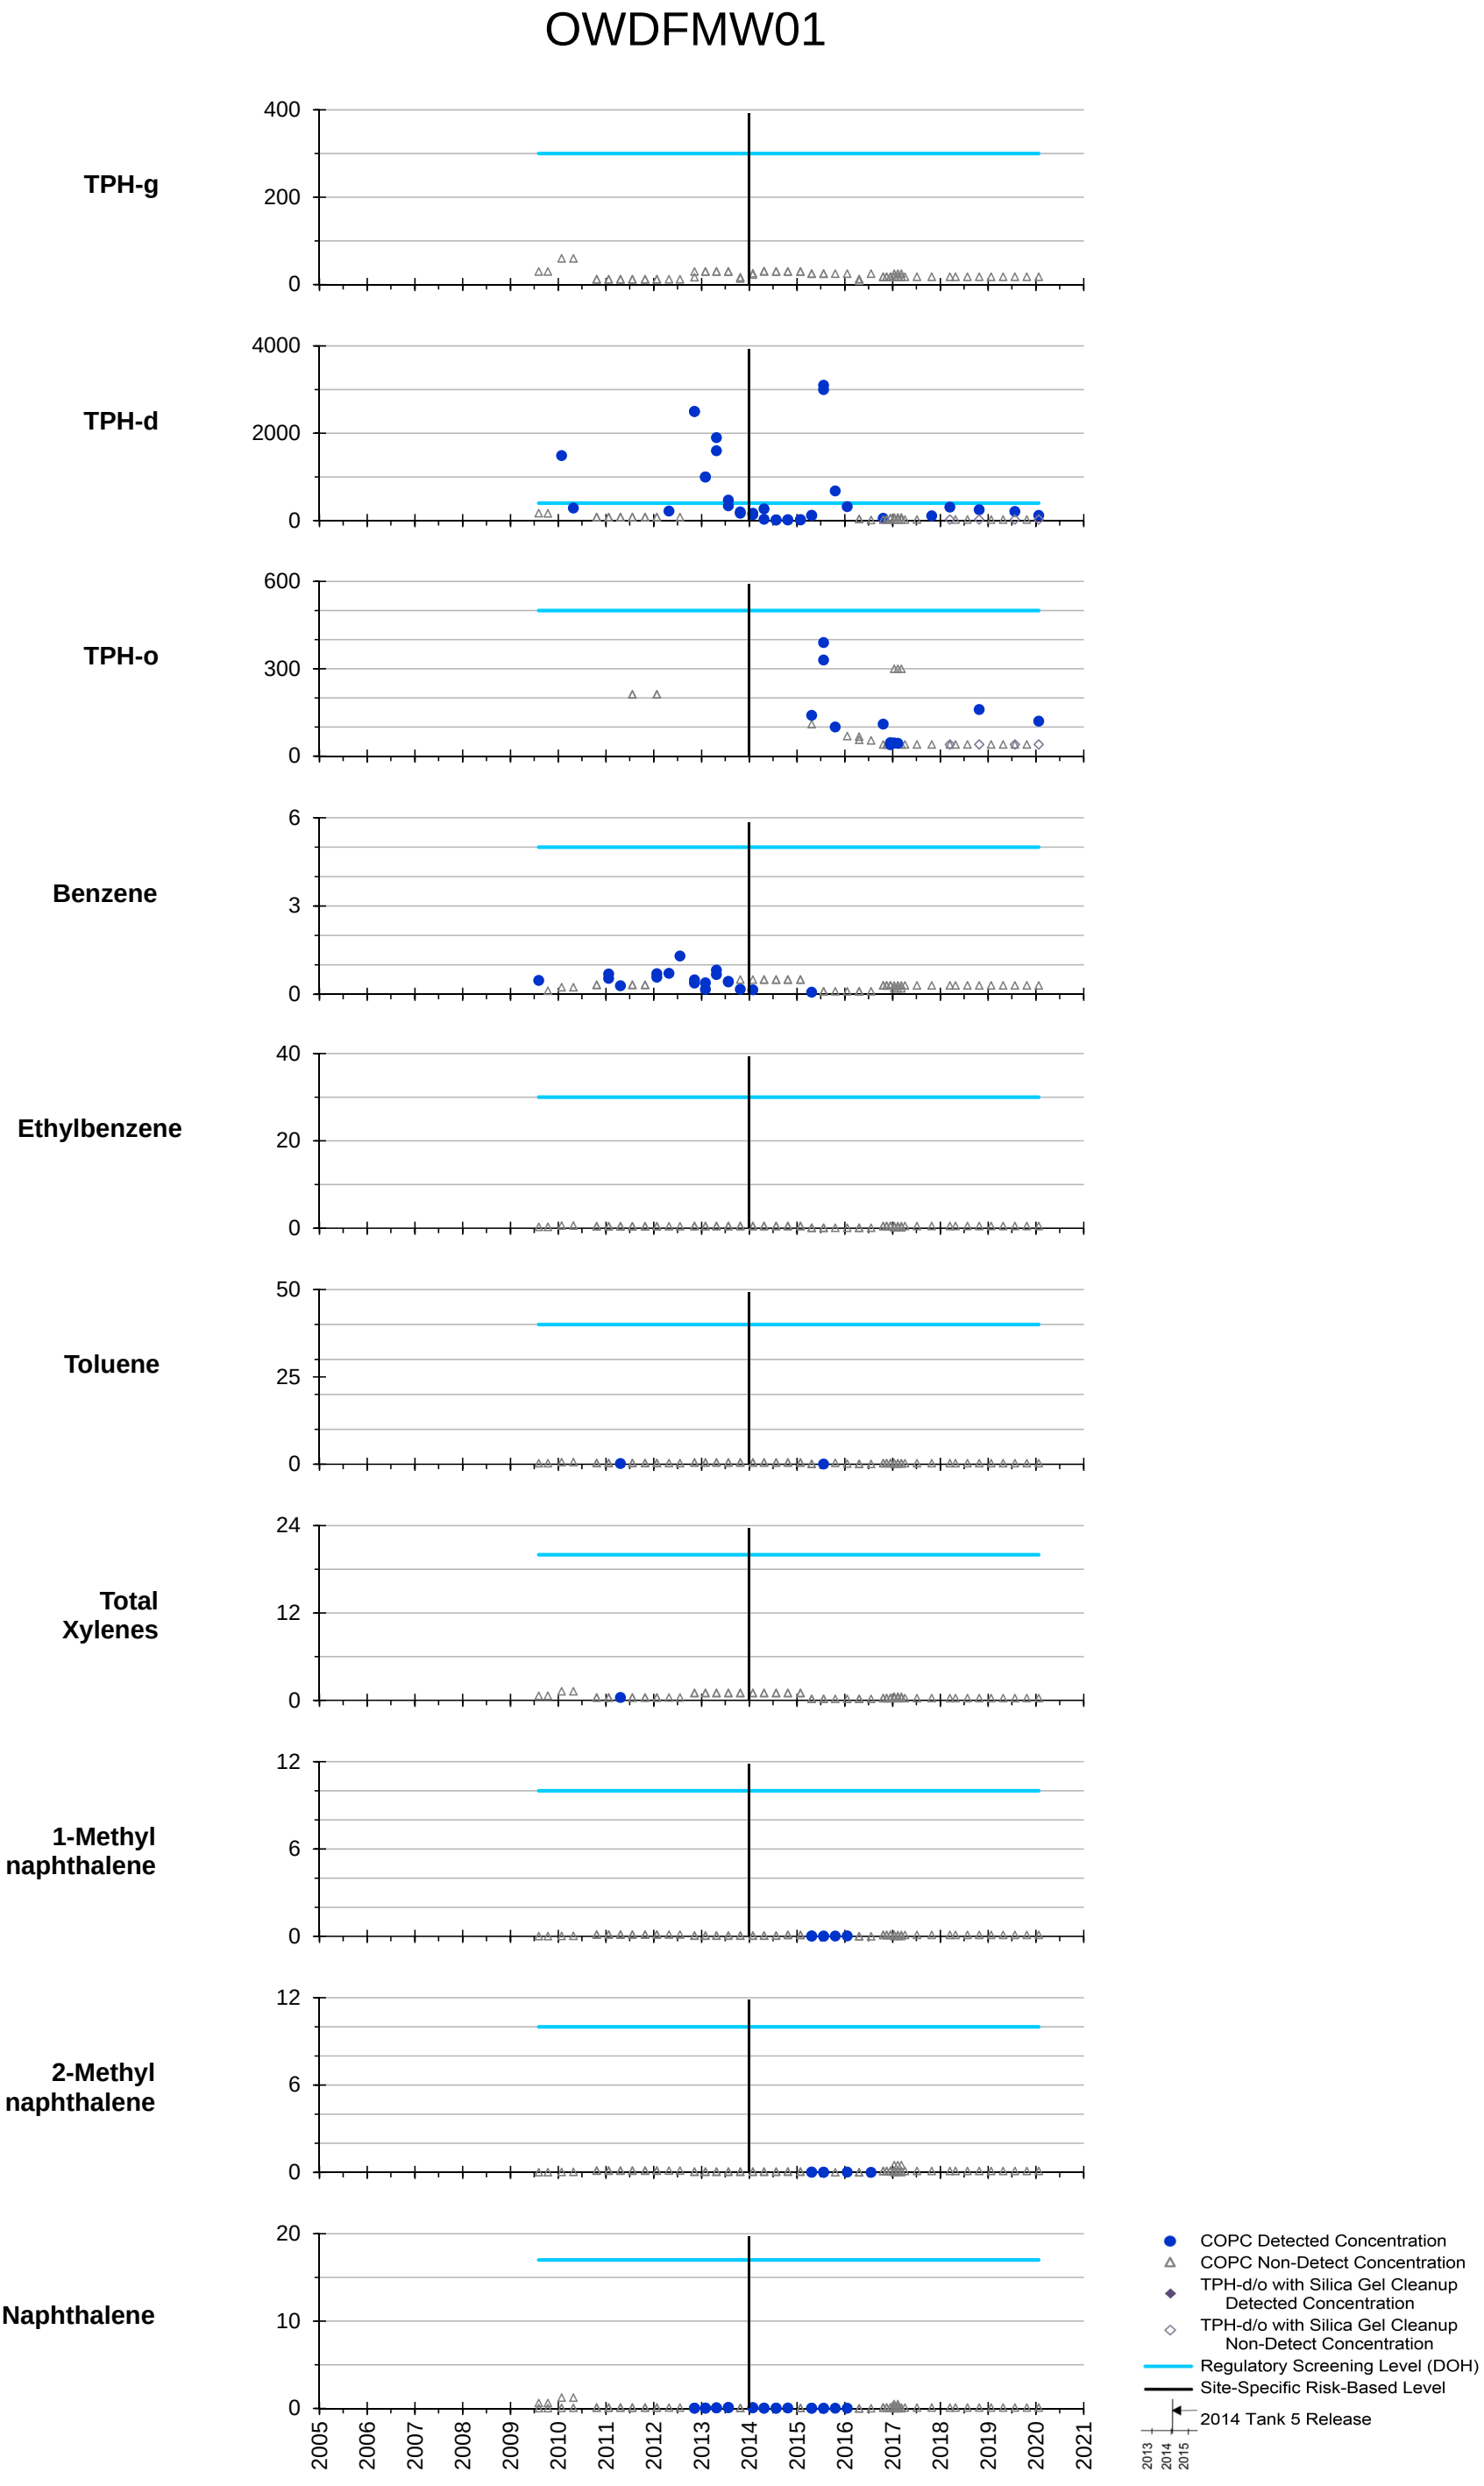
All results in micrograms per liter (µg/L or parts per billion).

Appendix A.2 Groundwater Concentration Graphs



All results in micrograms per liter (µg/L or parts per billion).

Appendix A.2 Groundwater Concentration Graphs

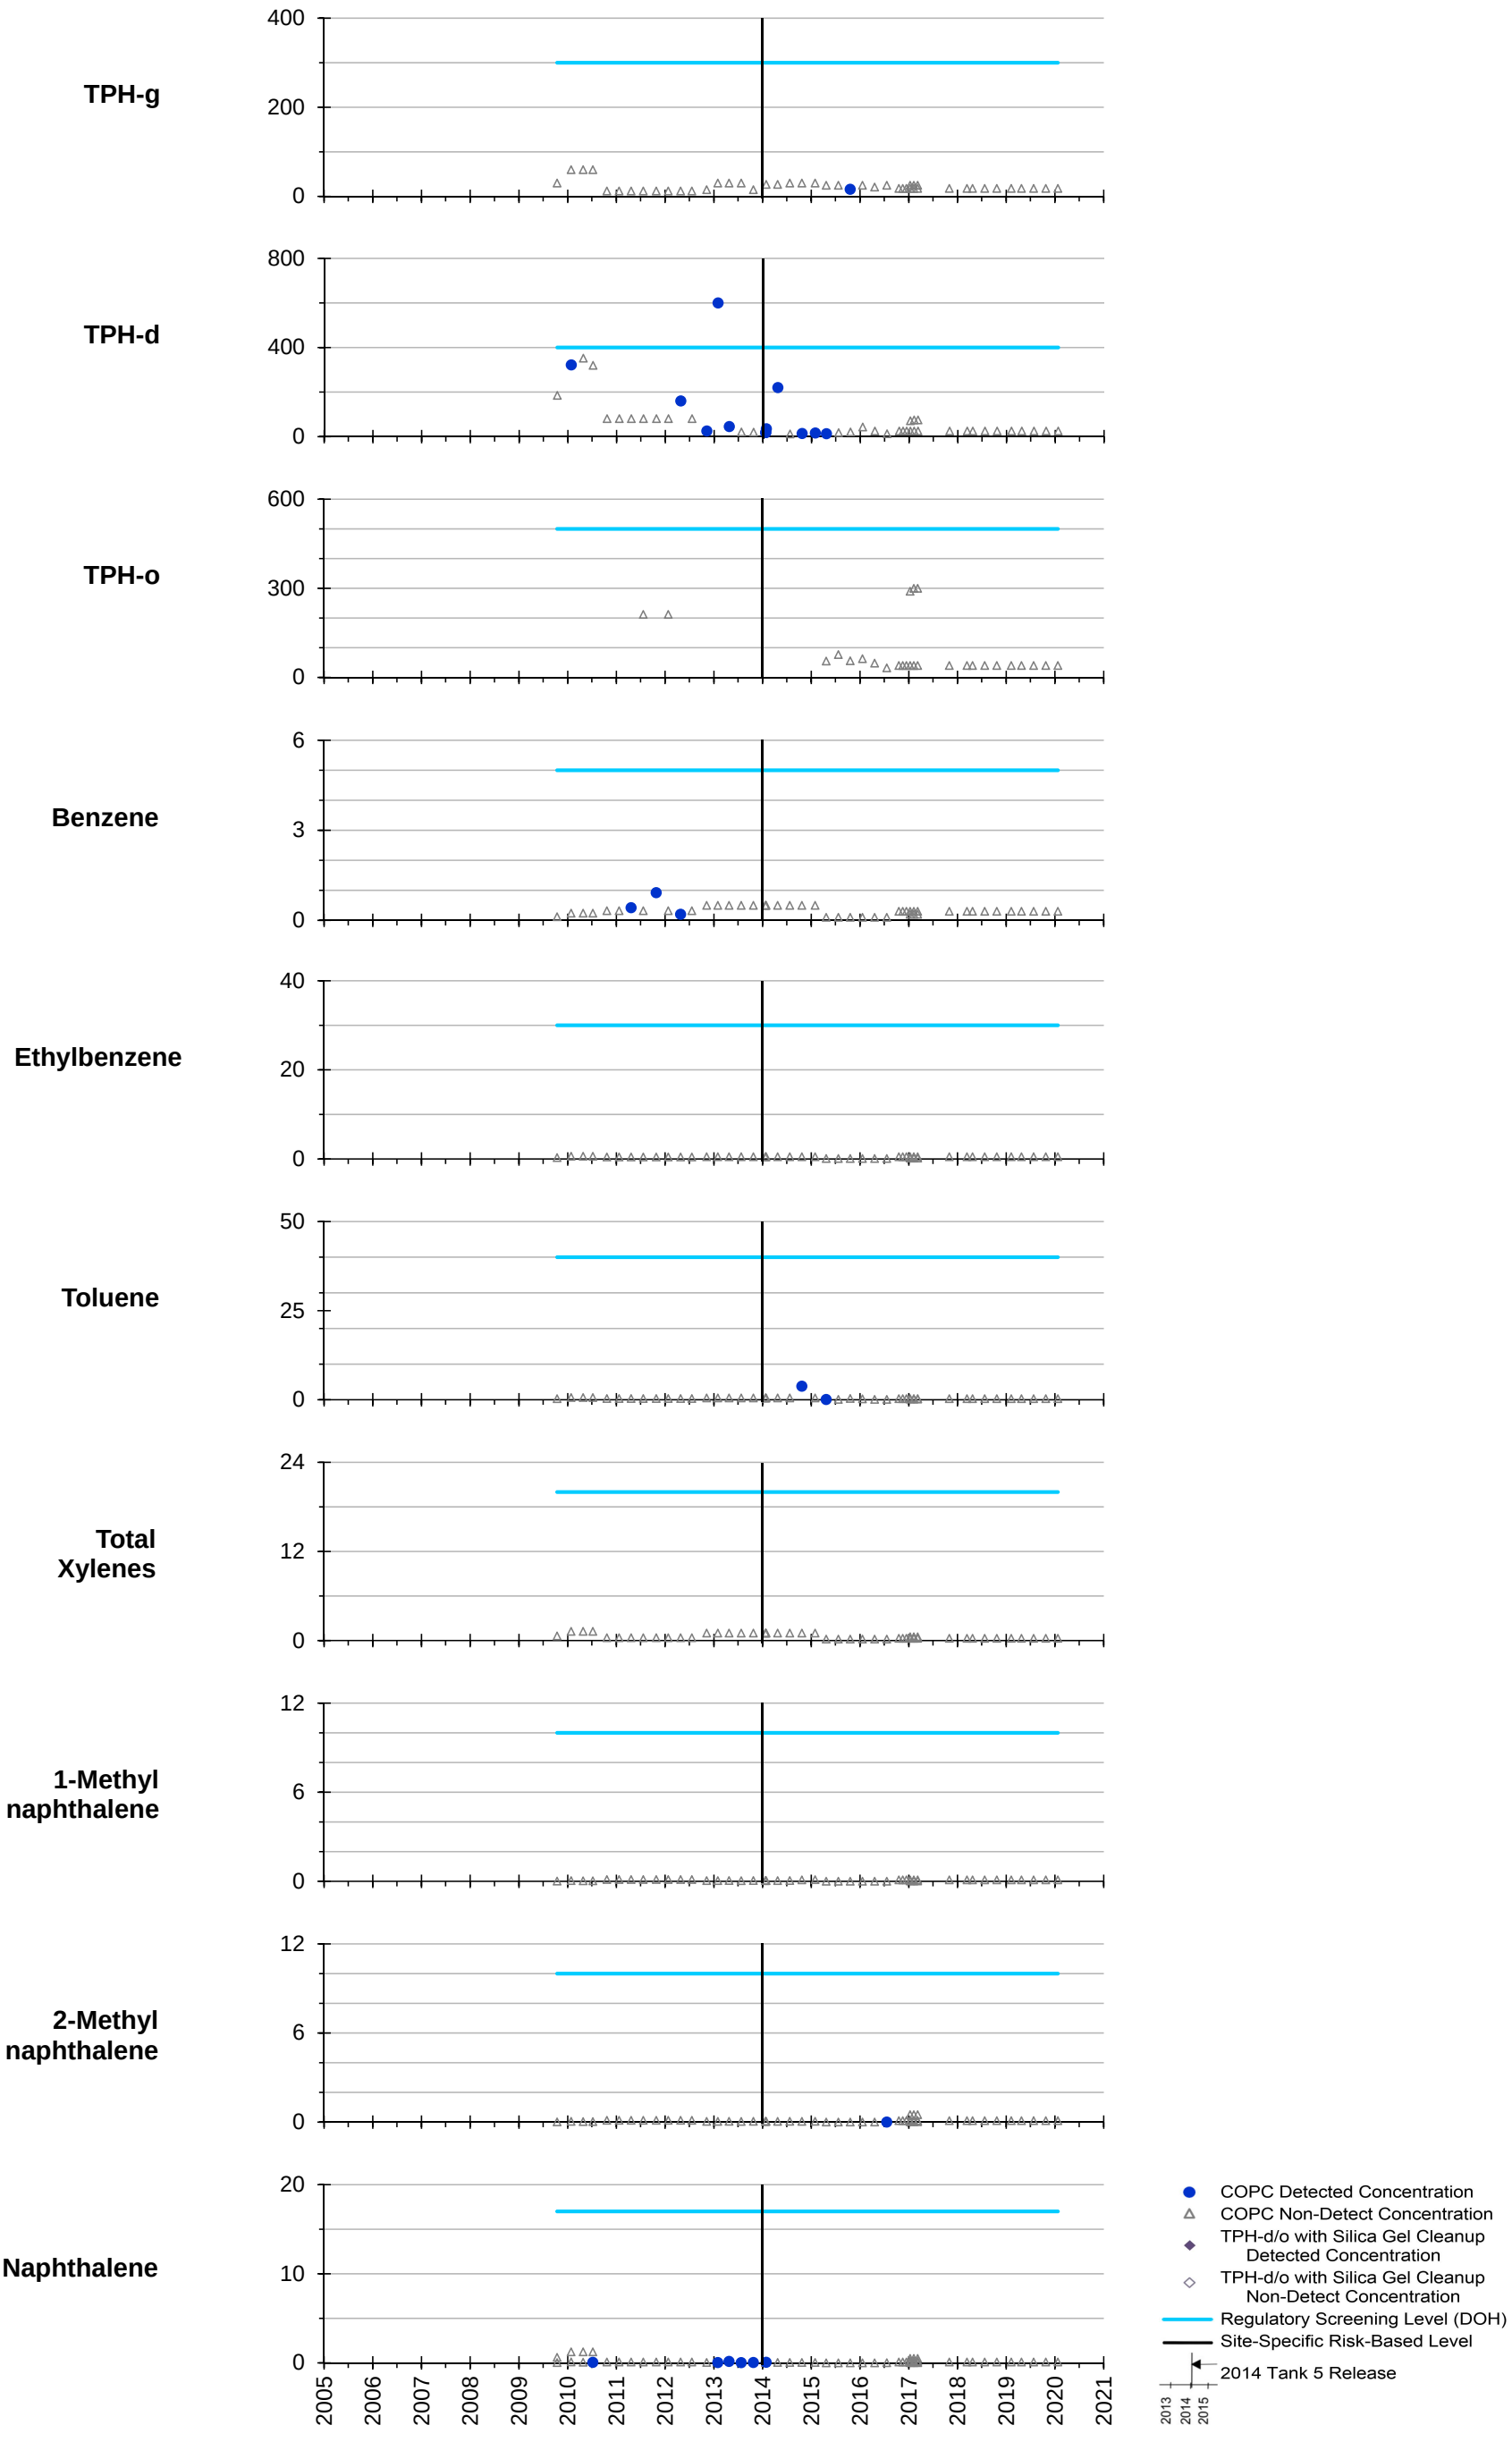


All results in micrograms per liter (µg/L or parts per billion).

EPA Region 9 Laboratory split sampling data from First to Third Quarters 2017 included in the graphs.

Appendix A.2 Groundwater Concentration Graphs

HDMW2253-03



All results in micrograms per liter (µg/L or parts per billion).

EPA Region 9 Laboratory split sampling data from First to Third Quarters 2017 included in the graphs.

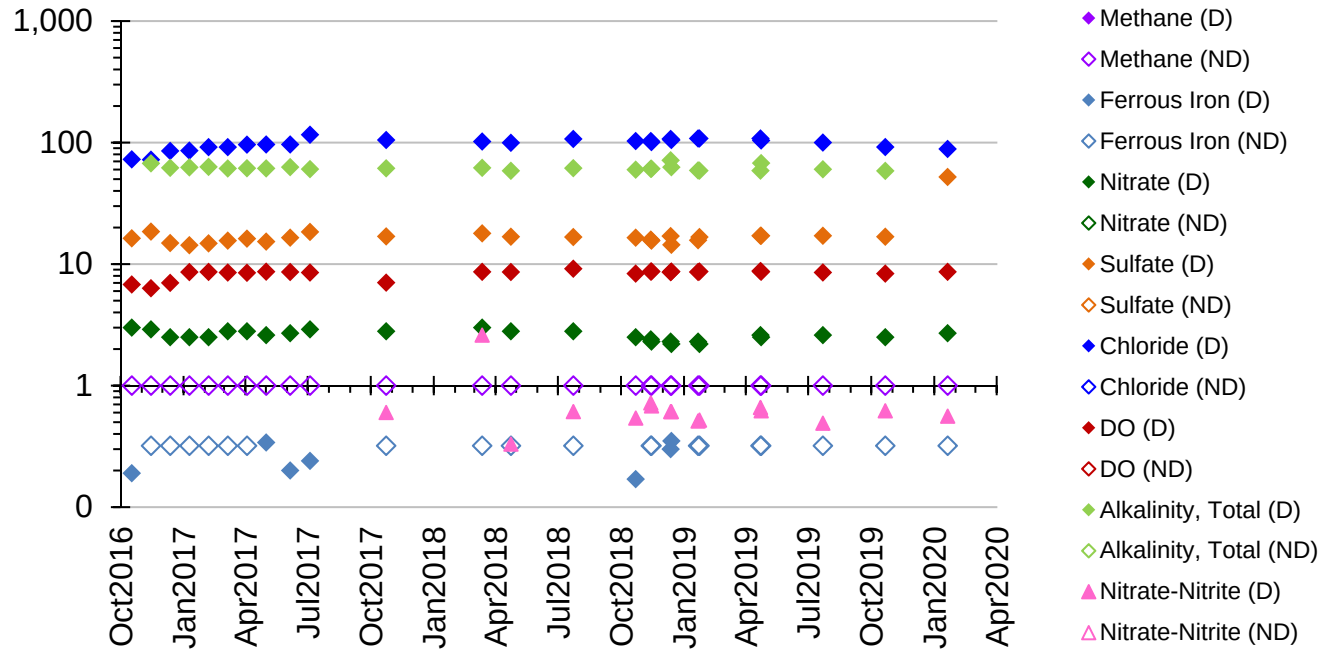
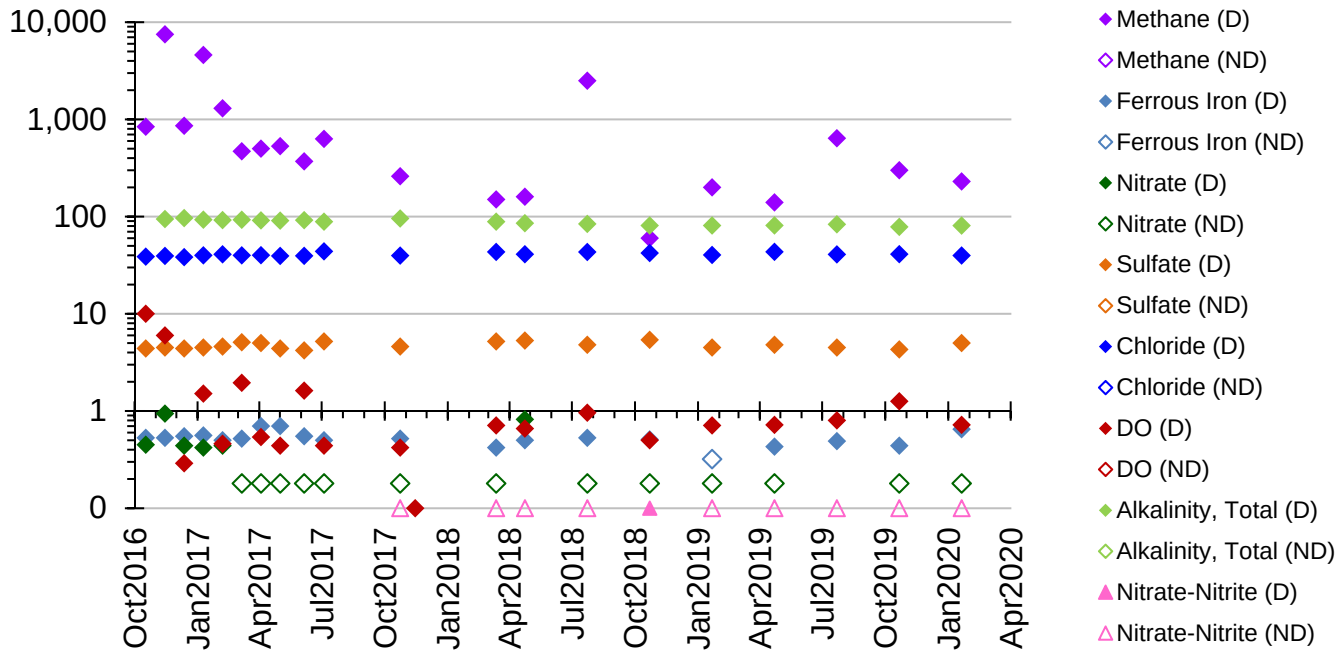
Appendix A.3.1 Cumulative Natural Attenuation Parameters Graphs

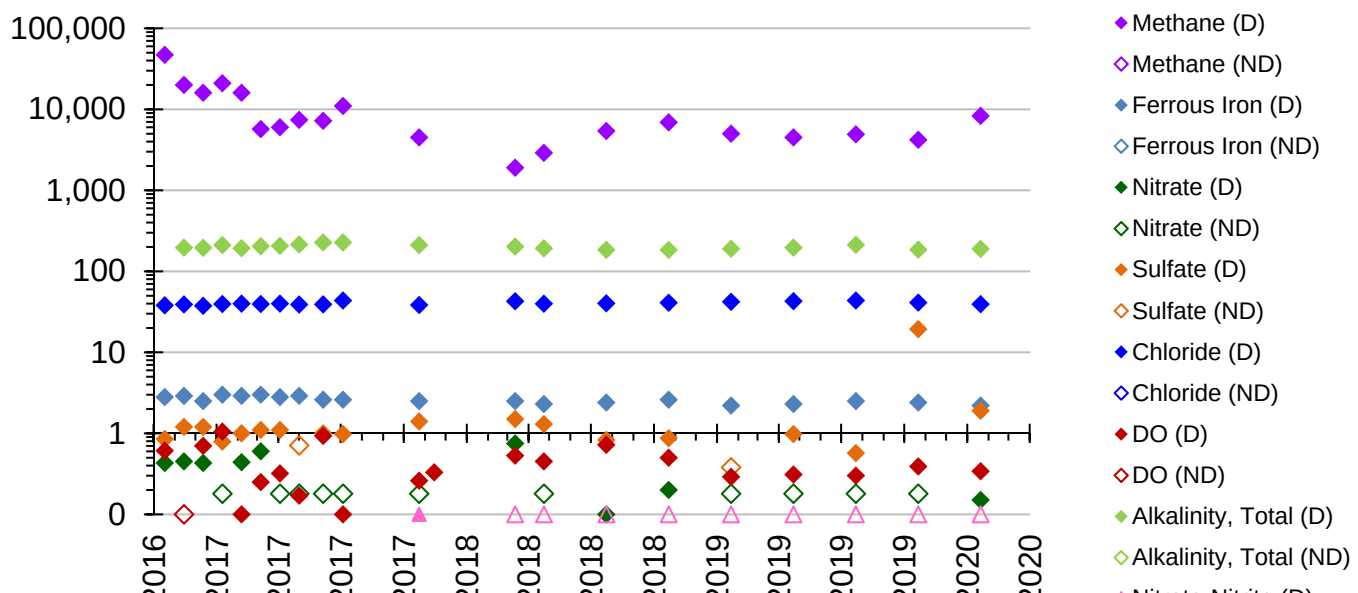
RHMW2254-01 NAPs



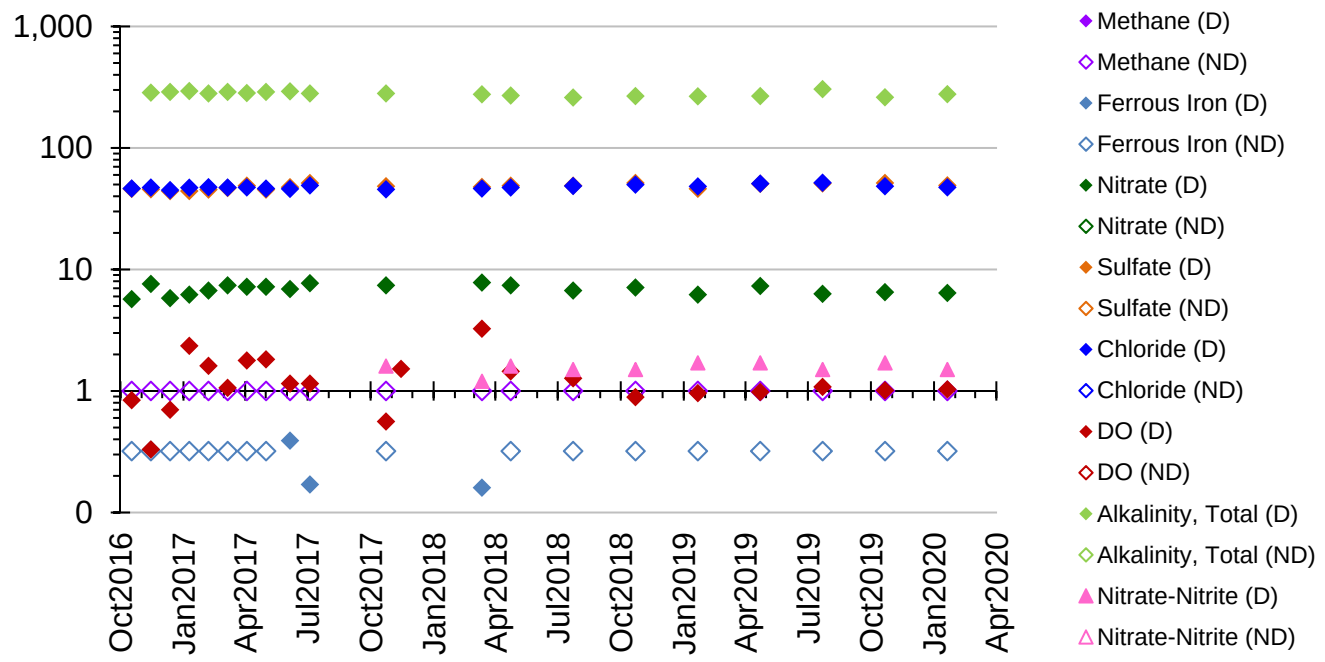
RHMW01 NAPs



RHMW02 NAPs



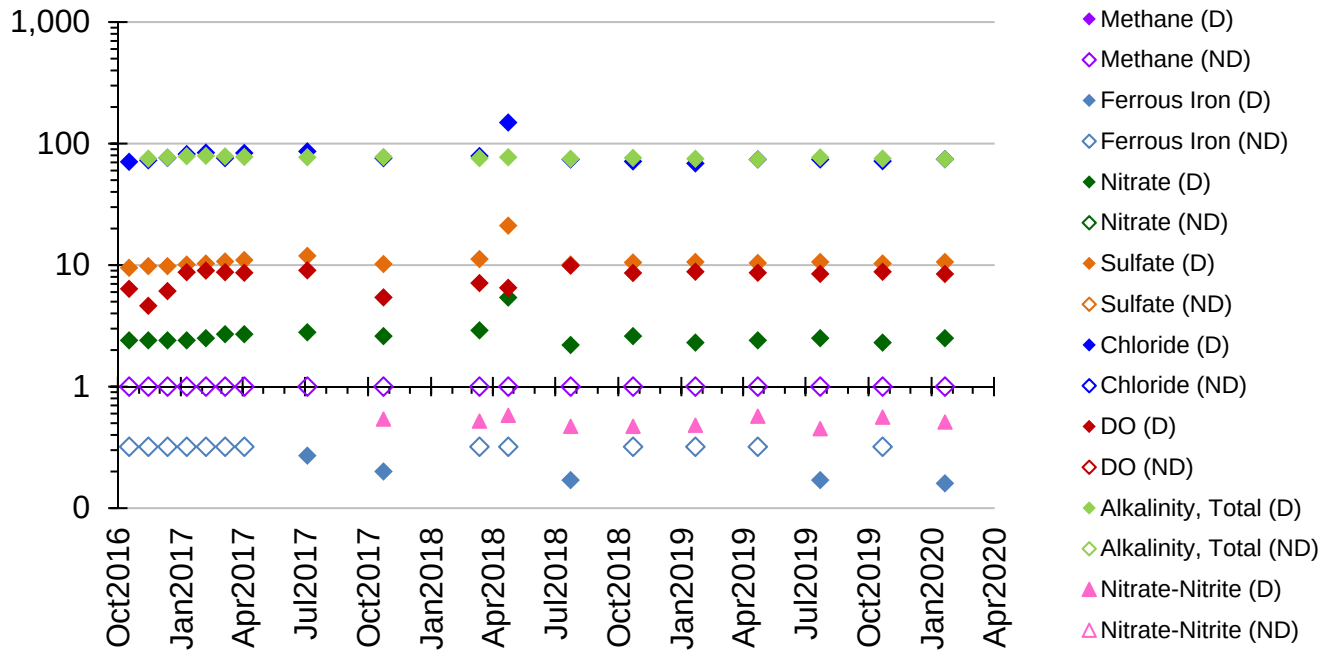
RHMW03 NAPs



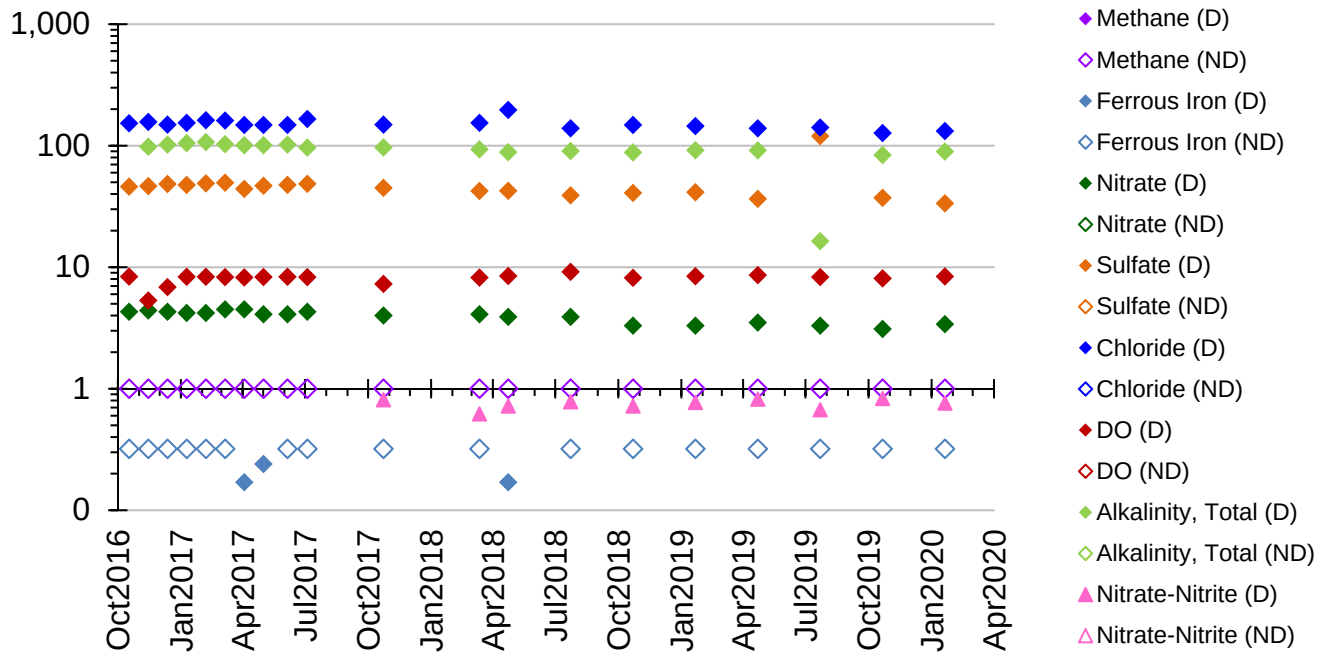
Methane results in micrograms per liter (µg/L or parts per billion).
All other results in milligrams per liter (mg/L or parts per million).

Appendix A.3.1 Cumulative Natural Attenuation Parameters Graphs

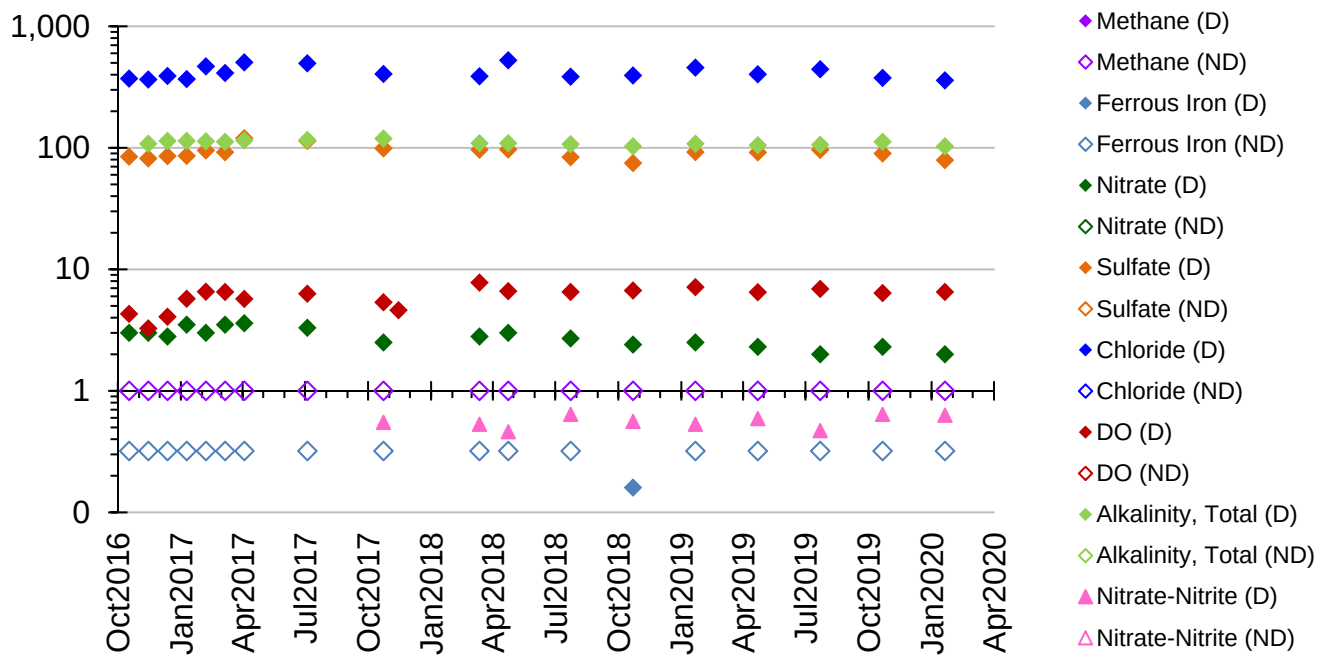
RHMW04 NAPs



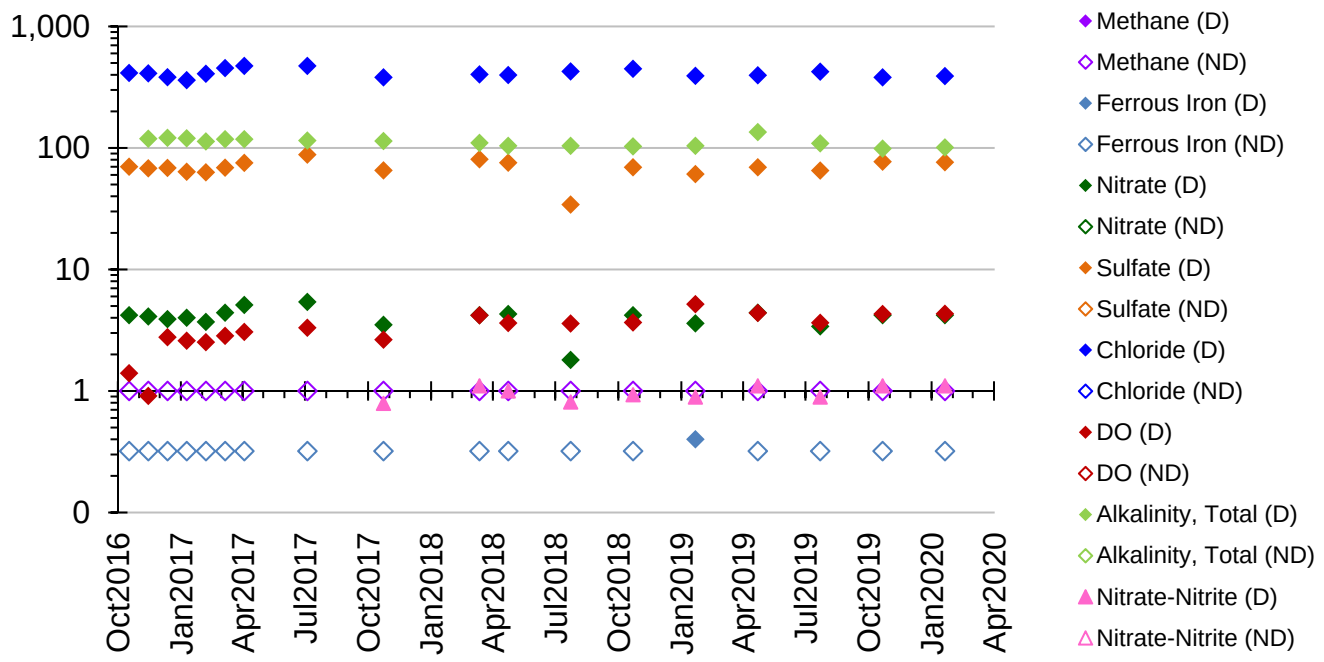
RHMW05 NAPs



RHMW06 NAPs



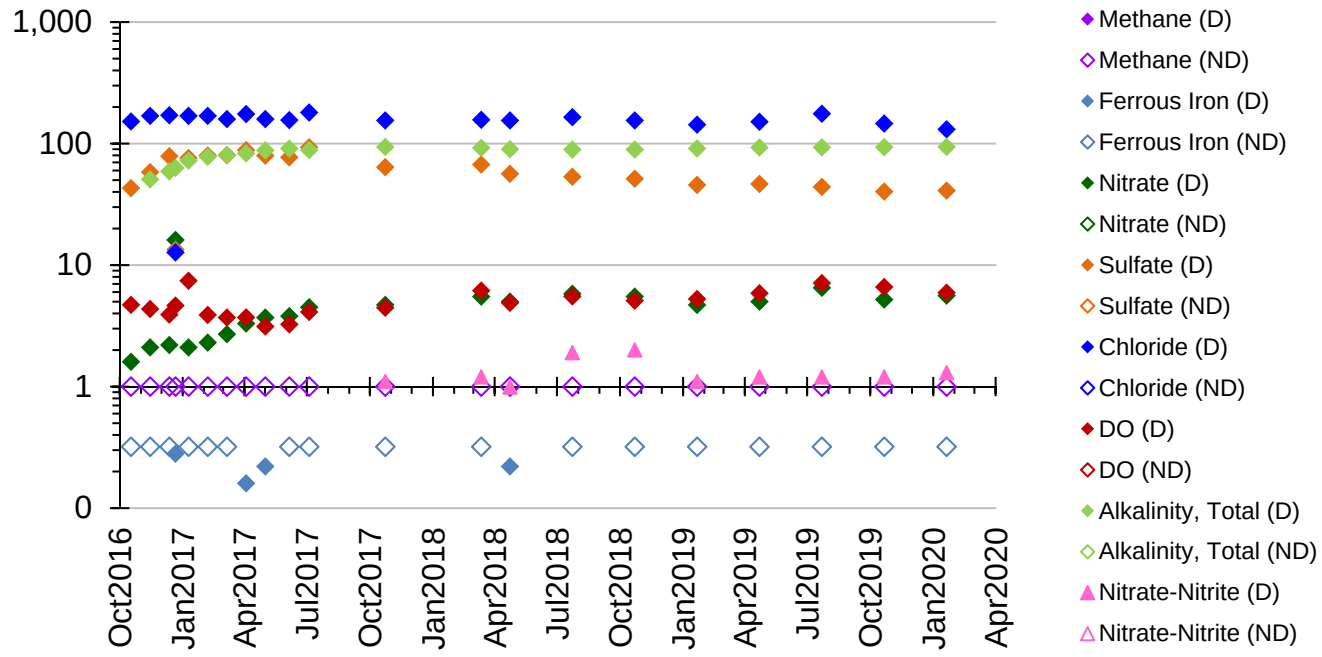
RHMW07 NAPs



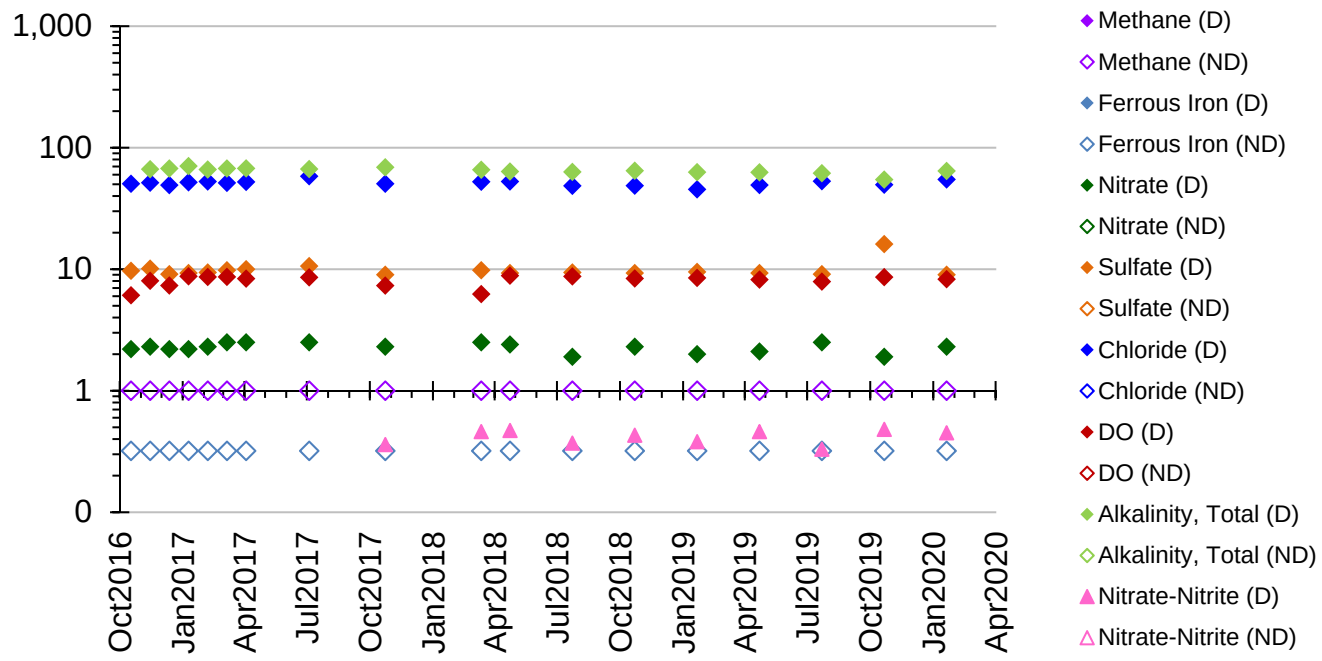
Methane results in micrograms per liter (µg/L or parts per billion).
All other results in milligrams per liter (mg/L or parts per million).

Appendix A.3.1 Cumulative Natural Attenuation Parameters Graphs

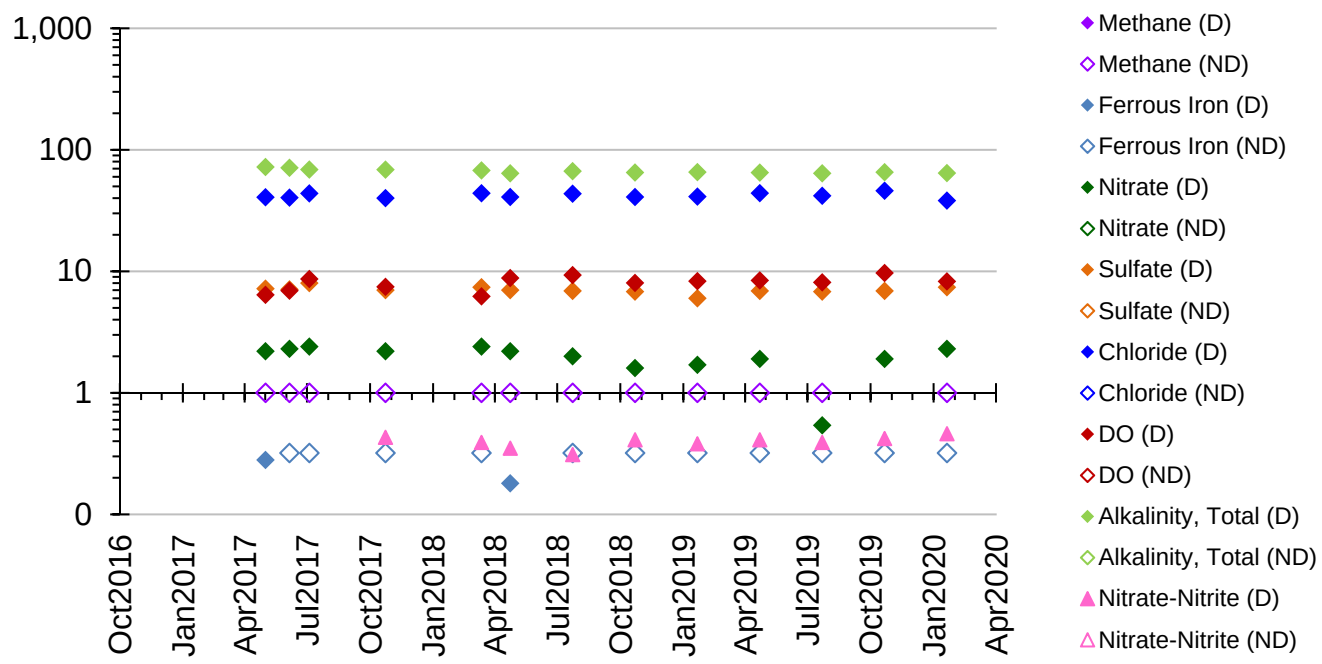
RHMW08 NAPs



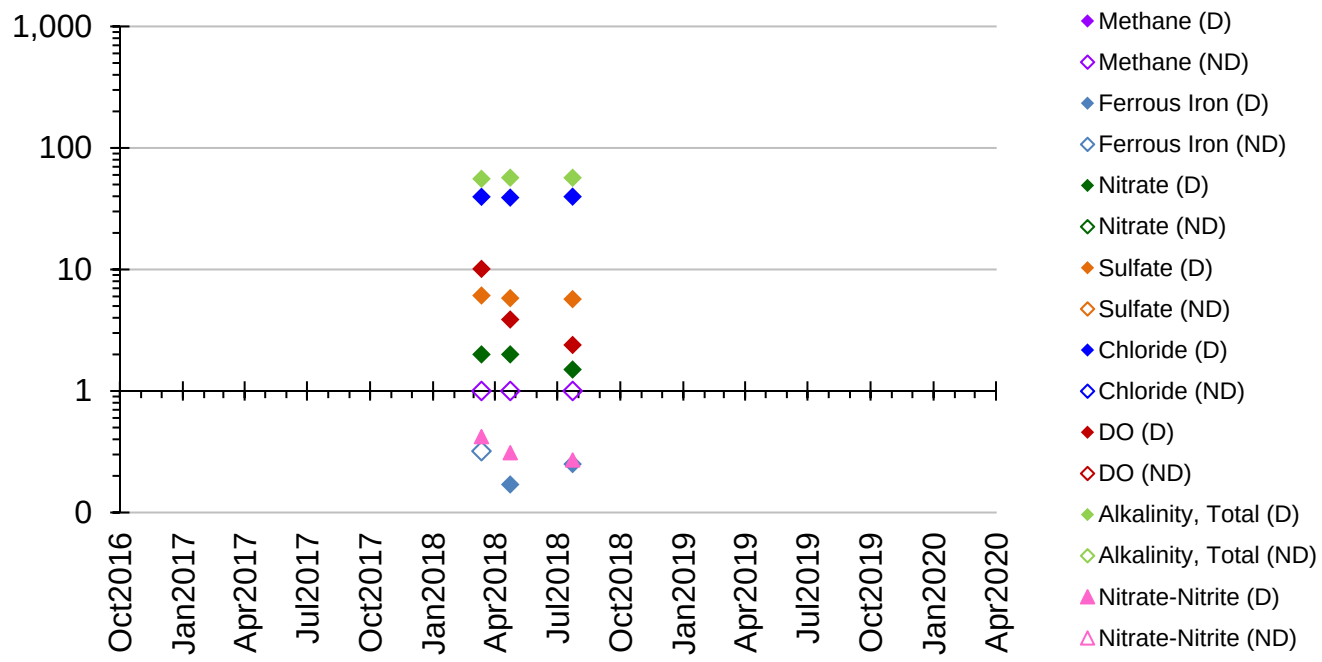
RHMW09 NAPs



RHMW10 NAPs



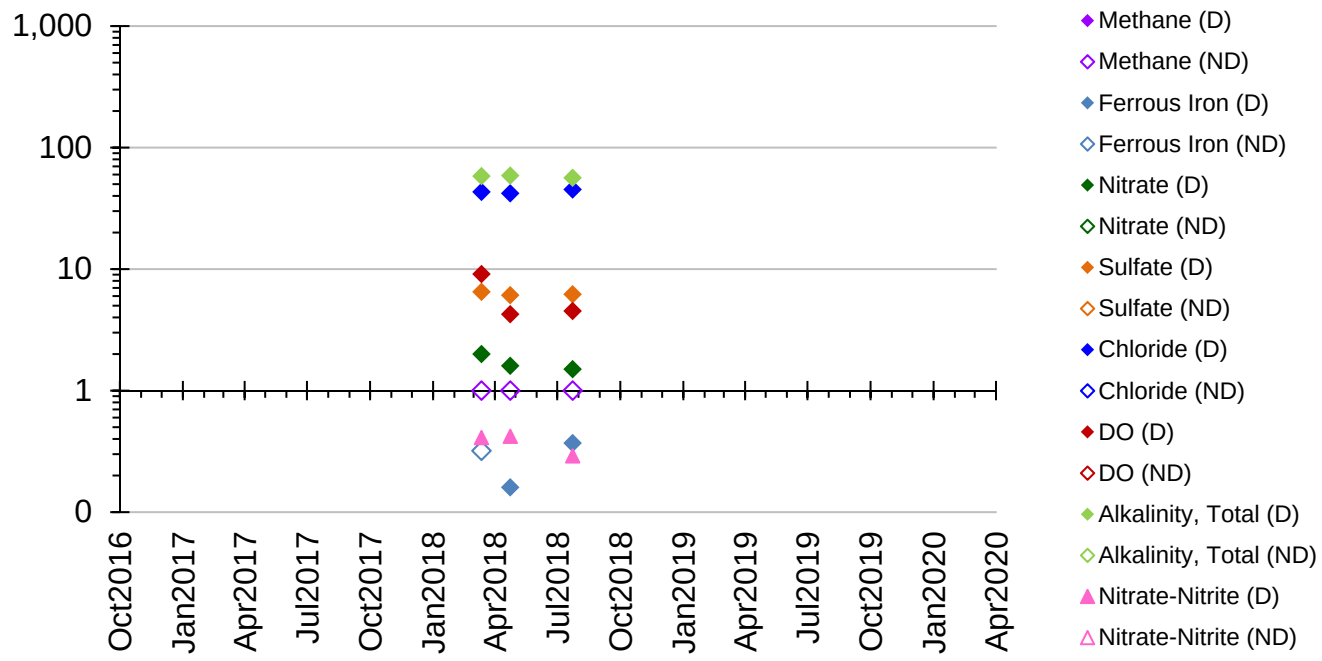
RHMW11 Zone 1 NAPs



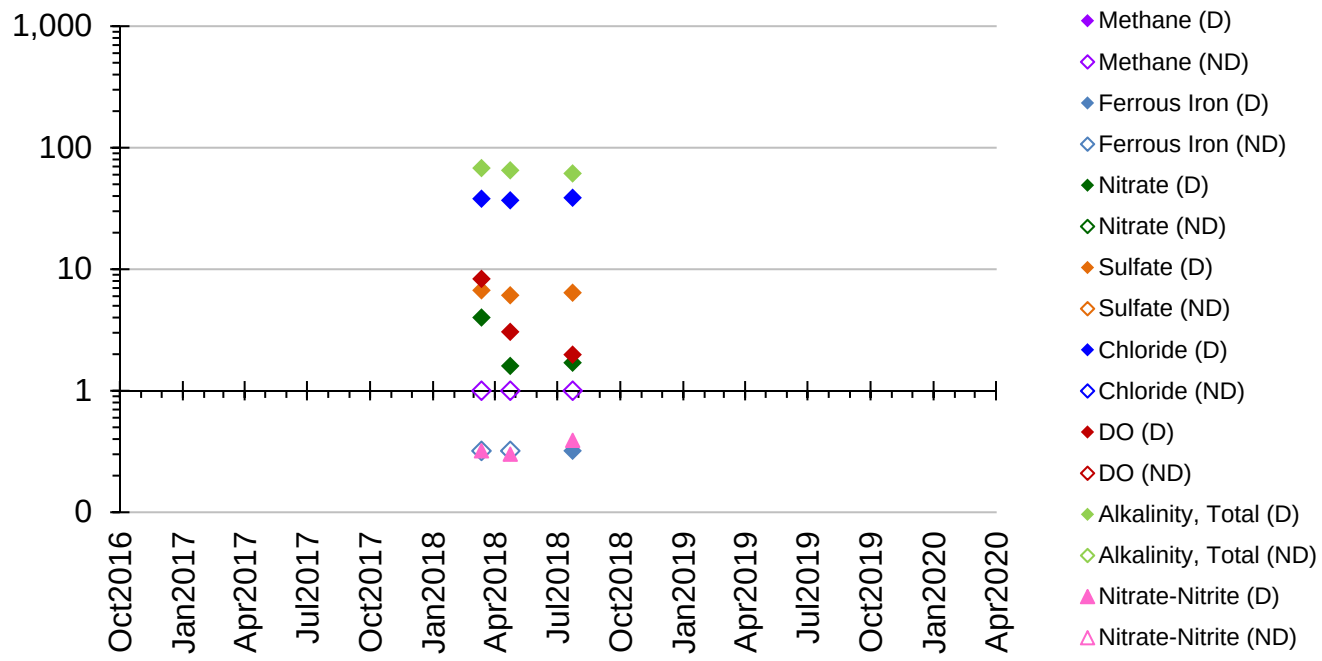
Methane results in micrograms per liter (µg/L or parts per billion).
All other results in milligrams per liter (mg/L or parts per million).

Appendix A.3.1 Cumulative Natural Attenuation Parameters Graphs

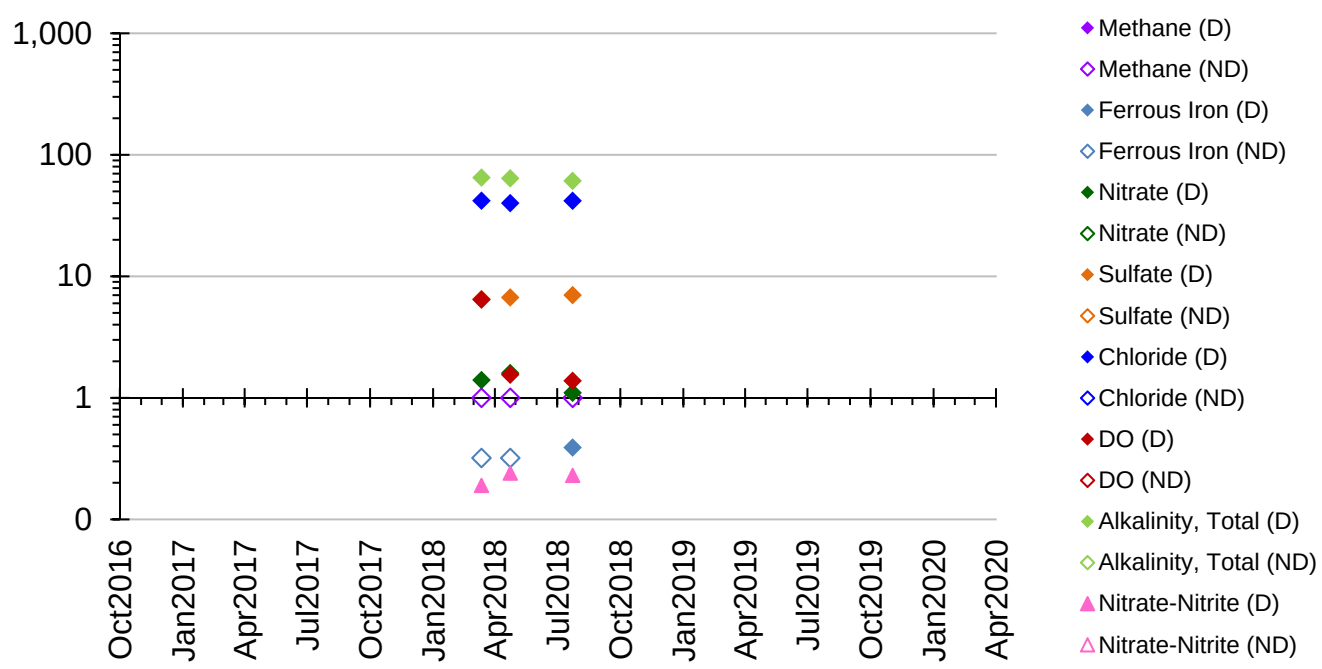
RHMW11 Zone 2 NAPs



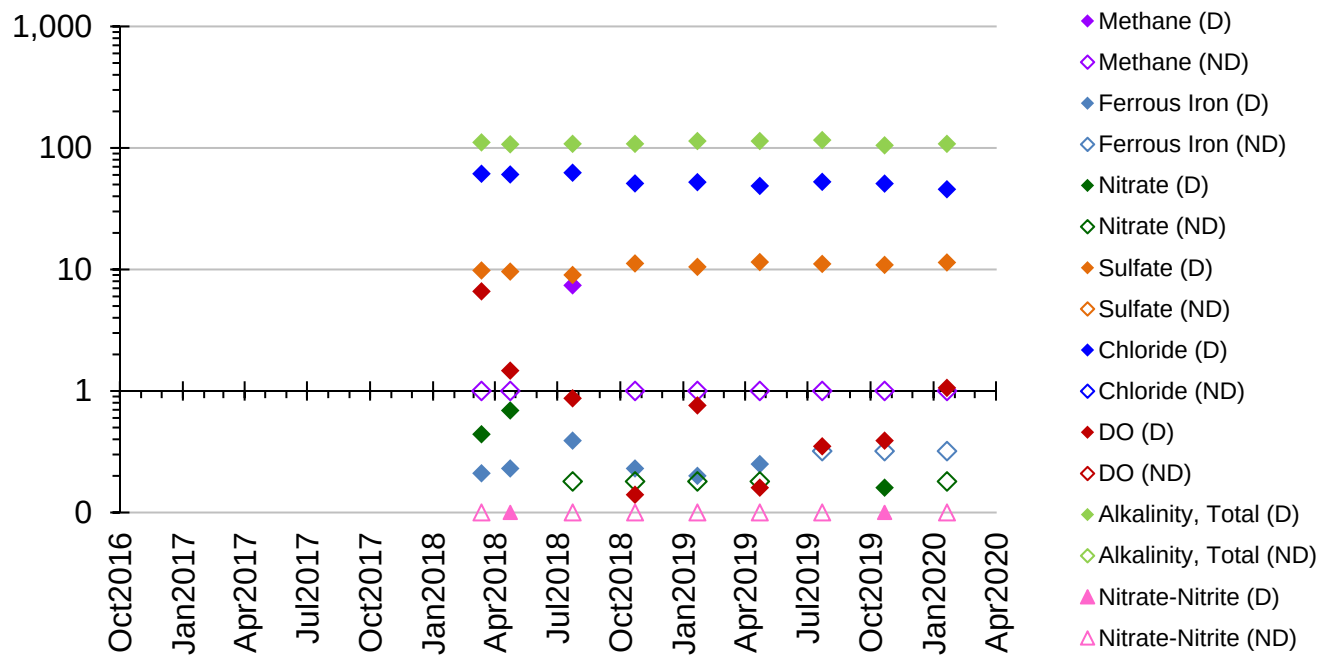
RHMW11 Zone 3 NAPs



RHMW11 Zone 4 NAPs



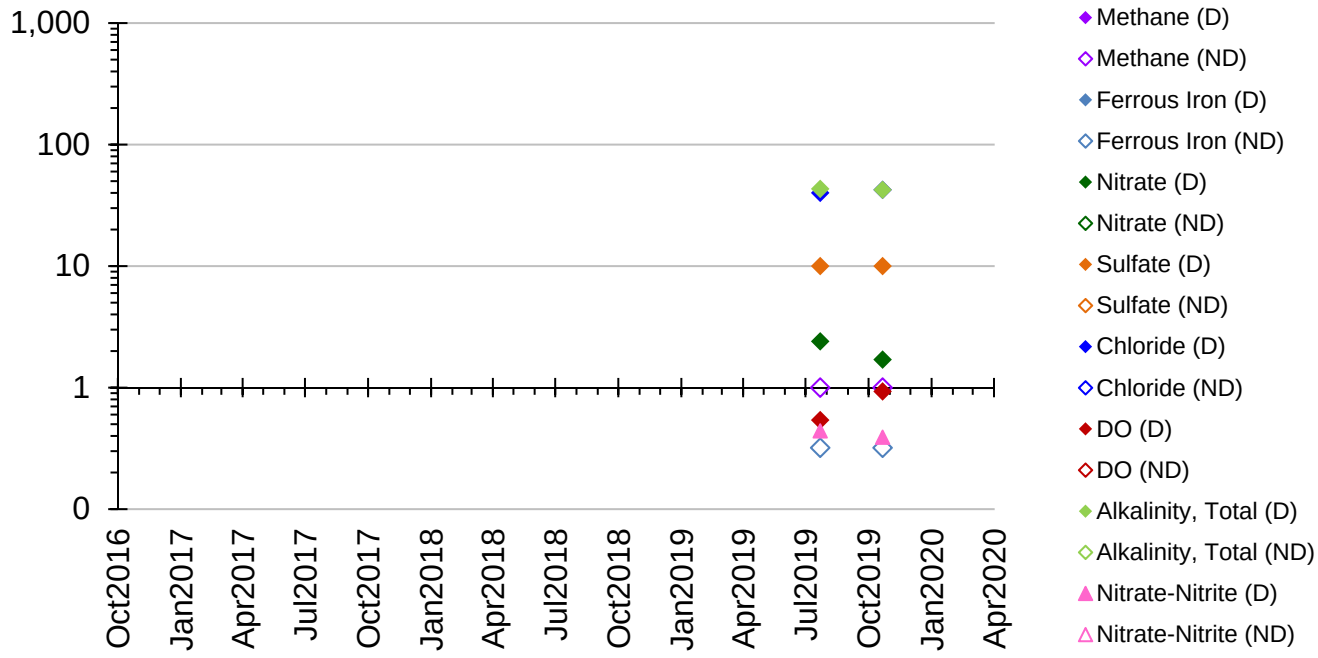
RHMW11 Zone 5 NAPs



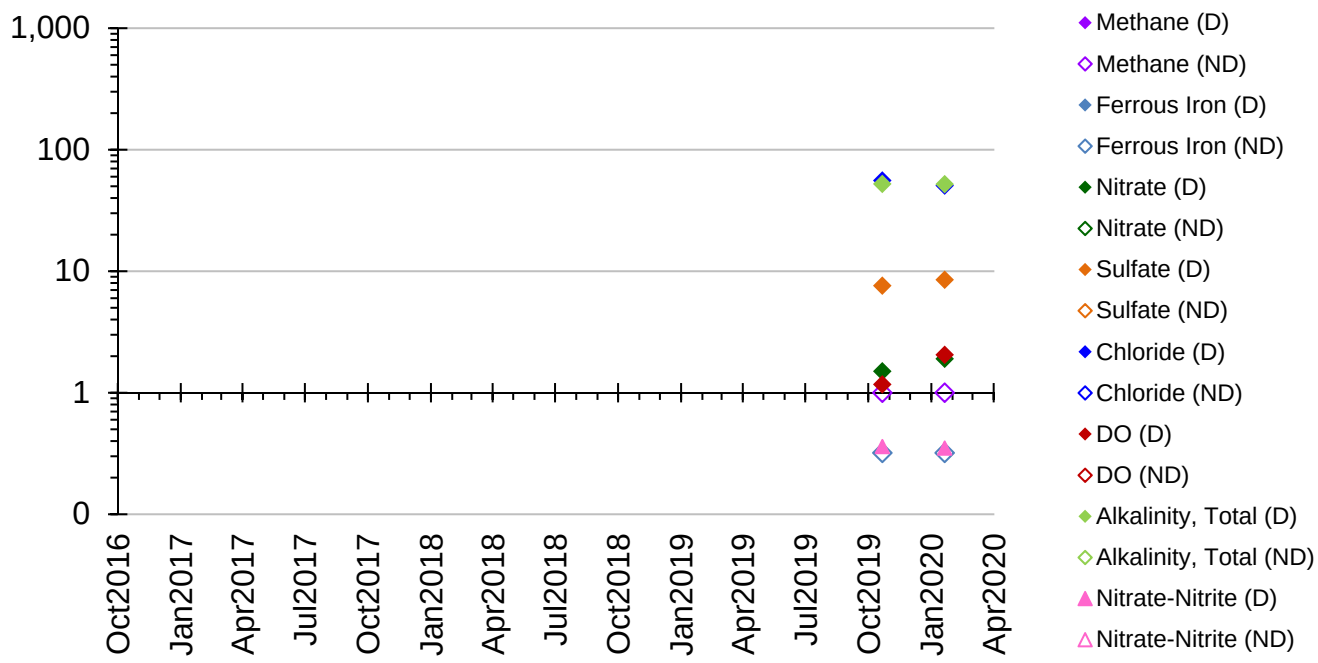
Methane results in micrograms per liter (µg/L or parts per billion).
All other results in milligrams per liter (mg/L or parts per million).

Appendix A.3.1 Cumulative Natural Attenuation Parameters Graphs

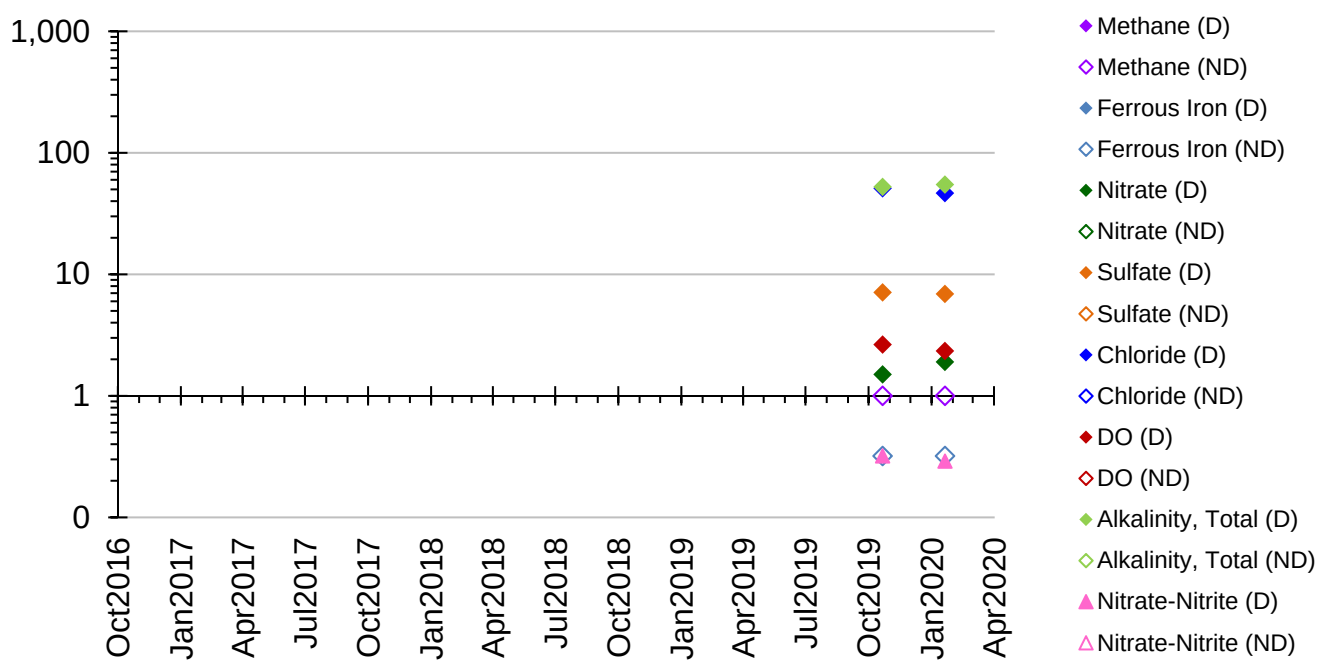
RHMW11 Zone 7 NAPs



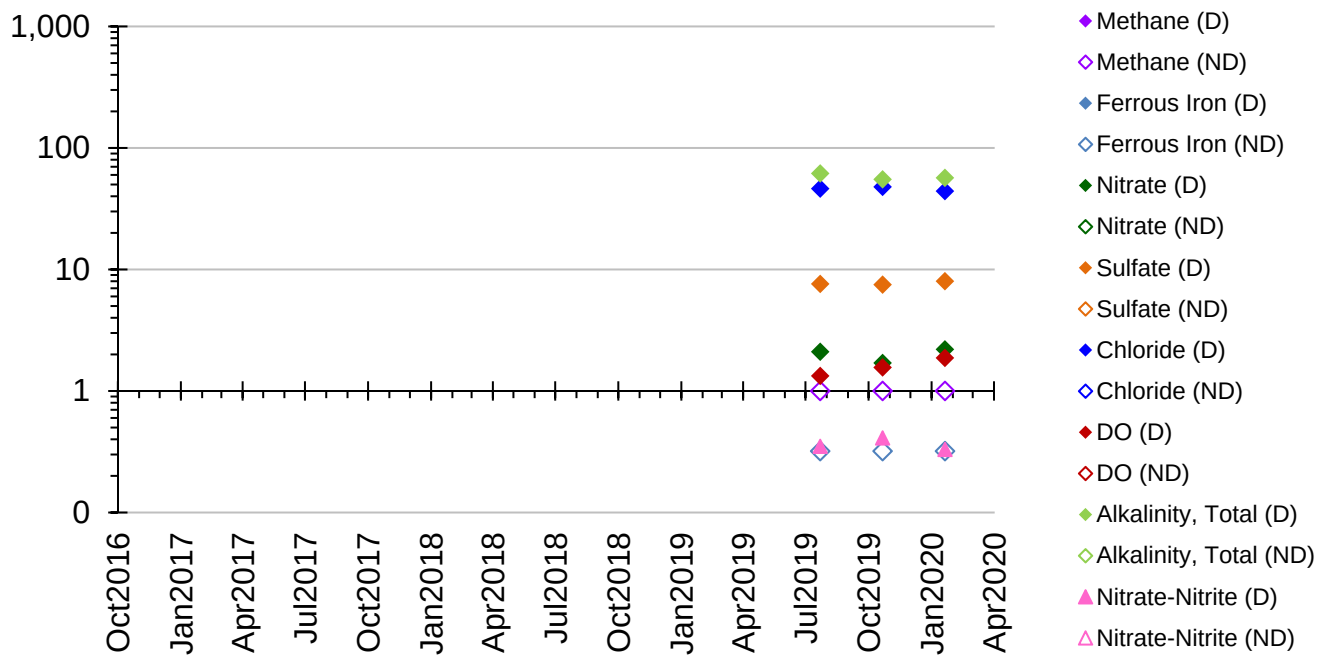
RHMW14 Zone 1 NAPs



RHMW14 Zone 2 NAPs



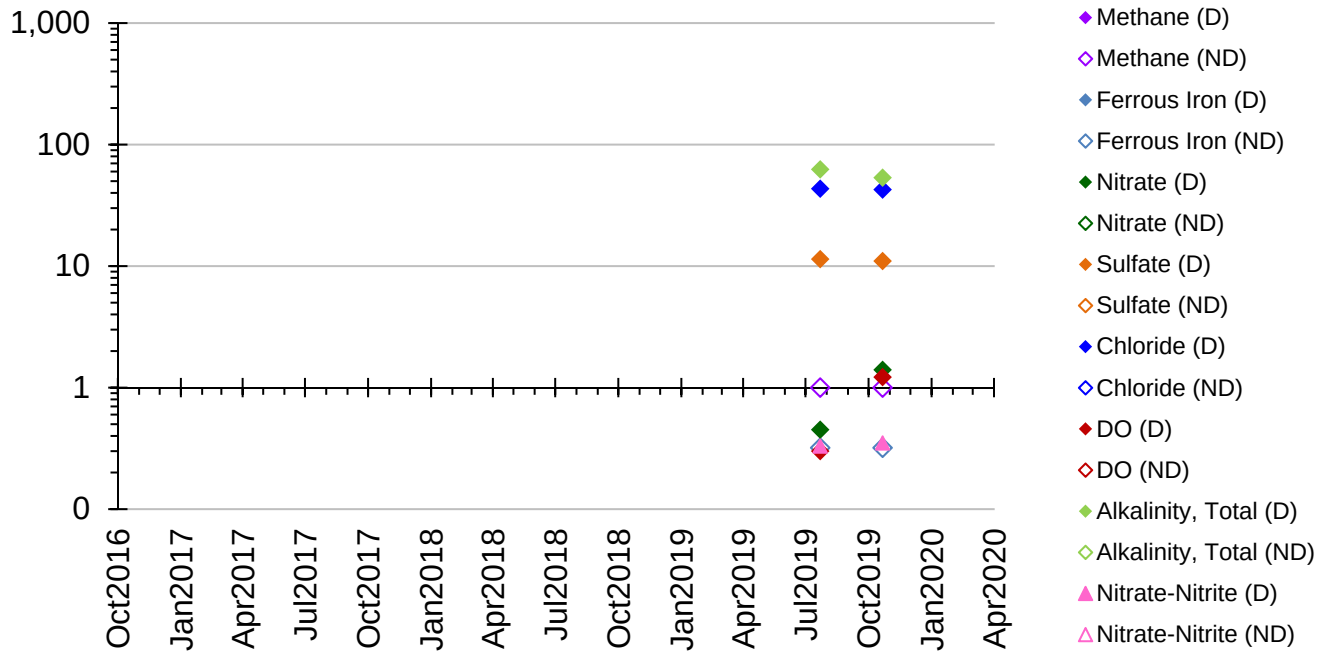
RHMW14 Zone 3 NAPs



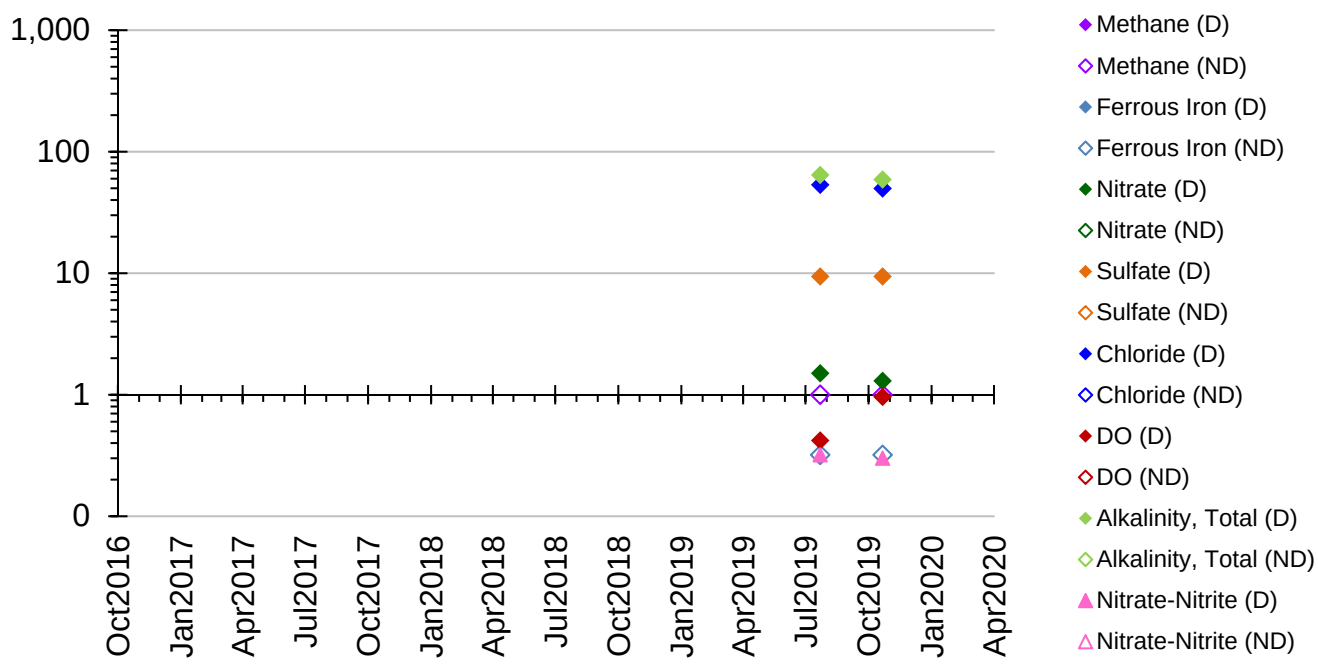
Methane results in micrograms per liter (µg/L or parts per billion).
All other results in milligrams per liter (mg/L or parts per million).

Appendix A.3.1 Cumulative Natural Attenuation Parameters Graphs

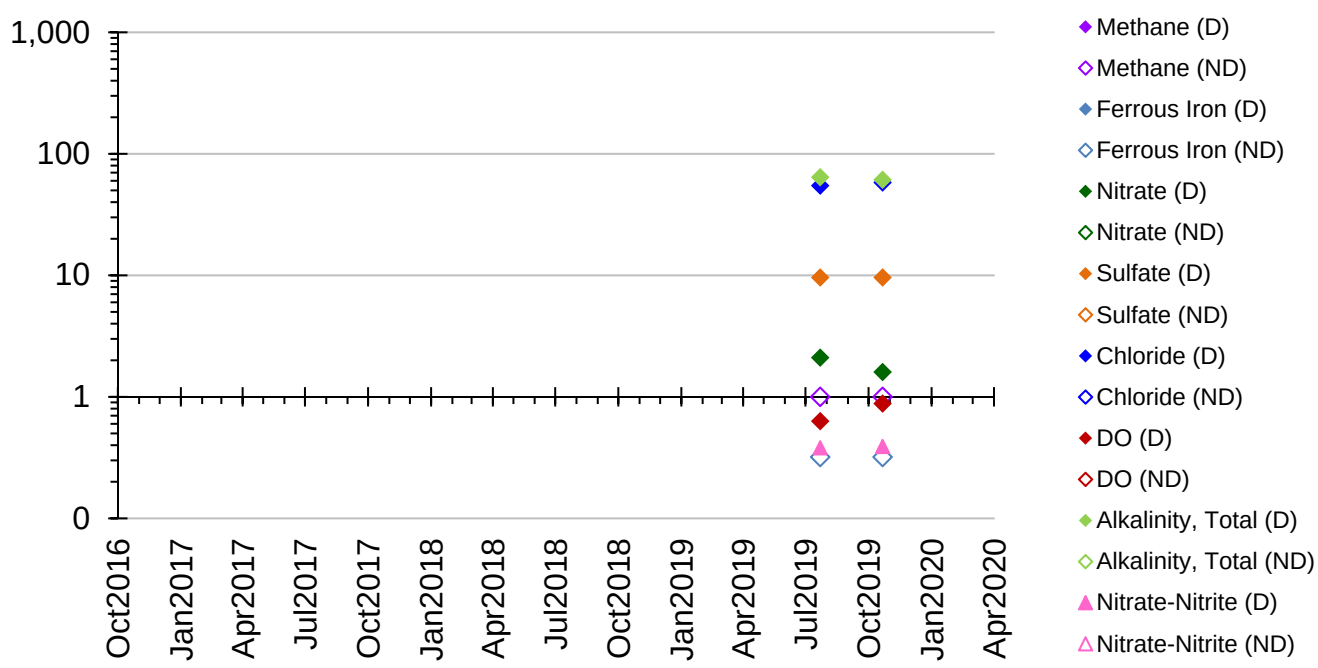
RHMW14 Zone 4 NAPs



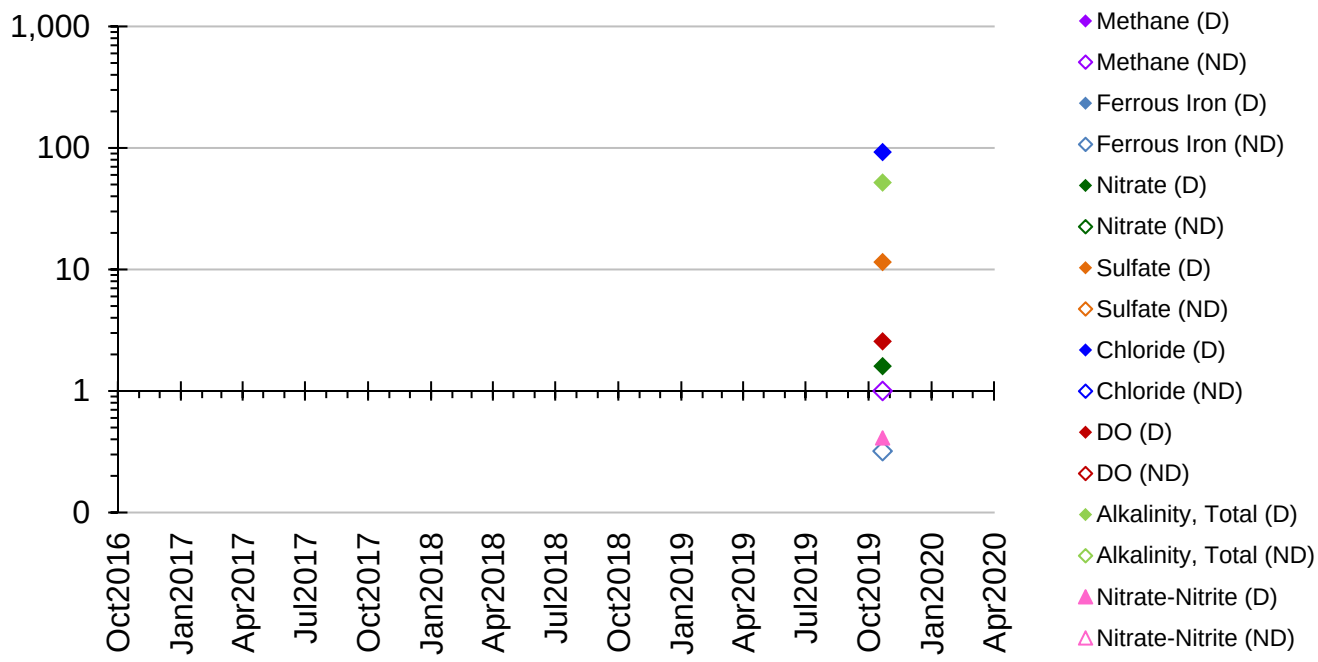
RHMW14 Zone 5 NAPs



RHMW14 Zone 7 NAPs



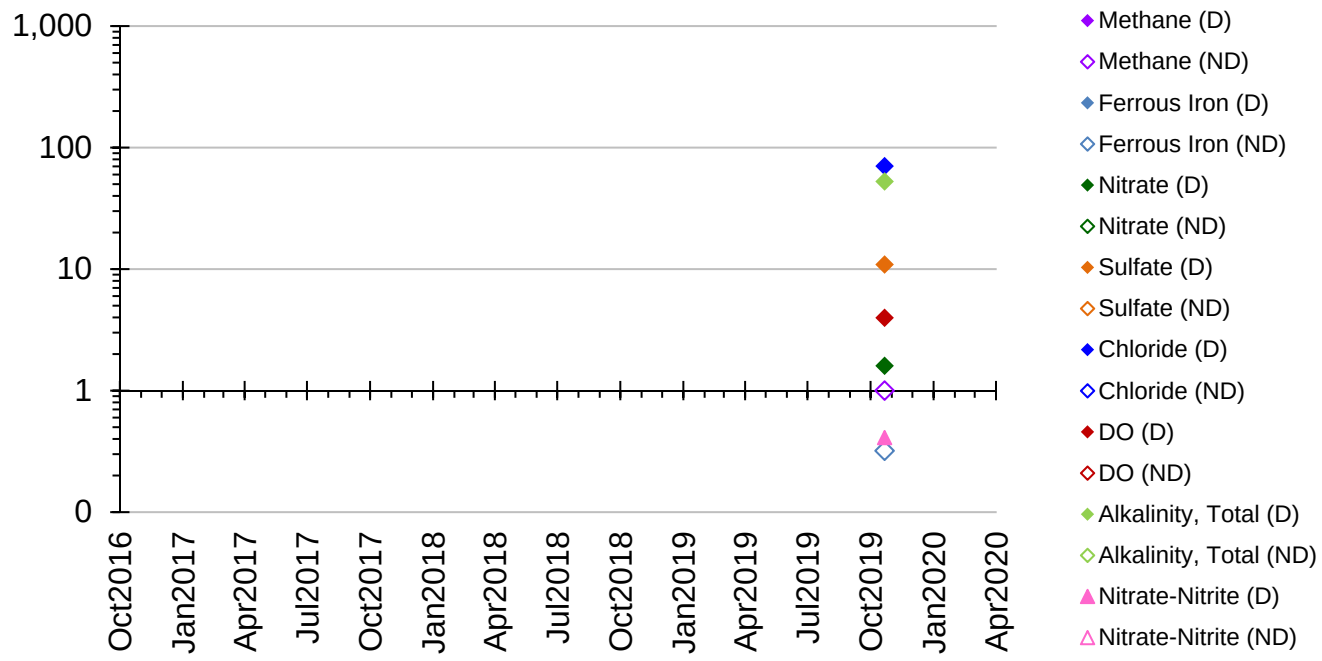
RHMW15 Zone 1 NAPs



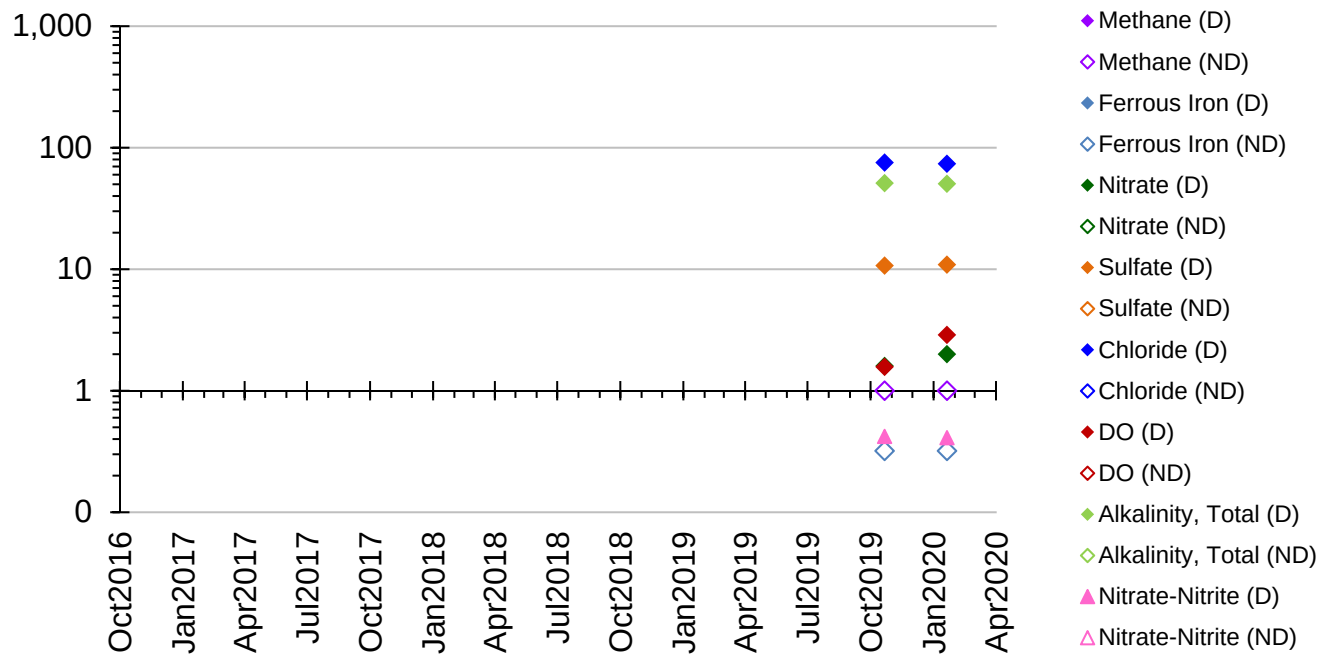
Methane results in micrograms per liter (µg/L or parts per billion).
All other results in milligrams per liter (mg/L or parts per million).

Appendix A.3.1 Cumulative Natural Attenuation Parameters Graphs

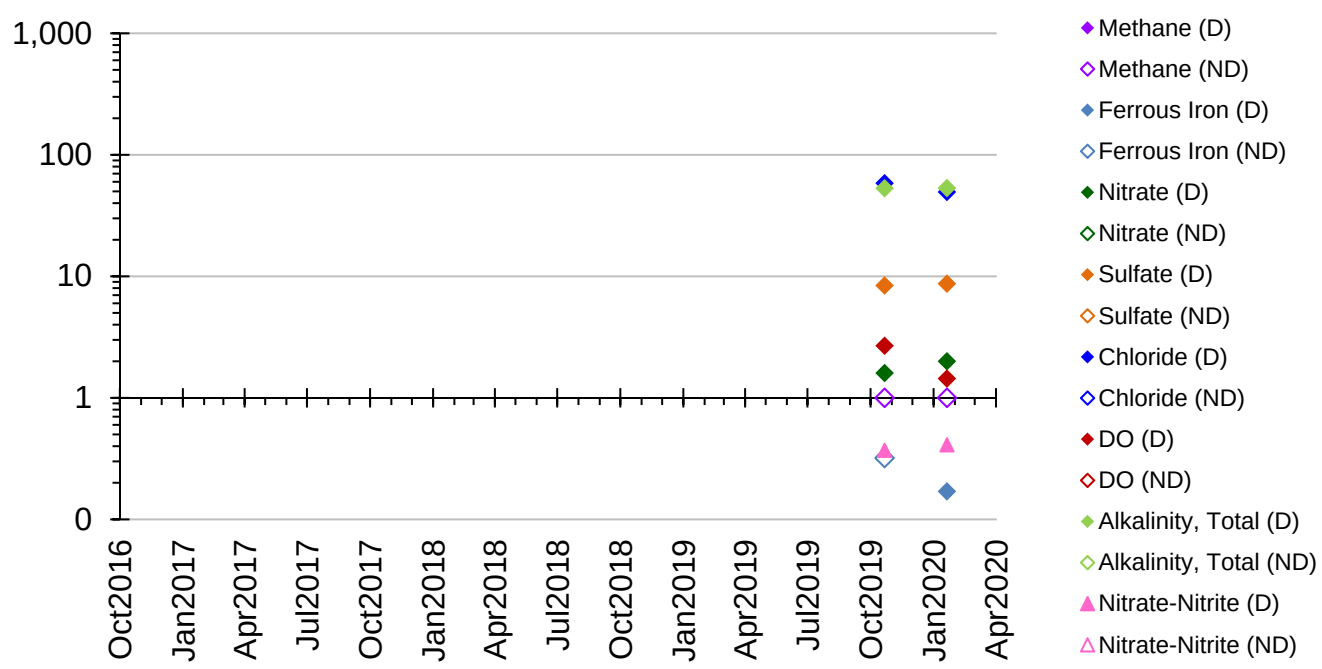
RHMW15 Zone 2 NAPs



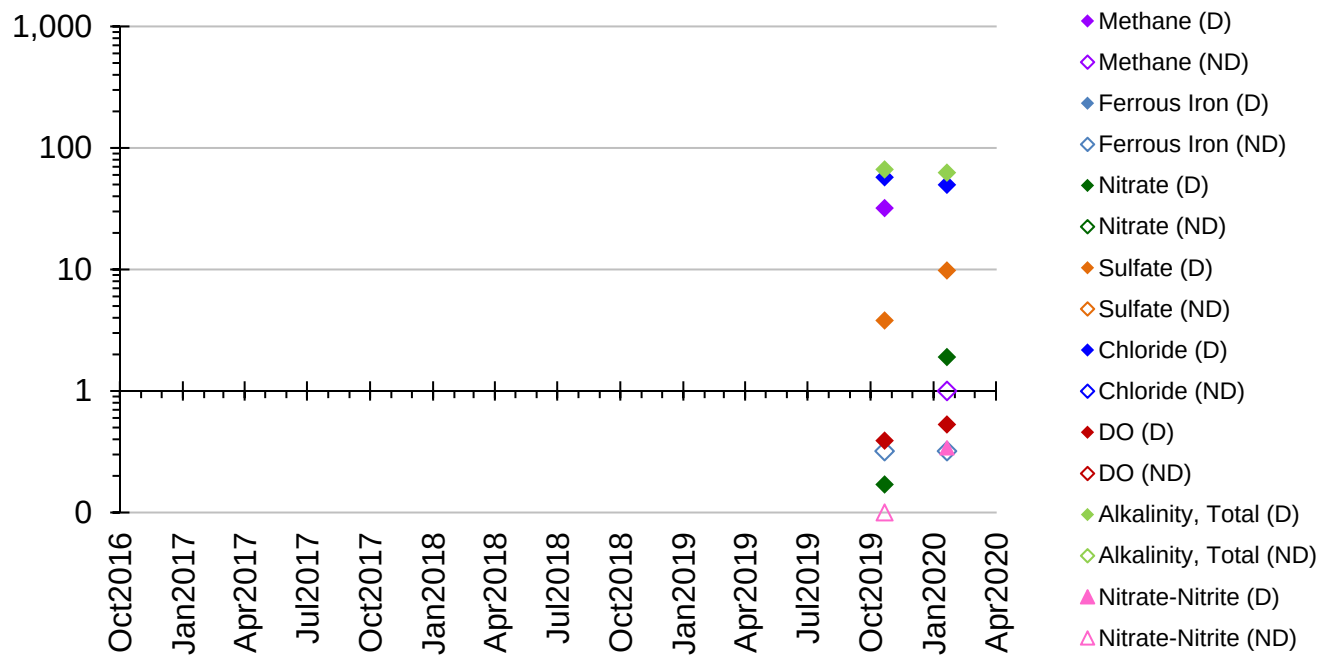
RHMW15 Zone 3 NAPs



RHMW15 Zone 4 NAPs



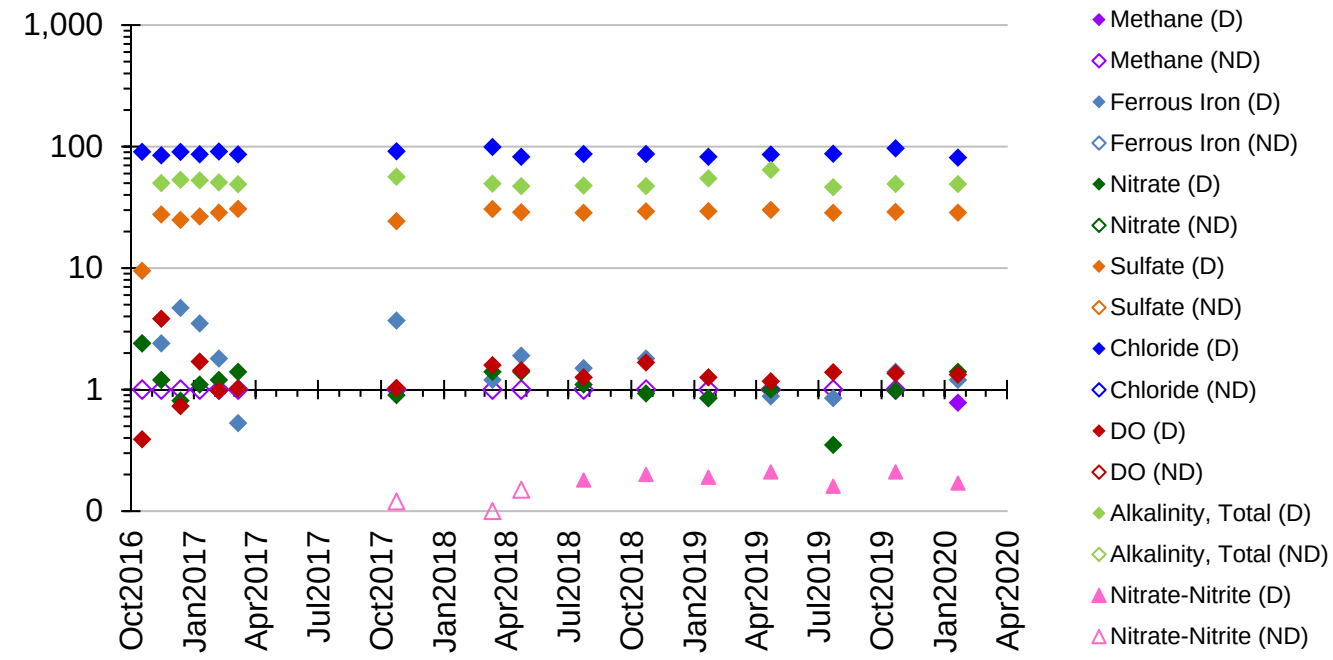
RHMW15 Zone 5 NAPs



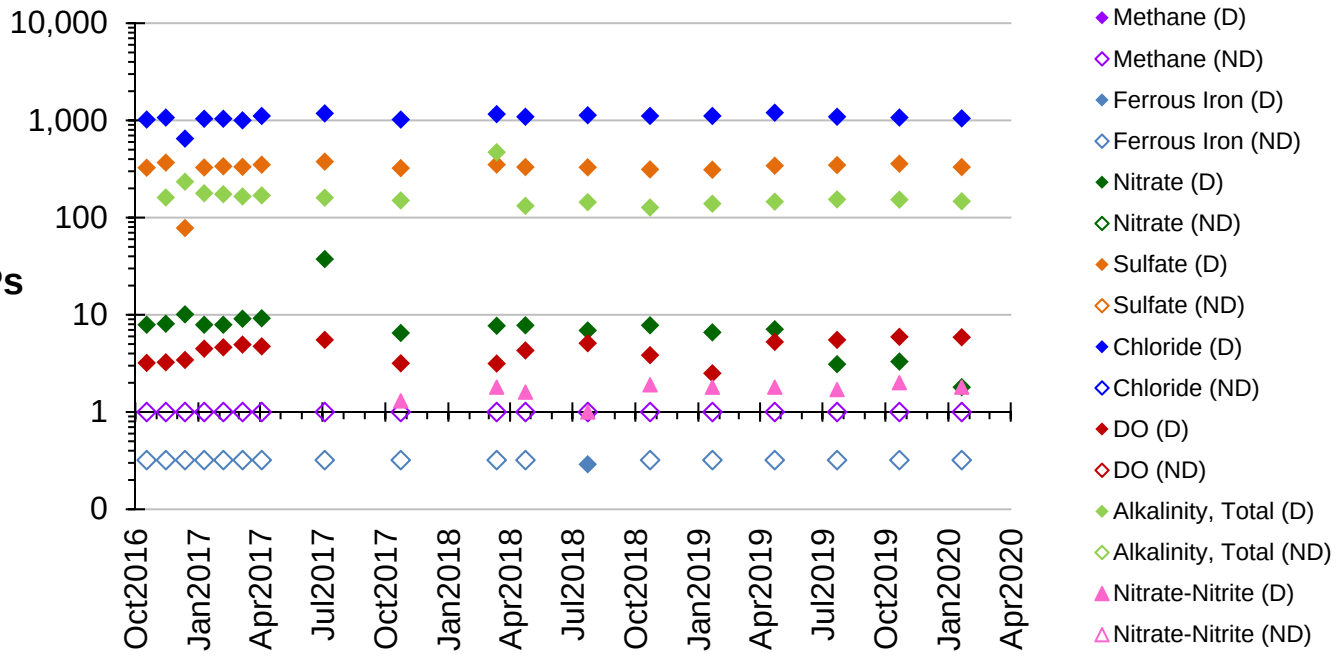
Methane results in micrograms per liter (µg/L or parts per billion).
All other results in milligrams per liter (mg/L or parts per million).

Appendix A.3.1 Cumulative Natural Attenuation Parameters Graphs

HDMW2253-03 NAPs



OWDFMW01 NAPs



Methane results in micrograms per liter (µg/L or parts per billion).
All other results in milligrams per liter (mg/L or parts per million).

Notes:

—	no data
btoc	below top of casing
ft	foot or feet
LTM	long-term monitoring
PVC	polyvinyl chloride

[a] Dates in month year format (e.g., Sep 2007) were obtained from oil/water interface reports, and exact dates were not available.

[b] The April 2009 measurements were pushed back a week (to 5/6/2009) due to the RHMW05 installation.

[c] The measurements have been corrected based on water level tape calibration and gyroscopic survey. See associated groundwater monitoring report.

Source:

Depth to groundwater values from recent oil/water interface reports and from the Appendix A Groundwater Tables GW-9, GW-10, GW-14, GW-15, and GW-17 through GW-24 in:
Department of the Navy. 2007. *Existing Data Summary and Evaluation Report for Groundwater Flow and Contaminant Fate and Transport Modeling, Red Hill Bulk Fuel Storage Facility, Joint Base Pearl Harbor-Hickam, O'ahu, Hawai'i; March 5, 2017 [Revision 00].* Prepared by AECOM Technical Services, Inc., Honolulu, HI. Prepared for Defense Logistics Agency Energy, Fort Belvoir, VA, under Naval Facilities Engineering Command, Hawaii, JBPHH HI.

Reference points for these depth to water measurements may have varied over time:

- Reference points for data prior to October 2016 are unknown.
- Reference points for RHMW01 to RHMW05, OWDFMW01, and HDMW2253-03 are the tops of permanent casings.
- Reference point for RHMW2254-01 was the top of the PVC casing for data prior to March 2018, and the high precision survey mark for data from March 2018 onwards.
- Reference points for RHMW06 to RHMW10 from October 2016 to July 2017 groundwater LTM events were the tops of the stand tubes (RHMW06 and RHMW07) and the tops of the slip rings (RHMW08, RHMW09, and RHMW10).
- Reference points for RHMW06 to RHMW10 from October 2017 groundwater LTM event onwards are the high precision survey mark on the tops of the gray plates.

Appendix B.2:
Field Logbooks

This page intentionally left blank

Location HCF Date 1/20/2020

Project / Client Red Hill LTM January 2020

Book #14 RHMW14Z1

Purpose: Complete a pressure profile in RHMW14 and sample RHMW14Z1.

0530 TV at warehouse to load.

0600 BM & BL at warehouse to load.

0615 SP at warehouse to load.

Personnel: AECOM-TV(SSHO), BM, BL, SP

Weather: 78°, intermittent showers

0700 KL conducts tailgate. See log for details.

0705 SP & TV head to site to setup. BM & BL put gas in generator and head to site

Rentals: Smart troll SN 512733
P10 SN 592-908165
Turbidimeter SN

0730 Sign in at HCF gate. Proceed to RHMW14 and setup.

0830 Setup for pressure profile. MP ~~BM35-285~~ 500152. Winch controller (yellow box) not reading depth. Call Westbay (Mark) to troubleshoot

0848 Fix winch controller. Cable had fallen off the wheel. Start Pressure Profile.

0905 Collect TB RH1003

Location HCF Date 1/20/2020

Project / Client Red Hill LTM January 2020

Book #14 RHMW14Z1 con't

0929 Complete pressure profile. MP3=HGIS243

0934 Send down canisters for parameters. Purged with Nitrogen.

1000 Collect RH1004

1028 Collect 1st parameters reading (slight delay due to passing silicon tubing). Continue to send sample canisters down.

1152 Send down canisters for second set of parameters. Purged with Nitrogen

1244 Continue sending down ~~samples~~ canisters for samples.

1320 TH on site.

1409 Send down canisters for third set of parameters. Purged with Nitrogen

1455 TH offsite (late entry)

1440 Finish sampling. Decon canisters and place in bags.

1510 TV, SP, BM, BL depart HCF Sign out at gate. TV and SP to warehouse.

1515 BM and BL to RH for IDW.

1540 At warehouse unload. End of field day.

1/20/2020

Rite in the Rain

0600 GM arrives at warehouse. KL, DH on, and DH calibrate equipment. See calibration logs for details. (LY) on Laur arrives to join outside team.

Objectives: Sample RHMW10. Pull pumps from RHMW10 and RHMW04

Weather: Sunny, light winds, 82% humidity, 80° @ 8:45

Equipment: PID = 914105, SmarTroll = 646770, oil/water interface = ~~CS~~ GM 01-5881

Team: Outside AECOM team (GM, CS, RS, and LY)

0713 Team finishes loading vehicles and heads to site. KL leads H&S tailgate as a group before leaving warehouse.

0738 Arrive onsite and check in with main gate guard. Notify security about needing access to RHMW10 from side gates. Guard escorts team to top of hill.

0758 Arrive at RHMW10 and begin to set up to deploy pump. Before deployment team discusses objectives and signs in on H&S tailgate. See tailgate for details

0815 Deployed pump and tubing into RHMW10.

0907 Started pumping at RHMW10

Rite in the Rain

Location Red Hill BFSF Date 01/22/2020

Project / Client LTM January 2020 Sampling Event Day 3

Logbook #17

0935 Water at surface. Flow rate of ~~300~~ mL/min was achieved. No bubbles in discharge tubing. Started collecting stabilization parameter readings.

0939 Air line burst at swaglock ferrul fitting directing at grey plate connection. Stopped controller and ~~set up~~ set up to pull out tubing and reconnect air tubing to air connector.

1003 When sending pump back down the weight remained on the steel cable or tubing indicating that pump ~~or~~ on tubing was wedged in the well preventing grey cap from holding weight of pump. Decided to pull pump/tubing totally out of well to determine how/where pump/tubing was getting wedged. Called JK to notify manager of problems. Called KL and tunnel team to help at RHMW10 to troubleshoot and pull pump.

1040 Team pulled RHMW10 pump/tubing out of well and re-spooled. KL, DM, arrive at RHMW10 to assist. ~~Started~~ Air/water line did not look crimped or damaged. Bladder was in good condition. Re-deployed into RHMW10.

1108 ~~St~~ Resumed pumping at RHMW10.

1121 Water back at surface. Reached approx flow rate of 250mL/min

Location Red Hill BFSF Date 01/22/2020

Project / Client LTM January 2020 Sampling Event Day 3

Logbook #17

1125 Air line blew out again but the sound of nitrogen was leaking downhole. Leak must be at splice or at pump attachment. Decided to pull pump completely again. Pump/tubing seemed to get wedged at the same place within the well. Pulled up and down slowly before pulling pump all the way to surface. Discovered air hole leak approx 3 inches up from air line connection to pump. In order to fix, we had to remove 3 inches of tubing and add new swaglock fittings. Tightened down and pull tested.

1130 JK arrived onsite. Showed and explained difficulties to JK. Re-deployed pump into RHMW10.

1230 DH arrives at RHMW10 w/ extra bladder and assists in pump redeployment.

1258 Pump back in well. Resumed pumping at 30 PSI air line blew down hole. Needed to pull entire pump/tubing set up out of well to identify Airline leak.

1320 DM and DH depart RHMW10 to offload IDW and pull pumps from RHMW06 and RHMW07. KL remains

Rite in the Rain

with team.
1356 Pump back at surface. Removed pump from end of tubing to pressure test air line with nitrogen by plugging end of nitrogen air line. Started pressurizing air line at 20 PSI air line leak was identified at approx the middle of the tubing at the bonding location. Based on discovery of hole called Geotek to discuss. Team attempted to cut ~~off~~ approx 3 inches and attempted to repair hole with swaglock splice connectors. Had to cut and repair air and water line.
1418 Repressurized line to check GM line repair. When increasing pressure the hole continued to spread down the air line. Attempted to cut out another 3 inches and add new swaglock fittings. Confirmed new splice was tight and set up to re-pressurize again.
1436 When re-pressurizing reached a pressure of approx 200 PSI and then a new bonding hole sprung up approx 3 inches below splice. Turned off pump controller and called RtHMW10 trouble shooting for the day. Called and notified JK.
1458 GM spoke to Geotek to troubleshoot difficulties. Team packed up supplies and

equipment at RtHMW10.
1505 Team mobilized to IDW storage area to drop off purge water from RtHMW10. Dropped off IDW in drum #108. Drum is now mostly full (approx 48 gallons).
1530 Team departs from site to return to warehouse
1558 Team arrives at warehouse and unloads supplies and equipment. Team discusses todays issues and CM calls JK.
1640 All activities completed for day. Closed up warehouse and End of Field Day

Weather: Sunny, light winds, 69°F, 70% humidity

0653 Team departs from warehouse to head to HCF.

0725 Team checks in at guardshack for HCF. CS stays to wait for escort Patricia Casey and Jack/Rylan from USGS. GM and RS head to OWOF well to retrieve nitrogen tank from 01/22/2020.

0800 Patricia, Rylan, and Jack show up to check in at HCF and escort team to HDMW2253-03.

08:26 Team sets up at HDMW2253-03. GM cuts down grass inside of containment fence of HDMW2253-03. Rylan/Jack pulled out transducer before start of set up.

0914 Started pump at HDMW 2253-03. Collected Trip Blank ERH996 @ 9:30. Late Entry: CS lead daily tailgate meeting. See log for details.

Location: Red Hill BFSF Date: 01/23/2020

Project / Client: LTM January 2020

0921 Water at surface. RS gets flow rate to approx 275mL/min. No bubbles in discharge.

0933 Started collecting parameter stabilization reading. See log for details.

1028 Parameters stabilized. NTU Turbidity was around 20 NTU the whole time. Turbidity did not clear up w/ time. Called MP to let her know and get confirmation to sample

1034 Started collecting HDMW2253-03 sample ERH997

1116 Finished collecting ERH997. Started packing up supplies and equipment. Rylan/Jack came back to well to redeploy transducer in well.

1158 Team leaves HDMW2253-03 and checks in w/ westbay team. Team leaves IDW w/ westbay team. Team checks out at HCF guardshack.

1218 Team arrives at warehouse and unloads supplies and equipment for the day.

1258 Team finishes unloading. GM calls Geotech to discuss and order replacement tubing for RHMW10. CS gets #11 Toyota Tacoma washed

1320 End of Field Day

01/23/2020

Location Red Hill BFSF Date 01/28/2020

Project / Client LTM January 2020 Event - RHMW10 Sampling Logbook #17

0600 Team arrives at warehouse. GM/KL calibrate equipment. See calibration log for detail. Team loads supplies and equipment into vehicles. TV loads nitrogen for today's sampling.

0638 Team leaves for site.

0706 Team arrives at Red Hill main gate. Team asks guard to open gate to RHMW10.

Objective: Set up new tubing/cable set up for RHMW10. Sample RHMW10.

Weather: Sunny, slightly overcast, 82°, 54%, light winds

Team: AECOM (GM, RS, CS, and KL)

Equipment: SmarTroll #= 637618, PID=908165, and oil/water interface = 01-5881

0728 Set up at RHMW10. CS leads H&S tailgate meeting. See sign in log for details. Discussed weight management and taking turns w/ weight.

0746 Got all tubing set up on ~~cart~~ spools / bar to get ready to deploy. Sent RS to return to warehouse to grab additional equipment.

0838 RS arrives back onsite and needed guard to re-open gate.

0905 Team discussed deployment of new RHMW10 tubing and cables. Worked out plan to have everyone lower at the same rate and zipties tubing together on the way down. Steel cable

Location Red Hill BFSF Date 01/28/2020

Project / Client LTM January 2020 Event - RHMW10 Sampling Logbook #17

ues attached to tubing at approx 70-100 ft increments w/ ziptties. Once fully deployed attached tubing to connectors at grey plate. Cut off approx 22.5 ft of water line (HDPE + FEP) and approx 16.2 ft of air line (HDPE). Completed connections to grey plate.

~~0949 Tested GM~~ 1127 Finished set up of new tubing/cables for RHMW10.

1134 Started pumping at RHMW10.

1149 Water at surface at RHMW10. Switched nitrogen tank.

1238 Started taking water parameter readings w/ SmarTroll. RS collected trip blank ERH992 @ 13:00.

1308 Finished collecting water stabilization parameters. See log for details.

1315 Started collecting RHMW10 sample ERH993 @ 1315. JM stops by to talk to team and see when to pull RHMW10

1355 Finished collecting RHMW10 sample. Team packed up all equipment and supplies. Contacted guards to open gates to get off the top of hill.

1456 RS and CS head off of site to return to warehouse. GM and KL head

Rite in the Rain

Location Red Hill BFSF Date 01/28/2020

Project / Client LTM January 2020 Event - RHMW10 Sampling
Logbook #17

to IDW storage area to drop off today's IDW in IDW drum #109. KL and GM prepare peristaltic pump to sample from DM106 for ERH1020 @ 15:30.

1543 Finished collecting DM106 IDW sample. Ran out of silicon tubing / could not collect IDW sample from Drum #097. Westbay team will collect sample on 01/29/2020.

1553 Guard lets KL and GM offsite and locks RH upper hill gate. Team heads to warehouse. Team signs off on H&S tailgate

1616 Arrive at warehouse. Team unloads all supplies and equipment. End of Field Day

Appendix B.3:
Tape Correction Factors

This page intentionally left blank

For Participant

Owner: **U.S. Navy**
Tape ID: **N-1**
Make: **Solinst**
Serial number: **133795**
Length: **500 feet**
Dates: **9/13/2017 - 9/15/2017**

Table 1. Correction table for Solinst 500-foot tape (serial number 133795; tape identifier N-1), tested 9/13/2017 to 9/15/2017.

Tape interval, in feet		[1]Correction to add to depth to water, in feet
From	To	
0.00	*6.41*	*0.00*
6.42	14.02	0.00
14.03	52.17	-0.01
52.18	90.33	-0.02
90.34	128.49	-0.03
128.50	166.64	-0.04
166.65	204.80	-0.05
204.81	242.96	-0.06
242.97	392.45	-0.07
392.46	*500.00*	*-0.07*

Values in red italics are extrapolated outside the range defined by the shallowest and deepest test measurements

[1]Use of the indicated correction values is expected to improve accuracy in water-level measurements made with this tape. However, because of scatter in the calibration data, the indicated corrections for this tape may contain uncertainty on the order of 0.01 - 0.02 feet.

Table 2. Depth-to-water measurements and errors for Solinst 500-foot tape (serial number 133795; tape identifier N-1), tested 9/13/2017 to 9/15/2017.

Well site	Reference tape depth to water, in feet	N-1 depth to water, in feet	[1]Error, in feet
Halawa Kiosk	6.40	6.42	-0.02
Moanalua	17.60	17.61	-0.01

Data Validatable Report

March 3, 2020

AECOM
1001 Bishop Street, Suite 1600
Honolulu, Hawaii 96813

Attn: Margie Pascua

Title: Report of Data: Case 91264

Project: 60571032 CV18F0126 Red Hill Fuel Storage. HI

Contract #: Prime contract # for DoD: NAVY CLEAN N62742-17-F-1800, CV18F0126
Subcontract: 18S-22209-HI27

Dear Ms. Pascua:

Nine water samples were received January 21,2020. Revised written results for the requested analyses are being provided on this March 3, 2020. **Revision:** Nitrate-Nitrite-N MS/MSD added for sample ERH974. The MS/MSD were inadvertently not spiked by the analyst prior to analysis.

Results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

If you have any questions or require further information, please contact your APPL Project Manager, Libby Cheeseborough, libby@applinc.com, at your convenience. Thank you for choosing APPL, Inc.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. These test results meet all requirements of NELAC and DoD QSM. Release of the hard copy has been authorized by the Laboratory Manager or her designee, as verified by the following signature.

CASE NARRATIVE

Case Narrative

ARF: 91264

Project: 60571032 CV18F0126 Red Hill Fuel Storage. HI

Sample Receipt Information:

Nine water samples were received January 21,2020, at 0.4°C, °C, 0.5°C, 1.6°C, 1.9°C and 2.5°C. The sample group was assigned Analytical Request Form (ARF) number 91264.

Sample Preparation and Analysis Information:

For the EPA 8015B analysis, the samples were extracted according to EPA method 3520C. The sample extracts were silica gel cleaned according to APPL's SOP CLN004; two extracts were placed on hold.

For the EPA 8270D SIM analysis, the samples were extracted according to EPA method 3520C.

For the EPA 8270D Phenol analysis, the samples were extracted according to EPA method 3520C.

For the APPL SOP ANA2MEE analysis, the samples were extracted according to EPA method 3535.

For the EPA 8260B analysis, the samples were purged according to EPA method 5030B.

For the RSK-175 analysis, the samples were allowed to equilibrate for 10 minutes at 40°C and a portion of the headspace was analyzed.

For the EPA 9060A, 300.0, 353.2, SM 2320B, SM 4500-SiD and SM 3500FeB analyses, the samples were prepared according to the methods.

Only the portion of the injection log relative to these samples is included. A full sequence log is available upon request. Measurement uncertainty can be reported upon request.

Analytical Exceptions, Deviations and Abnormalities.

EPA 8015B: Manual integrations were performed in accordance with APPL's SOP. Chromatograms of before and after manual integration are enclosed.

The surrogate Octacosane recovered above the upper control limit in four samples and the Method Blank. The surrogate is associated with Oil which, is non-detect.

The ending continuing calibration for Decanoic Acid decreased in sensitivity with a 23% Drift.

EPA 8270D SIM: The internal standard area response of Perylene-D12 for sample ERH976 was low. Corrective Action: None, Perylene-D12 is not associated with the target analytes.

EPA 8270D Phenol: In the 200122A LCS/LCSD, Phenol recovered above the 115% upper control limit. The surrogate Phenol-D6 also recovered above its 115% upper control limit. Corrective action: None, Phenol was not detected in the associated samples.

APPL SOP ANA2MEE: The RPD in the 200124A LCS/LCSD exceeded the 20% limit

Inorganics: The ferrous iron analysis was performed on 2/01/2020, within three days of sampling.

APPL Inc.
Abbreviations and Flags

FLAG	DESCRIPTION
#	Recovery or RPD outside control limits
*	Recovery or RPD outside control limits
B	Analyte detected in associated method blank
C1	Reason for correction: wrote incorrect response
C2	Reason for correction: calculated incorrectly
C3	Reason for correction: needs to be rechecked
C4	Reason for correction: data not usable
DO	Diluted out
E	Exceeds linear range
F	Estimated value
G1	Includes a wide range of hydrocarbons which does not match our gasoline standard
G10	Includes a match to hydrocarbon profiles within the range of mineral spirits
G11	Includes a match to hydrocarbon profiles within the range of JP-4
G12	Pattern does not match the gasoline standard; the carbon range for this sample is consistent with JP8
G13	Closely resembles the hydrocarbon profile of aviation gasoline
G14	Analyte concentration may be biased due to carry over
G2	Closely resembles the boiling point hydrocarbon profile consistent with weathered gasoline
G3	Includes higher boiling hydrocarbons
G4	Includes dominant peak(s) not indicative of petroleum hydrocarbons
G5	Is mainly dominant peak(s) not indicative of petroleum hydrocarbons
G6	Contains recognizable contaminant peak(s) which has been removed from quantitation
G7	Is mainly a match to hydrocarbons within the range of gasoline
G8	Closely resembles the boiling point hydrocarbon profile consistent with weathered gasoline
G9	Includes hydrocarbons within the range of kerosene
J	Estimated value
M	Matrix effect
MI1	Manual integration: integration does not follow baseline
MI2	Manual integration: non-target peak interference
MI3	Manual integration: to split a peak that was integrated as one peak by the computer.
MI4	Manual integration: to integrate a split peak
MI5	Manual integration: the whole peak or part of the peak was not integrated
MI6	Manual integration: computer integrated wrong peak
MI7	Manual integration: other – (See case narrative)
MDL	Method detection limit
ND	Not detected
NT	Non-target
Q	Acceptance criteria not met
T1 I	Includes wide range of hydrocarbons not indicative of diesel
T1 M	Is mainly wide range of hydrocarbons not necessarily indicative of diesel
T2 I	Includes lower boiling hydrocarbons, e.g. mineral spirits, kerosene, stoddard solvent, white gas
T2 M	Is mainly lower boiling hydrocarbons, e.g. mineral spirits, kerosene, stoddard solvent, white gas
T3 I	Includes higher boiling hydrocarbons, e.g. asphaltene, waste oil, motor oil, or weathered diesel fuel
T3 M	Is mainly higher boiling hydrocarbons, e.g. asphaltene, waste oil, motor oil, or weathered diesel fuel
T4 I	Includes dominant peak(s) not indicative of hydrocarbons
T4 M	Is mainly dominant peak(s) not indicative of hydrocarbons
T5	Contains recognizable contaminant peak(s) which has been removed from quantitation
T6	Is mainly a match to hydrocarbons within range of diesel fuel
T7	Closely resembles the boiling point hydrocarbon profile consistent with diesel fuel
T8	Includes a match to hydrocarbon profiles within range of diesel and kerosene fuel
T9 I	Includes non-diesel hydrocarbons within boiling point range of diesel fuel
T9 M	Is mainly non-diesel hydrocarbons within boiling point range of diesel fuel
U	Not detected
Y	Percent difference between primary and confirmation column > 40%

ARF, CRF, AND

CLIENT COMMUNICATION

APPL - Analysis Request Form 91264

Client: AECOM
Address: 1001 Bishop Street, Suite 1600
Honolulu, HI 96813
Attn: Margie Pascua
Phone: 808-356-5373 Fax: 808-523-8950
Job: 60571032 CV18F0126 Red Hill Fuel Storage
PO #: 18S-22209-HI27 PO# 102604
Chain of Custody (Y/N): Y # 144-5,147,149,154
RAD Screen (Y/N): Y pH (Y/N): Y
Turn Around Type: ONE WEEK

Received by: RBR
Date Received: 01/21/20 Time: 10:00
Delivered by: FEDEX
Shuttle Custody Seals (Y/N): Y Time Zone: -10
Chest Temp(s): SEE CRF
Color: VFRG/N-PurpleBlue
Samples Chilled until Placed in Refrig/Freezer: Y
Project Manager: Libby Cheesebor
QC Report Type: DVP4DOD/EQUIS/HI
Due Date: 01/28/20

Comments:
PM: login and F1s to Margie.Pascua@aecom.com
AN: 7 day TAT for Form 1s; 21 day TAT for PKG STYLE 1; DOD v5.1; DOD Forms: LOD database
Wetlab: Nitrate by EPA 300 and 353.2
8260: BTEX & TPH-G only; 8270 SIM: 1-methylnaphthalene, 2-methylnaphthalene & naphthalene only.
TPH D & O both with and w/o SGC, reverse surrogate for the SGC; BA06161 & BA06164: analyze SGC if dete
RSK: Methane only; $87DC53W5: report phenol only
FR: email ftp info to Margie, Stella, trommelfanger@lab-data.com & jcanlas@lab-data.com
EDD: AECOM EQuIS EDD 2.5.3 Red Hill 87DMEE->3535A to Margie.Pascua@aecom.com & jecklund@lab-data.com

Sample Distribution:
GC: 5-$87DC53W5, 5-$87DMEEW5, 3-$DOC53SGCW5LIQ, 5-$DOC53W5LIQ, 5-$SIM53LIQ51
Extractions: 5- LIQ003, 5- LIQ005SGC, 5- MWE2MEE
VOA: 9-$86BTOTXDOD5W, 9-$GASBL, 9-$GRO86BW, 8-$RSKMETH
Wetlab: 4-$232W(HCO3,CO3,ALK), 4-$300W, 4-$35FE, 4-$35OF, 4-$TOCW53

COOLER RECEIPT FORM **ARF: 91264**

1) Project: 60481245 CIV0053 Red Hill Fuel Storage Date Received: 01/21/20

2) Coolers: Number of Coolers: 0

3) YES Were custody seals present and intact?
How many? 0 Name/Date on seal? _____

4) YES Was there a shipping slip? Carrier name: FEDEX

5) Type of packing in cooler: __ bubble wrap __ popcorn __ foam __ plastic bags __ other
__ wet ice __ dry ice __ no ice __ gel ice

6) YES Were cooler temperatures acceptable?

7) Serial number of certified NIST thermometer use IR CF: -0.3°C

8) Cooler temp(s): In °C. Thermometer Temp / Corrected Temp
1: 1.9/1.6 2: 2.8/2.5 3: 0.7/0.4 4: 2.2/1.9 5: 0.8/0.5 6: _____
7: _____ 8: _____ 9: _____ 10: _____ 11: _____ 12: _____

Chain of custody:

9) YES Was a chain of custody received?

10) YES Were the custody papers complete/signed in the appropriate places?

Sample Labels:

11) YES Were all sample labels complete (sample ID, date/time of sampling, etc.)?

12) YES Did all container labels agree with custody papers?

Sample Containers:

13) YES Were all containers sealed in separate bags?

14) YES Did all containers arrive in good condition (unbroken, no leakage, no cracked/broken lids)?

15) YES Were correct containers and preservatives used for the tests indicated?

16) YES Was a sufficient amount of sample sent for tests indicated?

17) NA Were bubbles present in volatile samples?
If yes, the following were received with air bubbles:
Larger than a pea: _____
Smaller than a pea: _____

Preservation Hold time:

18) Yes Was a sufficient amount of holding time remaining to analyze the samples?

19) Yes Was the pH taken of all non-VOA preserved samples and written on the sample container?

20) Yes Was the pH of acid preserved non-VOA samples < 2?

21) NA Was the pH of sodium hydroxide preserved samples for Cyanide > 12 and Sulfide >9?

22) NO Were unpreserved VOA Vials received?

23) NA Are unpreserved VOA vials noted in the ADD TEST FIELD on the ARF?
pH strip lot number: HC982588
Lab notified if pH was not adequate: _____

Notes/Deficiencies:
Container missing for Ferrous Iron, sample ID ERH976. COC says we will receive it tomorrow.

Personnel receiving samples: ZG Second reviewer: _____
Personnel labeling samples: AD
Project manager notified: ZG Date/Time of notification 01/21/20
Name of client notified: _____ Date/Time of notification _____

Revision: 22, November 5, 2013

	Compound	R.T.	QIon	Response	Conc Unit		Qvalue
39)	2-Methylnaphthalene	7.63	142	502608	38.62970 ppb		99
40)	1-Methylnaphthalene	7.75	142	521546	38.54859 ppb		98
42)	Hexachlorocyclopentadiene	7.82	237	176384	36.58253 ppb		99
43)	1,2,4,5-Tetrachlorobenzene	7.83	216	268214	38.75357 ppb		97
44)	2,4,6-Trichlorophenol	7.97	196	176195	38.88432 ppb		99
45)	2,4,5-Trichlorophenol	8.02	196	192075	39.08438 ppb		94
47)	1,1'-Biphenyl	8.17	154	649127	38.52004 ppb		98
48)	2-Chloronaphthalene	8.20	162	521946	38.51358 ppb		97
49)	2-Nitroaniline	8.31	65	200138	38.89341 ppb		95
50)	Dimethyl phthalate	8.53	163	640502	38.55712 ppb		99
51)	2,6-DNT	8.60	165	142948	39.45629 ppb		86
52)	Acenaphthylene	8.67	152	814666	39.04333 ppb		99
53)	3-Nitroaniline	8.32	138	168892	39.27271 ppb		93
54)	Acenaphthene	8.88	154	504832	38.67929 ppb		99
55)	2,4-Dinitrophenol	8.92	184	74846	36.78536 ppb		86
56)	4-Nitrophenol	8.60	65	13109	38.71590 ppb		95
57)	Dibenzofuran	9.08	168	753264	37.99707 ppb		98
58)	2,4-DNT	9.07	165	207839	39.01941 ppb		89
59)	2,3,4,6-Tetrachlorophenol	9.23	232	147125	39.47119 ppb		94
60)	Diethyl phthalate	9.35	149	671228	39.00159 ppb		98
61)	4-Chlorophenyl phenyl ethe	9.47	204	352091	36.94829 ppb		88
62)	Fluorene	9.48	166	641030	38.00953 ppb		98
63)	4-Nitroaniline	8.79	138	141770	39.56230 ppb		88
66)	4,6-Dinitro-2-methylphenol	9.56	198	122593	38.64878 ppb		99
67)	Diphenyl amine	9.62	169	1020591	77.05626 ppb		100
68)	n-Nitrosodiphenylamine	9.62	169	1020591	77.05626 ppb		100
69)	1,2-Diphenylhydrazine	9.66	77	751770	39.24670 ppb		94
70)	4-Bromophenyl phenyl ether	10.05	248	199129	39.93106 ppb		88
71)	Hexachlorobenzene	10.12	284	196806	39.01049 ppb	#	84
72)	Atrazine	10.24	200	89439	19.66371 ppb		99
73)	Pentachlorophenol	10.35	266	112272	36.20294 ppb		96
74)	Phenanthrene	10.60	178	877664	39.09087 ppb		99
75)	Anthracene	10.66	178	919645	39.18457 ppb		99
76)	Carbazol	10.85	167	830000	38.84199 ppb		98
77)	Di-n-butylphthalate	11.25	149	1156611	39.58322 ppb		98
78)	2-Nitrodiphenylamine	11.42	167	137354	20.66472 ppb		92
79)	Fluoranthene	11.99	202	1038608	39.49426 ppb		98
81)	Benzidine	12.14	184	334522	36.65784 ppb		99
82)	Pyrene	12.26	202	1083004	40.40627 ppb		100
84)	Butyl benzylphthalate	13.00	149	541594	40.32946 ppb		87
85)	3,3'-Dichlorobenzidine	13.61	252	372475	40.43680 ppb		100
86)	Benz (a) anthracene	13.65	228	1137597	38.96454 ppb		99
87)	Bis (2-ethylhexyl) phthala	13.66	149	880088	39.22141 ppb		97
88)	Chrysene	13.69	228	1034971	40.76106 ppb		99
89)	Di-n-octylphthalate	14.41	149	1322580	39.92965 ppb		97
91)	Benzo (b) fluoranthene	14.95	252	1137431	39.99867 ppb		98
92)	Benzo (k) fluoranthene	14.99	252	981428	38.27939 ppb		98
93)	Benzo (a) pyrene	15.40	252	980057	38.83327 ppb		98
94)	Indeno (1,2,3-cd) pyrene	17.34	276	1157206	39.33449 ppb		99
95)	Dibenz (a,h) anthracene	17.37	278	1022289	39.00732 ppb		98
96)	Benzo (g,h,i) perylene	17.91	276	908299	39.29134 ppb		98

Data Validatable Report

March 3, 2020

AECOM

1001 Bishop Street, Suite 1600

Honolulu, Hawaii 96813

Attn: Margie Pascua

Title: Report of Data: Case 91282

Project: 60571032 CV18F0126 Red Hill Fuel Storage. HI

Contract #: Prime contract # for DoD: NAVY CLEAN N62742-17-F-1800, CV18F0126

Subcontract: 18S-22209-HI27

Dear Ms. Pascua:

Fourteen water samples were received January 22,2020. Revised written results for the requested analyses are being provided on this March 3, 2020. **Revisions**: Sulfate was added to the 200122A-LCS; the TOC duplicate was added to sample ERH971; the 2-(2-Methoxyetholy)-Ethanol LCS Recovery page was added; the EPA 8011 raw data was replaced.

Results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

If you have any questions or require further information, please contact your APPL Project Manager, Libby Cheeseborough, libby@applinc.com, at your convenience. Thank you for choosing APPL, Inc.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. These test results meet all requirements of NELAC and DoD QSM. Release of the hard copy has been authorized by the Laboratory Manager or her designee, as verified by the following signature.

CASE NARRATIVE

Case Narrative

ARF: 91282

Project: 60571032 CV18F0126 Red Hill Fuel Storage. HI

Sample Receipt Information:

Fourteen water samples were received January 22,2020, at 0.9°C, 1.4°C, 1.4°C, 1.4°C, 1.4°C, 2.4°C, and 2.4°C. The sample group was assigned Analytical Request Form (ARF) number 91282.

Sample Preparation and Analysis Information:

For the EPA 8011 analysis, the samples were extracted according to APPL SOP method MWE012.

For the EPA 8015B analysis, the sample was extracted according to EPA method 3510C. The sample extracts were silica gel cleaned according to APPL's SOP CLN004 and placed on hold.

For the EPA 8270D SIM analysis, the samples were extracted according to EPA method 3520C.

For the EPA 8270D Phenol analysis, the samples were extracted according to EPA method 3520C.

For the APPL SOP ANA2MEE analysis, the samples were extracted according to EPA method 3535.

For the EPA 8260B analysis, the samples were purged according to EPA method 5030B.

For the RSK-175 analysis, the samples were allowed to equilibrate for 10 minutes at 40°C and a portion of the headspace was analyzed.

For the EPA 9060A, 300.0, 353.2, SM 2320B, SM 3500FeB analyses, the samples were prepared according to the methods.

Only the portion of the injection log relative to these samples is included. A full sequence log is available upon request. Measurement uncertainty can be reported upon request.

Analytical Exceptions, Deviations and Abnormalities.

EPA 8015B: Manual integrations were performed in accordance with APPL's SOP. Chromatograms of before and after manual integration are enclosed.

The surrogate Octacosane recovered above the upper control limit in one sample. The increased recovery can be attributed to matrix affects. Octacosane is within limits in the silica gel clean up analysis of the sample.

The continuing calibration 129016.D for Decanoic Acid increased in sensitivity with a 28% Drift.

Samples ERH971 and ERH979 were rextracted and reanalyzed 14 days past the collection date at the request of the client.

APPL SOP ANA2MEE: In the 200124A LCS/LCSD, the RPD exceeded the 20% limit.

APPL Inc.
Abbreviations and Flags

FLAG	DESCRIPTION
#	Recovery or RPD outside control limits
*	Recovery or RPD outside control limits
B	Analyte detected in associated method blank
C1	Reason for correction: wrote incorrect response
C2	Reason for correction: calculated incorrectly
C3	Reason for correction: needs to be rechecked
C4	Reason for correction: data not usable
DO	Diluted out
E	Exceeds linear range
F	Estimated value
G1	Includes a wide range of hydrocarbons which does not match our gasoline standard
G10	Includes a match to hydrocarbon profiles within the range of mineral spirits
G11	Includes a match to hydrocarbon profiles within the range of JP-4
G12	Pattern does not match the gasoline standard; the carbon range for this sample is consistent with JP8
G13	Closely resembles the hydrocarbon profile of aviation gasoline
G14	Analyte concentration may be biased due to carry over
G2	Closely resembles the boiling point hydrocarbon profile consistent with weathered gasoline
G3	Includes higher boiling hydrocarbons
G4	Includes dominant peak(s) not indicative of petroleum hydrocarbons
G5	Is mainly dominant peak(s) not indicative of petroleum hydrocarbons
G6	Contains recognizable contaminant peak(s) which has been removed from quantitation
G7	Is mainly a match to hydrocarbons within the range of gasoline
G8	Closely resembles the boiling point hydrocarbon profile consistent with weathered gasoline
G9	Includes hydrocarbons within the range of kerosene
J	Estimated value
M	Matrix effect
MI1	Manual integration: integration does not follow baseline
MI2	Manual integration: non-target peak interference
MI3	Manual integration: to split a peak that was integrated as one peak by the computer.
MI4	Manual integration: to integrate a split peak
MI5	Manual integration: the whole peak or part of the peak was not integrated
MI6	Manual integration: computer integrated wrong peak
MI7	Manual integration: other – (See case narrative)
MDL	Method detection limit
ND	Not detected
NT	Non-target
Q	Acceptance criteria not met
T1 I	Includes wide range of hydrocarbons not indicative of diesel
T1 M	Is mainly wide range of hydrocarbons not necessarily indicative of diesel
T2 I	Includes lower boiling hydrocarbons, e.g. mineral spirits, kerosene, stoddard solvent, white gas
T2 M	Is mainly lower boiling hydrocarbons, e.g. mineral spirits, kerosene, stoddard solvent, white gas
T3 I	Includes higher boiling hydrocarbons, e.g. asphaltene, waste oil, motor oil, or weathered diesel fuel
T3 M	Is mainly higher boiling hydrocarbons, e.g. asphaltene, waste oil, motor oil, or weathered diesel fuel
T4 I	Includes dominant peak(s) not indicative of hydrocarbons
T4 M	Is mainly dominant peak(s) not indicative of hydrocarbons
T5	Contains recognizable contaminant peak(s) which has been removed from quantitation
T6	Is mainly a match to hydrocarbons within range of diesel fuel
T7	Closely resembles the boiling point hydrocarbon profile consistent with diesel fuel
T8	Includes a match to hydrocarbon profiles within range of diesel and kerosene fuel
T9 I	Includes non-diesel hydrocarbons within boiling point range of diesel fuel
T9 M	Is mainly non-diesel hydrocarbons within boiling point range of diesel fuel
U	Not detected
Y	Percent difference between primary and confirmation column > 40%

ARF, CRF, AND

CLIENT COMMUNICATION

APPL - Analysis Request Form 91282

Client: AECOM
Address: 1001 Bishop Street, Suite 1600
Honolulu, HI 96813
Attn: Margie Pascua
Phone: 808-356-5373 Fax: 808-523-8950
Job: 60571032 CV18F0126 Red Hill Fuel Storage
PO #: 18S-22209-HI27 PO# 102604
Chain of Custody (Y/N): Y # 139-143,146,148,160,
RAD Screen (Y/N): Y pH (Y/N): Y
Turn Around Type: ONE WEEK

Received by: AAR
Date Received: 01/22/20 Time: 10:00
Delivered by: FEDEX
Shuttle Custody Seals (Y/N): Y Time Zone: -10
Chest Temp(s): 1.4X8,0.9,2.4X2°C
Color: VFRG/N-PurpleBlue
Samples Chilled until Placed in Refrig/Freezer: Y
Project Manager: Libby Cheesebor
QC Report Type: DVP4DOD/EQUIS/HI
Due Date: 01/29/20

Comments:
PM: login and F1s to Margie.Pascua@aecom.com
AN: 7 day TAT for Form 1s; 21 day TAT for PKG STYLE 1; DOD v5.1; DOD Forms: LOD database
Wetlab: NO3,CL & SO4 by EPA 300 and NO3-N & NO2-N 353.2
8260: BTEX & TPH-G only; 8270 SIM: 1-methylnaphthalene, 2-methylnaphthalene & naphthalene only.
TPH D & O both with and w/o SGC, reverse surrogate for the SGC; analyze SGC if detections
RSK: Methane only; 8011: EDB only; $87DC53W5: report phenol only
FR: 2 labeled CDs to Margie AFTER validation; email ftp info to Margie, Stella, trommelfanger@lab-data
EDD: AECOM EQuIS EDD 2.5.3 Red Hill 87DMEE->3535A to Margie.Pascua@aecom.com & jecklund@lab-data.com

COOLER RECEIPT FORM **ARF: 91282**

1) Project: 60571032 CV18F0126 Red Hill Fuel Storage Date Received: 01/22/20

2) Coolers: Number of Coolers: 11

3) YES Were custody seals present and intact?
How many? 22 Name/Date on seal? see below

4) YES Was there a shipping slip? Carrier name: FEDEX

5) Type of packing in cooler: X bubble wrap __ popcorn __ foam X plastic bags __ other
X wet ice __ dry ice __ no ice __ gel ice

6) YES Were cooler temperatures acceptable?

7) Serial number of certified NIST thermometer use R1 @ +0.4°C

8) Cooler temp(s): In °C. Thermometer Temp / Corrected Temp

1: 1.0°C/ 1.4°C	2: 1.0°C/ 1.4°C	3: 1.0°C/ 1.4°C	4: 1.0°C/ 1.4°C	5: 1.0°C/ 1.4°C	6: 1.0°C/ 1.4°C
7: 1.0°C/ 1.4°C	8: 1.0°C/ 1.4°C	9: 0.5°C/ 0.9°C	10: 2.0°C/ 2.4°C	11: 2.0°C/2.4 °C	12:

Chain of custody:

9) YES Was a chain of custody received?

10) YES Were the custody papers complete/signed in the appropriate places?

Sample Labels:

11) YES Were all sample labels complete (sample ID, date/time of sampling, etc.)?

12) YES Did all container labels agree with custody papers?

Sample Containers:

13) YES Were all containers sealed in separate bags?

14) YES Did all containers arrive in good condition:(unbroken, no leakage, no cracked/broken lids)?

15) YES Were correct containers and preservatives used for the tests indicated?

16) YES Was a sufficient amount of sample sent for tests indicated?

17) Yes Were bubbles present in volatile samples?
If yes, the following were received with air bubbles:
Larger than a pea:
Smaller than a pea: BA06272W02, BA06273W01, BA06284W01-2

Preservation Hold time:

18) Yes Was a sufficient amount of holding time remaining to analyze the samples?

19) Yes Was the pH taken of all non-VOA preserved samples and written on the sample container?

20) Yes Was the pH of acid preserved non-VOA samples < 2?

21) NA Was the pH of sodium hydroxide preserved samples for Cyanide > 12 and Sulfide >9?

22) NO Were unpreserved VOA Vials received?

23) NA Are unpreserved VOA vials noted in the ADD TEST FIELD on the ARF?
pH strip lot number: hc982588
Lab notified if pH was not adequate:

Notes/Deficiencies:
