Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the s

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does r

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample we

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result i

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the s

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does r

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample we

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result i

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are repo
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond t
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site g
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:
1 - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

2 - Bailer method – sample without purging and from the top of the water column.

3 - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

4 - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

e = Sample extract was reanalyzed due to suspected carryover contamination from the LCSD. In-hold reanalysis indicates that the sample is non-detect. Reanalysis results reported.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:
1 - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

2 - Bailer method – sample without purging and from the top of the water column.

3 - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When t

4 - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

e = Sample extract was reanalyzed due to suspected carryover contamination from the LCSD. In-hold reanalysis indicates that the sample is non-detect. Reanalysis results reported.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"--" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"--" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"--" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"--" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"--" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"--" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"--" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"--" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"--" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"-" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"--" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"--" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"--" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"--" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"--" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"--" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"--" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

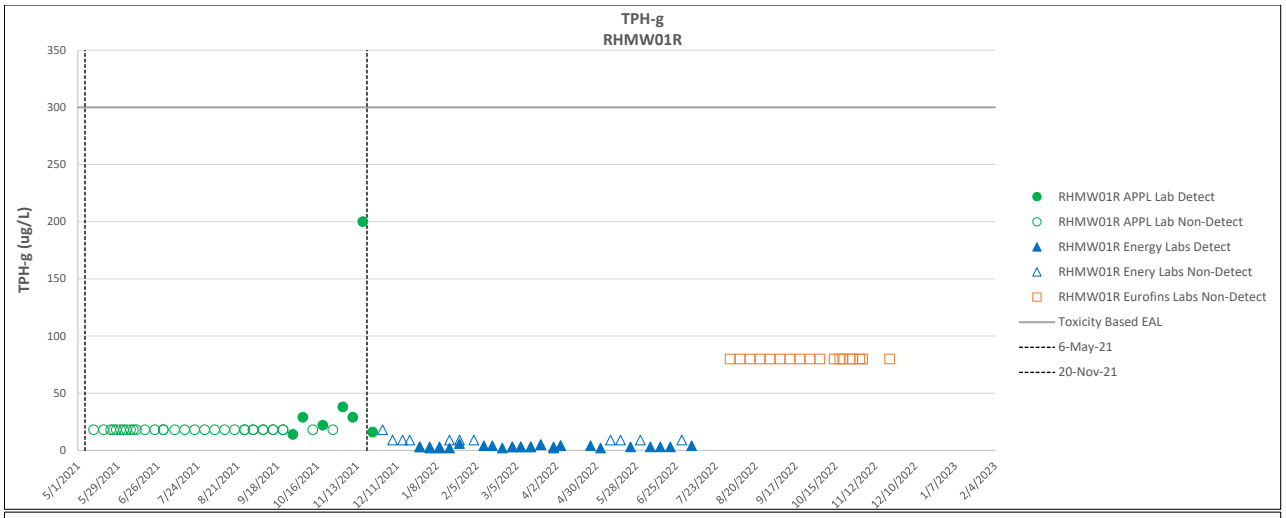
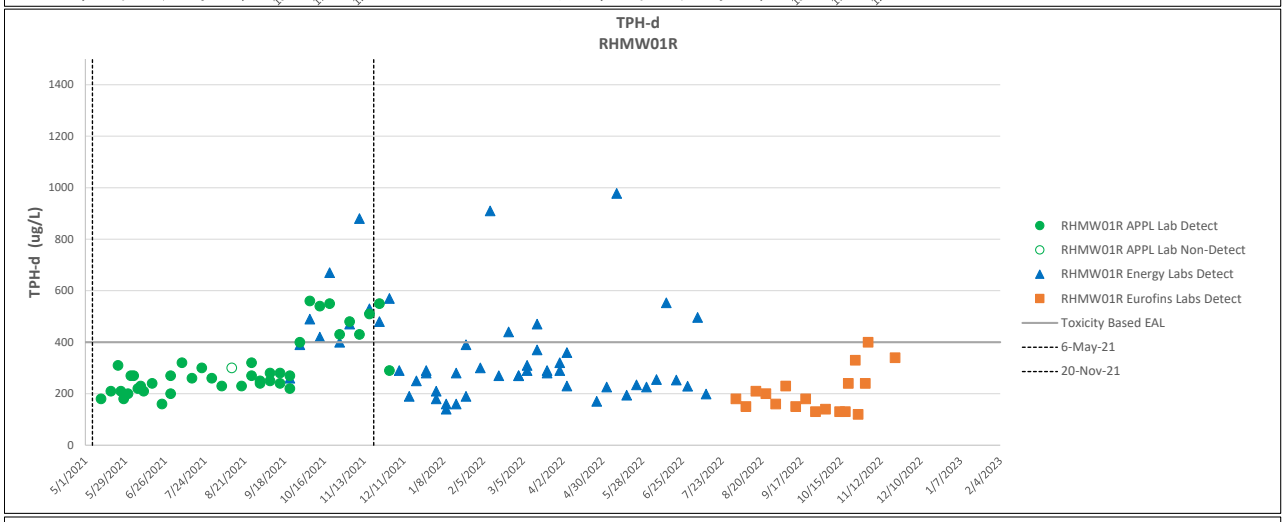
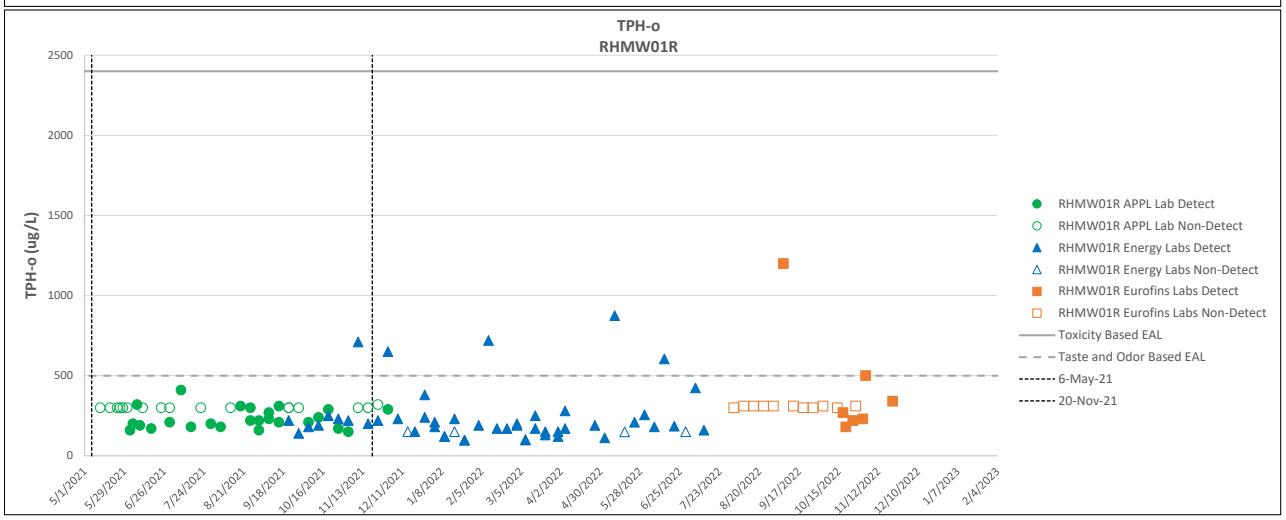
"–" - not applicable

Appendix B.4.5 – TPH Charts







Notes:

[1] Sample collected on 12/20/2021 was reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

Notes:

[1] Sample collected 12/1/2021 was reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

Notes:

[1] Sample collected 12/2/2021 was reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

Notes:
Detects are displayed in bold font.
Analytical results exceeding the screening criteria are highlighted in blue.
Project Screening Levels from: State of Hawaii, Department of Health Environmental Action Levels (EALs) >150m

-	No data available
PAH	Polynuclear Aromatic Hydrocarbon
SGC	Silica Gel Cleanup
SVOC	Semivolatile Organic Compound
TOC	Total Organic Carbon
TPH	Total Petroleum Hydrocarbons
VOC	Volatile Organic Compound

Sample Type

N	Normal environmental sample
FD	Field Duplicate

Matrix

WG	Ground Water

Units

µg/L	Micrograms per Liter

Qualifier

Yellow highlight indicates flag change since the previous submittal.

J	Estimated value, bias undetermined
J+	Estimated value, high biased
J-	Estimated value, low biased
U	The analyte was not detected and was reported as less than the limit of detection.
UJ	The analyte was not detected and was reported as less than the limit of detection. However, the associated result is flagged as estimated based on quality control criteria concerns.
R	Data excluded/rejected. See Data Validation Report for details.

Appendix B.6 – NOI Groundwater Sampling Plan

Appendix E Groundwater Sampling Plan
Revised December 27, 2021

The objective of the following Groundwater Sampling Plan is to obtain an assessment of groundwater impacts from the May 6 and November 20, 2021 release events, as well as evidence of recent mobilization of earlier fuel spills remaining in the vadose zone. Based on data obtained and additional work to identify nature and extent of the fuel releases on the environment, the scope and frequency of data collection may change. In addition, the groundwater sampling program may eventually be utilized to evaluate the effectiveness of contaminant containment or as a possible indicator of potential impact on Red Hill Shaft during pumping. Effective the week (December 13-17, 2021), the Navy's groundwater sampling plan shall at a minimum consist of:

1. Collect the samples noted on Tables 1, 2 and 3. HDOH or an HDOH contractor shall be afforded an opportunity to be present to observe, and elect on a well by well basis to obtain, handle, and ship the split sample to the HDOH contracted laboratory for analysis;
2. Provide the results in an extractable laboratory database format with an updated cumulative groundwater results spreadsheet in excel format;
3. Have the laboratories provide EDD files and all chromatograms in electronic format of the ASCII files (including a PDF format copy). This includes results from the May 6th release, long term monitoring data, and the Nov 20th release incidents;
4. Provide all the field logs in excel spreadsheet of the Groundwater (GW) monitoring at mentioned wells, since the May 6th release incidence through present and beyond (e.g., Redox Parameters, pH, Total Dissolved Solids (TDS), Oxidation Reduction Potential (ORP), etc.);
5. Provide all the field logs in excel spreadsheet of the Soil Vapor monitoring activities, since the My 6th release incidence through present and beyond;
6. In addition to groundwater samples, provide free product gauging using a bailer and headspace measurements using a photo-ionization detector (PID) for all locations; and
7. Provide fuel fingerprinting for:
    a. Fuel from the Nov 20th release and a sample collected from RHMW2254-01 on December 2, 2021.
    b. The three (3) different fuel types used at Red Hill obtained in response to the Hotel Pier release.
    c. The Fuel Analysis of Free Product mentioned in Table 2 will be analyzed only once.

Please see *Table 1* for the for the Groundwater Sampling Plan, *Table 2* for the Groundwater Parameters and *Table 3* for the Soil Vapor Monitoring and Summa Cannister Sampling.

Appendix E Groundwater Sampling Plan
Revised December 27, 2021

Table 1. Groundwater Sampling Plan

Sample type	Incidence date	Locations	Collection Method	Frequency of sampling	Duration of sampling	Analytes	Reporting Turn Around Time (TAT)
Ground-water	Nov 20th (14 GW wells with 1 Sump and 1 AFFF tank)	RHMW05 RHMW08 RHMW06 RHMW09 RHMW12 RHMW12-A RHMW17 *(when complete)* RHMW16 OWDFMW01	Bailer: RHMW04 RHMW05 RHMW06 RHMW08 RHMW09 RHMW19	Weekly	2 months	See Table 2	7 days
			Low Flow pump: RHMW12-A RHMW17 (*when complete*) RHMW16 OWDFMW01 Additional four OWDFMW wells*				
		RHMW2254-01 *(2 samples)*	Bailer & Low flow dedicated pump (both)	Weekly	2 months		
		RHMW11 (Zone 5) RHMW13 (Zone 5) RHMW 14 (Zone 3) RHMW15 (Zone 5)	Low flow (Westbay sampling method) Headspace/FP check will be taken after every sample collection)	Weekly	2 months		

	One time groundwater analysis of water portion from the:	**Infiltration Groundwater Sump****	**If additional water enters the sump, sampling to restart and continue weekly instead of a one-time sample**				
		Waste in AFFF tank	**One time**				
	May 6th	**RHMW01R, RHMW02, RHMW03**	**Bailer**	**Weekly**	**2 months**		

*Navy request to include 4 new wells at the OWDF to the GW sampling is approved. DOH reserves right to adjust specific wells selected within two weeks of receiving the monitoring well installation records and field notes.

**The Infiltration Groundwater Sump was sampled by the Navy on November 24, 2021, and these results, once received, will meet the one-time requirement of the sampling plan. If additional water enters the sump, we are asking for weekly sampling instead of a one-time sample.

Table 2: Groundwater Parameters (Analytes): Analyze all the analytes mentioned in the "Table 1. Tier 1 Screening Levels for Groundwater" mentioned in Hawaii Administrative Rules, Section 11-280.1 Subchapter 6: Release Response Action. (§11-280.1-65.3 Site cleanup criteria). In addition, add the following analytes:

Parameters	Analytical method	Analytes	HDOH-EALs (ug/L)	Lab Limits
Total Petroleum Hydrocarbons (TPH) -gasoline range organics (g), diesel range organics (d), or oil range organics (o)	**EPA 8260**	**TPH-g**	**300**	**Requests for the Lab:** 1. Please provide appropriate Limit of Quantitation (LOQ), Limit of Detection (LOD), Method Detection Limit (MDL) for each method. 2. Please ensure MDLs will detect for chemicals with
	EPA 8015	**TPH-d**	**400**	
		TPH-g	**300**	
		TPH-o	**500**	
TPH with Silicon Gel Cleanup (SGC) (TPH-d and TPH-o with SGC would only be analyzed in samples with positive detections of TPH-d and TPH-o without SGC).	**EPA 3630 / 8015**	**TPH-d**		
		TPH-o		
VOC (Full suite) against appropriate HDOH-EALs Including BTEX	**EPA 8260 (full suite)**			

Appendix E Groundwater Sampling Plan
Revised December 27, 2021

Parameters	Analytical method	Analytes	HDOH-EALs (ug/L)	Lab Limits
				low level EALs (e.g. Benzo-a-Pyrene).
SVOC (Full suite) against appropriate HDOH-EALs Including naphthalene, 1-methylnaphthalene, 2-methylnaphthalene	**EPA 8270 SIM (full suite)**			
One time Fuel Analysis of Free Product from the: **(1) RHMW2254-01** **(2) Waste in the AFFF tank** **(3) Infiltration Groundwater Sump where fuel was collected***	**EPA 8015 B**			**Sample the waste in the AFFF tank if the waste is still representative of what was pumped from the Nov 20th release.**
Total Organic Carbon	**EPA 9060A**			
Methane	**RSK 175 M**			
PFAS	**EPA 537.1 or EPA 1633 (draft) ****			**from RHMW2254 -01. Only one time analysis is requested.**
Lead Scavengers (1—dibromomethane and 1-2 dichloroethane)	**EPA 8011 and EPA 8260**			

** Run EPA draft method 1633 for matrices other than drinking water on the groundwater sample from RHMW2254-01. HDOH acknowledges that laboratories are likely not accredited for this new method.

Table 3. Soil Vapor Monitoring and Summa Canister Sampling

SAMPLE TYPE	METHOD	LOCATIONS	FREQUENCY/DURATION
Soil Vapor Concentrations	Photo-ionization Detector (PID)	All SV probe locations including new probes installed since 11/20/21. Include background reading at each tank	Once per week for 2 months Field note images delivered to DOH within 12 hours of collection and data tables listing ongoing results displayed within 7 days.
Summa Canister Samples	TO-15 & TO-3 w/ C5-C12	SVMP with highest PID readings (e.g., SV15S, SV17S, SV18S, SV20M) and most outer bound probe under the same tanks (SV15D, SV17D, SV18D, SV20D)	Once per month for 6 months.
	TO-15 & TO-3 w/ C5-C12	Collect one round of SVMP samples in the lower tunnel near station 400 and other SVMPs to fingerprint fuel signature	Consider future SVMP summa samples to evaluate migration of other older releases.

Appendix C – Index of Soil Vapor Analytical Data
