Dear [redacted]

SUBJECT: MARCH 2023 QUARTERLY RELEASE RESPONSE REPORT,
RED HILL BULK FUEL STORAGE FACILITY,
DOH FACILITY ID NO. 9-102271, DOH RELEASE ID NOS. 140010 AND 210012
DOH HEER RELEASE INCIDENT CASE NOS. 20210507-0852 AND 20211120-2330

The Navy is submitting a Quarterly Release Response Report to provide information on release response actions related to the January 2014, May 2021, and November 2021 releases from Red Hill Bulk Fuel Storage Facility in accordance with State of Hawai'i Department of Health (DOH) Technical Guidance Manual. As required by Hawai'i Administrative Rules (HAR) Section 11-280.1-65.2, Release Response Reporting, this report presents release response actions taken pursuant to HAR Section 11-280.1 during the reporting period of November 5, 2022 to February 3, 2023, as well as a plan for future release response actions.

The Enclosure 1 Quarterly Release Response Report will be available for download from the JBPHH Red Hill Bulk Fuel Storage Facility environmental data management system (EDMS) at https://synectics.net. EDMS users will receive a system generated email notification.

If there are any questions regarding this matter, or if more information is needed, please contact [redacted] (b) (6) (b) (6) (b) (6)

Sincerely,

[redacted]

Captain, CEC, U.S. Navy
Deputy Regional Engineer
By direction of the
Commander

Executive Summary

This Quarterly Release Response Report (RRR) was prepared for Naval Facilities Engineering Systems Command, Hawaii by AECOM Technical Services, Inc. for the Red Hill Bulk Fuel Storage Facility in accordance with the State of Hawai‘i Department of Health (DOH) Technical Guidance Manual (DOH 2021c). As required by Hawai‘i Administrative Rules Section 11-280.1-65.2, Release Response Reporting, this report presents release response actions taken pursuant to Hawai‘i Administrative Rules Section 11-280.1 during this reporting period (November 5, 2022 to February 3, 2023) and a plan for future release response actions to be taken.

This report combines release response reporting for three releases of fuel from the Red Hill Bulk Fuel Storage Facility:

- **January 2014 Release:** On January 23, 2014, the Navy reported to DOH a release of an estimated 27,000 gallons of JP-8 from one of the Facility's underground fuel storage tanks (Tank 5). The release occurred when placing the tank back in service following a 3-year tank inspection and refurbishment process completed in December 2013.
- **May 2021 Release:** On May 6, 2021, a Jet Propellant 5 pipeline near Red Hill Tanks 18 and 20 was damaged during a fuel transfer procedure, fuel was released to the tunnel floor, and attempts were made to recover the fuel. It was later determined that fuel that was not recovered was pumped from a fire suppression retention system into a fire suppression recovery drain line. The fuel remained contained in the drain line until it was damaged on November 20, 2021.
- **November 2021 Release:** On November 20, 2021, fuel was released from the fire suppression recovery drain line, traveled on the concrete tunnel floor toward Adit 3, and collected in a groundwater sump near Adit 3 (Adit 3 Sump). A portion of the fuel was recovered from the sump; the remainder of the fuel entered the soil (or volcanic bedrock) near United States Department of the Navy Well 2254-01 (Red Hill Shaft), from which some of the fuel entered the Joint Base Pearl Harbor-Hickam (JBPHH) Water Distribution System. Red Hill Shaft ceased pumping and was isolated from the JBPHH Water Distribution System on November 28, 2021. Initial site characterization of the release areas has been completed; additional characterization, monitoring, and remediation efforts continue.

Site characterization, removal, and remedial efforts conducted during this reporting period include:

- Continued soil vapor monitoring in the tank farm and Adit 3 and Pearl Harbor Tunnels
- Continued monitoring well free product gauging, groundwater monitoring well headspace, and purge water natural chemistry parameters
- Continued groundwater sampling and analysis and expansion of the groundwater monitoring network
- Continued operation of the granular activated carbon (GAC) pump and treat system at Red Hill Shaft

- Adit 3 and Pearl Harbor Tunnel site characterization activities
- Installation of additional delineation wells in the vicinity of Red Hill Shaft
- Collection, Holding, and Transfer (CHT) Tank site characterization planning activities
- Remediation pilot test planning activities

Results from this reporting period indicated the following:

- Soil vapor impacts associated with the January 2014, May 2021, and November 2021 Releases are decreasing over time, consistent with natural attenuation of light nonaqueous-phase liquid (LNAPL) in the environment.
- Groundwater concentrations for all contaminants appear to be declining or stable over time. Several indicators suggest that groundwater impacts are undergoing natural attenuation, including biodegradation.

In addition to the site characterization activities described in this report, the Navy has conducted fuel recovery efforts since December 2021. These efforts include the use of absorbent materials, skimmers, direct recovery from piping, and soil excavation.

Planned Future Actions

Planned future actions include:

- Continued soil vapor monitoring at sampling locations within the tank farm and Adit 3 and Pearl Harbor Tunnels near Red Hill Shaft
- Groundwater sampling from the Red Hill monitoring well network, including monitoring wells at the Oily Waste Disposal Facility
- Installation of new delineation and sentinel wells
- Continued operation of the GAC pump and treat system at Red Hill Shaft
- Continued site characterization activities (Adit 3 and Pearl Harbor Tunnels and the Adit 3 CHT Tank)
- Conducting a remediation pilot test in Adit 3
- Additional removal or remedial actions, as appropriate

The Navy is continuing to expand the groundwater monitoring well network as part of plume delineation efforts and to monitor groundwater quality between Red Hill and offsite water supply wells at new sentinel well locations.

Current and future conditions of the JBPHH Water Distribution System and related activities are regulated by the DOH Safe Drinking Water Branch. Therefore, activities and sampling of the drinking water system are not addressed in this Quarterly RRR.

1.0 Introduction and Purpose

On January 23, 2014, the Navy reported to the State of Hawai‘i Department of Health (DOH) a release of an estimated 27,000 gallons of Jet Fuel Propellant (JP)-8 from one of the Red Hill Bulk Fuel Storage Facility's ("Facility") underground fuel storage tanks (Tank 5) (the "January 2014 Release"). The release occurred when placing the tank back in service following a 3-year inspection and refurbishment process completed in December 2013.

On May 6, 2021, a JP-5 pipeline near Red Hill Tanks 18 and 20 was damaged during a fuel transfer procedure. Fuel was released to the lower access tunnel floor, and fuel was recovered shortly after the event (the "May 2021 Release"). It was later determined that fuel that was not recovered was pumped from the fire suppression retention system into the fire suppression recovery drain line. The fuel remained contained in the fire suppression recovery drain line until it was damaged on November 20, 2021.

On November 20, 2021, fuel in the fire suppression recovery drain line was released into the tunnel and traveled on the concrete tunnel floor toward Adit 3 and collected in a groundwater sump near Adit 3 (Adit 3 Sump) (the "November 2021 Release"). A portion of the fuel was recovered from the sump; the remainder of the fuel entered the soil (or volcanic bedrock) near United States (U.S.) Department of the Navy (Navy) Well 2254-01 (Red Hill Shaft), from which some of the fuel entered the Joint Base Pearl Harbor-Hickam (JBPHH) Water Distribution System or was pumped from the sump to a Holding Tank and Leach Tank outside Adit 3 where it was released to the subsurface. Red Hill Shaft ceased pumping on November 28, 2021 and was isolated from the JBPHH Water Distribution System. Response activities have been conducted at the site since the May 2021 Release and remain ongoing.

This Quarterly Release Response Report (RRR) presents a summary of the combined release response activities performed from November 5, 2022 to February 3, 2023 in response to the January 2014, May 2021, and November 2021 Releases at the Facility, located at JBPHH, O‘ahu, Hawai‘i. Specifically, as required by Hawai‘i Administrative Rules Section 11-280.1-65.2, this Quarterly RRR describes:

- All response actions (investigation, removal, and remediation activities) taken during the quarterly reporting period
- A plan for future release response actions to be taken

This report summarizes the following activities conducted during the reporting period:

- Continued soil vapor monitoring in the tank farm and Adit 3 and Pearl Harbor Tunnels
- Continued monitoring-well free product gauging, groundwater monitoring well headspace, and purge water natural chemistry parameters
- Continued groundwater sampling and analysis and expansion of the groundwater monitoring network

- Continued operation of the granular activated carbon (GAC) pump and treat system at Red Hill Shaft
- Adit 3 and Pearl Harbor Tunnel site characterization activities
- Installation of new delineation wells in the vicinity of Red Hill Shaft
- Collection, Holding, and Transfer Tank (CHT) site characterization investigation planning activities
- Remediation and treatability study pilot test planning activities

This report presents field observations and final analytical results available through the reporting period ending February 3, 2023, including:

- Results from soil vapor field measurements using photoionization detectors (PIDs)
- Results from a fixed-based laboratory for soil vapor Summa canister samples
- Results from monitoring well free product gauging and headspace measurements
- Laboratory results for groundwater samples

Field activities for investigations conducted at the Adit 3 and Pearl Harbor Tunnel area and at the Holding Tank and Leach Tank area are described in this report; however, results for soil and groundwater analytical data for these investigations will be provided in respective forthcoming investigation reports for those areas.

In addition to the activities described in this report, the Navy has conducted fuel recovery efforts since December 2021 and is continuing operation of the GAC pump and treat system at Red Hill Shaft, which began in January 2022. Fuel recovery efforts include the use of absorbent materials, skimmers, direct recovery from piping, and soil excavation. In addition, pumping of Red Hill Shaft continues to remove contaminants by creating a contaminant capture zone in the vicinity of the Red Hill Shaft, as described in the *Red Hill Shaft Recovery and Monitoring Plan* (IDWST 2022).

Current and future conditions of the JBPHH Water Distribution System and related activities are regulated by the DOH Safe Drinking Water Branch. Therefore, activities and sampling of the drinking water system are not addressed in this Quarterly RRR.

1.1 Statement of Purpose

Release response activities were performed to address the January 2014, May 2021, and November 2021 Releases. The DOH issued Notice of Interest (NOI) letters for the three events:

- January 2014 Release
  - Red Hill Tank Complex (Tank #5): Facility ID No. 9-102271 / DOH Release ID No. 140010, February 3, 2014
- May 2021 Release

  - DOH Hazard Evaluation and Emergency Response Release Incident Case Number (No.) 20210507-0852 on May 10, 2021 (DOH 2021a)
  - DOH Underground Storage Tank (UST) Release Identification No. 210012 (DOH 2021b)
- November 2021 Release
  - DOH Hazard Evaluation and Emergency Response Release Incident Case No. 20211120-2330 on November 24, 2021 (DOH 2021d)

1.2 Previous Reports

The following documents were previously submitted to DOH:

- Release confirmation information for Tank 5; January 23, 2014
- Tank 5 Initial Release Response Report; April 24, 2014
- Tank 5 Quarterly Release Response Reports; July 22, 2014 – October 3, 2022
- Response to Notice of Interest in a Release or Threatened Release of Hazardous Substance; May 21, 2021
- Confirmed Release Notification Form, Pipeline Breach in Tunnel; June 21, 2021

- Draft Natural Source-Zone Depletion Work Plan; February 23, 2023
- Technical Memorandum: In-Progress Data Report, Adit 3 Site Characterization; February 23, 2023
- Draft Deep Soil Vapor Extraction Work Plan; February 27, 2023
- Recommendations for the Notice of Interest Groundwater Sampling and Analysis Program at the Red Hill Bulk Fuel Storage Facility; March 1, 2023

2.0 Background

January 2014 Release. During Tank 5 refilling operations in January 2014 following a routine 3-year tank inspection and refurbishment process, a release of approximately 27,000 gallons of JP-8 fuel was confirmed and reported to DOH on January 23, 2014 (Figure 1). During that month, a fuel hydrocarbon seep was observed on a tunnel wall below Tank 5, and soil vapor monitoring points (SVMPs) installed beneath Tank 5 exhibited a sharp increase in hydrocarbon vapor concentrations. Subsequent analyses indicated that the causes of the release were defective workmanship in welding by the tank refurbishment contractor, poor inspection, and ineffective

quality control (QC). The release resulted in the United States (U.S.) Environmental Protection Agency (EPA), DOH, the Navy, and Defense Logistics Agency (DLA) agreeing to the Red Hill Administrative Order on Consent (AOC) in September 2015 (EPA Region 9 and DOH 2015).

May 2021 Release. On May 6, 2021, Navy personnel responded to a reported release of fuel from a distribution pipeline inside the Facility in the vicinity of Tanks 17, 18, 19, and 20 (Figure 1). The Navy notified DOH of the release within 24 hours. The fuel containment system at Red Hill was used to monitor, detect, and collect the fuel from the pipeline breach.

The Navy provided preliminary findings of the ongoing investigation to DOH on October 1, 2021, indicating that JP-5 fuel was released during a fuel transfer and properly collected by the fuel containment system; there were no leaks from any fuel tanks. The Navy captured JP-5 fuel from the tunnel drain system, which was followed by a complete wash down of the area with fresh water on May 7, 2021 (DON 2021c). Some soil vapor monitoring vaults on the tunnel floor near the May 2021 Release were impacted by fuel, and the below-tank SVMPs exhibited elevated PID readings.

November 2021 Release. On November 20, 2021, a release of JP-5 fuel occurred in the Adit 3 Tunnel of the Facility (Figure 1). JP-5 fuel was released from an overhead 14-inch polyvinyl chloride (PVC) fire suppression recovery drain line at a location approximately 400 feet (ft) east of the water supply pumping station Navy Well 2254-01 (Red Hill Shaft) and approximately 200 ft east of the junction with the Pearl Harbor Tunnel. The location of the release point was in close proximity to the supply well's underlying water development tunnel that extends greater than 1,200 ft east-southeast of the pumping station at an elevation of approximately 0–20 ft above mean sea level (msl).

Released fuel flowed along the Adit 3 Tunnel floor westward past the junction with the Pearl Harbor Tunnel and Navy Well 2254-01. Fuel accumulated in a groundwater sump (Adit 3 Sump), approximately 750 ft west of the November 2021 Release point (Figure 2). JP-5 fuel was recovered from the Adit 3 Sump, connected piping, the fire suppression recovery drain line, and the Holding Tank/Leach Tank area including subsurface soil.

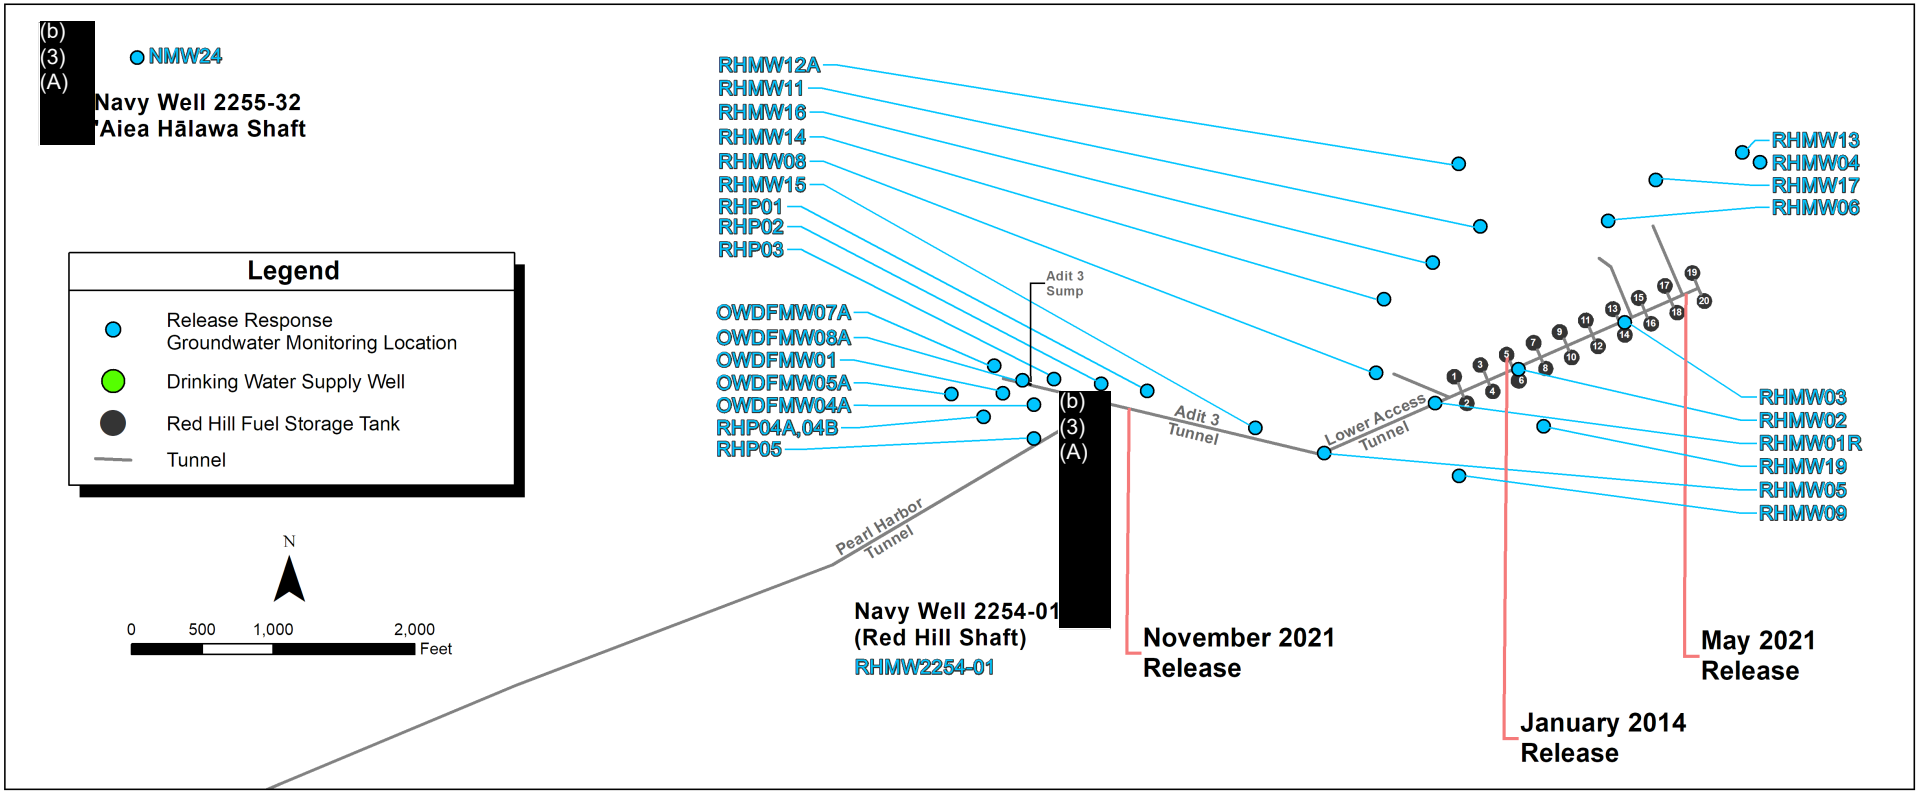

Figure 1: Locations of Releases and Groundwater Monitoring Wells

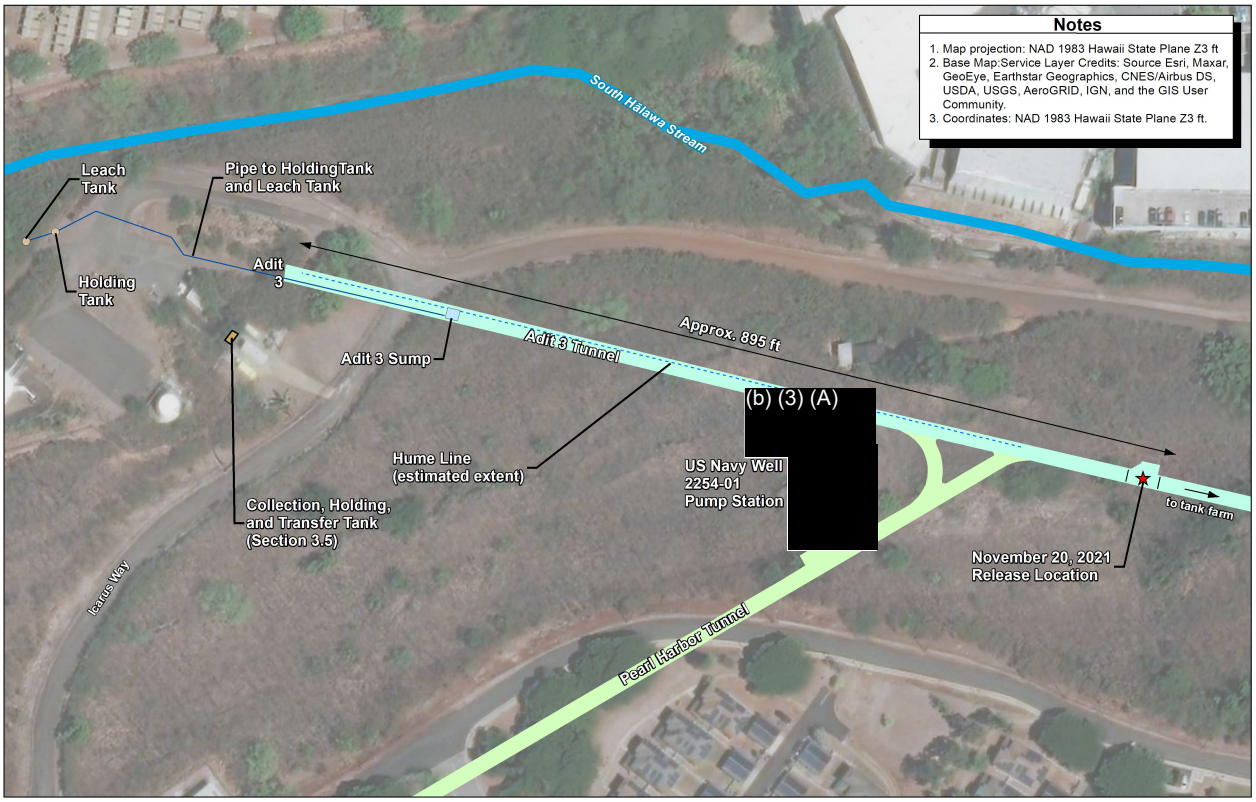

Figure 2: Adit 3 and Pearl Harbor Tunnel Layout Map

The November 2021 Release released fuel to the environment from the Adit 3 Sump, the Hume line located immediately below the tunnel floor, and the Adit 3 Sump drain leading to the Holding Tank and Leach Tank area. Fuel was observed in the water development tunnel of water supply Navy Well 2254-01 (Red Hill Shaft). Upon confirmation that a fuel-like odor was present in drinking water in homes served by Red Hill Shaft, Navy Well 2254-01 was shut off and isolated from the drinking water distribution system on November 28, 2021.

2.1 Site Description

The 144-acre underground fuel storage Facility is located in south-central O‘ahu approximately 2–3 miles east of Pearl Harbor, within the Red Hill ridge that divides South Hālawa Valley from Moanalua Valley on the southwest flank of O‘ahu’s Ko‘olau mountain range (Figure 3). The Facility’s twenty fuel storage tanks store and supply fuel for military operations in Hawai‘i and throughout the Pacific. The tank bottoms are situated approximately 100–130 ft above an underlying basal aquifer that is a major municipal and military drinking water source.

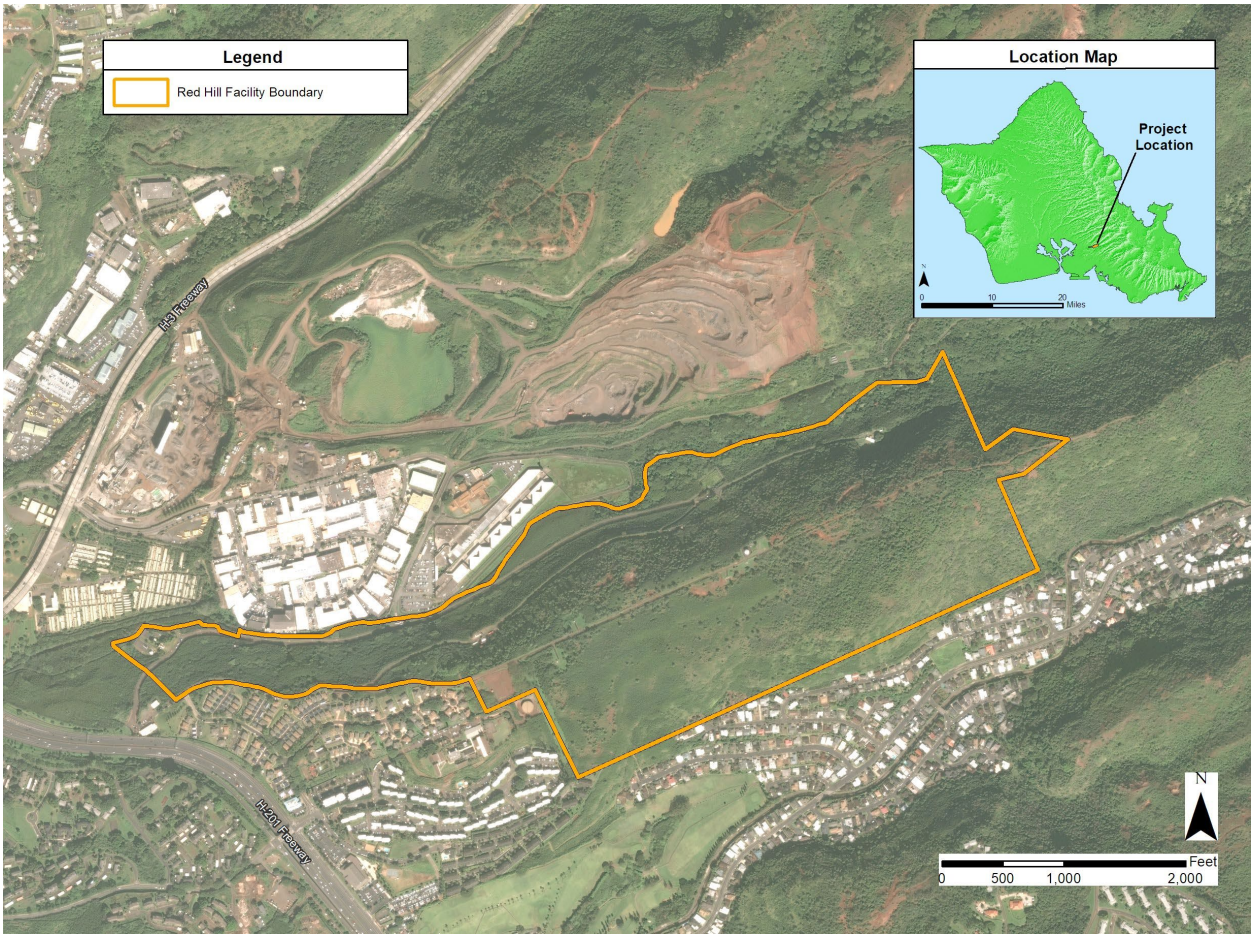

Figure 3: Site Location Map

2.1.1 Climate

Climatological conditions in the vicinity of the Facility consist of warm to moderate temperatures and low to moderate rainfall. The average annual precipitation is approximately 40 inches, which occurs mainly between November and April (Giambelluca, Nullet, and Schroeder 1986). Average temperatures range from the low 60s to high 80s (degrees Fahrenheit) (Juvik and Juvik 1998).

2.1.2 Soils and Geology

The Facility is located within the Koʻolau Volcanic series. The Koʻolau formation at Red Hill consists of basaltic lava flows that erupted from a fissure line approaching 30 miles in length and trending in a northwest rift zone (Wentworth and Macdonald 1953). Pāhoehoe and aʻā lava flows are present in the Koʻolau formation. The valleys on either side of the Red Hill ridge were formed as a result of fluvial erosion and are filled with sedimentary deposits (alluvium and colluvium), also known as valley fill, underlain by weathered basalt, also known as saprolite. Saprolite zones in Hawaiʻi are typically around 75 ft thick but can be 300 ft thick or greater beneath the valley floors or in areas of high precipitation (Hunt Jr. 1996; Macdonald, Abbott, and Peterson 1983) The results of a recently conducted seismic survey in North and South Hālawa Valleys, Red Hill, and

Moanalua Valley (DON 2018a) found that valley fill and saprolite extend much deeper in the valleys surrounding Red Hill, particularly in the center of the valleys and below the streambeds.

Soils in the vicinity of the Facility are mapped as Helemano-Wahiawā association consisting of well drained, moderately fine-textured and fine-textured soils (USDA SCS 1972). The surfaces of the basaltic flows have been weathered to form reddish-brown clayey silt, which is the basis for the local name "Red Hill." These soils typically range from nearly level to moderately sloping and occur in broad areas dissected by very steep gulches. They formed in material weathered from basalt to a depth of approximately 10 ft below ground surface (bgs). Along the slopes, the basaltic bedrock is covered with approximately 10–30 ft of Koʻolau residuum. These soils were derived from weathering of the underlying basalt bedrock or were deposited as alluvium/colluvium. The younger alluvium/colluvium deposits were derived from fractured basalts and tuff. Beneath the surficial soils, alternating layers of clay and basalts are encountered at depth. The northwestern slope of Red Hill is generally barren of soil and consists of outcropping basalt lava flows to the valley floor.

2.1.3 Surface Water

Surface water features in the general vicinity of the Facility include South Hālawa Stream (an ephemeral stream approximately 600–800 ft north of the tanks), North Hālawa Stream (approximately 4,000–4,500 ft northwest of the tanks), and Moanalua Stream (approximately 1,700–2,000 ft south of the tanks). Potential recharge (run-on and operational water use) from the Hālawa Quarry north of the Facility may also impact groundwater flow in this area. In Hālawa Valley, streamflow may contribute water to perched groundwater within alluvial material (valley fill) but is generally isolated from the underlying basal aquifer. Most precipitation percolates to the basal aquifer and does not maintain base flows in the streams (Izuka 1992). Groundwater that flows beneath the Facility does not intercept surface water inland of the ocean shoreline (DON 2007). Both South Hālawa Stream and Moanalua Stream (to the north and south of the Red Hill ridge, respectively) are located approximately 170 ft or more above the basal water table in the vicinity of the tanks. The bottoms of the Facility's fuel storage tanks are located at least 50 ft below the bottoms of these streams.

2.1.4 Groundwater

In the vicinity of Red Hill, the basal aquifer water table lies between 15 and 20 ft above msl; regionally, groundwater flows toward Pearl Harbor (mauka to makai) (Hunt Jr. 1996), although potential exists for variability in localized flow directions depending on geologic formations and other factors.

The Facility is located at the administrative boundary between the Waimalu Aquifer System of the Pearl Harbor Aquifer Sector and the Moanalua Aquifer System of the Honolulu Aquifer Sector. The underlying aquifer is classified as a basal, unconfined, flank-type aquifer and is currently used as a drinking water source.

The Facility is located upgradient of the Hawaii State Underground Injection Control Line, which separates potable groundwater from non-potable groundwater. The drinking water supply well closest to the tanks is Red Hill Shaft, located within the Facility's lower access tunnel, which is approximately 2,600 ft topographically downgradient of the nearest tank. Red Hill Shaft formerly provided potable water to the JBPHH Water Distribution System, which serves approximately 65,200 military customers; the potable water is now supplied by the Waiawa Shaft, located far to the west of the Facility. Naval Facilities engineering Systems Command (NAVFAC), Hawaii, Utilities Management Division operates the drinking water system. The nearest Honolulu Board of Water Supply (BWS) public drinking water supply well (BWS Hālawa Shaft Well 2354-01) is located hydraulically cross-gradient of the Facility approximately 4,400 ft northwest of the tanks, within the basal aquifer.

2.2 Historical Land Use

Prior to construction of the tank farm, the surface of Red Hill supported cane and pineapple agriculture. Navy archive images show that the Red Hill ground surface was exposed and modified during construction of the tank farm beginning in 1940. A 1952 aerial photograph shows unmaintained land on the Red Hill ridge and agriculture on the lower reaches of Red Hill north of the Moanalua Golf Course (DON 2019).

2.3 Current Land Use

The Facility is located on land zoned by the City and County of Honolulu as a mix of F-1 Federal and Military and P-1 Restricted Preservation districts. All major structures at the Facility are located underground. Populated areas closest to the Facility are ʻAiea to the west and Honolulu to the south and east. Honolulu is heavily urbanized and densely populated.

Preservation land is located east and northeast of the Facility boundary. To the southeast are residential single-family homes in Moanalua Valley; a high cliff face with a 100–200 ft elevation difference exists between the Facility and this residential area. Southwest of the tank farm area on the lower southwest flank of Red Hill are the public Red Hill Elementary School and residential apartments, and further west is U.S. Coast Guard Housing on F-1 Military land. North of the western segment of the Facility boundary in South Hālawa Valley is the State Animal Quarantine Station, private businesses in Hālawa Industrial Park, and the State-operated Hālawa Correctional Facility. To the north of the Correctional Facility at the lower reaches of an inter-valley ridge that forms the north wall of South Hālawa Valley is the open-pit Hālawa Quarry operated by the Hawaiian Cement Company.

As shown on Figure 3, the H-201 Moanalua Freeway transits approximately 350–700 ft beyond the Facility's southwest boundary and intersects with the H-1 and H-3 Freeways at the Hālawa Interchange, approximately 1,800 ft west of the Facility. The H-3 Freeway transits northeast from the interchange through North Hālawa Valley and on to Oʻahu's windward side.

2.4 Conceptual Site Model

2.4.1 Facility Construction and Operations

The Facility's 20 bulk fuel storage tanks were field-constructed of steel-lined concrete in the early 1940s. They were connected to a fuel pumping station at Pearl Harbor via a tunnel system. The Facility is operated by Naval Supply Systems Command Fleet Logistics Center Pearl Harbor (formerly Fleet and Industrial Supply Center). Each fuel tank has a total capacity of approximately 12.5 million gallons. The 14 bulk fuel storage tanks that currently contain fuel store either JP-5, North Atlantic Treaty Organization-grade F-24 jet fuel, or F-76 marine diesel fuel.

2.4.2 Subsurface Conditions

The Facility's bulk fuel storage tanks are surrounded by rock in the vadose (i.e., unsaturated) zone, which consists primarily of basalt flows in complex, alternating layers. These heterogeneous layers vary from extremely high to extremely low permeability, with a corresponding ability to transmit and hold light nonaqueous-phase liquid (LNAPL, also referred to as free product in this report), depending on the layer's rock type and micro-pore structure (i.e., high ability in high-permeability a‘ā and thin pāhoehoe flows and in a‘ā clinker zones; low ability in massive a‘ā and massive pāhoehoe flows). Geologic and water saturation characteristics in the rock surrounding the tanks could cause LNAPL to spread as it moves through the rock. As LNAPL moves through the larger pore spaces, some of it could be trapped in poorly connected fractures and blocked by nearby low-permeability regions or by surface tension and capillary forces of moisture, especially water held in the smaller pores. The potential presence of intact lava tubes might serve as preferential pathways and conduits for LNAPL migration.

Hawaiian volcanic rocks vary in porosity and permeability depending on the emplacement process, lava type, genesis, flow thickness, flow rate, extent, cooling rate, and weathering. Permeability is typically highest in the relatively thick, unweathered, rubbly a‘ā clinker zones and intensely fractured zones or lava tubes of pāhoehoe flows. Permeability is much lower in the interior portions of massive flows, weathered interflows, intrusive rocks (dikes and sills), ash beds, and weathered rocks (saprolite) and soil horizons, which can impede both vertical and horizontal flows across valleys. Generally, the bulk vertical permeability of the basalt is orders of magnitude lower than the bulk horizontal permeability. Horizontal permeability is generally higher in the direction that the lava flowed than in the transverse direction.

Groundwater flow and solute transport are controlled by both the hydraulic conditions (e.g., gradients) and the physical properties of the hydrogeologic units, including hydraulic conductivity, effective porosity, specific yield, specific storage, anisotropy, and dispersivity that vary significantly under highly heterogeneous conditions.

Fresh groundwater inflow originates as deep infiltration of precipitation and seepage from surface water features. According to the U.S. Geological Survey, estimates of recharge for O‘ahu for recent conditions (2010 land cover and 1978–2007 rainfall) differ from predevelopment recharge values by only a few percent (Izuka et al. 2018). Spatial distribution of recharge mimics the orographic

rainfall pattern; recharge is highest on windward slopes and mountain peaks below the top of the tradewind inversion.

Groundwater outflow includes withdrawals from wells and natural groundwater discharge to springs, streams, wetlands, and submarine seeps. Data collected by the U.S. Geological Survey for groundwater levels, saltwater/freshwater interface, spring flow, and stream base-flow indicate an overall reduction in aquifer storage for most areas where groundwater has been extracted; this has caused groundwater levels to decline (Izuka et al. 2018).

Regional groundwater levels decrease from areas of recharge (mauka) to areas of discharge (makai) (Hunt Jr. 1996). Locally, water level gradients are extremely low and are influenced by geologic conditions, as well as by variability in local pumping stresses from water development shafts and wells.

2.4.3 Exposure Model

Potentially contaminated media are tunnel air; unconsolidated materials, volcanic rock, and soil/rock vapor surrounding the tanks and tunnel; groundwater beneath the Facility, which has the potential to migrate off site; and offsite surface water where groundwater may discharge. Human receptors that may potentially contact onsite or offsite Facility-impacted media are Facility occupational workers, construction workers, visitors, and offsite residents. Among the potentially complete exposure pathways identified, the primary pathway of concern is exposure to impacted tap water via direct ingestion and dermal contact, and via inhalation while showering and bathing. Animals and vegetation may also be exposed to tap water as pets or from irrigation. Exposure by ecological receptors is considered incomplete or insignificant (DON 2019).

2.5 Previous Facility Investigations

Previous environmental investigations at the Facility, summarized in Table 1, are divided into two categories: those preceding the 2015 AOC, and those subsequent to its issuance.

Table 1: Summary of Previous Red Hill Environmental Investigations

Investigation Report	Summary
Pre-AOC Investigations	
Remedial Investigation Phase I and II, Red Hill Oily Waste Disposal Facility (DON 1996; 2000)	A two-phase RI was initiated in the early 1990s at the Red Hill Oily Waste Disposal Facility. No contaminants were detected in the basal aquifer beneath the site, and DOH issued a concurrence letter for a No Further Action determination in 2005 (DOH 2005).
Facility Site Characterization and Investigation (DON 1999, 2002)	A two-phase investigation initiated in 1998 evaluated the presence of petroleum constituents at the Facility. DOH requested the Navy to conduct quarterly groundwater monitoring, conduct a Tier 3 risk assessment, and develop a contingency plan.
Quarterly Groundwater Monitoring Reports (DON 2005 to present)	Sampling and analysis of Red Hill network groundwater monitoring wells were initiated in 2005 and incorporated into the Red Hill GWPP (DON 2008b; 2014b); results are reported to DOH.

Investigation Report	Summary
Technical Report (DON 2007)	An environmental investigation and risk assessment initiated in 2004 included installation of SVMPs in angle borings under the active fuel storage tanks, three additional groundwater monitoring wells in the lower access tunnel, a three-dimensional groundwater model, and a Tier 3 human health risk assessment.
Tank 17 Removal Action Report (DON 2008c)	A limited removal action and site characterization investigation was conducted in June 2008; the report's Environmental Hazard Analysis determined that the release posed no further significant environmental hazards.
Type 1 Letter Report (DON 2010)	A 2010 investigation re-evaluated the DON (2007) groundwater model assumptions and results, as well as the Tier 3 risk assessment results.
Monthly Soil Vapor Monitoring Reports (DON 2008a)	Soil vapor PID measurements are collected monthly under the Facility's fuel storage tanks with SVMPs in accordance with the Red Hill GWPP (DON 2008a; 2014b); results are reported to DOH.
AOC-Related Investigations (EPA Region 9 and DOH 2015)	
Tank 5 Initial and Quarterly Release Response Reports (DON 2014a to December 2022)	Documented the results of release response efforts for the Tank 5 January 2014 Release.
Seismic Profiling to Map Hydrostratigraphy in the Red Hill Area (DON 2018a)	Presented results and evaluation of nine seismic profiling transects conducted at Red Hill and in North and South Hālawa Valleys and Moanalua Valley to improve understanding of subsurface conditions that affect groundwater flow and CF&T.
Groundwater Protection and Evaluation Considerations for the Red Hill Bulk Fuel Storage Facility (DON 2018c)	Presented an interim environmental analysis of data and an initial analysis of potential environmental risks; interim results of the groundwater flow model; and an evaluation of hypothetical release scenarios.
Conceptual Site Model (DON 2018b; 2019)	Established a basis for evaluating contaminant transport pathways and potential for exposure of human receptors to potentially impacted drinking water.
Groundwater Flow Model Report (DON 2020a)	Refined the previous groundwater flow model to improve understanding of the direction and rate of groundwater flow within the aquifers around the Facility.
Investigation and Remediation of Releases Report (DON 2020b)	Documented the response to the January 2014 Tank 5 release and evaluated potential remedial alternatives for that release and any potential future release.
Evaluation of Chromatograms for Understanding TPH Detections in Monitoring Wells (DON 2020c)	Provided an evaluation of TPH detections in monitoring wells to determine whether those detections are indicative of potential fuel impacts from the Facility.

Investigation Report	Summary
Initial and Quarterly Release Response Reports, Pipeline Breach in Tunnel and Fire Suppression Drain Line (DON 2021a; 2021b; 2021d; 2022c; 2022d; 2022g; 2022i)	Documented the results of release response efforts for the May 6, 2021 Tunnel Pipeline Breach and the November 20, 2021 Fire Suppression Recovery Drain Line releases.
Phase 1 and *Phase 2 Technical Memoranda, Holding Tank and Leach Tank Characterization, November 2021 Pipeline Release* (DON 2022b; 2022k)	Presented preliminary results of a two-phase site characterization effort at the Holding Tank and Leach Tank area outside Adit 3.
Quarterly Release Response Report, Red Hill Bulk Fuel Storage Facility (DON 2022l)	Documented the combined results of release response efforts for the January 2014, May 2021, and November 2021 releases.
Technical Memorandum: In-Progress Data Report, Adit 3 Site Characterization (DON 2023e)	Presented interim results of the Adit 3 site characterization effort summarized in Section 3.3.

CF&T contaminant fate and transport
GWPP Groundwater Protection Plan
RI remedial investigation
SVMP soil vapor monitoring point
TPH total petroleum hydrocarbons

3.0 Summary of Investigation History

Investigation activities associated with the January 2014 Release began in 2014 and have continued under the AOC since it was signed in 2015.

Investigation activities in response to the May 2021 Release began on May 10, 2021 and included soil vapor, groundwater, and drinking water monitoring and free product gauging and headspace measurements. Following the November 2021 Release, site characterization and investigation efforts were expanded to include investigations of the Adit 3 and Pearl Harbor Tunnels, the Holding Tank and Leach Tank area and the CHT Tank area outside Adit 3, video inspection of the Red Hill Shaft water development tunnel, single-event groundwater sampling at two non-network monitoring wells on the Moanalua Valley side of Red Hill, and pilot and bench-scale tests currently being planned to evaluate potential technologies for remediating the November 2021 Release.

Results from previous investigations of the May 2021 and November 2021 Releases are provided in the published reports to DOH listed in Section 1.2. Groundwater and soil vapor monitoring requirements for the two releases are combined in a single plan (Appendix B.6) to assess and evaluate groundwater impacts and soil vapor concentrations in the subsurface from both releases and their potential migration pathways.

3.1 AOC Release Response Activities

Continuing release response activities for the January 2014 Release at Tank 5 under the Red Hill AOC include soil vapor and groundwater sampling analysis, evaluation, and reporting; installation of additional groundwater monitoring wells; geologic mapping; forensics analyses; and groundwater modeling.

3.2 NOI Soil Vapor Sampling, Free Product Gauging, and Water Sampling

Investigation activities in response to the May 2021 Release began on May 10, 2021 with a site assessment that included soil vapor PID field measurements and laboratory sample collection and analysis, free product gauging and headspace measurements in groundwater monitoring wells, and groundwater and drinking water sampling and analysis.

Soil vapor monitoring currently includes weekly collection of soil vapor PID readings from probes at Tank 2 through 18 and Tank 20 (Figure 4). Summa canister samples for laboratory analyses are collected at least monthly at probes SV15S, SV15D, SV17S, SV17D, SV18S, SV18D, SV20S, and SV20M.

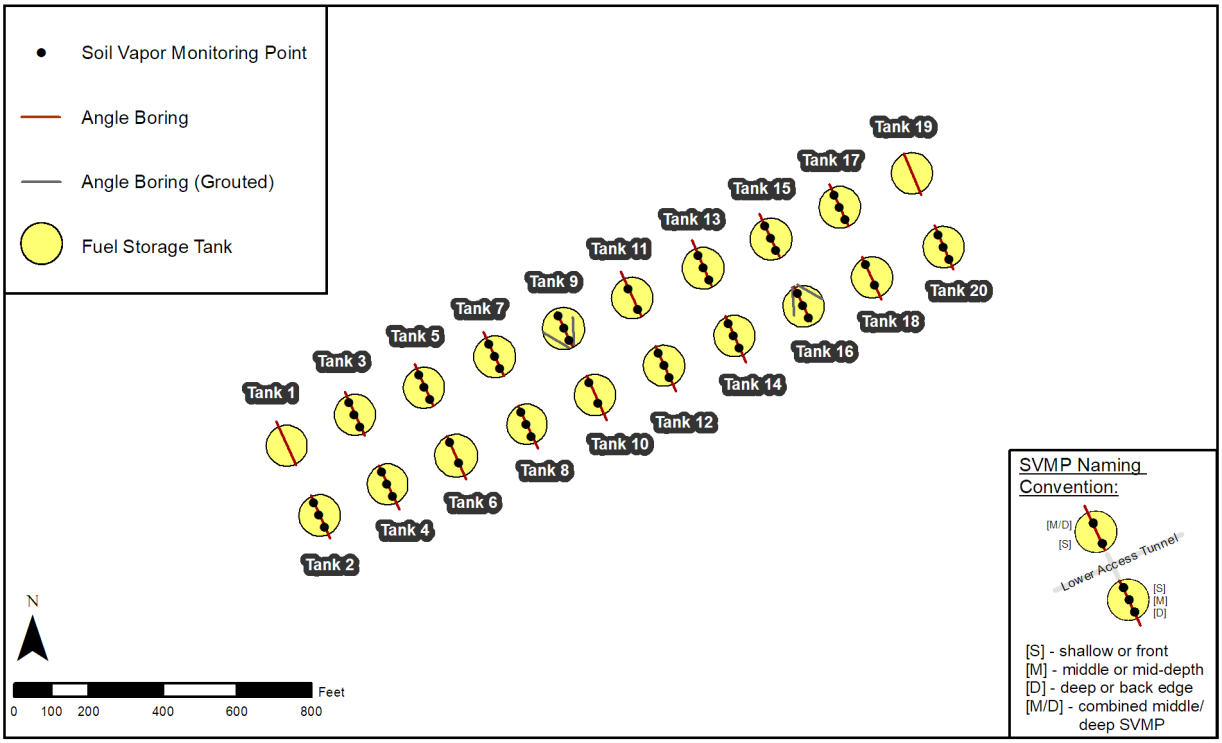

Figure 4: Soil Vapor Monitoring Network Underneath the Red Hill Fuel Storage Tanks

Free product gauging and headspace measurements were collected as part of the NOI sampling activities and also from the entire Red Hill monitoring network as part of the Red Hill groundwater long-term monitoring program. Free product has never been detected in any monitoring well outside of Red Hill Shaft.

Groundwater samples were initially collected from RHMW01R, RHMW02, and RHMW03 beginning in May 2021 (Figure 1). The collection of drinking water samples at the pre-chlorination spigot in conjunction with groundwater sampling began in June 2021. The groundwater sampling locations were increased to include RHMW05 and RHMW2254-01 in September 2021 following the detection of TPH-diesel range organics (TPH-d) and TPH-residual range organics (i.e., TPH-oil) (TPH-o) in the Red Hill Shaft pre-chlorination samples, including detections of TPH-o above the DOH Environmental Action Level (EAL) that occurred in August and September 2021.

Groundwater sampling locations were again expanded in December 2021 and January 2022 to include weekly sampling at RHMW04, RHMW06, RHMW08, RHMW09, RHMW12A, RHMW16, RHMW19, OWDFMW01, OWDFMW04A, OWDFMW05A, OWDFMW07A, OWDFMW08A, and multilevel wells RHMW11-05 (Zone 5), RHMW13-05 (Zone 5), RHMW14-03 (Zone 3), and RHMW15-05 (Zone 5), along with including sump water sampling from the Adit 3 Sump. Monitoring well RHMW17 was installed and added to the NOI groundwater sampling program in June 2022.

Delineation wells have been installed at locations shown on Figure 1 and Figure 5 to evaluate groundwater conditions in the vicinity of Red Hill Shaft. They are installed to provide water chemistry and water level data from the basal aquifer and allow for detection of any fuel product on the water table surface. Data collected during drilling are also evaluated to detect potential impacts to the vadose zone. With the exception of RHP04B (a deep well to monitor the saltwater–freshwater interface), the completed delineation wells are installed to depths of 141–160 ft bgs as 2-inch-diameter wells screened across the basal aquifer water table (approximately 10 ft of screen above and 20 ft of screen below). As of this reporting period, six delineation wells are complete (RHP01, RHP02, RHP03, RHP04A, RHP04B, and RHP05); deep well RHP04C is nearing completion; and coring and drilling have commenced at RHP06, RHP08, and in-tunnel well RHP07. Additional details (e.g., boring logs, well construction details) on the delineation well installation and water quality data are uploaded to the JBPHH Red Hill Environmental Data Management System (EDMS) and are reported in the Quarterly RRRs as they are acquired.

Installation of sentinel wells as part of the expansion of the Red Hill Monitoring Network commenced with the completion of well NMW24, located approximately 430 ft southeast of water supply well Navy ʻAiea Hālawa Shaft and 1.2 miles northwest of the western portion of the Facility (see Figure 1).

Drinking water sampling was initially conducted as part of the release response effort but was terminated in December 2021 when Red Hill Shaft was disconnected from the JBPHH water distribution system. Ongoing drinking water sampling and analyses are conducted under another program and are therefore not described in this Quarterly RRR.

Recommended modifications to the current NOI groundwater sampling and analysis program were presented to the Regulatory Agencies for consideration in a *Recommendations for the Notice of Interest Groundwater Sampling and Analysis Program at the Red Hill Bulk Fuel Storage Facility* memorandum on March 1, 2023 (DON 2023f).

3.3 Site Characterization at Adit 3

Investigation and sampling activities in response to the November 2021 Release began on November 29, 2021. A *Preliminary Site Characterization Plan* (DON 2022a) described an in-tunnel characterization effort focused on developing remedial alternatives to mitigate impacts of the release. The plan identified the first actions to be taken to characterize the November 2021 Release to soil, rock, and soil vapor and included:

- In-Tunnel Characterization
  - Geophysical characterization of shallow and deep subsurface features (Section 3.3.1)
  - Near-surface intrusive trench soil and soil vapor sampling and installation of shallow, intermediate, and deep subsurface SVMPs (Section 3.3.2)
- External Characterization
  - Holding Tank and Leach Tank subsurface characterization (Section 3.4)

Initial shallow soil borings identified a perched water layer and JP-5 LNAPL in a shallow boring adjacent to the U.S. Navy Well 2254-01 Pump Station.

3.3.1 Geophysical Characterization

A geophysical characterization of subsurface features using two survey lines of electrical resistivity, induced polarization, and ground-penetrating radar (GPR) was conducted between January 28 and February 2, 2022 in sections of the Adit 3 and Pearl Harbor Tunnels to facilitate understanding of LNAPL downward migration and potentially identify pooled LNAPL in the vadose zone. A GPR survey consisting of 16 survey lines was also conducted in the Lower Access Tunnel in the vicinity of Tanks 17 through 20 (HGI 2022). The draft technical memorandum describing the results of this work was provided to the Regulatory Agencies in early April 2022, and the Navy provided a briefing to the Regulatory Agencies on April 19, 2022. The briefing summarized the geophysical survey results and the limitations associated with the tunnel design and infrastructure. Based on discussions with the Regulatory Agencies and comments received following this presentation, a second GPR survey was conducted focusing on the shallow subsurface within the Adit 3 tunnel (described below).

On November 9 and 10, 2022, an additional GPR survey of the Adit 3 tunnel shallow subsurface was conducted using shielded high-frequency signal (250, 500, and 1,000 MHz) to focus on the features located between the tunnel floor and 10 ft below the tunnel floor.

3.3.2 In-Tunnel Soil, Soil Vapor, and Perched Water Sampling

Sampling activities conducted in the Adit 3 and Pearl Harbor Tunnels as part of the preliminary site characterization effort include concrete cutouts in the tunnel floor and soil, soil vapor, and perched water sample collection and analysis.

Soil Sampling. Six shallow trenches were excavated through the Adit 3 and Pearl Harbor Tunnel floors during March–April 2022 to evaluate hotspots identified by subslab SVMP monitoring and to uncover the concrete Hume drain line. Both discrete and multi-increment soil samples were collected at the locations shown on Figure 6 and analyzed for TPH-gasoline range organics (TPH-g), TPH-d, and TPH-o; benzene, toluene, ethylbenzene, and xylenes (BTEX); and naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene (N, 1MN, and 2MN, respectively).

The Hume drain was encountered in the sixth trench excavated, and a riser pipe and cap were installed in the line for data gathering or potential future remedial actions. PID samples of organic vapor collected from the pipe indicated it had been impacted with hydrocarbons, likely from the November 2021 Release.

Soil Vapor Sampling. Two near-surface SVMPs and 52 subslab SVMPs were installed in the floor of the Adit 3 and Pearl Harbor Tunnels and sampled weekly through the week of June 20, 2022 and monthly thereafter using hand-held PIDs to collect real-time measurements. As part of the monthly sampling program, the collection of PID measurements is also required following any precipitation events resulting in greater than 1 inch of rainfall within a 24-hour period.

During July–September 2022, deep nested SVMPs were installed within the Adit 3 and Pearl Harbor Tunnels to depths of 68–72 ft below the tunnel floor at the following three locations, as shown on Figure 7:

- A3-010-DSVMP, located adjacent to the U.S. Navy Well 2254-01 Pump Station doorway in the Adit 3 Tunnel. Three nested SVMPs and temperature probes were installed at 40, 48.5, and 62 ft below the tunnel floor.
- 1S+075-DSVMP, installed where two spurs of the Pearl Harbor/Adit 3 wye converge in the Pearl Harbor Tunnel approximately 75 ft south of the Adit 3 and Pearl Harbor Tunnel merge. Four nested SVMPs and temperature probes were installed at 12.6, 29, 39, and 58 ft below the tunnel floor.
- A3-375-DSVMP, installed directly adjacent to the November 20, 2021 valve release of JP-5 approximately 375 ft east of the U.S. Navy Well 2254-01 Pump Station entrance way. Four nested SVMPs and temperature probes were installed at 12.5, 34.5, 47.5, and 63.5 ft below the tunnel floor.

Starting in December 2022, 6 months of monthly sampling of up to 20 subslab and deep SVMP locations began from selected SVMP probes to be analyzed at the contract laboratory. These samples are being analyzed for TPH-g by Method TO-3; BTEX and N, 1MN, and 2MN by Method TO-15; and oxygen, carbon dioxide, methane and helium by Method 3C. During the current reporting period, sampling was conducted on December 17, 18, and 19, 2022, and on January 17 and 18, 2023.

Perched Water and LNAPL Sampling. Shallow borings were installed in five of the trenches to conduct near-surface soil vapor monitoring (5–6 ft below tunnel floor) (Figure 6). Perched

water was encountered in three of the trench borings (A3+215-BH, A3+000-BH, and A3-150-BH), and fuel oil identified by laboratory analysis as JP-5 was observed in the trench boring (A3+000-BH) located adjacent to the U.S. Navy Well 2254-01 Pump Station.

Details and results of the Adit 3 soil, soil vapor, and perched water sampling to date were provided to the Regulatory Agencies in an *In-Progress Data Report, Adit 3 Site Characterization Technical Memorandum* (DON 2023e) on February 23, 2023 (see Section 3.3.3).

3.3.3 LNAPL Site Characterization at Adit 3

In response to the observation of LNAPL in the trench boring at A3+000 and in consultation with DOH, the Navy began implementing a *LNAPL Site Characterization Plan Addendum* (DON 2022f), which included installation of 25 shallow soil borings to a maximum depth of 6 ft below the tunnel floor along the Adit 3 and Pearl Harbor Tunnels and installation of temporary wells in seven of these borings. Shallow borehole and temporary well sampling locations for the LNAPL site characterization effort are included on Figure 7 and described below.

During March 11 and April 1, 2022, seven initial step-out borings were advanced: Soil from all seven borings was collected and analyzed at a fixed-base laboratory. Based on the amount of soil recovered:

- Four borings were analyzed for TPH-g/d/o, BTEX, N, 1MN, and 2MN
- The remaining three borings were analyzed for TPH-d/o, N, 1MN, and 2MN only due to limited soil recovery.

During June–August 2022, 18 soil borings were advanced to 6 ft below tunnel floor, soil cuttings were screened for organic vapor with a PID, and the soil interval with the maximum PID result was collected for "OIL-IN-SOIL" field tests and for laboratory analysis for TPH-d, N, 1MN, and 2MN.

The LNAPL site characterization effort identified petroleum-impacted groundwater in the perched zone located between 4 and 15 ft below the tunnel floor. As shown on Figure 7, shallow soil borings were installed, and during September 1–8, 2022, seven selected borings were developed into temporary groundwater monitoring wells (A3+375-TW, A3+325-TW, A3+210-TW, A3+050-TW, A3+015-TW, A3-010-TW, and A3-040-TW) for sampling to characterize the extent and magnitude of petroleum-impacted perched water in the area. The temporary wells were first sampled on September 12, 2022. Groundwater samples were analyzed for TPH-g, TPH-d, TPH-o; 1MN, 2MN, and N; and BTEX.

Note

A3-050-BHOffset is a step-out boring because the first boring (A3-050-BH) was drilled in a solid matrix, originally thought to be concrete fill. A3-050-BHOffset was drilled next to it within 2 feet of the original. The Navy continues to monitor each boring for vapor weekly.

LNAPL site characterization activities conducted during the current reporting period are described in Sections 5.1.2, 5.2, and 5.3.5. The Navy provided the Regulatory Agencies an *In-Progress Data Report, Adit 3 Site Characterization Technical Memorandum* on February 23, 2023 (DON 2023e). The memorandum recommended preparation of a comprehensive Site Investigation Report in accordance with the DOH *Technical Guidance Manual for the Implementation of the Hawaii State Contingency Plan* (TGM) (DOH 2021c). Once completed, that report will serve as the basis for an Adit 3 Conceptual Site Model (CSM) and a site-specific Environmental Hazard Evaluation, and will provide data for assessment of remedial alternatives and, if necessary, remedial design.

3.4 Site Characterization at Holding Tank and Leach Tank Area

A multi-phase subsurface site characterization and removal action of contaminated soil at the Holding Tank and Leach Tank area outside Adit 3 (Figure 2) was initiated in January 2022. Phase 1 and 2 sampling locations are shown on Figure 8.

Under Phase 1, 21 subsurface soil borings were drilled and sampled in January 2022 using direct-push methodology. The investigation was unable to delineate the extent of contamination in the perched aquifer due to encountering shallow refusal, as documented in a *Technical Memorandum November 2021 Pipeline Release Red Hill Fuel Storage Facility, February 2022* (DON 2022b).

Following consultation with DOH and the U.S. Environmental Protection Agency (EPA), the Navy conducted Phase 2 field work during March 9–17, 2022 to obtain data to conduct further vertical delineation of the petroleum in subsurface soil and to obtain data to characterize petroleum impacts in the shallow perched water body located at approximately 30 ft bgs in the study area. Subsurface soil samples and organic vapor headspace readings were collected at eight soil borings from data gap locations, and groundwater grab samples were collected from three temporary monitoring wells within the perched groundwater zone. The chemical constituents evaluated were TPH-g, TPH-d, and TPH-o; BTEX; and N, 1MN, and 2MN.

The Phase 2 findings led to excavation and removal of both tanks and approximately 97 tons of soil in May 2022. Waste characterization soil samples were collected and analyzed for TPH-g, TPH-d, and TPH-o prior to the excavation event, and the excavated soil was properly disposed of at a permitted landfill.

Removal activities were subsequently completed with a second soil removal action in September–October 2022. The second excavation removed approximately 1,000 cubic yards (1,712 tons) of additional petroleum-contaminated subsurface soil. Soil samples were collected using multi-increment sampling methods. After sampling, all excavated soil was properly disposed of at a permitted landfill.

Details and results were presented to the Regulatory Agencies for comment in a *Draft Final Technical Memorandum, Phase 2 Holding Tank and Leach Tank Characterization, November 2021 Pipeline Release* (DON 2022k) on December 7, 2022. Once the removal action confirmation sampling results have been evaluated, the Navy will develop site-specific risk-based action levels

following the DOH Hazard Evaluation and Emergency Response (HEER) Environmental Hazard Evaluation process and, if necessary, develop and implement an Environmental Hazard Management Plan in accordance with HEER guidelines.

In addition, a *Draft Closure Report, Concrete Tank Removal* was provided to the Regulatory Agencies for comment on February 24, 2023 (DON 2023a).

3.5 Site Characterization at the Collection, Holding, and Transfer Tank

Site characterization activities are being planned as part of a Phase 1 assessment to characterize the nature and lateral extent of petroleum hydrocarbon impacts in near-surface soil around a CHT Tank located outside Adit 3 (see Figure 2). Additional activities will include characterizing and quantifying the amount of LNAPL, petroleum-contaminated water, and petroleum-impacted sludge stored in four fractionation (frac) tanks of recovered material near Adit 1 to quantify the amount of petroleum recovered. Details and results of the investigation were presented to the Regulatory Agencies for comment in a *Site Characterization Plan Addendum – Collection, Hold, and Transfer Tank Overflow Site Characterization, November 2021 Release* on December 7, 2022 (DON 2022j).

3.6 Inspection of Water Development Tunnel

Inspections of the Red Hill Shaft water development tunnel were conducted using a submersible remotely operated vehicle (ROV) to better understand the extent of impact in the tunnel and to potentially identify areas of fluid infiltration. The cable-controlled ROV's cameras recorded downward, forward, and upward video of the first 515 ft of the tunnel, which investigators then reviewed and evaluated. An initial inspection conducted on January 13, 2022 was followed by a second June 14–15, 2022 inspection; the results are reported in a *Findings from ROV Inspection #2 Video Review of Red Hill Water Development Tunnel* technical memorandum (DON 2022h).

3.7 Single-Event Groundwater Sampling at DH-43 and BWS2253J1 Well

In a single sampling event in October 2022, the Navy collected split samples with BWS at monitoring wells DH-43 (State Well ID No. 3-2253-02), located adjacent to Red Hill in Moanalua Valley, and BWS2253J1 Well (State Well ID No. 3-2253-006), located beside an aboveground BWS water tank southwest of the Red Hill fuel storage tanks adjacent to the Facility boundary and RHMW09. The split sampling was conducted to obtain data to further evaluate potential impacts to groundwater southeast and south of the tank farm. The Navy's samples were analyzed for the NOI parameters identified in Section 5.3. Details and analytical results were reported in the December 21, 2022 Quarterly RRR (DON 2022l).

3.8 Remediation Pilot Test

The Navy is planning to conduct pilot and bench-scale tests to evaluate potential technologies for remediating fuel released to the environment by the November 2021 Release. The objectives are to assess the technologies' effectiveness in heterogenous lithologies, assess the constructability of the technologies, and identify design parameters prior to full-scale implementation.

This page intentionally left blank

The proposed field pilot testing is anticipated to consist of short-duration soil vapor extraction (SVE) and air sparging (AS) pilot tests, a 6-month SVE pilot test, a 24-month natural source-zone depletion (NSZD) study, and a laboratory JP-5 weathering treatability study. Following the testing period, 18 months of SVE system operation is planned.

The Navy provided to the Regulatory Agencies for comment a *Draft Shallow SVE/AS Work Plan* (WP) on January 9, 2023 (DON 2023b); a *Draft NSZD WP* on February 23, 2023 (DON 2023d); and a *Draft Deep SVE WP* on February 27, 2023 (DON 2023c).

4.0 Site Investigation Objectives

Sampling activities in response to the three fuel releases include routine sampling and other investigation activities associated with soil vapor and groundwater monitoring and site characterization, as described below.

4.1 Soil Vapor

AOC and NOI Soil Vapor Sampling. The Navy installed SVMPs below each of the active Red Hill fuel storage tanks in the mid-2000s to collect data that provide additional layers of protection to screen for potential releases (DON 2007). These SVMPs are monitored monthly for total volatile organic compound (VOC) vapors as a release detection screening tool that operates in conjunction with other leak detection systems used at the Facility. More frequent monitoring of some or all of the below-tank SVMPs has been conducted since the May 2021 Release. Under the NOI, all below-tank SVMPs were monitored weekly during this reporting period. In addition, samples were collected from selected SVMPs with Summa canisters and analyzed at a fixed-base analytical laboratory to further characterize the specific VOCs associated with the May 2021 Release and to evaluate the extent of weathering that has occurred.

Adit 3 Soil Vapor Sampling. Routine monitoring of the SVMPs installed in the tunnel floor near Adit 3 and in the Pearl Harbor Tunnel has been conducted to further characterize the nature and extent of impacts from the November 2021 Release near Adit 3. Results have been used to identify initial hotspots and to lead additional subsurface soil, LNAPL, and groundwater studies to develop a complete CSM for the development of future feasibility studies and remedial designs.

4.2 Free-Product Gauging and Headspace Measurements

AOC Oil/Water Interface Measurements. The Navy continues to collect monthly oil/water interface measurements from monitoring wells located in the tunnel in response to the January 2014 Release. The objective of the measurements is to evaluate whether free product has reached groundwater at specific monitoring well locations.

NOI Free-Product Gauging and Headspace Measurements. Free product gauging and headspace measurements are conducted prior to the collection of groundwater samples. The objectives of the free product gauging and groundwater monitoring well headspace measurements are to evaluate whether free product has reached groundwater at specific monitoring well locations and to monitor for the presence of free product in Red Hill Shaft.

4.3 Groundwater

NOI Groundwater Sampling. The objective of groundwater sample collection and analysis from monitoring wells and Red Hill Shaft is to evaluate the nature and extent of impacts to the basal groundwater aquifer.

Delineation wells (Section 3.2) are being installed to evaluate: basal aquifer groundwater quality in the vicinity of Red Hill Shaft; the extent and magnitude of groundwater impact associated with the November 2021 Release; groundwater flow and the effect of pumping Red Hill Shaft on the local hydraulic gradient; and whether contamination is migrating from the site toward potential offsite receptors.

Adit 3 and Pearl Harbor Tunnels Groundwater Sampling. The objective of groundwater sample collection from perched aquifers located beneath the Adit 3 and Pearl Harbor Tunnels is to evaluate impacts to shallow groundwater above the basal aquifer that may have been impacted by the downward migration of fuel. These data help to further characterize the occurrence, nature, and extent of fuel impacts and the potential for perched groundwater to serve as a source that could further impact the subsurface beneath it.

4.4 Soil and Rock

The objectives of the discrete subsurface soil sampling conducted in the Adit 3 and Pearl Harbor Tunnel area and Holding Tank and Leach Tank area for laboratory analysis include:

- Compare the concentration of site-specific COPCs in each soil boring to site-specific and constituent-specific DOH Table 2-A Soil Action Levels, as presented in the *Preliminary Site Characterization Plan* (DON 2022a)
- Evaluate the potential for COPCs to have migrated below the bottom of the borehole and potentially into the underlying groundwater systems
- Use the results to support the development of an improved CSM that can be used for a feasibility study, remedial design, or for design of a removal action

4.5 Data Usability

The usability of data collected depends on its quality, which in turn depends on a variety of factors. Adhering to proper sample collection techniques, observing and documenting chain of custody procedures, and using Department of Defense (DoD)-accredited laboratories and approved analytical methods ensure that the quality of data generated meets site characterization objectives.

DOH's technical perspective and regulatory guidance on the characterization of petroleum-impacted soil and groundwater are described in Section 6 ("Soil, Soil Vapor and Groundwater Action Levels for TPH") of the DOH guidance document *Evaluation of Environmental Hazards at Sites with Contaminated Soil and Groundwater* (DOH 2017) as follows:

- Petroleum is a complex mixture that degrades into potentially toxic metabolites.

- Non-specific aliphatic and aromatic compounds and related degradation compounds compose the majority of the mass collectively referred to as TPH.
- Risk to human health and the environment posed by petroleum releases is evaluated in terms of both TPH and individual "indicator" compounds such as BTEX as well as N, 1MN, and 2MN and other targeted polynuclear aromatic hydrocarbons (PAHs). The latter compose only a small percentage of the total mass in fuels and in vapors but can pose a significant risk due to their higher toxicity and can be important for evaluating risk due to their higher toxicity.
- For risk evaluation, samples are evaluated for additives known or suspected to have been pre-blended into the fuel. Additives, including antioxidants, biocides, and fuel system ice inhibitors, are normally pre-blended into stored jet fuel.

Appendix A, Section 4.1.6 (LNAPL Plume Delineation) of the DOH (2017) guidance document identifies soil borings as part of the LNAPL characterization process, including the following delineation methods for soil:

- If the depth of the source of a release is known, then the approximate upper extent of that release can be inferred.
- Headspace measurements for volatile organics will typically show an increase in concentration within the LNAPL zones. Plotting these on a simple chart of depth against concentration will typically show the inferred bulk LNAPL zone (mobile or residual).
- Visual and olfactory observations are typically logged as well, giving another indication of the presence of LNAPL.
- Soil samples are often collected and analyzed chemically, which will give another set of clear LNAPL indications. In general, TPH analytical results (for the appropriate fuel carbon range) greater than 250 milligrams per kilogram (mg/kg) are indicative of residual LNAPL (because soil has a limited sorptive capacity).

Target petroleum-related analytes identified in the above guidance are listed in Table 2, and relevant DOH EALs are listed in Table 3.

Table 2: Target Analytes for Middle-Distillate Contaminated Media

Petroleum Product	Media	Recommended Target Analytes
Middle Distillates (e.g., diesel, kerosene, Stoddard solvents, heating fuels, jet fuels)	Soil	TPH, BTEX, N, 1MN, and 2MN
	Soil Vapor	TPH, BTEX, N, and methane
	Groundwater	TPH, BTEX, N, 1MN, and 2MN

Source: (DOH 2017, Volume 2, Table 6-1).

5.0 Field Activities

Activities performed to characterize soil vapor, groundwater, and soil during this reporting period are described below. Site characterization activities associated with the Adit 3 and Pearl Harbor Tunnel and the Holding Tank and Leach Tank areas are also summarized below; the data and results of these two investigations will be documented separately in forthcoming reports.

Analytical results for the sampling activities described below are discussed in Section 9.0.

5.1 Soil Vapor Monitoring

5.1.1 Below-Tank SVMPs

Soil vapor PID measurements were collected during 13 weekly sampling events completed between November 5, 2022 and February 3, 2023. VOC concentrations at below-tank SVMPs

were measured in the field using hand-held PIDs at all SVMPs under Tanks 2 through 18 and 20; locations are shown on Figure 4.

Soil vapor samples for analysis at a fixed-base analytical laboratory were collected monthly during this reporting period. Summa canister samples were collected from SV15S, 15D, 17S, 17D, 18S, 18D, 20M, and 20D. In addition to this monthly sampling, Summa canister samples were collected from SV18S and SV18D on December 20, 2022 in response to the elevated PID readings observed at these two locations during the weekly PID monitoring conducted on that day.

5.1.2 Adit 3 and Pearl Harbor Tunnel SVMPs

During this reporting period, eight SVMP monitoring events were conducted as part of implementing the *Preliminary Site Characterization Plan* (DON 2022a) and *LNAPL Site Characterization Plan* (DON 2022f) (Section 3.3). These included seven "out-of-frequency" sampling events following rainfall events of greater than 1 inch within a 24-hour period (DON 2022e). All sampling events conducted in November and December were considered out-of-frequency events because they were conducted following rainfall events of greater than 1 inch within a 24-hour period. Figure 9 depicts the location of each tunnel subslab and near-surface SVMP and the organic vapors measured between December 17, 2021 and February 1, 2023 (the last sampling event within this reporting period).

Installation and monitoring of the Adit 3 deep nested SVMPs are discussed in an *In-Progress Adit 3 Site Characterization Technical Memorandum* (DON 2023e).

5.2 Free Product Gauging and Groundwater Monitoring Well Headspace Measurements

AOC Sampling. Free product gauging (i.e., oil/water interface measurements) data were collected monthly at in-tunnel monitoring wells RHMW01, RHMW01R, RHMW02, RHMW03, and RHMW05.

NOI Sampling. Free product gauging and groundwater monitoring well PID headspace measurements were collected weekly during this reporting period at groundwater monitoring wells included in the *NOI Groundwater Sampling Plan* (Appendix B.6) and at RHMW17 and NMW24. At the request of DOH, the free product gauging method was changed from using a low-flow pump to using a clear bailer; this method consisted of collecting a sample from the water surface in the monitoring well and photographing the water in the bailer to demonstrate any evidence of free product. In addition, an ultraviolet light was used at Adit 3 Sump and Red Hill Shaft to check for the presence of free product.

Groundwater sampling, free product gauging, and PID headspace measurements were collected biweekly during this reporting period at the completed delineation wells. Free product gauging used a clear bailer as described above in addition to using an oil/water interface probe. Headspace measurements were collected using a PID with readings both from inside the well casing and from a jar that had been filled with purge water, sealed, and then allowed to equilibrate.

Adit 3 Sampling. As described in Section 3.3, LNAPL was identified in the shallow trench boring installed adjacent to the U.S. Navy Well 2254-01 Pump Station in March 2022 (Figure 6), and additional step-out borings were installed to evaluate the extent of LNAPL on the perched water table (Figure 7). Water levels have also been measured weekly since March 2022. During that time, evidence of LNAPL has been observed in A3+015-BH, A3+000-BH, A3-010-BH, and A3-040-BH, covering approximately 65 linear ft of the shallow subsurface beneath the tunnel floor. Details and results to date were presented in an *In-Progress Adit 3 Site Characterization Technical Memorandum* (DON 2023e).

5.3 Groundwater and Adit 3 Sump Water Sampling

Two new wells were added to the Release Response groundwater sampling network during this reporting period: delineation well RHP05 and sentinel well NMW24.

In accordance with the *NOI Groundwater Sampling Plan* revised on December 27, 2021 (Appendix B.6; note contingent revision provided to DOH on February 10, 2022), the following locations were monitored during this reporting period, as depicted on Figure 1:

- Groundwater monitoring in-tunnel wells within the lower access tunnel: RHMW01R, RHMW02, RHMW03, and RHMW05
- Groundwater sampling point RHMW2254-01 at Red Hill Shaft
- Selected outlying groundwater monitoring wells external to the tunnel:
  - RHMW04, located within the Facility boundary east of the tank farm in a location believed to be hydraulically upgradient from the tanks
  - RHMW06, RHMW08, RHMW13-05, RHMW15-05, RHMW16, and RHMW17, located within the Facility boundary northeast and northwest of the tank farm in locations along the Facility's northern border
  - RHMW09 and RHMW19, located within the Facility boundary southwest and southeast of the tank farm in locations along the Facility's southern border
  - OWDFMW01, OWDFMW04A, OWDFMW05A, OWDFMW07A, and OWDFMW08A, located within the Facility boundary west of Red Hill Shaft
  - RHMW11-05, RHMW12A, and RHMW14-03, located outside the Facility boundary north of the tank farm on the grounds of the Hālawa Correctional Facility
- Delineation wells RHP01, RHP02, RHP03, RHP04A, RHP04B, and RHP05
- Sentinel well NMW24
- Adit 3 Sump

Field activities for NOI wells, delineation wells, sentinel wells, and Adit 3 Sump water sampling are presented in the following subsections. The sampling procedures and analyses conducted vary between sampling programs, as described in Sections 5.3.1 through 5.3.5.

5.3.1 NOI Groundwater Sampling

For the NOI sampling effort at DOH's request, monitoring wells with sampling zones that intersect the water table were sampled with a bailer without purging. However, several groundwater sampling locations are screened across confined portions of the aquifer, and therefore purging and sampling is conducted with a pump to ensure samples are representative of the screened interval.

The wells sampled with methods other than or in addition to a bailer include the following:

- OWDFMW01, OWDFMW04A, OWDFMW05A, OWDFMW07A, OWDFMW8A, RHMW12A, and RHMW16 are purged and sampled with a low-flow pump.
- RHMW11-05, RHMW13-05, RHMW14-03, and RHMW15-05 are multilevel wells and are sampled according to their standard operating procedures (SOPs).
- RHMW2254-01 is sampled with both a low-flow pump and a bailer.

NOI groundwater sampling was temporarily suspended during groundwater Quarterly Long-Term Monitoring as both programs address different project objectives. NOI groundwater sampling was suspended during December 5–16, 2022 for the Fourth Quarter groundwater long-term monitoring event, and during January 30–February 10, 2023 for the First Quarter groundwater long-term monitoring event. In addition, the NOI sampling frequency increased to twice a week for all wells sampled from October 17 through November 26, 2022 to monitor for groundwater impacts during unpacking activities.

Analyses were conducted for the following analytes, some of which are listed as site cleanup criteria in Hawai‘i Administrative Rules Section 11280.1-65.3:

- TPH-d and TPH-o
- TPH-g
- "Full suite" of VOCs
- "Full suite" of semivolatile organic compounds (SVOCs) (including N, 1MN, and 2MN)
- PAHs
- Total organic carbon (TOC)
- Methane
- Lead scavengers
- Total and dissolved lead

For those samples in which TPH-d and TPH-o were detected, the sample was extracted and analyzed again for TPH-d and TPH-o using silica gel cleanup (SGC) to quantify the amount of non-polar hydrocarbons compared to total (polar and non-polar) components in those carbon ranges. As described in the DOH *Technical Guidance Manual* (DOH 2021c), SGC can help evaluate whether TPH is related to fresh petroleum or other sources and can also be used to better understand the amount of natural degradation that is taking place in a particular location.

The first sampling event for well NMW24 was conducted on November 22, 2022 in accordance with the NOI sampling and analytical program, after which sampling was transitioned to the sentinel well program. The sentinel well program is described in Section 5.3.3.

The analyses for this reporting period were conducted by Eurofins Seattle. Eurofins Seattle is accredited under the DoD Environmental Laboratory Accreditation Program for the analyses performed.

5.3.2 Delineation Well Groundwater Sampling

Groundwater samples were collected from the six completed delineation wells during this reporting period: RHP01, RHP02, RHP03, RHP04A, RHP04B, and RHP05. Well locations are depicted on Figure 5. Each well was sampled using a low-flow pump twice a month for a minimum of 2 months after completion. Samples were analyzed for BTEX, TPH-g, TPH-d, TPH-o, N, 1MN, and 2MN. Initial sampling of each well also included analysis of natural attenuation parameters (NAPs) (alkalinity, bicarbonate alkalinity as calcium carbonate [$CaCO_3$], carbonate alkalinity as $CaCO_3$, nitrate as nitrogen, nitrate-nitrite as nitrogen, chloride, sulfate, methane, ferrous iron, and TOC). The analytical testing was conducted by Eurofins Seattle and its sister facilities in Arvada, Colorado, and Lancaster, Pennsylvania. The data obtained will be evaluated to determine future sampling requirements.

During the pipeline unpacking activities in late 2022, the delineation well sampling frequency increased to twice a week beginning on October 17, 2022 and continued at this frequency through November 26, 2022.

5.3.3 Sentinel Well Groundwater Sampling

Groundwater samples were collected from one completed sentinel well, NMW24, during this reporting period, beginning on November 22, 2022 following completion of well installation. The well location is depicted on Figure 1. The first sampling event for NMW24 was conducted on November 22, 2022 in accordance with the NOI sampling and analytical program (see Section 5.3.1), after which sampling was transitioned to the sentinel well program. Beginning on December 1, 2022, the well was sampled once per week with a bailer without purging; samples were analyzed for BTEX, TPH-g, TPH-d, TPH-o, N, 1MN, 2MN, and NAPs. The analytical testing was conducted by Eurofins Seattle and its sister facility in Arvada, Colorado. The data obtained will be evaluated to determine future sampling requirements.

5.3.4 Adit 3 and Pearl Harbor Tunnel Temporary Well Sampling

The seven temporary wells installed in September 2022 as part of the LNAPL site characterization effort (described in Section 3.3.2) were sampled on September 12, 2022 and analyzed for TPH-g, TPH-d, TPH-o; 1MN, 2MN, and N; and BTEX. These wells were not sampled during the current reporting period. Details and results to date were presented in an *In-Progress Adit 3 Site Characterization Technical Memorandum* (DON 2023e).

5.3.5 Adit 3 Sump Water Sampling

The Adit 3 Sump was sampled with a bailer. The samples were analyzed for the same parameters as the NOI groundwater samples as described in Section 5.3.1. The analyses for this reporting period were conducted by Eurofins Seattle. Eurofins Seattle is accredited under the DoD Environmental Laboratory Accreditation Program for the analyses performed. Details and results to date were presented in an *In-Progress Adit 3 Site Characterization Technical Memorandum* (DON 2023e).

5.4 Soil Sampling

No soil sampling was conducted during the current reporting period.

6.0 Sample Control Procedures

Prior to sampling, the field team inspected all supplies and consumables to ensure that they were acceptable for use. Sampling and sample handling procedures were designed to ensure that samples were consistently collected, labeled, preserved, and transported in a manner that maintained their integrity for their intended purposes.

6.1 Sample Containers and Preservation

Sample container, preservative, and holding time requirements for NOI, delineation well, and site characterization groundwater and soil (unconsolidated material) are listed in Table 4 and Table 5, respectively. The samples were preserved as indicated and analyzed within the required holding times. The containers, preservatives, and holding times are specified in the respective EPA or SW-846 methods.

Table 4: Groundwater Sample Containers, Preservatives, and Holding Times

Parameter	Number/Type of Containers per Sample	Preservative	Holding Time
VOCs			
VOCs, Benzene, Toluene, Ethylbenzene, Total Xylenes	2 × 40-mL vials, Teflon-lined septum caps	No headspace, cool to ≤6°C and adjust to pH <2 with H_2SO_4, HCl, or solid $NaHSO_4$	Maximum holding time is 7 days if pH >2 or 14 days if pH <2
TPH			
TPH-g	2 × 40-mL vials, Teflon-lined septum caps	No headspace, cool to ≤6°C and adjust to pH <2 with HCl	Maximum holding time is 7 days if pH >2 or 14 days if pH <2
TPH-d, TPH-o (without and with SGC)	2 × 1-L amber glass, Teflon-lined lid	Cool to ≤6°C and adjust to pH <2 with HCl or H_2SO_4	14 days / 40 days [a]
TPH-d, Saturated Hydrocarbons Whole Oil Analysis (Product)	2 × 40-mL vials, hard top, Teflon-lined caps	Cool to ≤4°C	N/A
SVOCs, PAHs			
Full list SVOCs, including 1MN, 2MN, N, and PAHs	2 × 1-L amber glass, Teflon-lined lid	Cool to ≤6°C	7 days / 40 days [a]
Fuel Additives			
2-(2-Methoxyethoxy)-ethanol	2 × 1-L amber glass, Teflon-lined lid	Cool to ≤6°C	7 days / 40 days [a]
Lead Scavengers			
1,2-Dibromoethane	2 × 40-mL vials, Teflon-lined septum caps	No headspace, cool to ≤6°C	7 days
1,2-Dichloroethane	2 × 40-mL vials, Teflon-lined septum caps	No headspace, cool to ≤6°C, and adjust to pH <2 with H_2SO_4, HCl, or solid $NaHSO_4$	Maximum holding time is 7 days if pH >2 or 14 days if pH <2
Natural Attenuation Parameters			
Methane	2 × 40-mL vials, Teflon-lined septum caps	No headspace, cool to ≤6°C, and adjust to pH <2 with HCl or H_2SO_4	Maximum holding time is 7 days if pH >2 or 14 days if pH <2
Ferrous iron	2 × 250-mL brown plastic	Field filtered, no headspace, cool to ≤6°C, HCl to pH <2	7 days
Chloride, sulfate, nitrate	1 × 250 mL plastic	Cool to ≤6°C	28 days (nitrate 48 hours)
Nitrate-nitrite	1 × 250 mL plastic	Cool to ≤6°C, H_2SO_4 to pH <2	28 days

Parameter	Number/Type of Containers per Sample	Preservative	Holding Time
Total Organic Carbon			
Total Organic Carbon	3 × 40-mL amber VOA vials, Teflon-lined lid or 2 × 250-mL amber glass, Teflon-lined lid	Cool to ≤6°C and adjust to pH <2 with H_2SO_4 or H_3PO_4	28 days
Metals			
Total and Dissolved Lead	2 × 250-mL HDPE containers	Cool to ≤6°C and adjust to pH <2 with HNO_3	180 days
Ethanol			
2-(2-Butoxyethoxy) ethanol	2 × 40-mL VOA vials w/ HCl, Teflon-lined septum caps	No headspace, cool to ≤6°C and adjust to pH <2 with HCl	14 days

°C degree Celsius
H_2SO_4 sulfuric acid
H_3PO_4 phosphoric acid
HCl hydrochloric acid
HDPE high-density polyethylene
HNO_3 nitric acid
L liter
mL milliliter
N/A not applicable, holding times not provided
$NaHSO_4$ sodium hydrogen sulfate

[a] *x* days / *y* days = *x* days from sample collection to extraction / *y* days for analysis of extracts following extraction

Table 5: Soil Sample Containers (Unconsolidated Material), Preservatives, and Holding Times

Parameter	Number/Type of Containers per Sample	Preservative	Holding Time
TPH-g, VOCs			
TPH-g, Benzene, Toluene, Ethylbenzene, Total Xylenes	2 × 10-mL water-preserved with magnetic stir bar; 1 × 5-mL methanol-preserved; Teflon-lined septum caps	Cool to 6°C or frozen at -7°C	Samples shipped at 6°C must be received by laboratory within 48 hours and frozen upon receipt; samples frozen must be analyzed within 14 days
TPH			
TPH-d, TPH-o	1 × 8-oz. glass jar, Teflon-lined lid	Cool to 6°C or frozen at -7°C	14 days / 40 days [a]
PAHs			
1MN, 2MN, N	1 × 8-oz. glass jar, Teflon-lined lid	Cool to 6°C or frozen at -7°C	14 days / 40 days [a]

°C degree Celsius
mL milliliter
oz. ounce
[a] *x* days / *y* days = *x* days from sample collection to extraction / *y* days for analysis of extracts following extraction

6.2 Chain of Custody

Chain-of-custody documentation was maintained for samples during all phases of sample collection, transport, and receipt and internal transfer within the laboratory.

6.3 Laboratory Analytical Methods

Groundwater samples were analyzed for the analytes specified in Section 5.3 using the following tests and analytical methods:

- TPH-d and TPH-o by Method 8015, including 3510 extraction
- TPH-g by Method 8260 or 8015
- VOCs by Method 8260
- SVOCs (including N, 1MN, and 2MN) by Method 8270
- PAHs by Method 8270 with SIM
- TOC by Method 9060A
- Methane by Method 8015 or RSK-175
- Lead scavengers by Methods 8011 and 8260

- Total and dissolved lead by Method 6020
- Ferrous iron by Standard Method 3500-Fe
- Anions (nitrate as nitrogen, sulfate, and chloride) by EPA Method 300.0
- Nitrate-nitrite as nitrogen by EPA Method 353.2
- Alkalinity (total, bicarbonate, and carbonate) by SM2320B

7.0 Field Observations during Sampling

Field observations made during the NOI soil vapor and groundwater sampling activities this reporting period are described below.

7.1 Soil Vapor Monitoring Observations

During this reporting period, NOI soil vapor monitoring was conducted weekly at the below-tank SVMPs and monthly plus additional out-of-frequency monitoring at the subslab and shallow SVMPs installed in the tunnel system by Adit 3 near Red Hill Shaft (see Section 5.1).

Three Adit 3 subslab SVMPs (A3-075, A3-125, and A3-225) have been consistently poor vapor producers, with sampling results designated as "tight" to indicate vacuum is pulled when sampling and readings could not be obtained potentially due to low-permeability soil directly underneath the tunnel floor.

7.2 Free Product Gauging and Groundwater Monitoring Well Headspace Observations

A summary of free product gauging and groundwater monitoring well headspace measurements is provided in Appendix B.2. No free product was observed during the reporting period in any groundwater monitoring well during any sampling event, regardless of the detection method used (either oil/water interface probe or bailer). RHMW12A, RHMW16, OWDFMW01, OWDFMW04A, OWDFMW05A, OWDFMW07A, and OWDFMW08A have submerged well screens. RHMW11, RHMW13, RHMW14, and RHMW15 are closed systems with sampling ports below the water level surface. Free product would likely not be able to enter these wells, and field checks verified that free product was not present in the samples from these wells.

Groundwater monitoring well headspace concentrations were generally low. The maximum headspace reading was reported at OWDFMW01, for which a headspace PID reading of 5.3 parts per million by volume (ppmv) was recorded on November 18, 2022. No free product was detected, and no odor was observed. All other readings were 1.7 ppmv or less and occurred only occasionally throughout the reporting period.

For delineation wells installed in the vicinity of Red Hill Shaft, headspace readings were generally 0.0 ppmv with some occasional readings of 0.3 ppmv or less. One well (RHP04B) had more than one reading above 0.0 ppmv, with measurements of 0.3 ppmv recorded on December 23, 2022 and January 13, 2023.

Headspace readings at sentinel well NMW24 were generally 0.0 ppmv, with one measurable reading of 0.1 ppmv on December 22, 2022.

Adit 3 Site Characterization Activities. Headspace measurements and groundwater levels were collected weekly from borings associated with the LNAPL site characterization effort following the boring and temporary well installation conducted between July 13 and September 19, 2022 (see Section 5.3.2). Results will be reported in a forthcoming Adit 3 and Pearl Harbor Tunnel Area technical memorandum.

7.3 Groundwater Sampling Observations

The following observations were made during NOI groundwater sampling this reporting period:

- An organic odor was noted during most sampling events at RHMW02. Suspended flocculants were observed in most bailer pulls at RHMW02.
- Organic odors were noted intermittently at RHMW03.
- An unknown chemical odor was noted intermittently at RHMW2254-01.
- A decaying organic odor was noted at RHMW11 during most sampling events.

8.0 Data Quality

Field and laboratory QC measures are described below. When applicable, corrective actions were implemented when control limits for field or laboratory QC measurements were not met.

8.1 Laboratory Quality Control

The following laboratory QC samples for soil vapor Summa canisters and groundwater samples were collected and analyzed.

8.1.1 Soil Vapor Samples

Laboratory QC samples included method blank, laboratory control sample (LCS), and laboratory control sample duplicate (LCSD) analyses.

8.1.2 Groundwater Samples

Laboratory QC samples included method blanks, LCSs/LCSDs, matrix spikes/matrix spike duplicates (MSs/MSDs), and duplicates, as described in the DoD *Quality Systems Manual Version 5.4* (DoD and DOE 2021) and the AOC *Red Hill Sampling and Analysis Plan Addendum 01* (DON 2017d).

8.2 Field Quality Control

Field QC samples for groundwater including trip blanks and equipment rinsates were collected according to procedures described in NAVFAC Pacific Environmental Restoration Program Project Procedure III-B, *Field QC Samples* (Water, Soil) (DON 2015). Field QC samples are listed in Table 6.

Table 6: Measurement Performance Criteria – Field QC Samples

QC Sample	Analytical Group [a]	Frequency [b]	DQI	Measurement Performance Criteria
Field duplicate	VOCs, TPH-g, TPH-d, TPH-o, PAHs, SVOCs	10% of primary samples collected per matrix per analytical method	Field sampling precision	RPD ≤50% water [c]
Trip blank	VOCs, TPH-g, methane, lead scavengers	At minimum, one per cooler containing VOCs, TPH-g, methane, or lead scavenger samples	Contamination during sample transport	≤1/2 of LOQ
Non-Program Required Field QC				
Field blank	PAHs, SVOCs, VOCs	1–2 per week; evaluate decontamination water	Adequacy of the decontamination water quality or potential for contamination due to field conditions	≤1/2 of LOQ
Equipment blank [d]	PAHs, SVOCs	2–4 per week	Adequacy of the decontamination process	≤1/2 of LOQ

% percent
DQI data quality indicator
LOQ limit of quantitation
RPD relative percent difference
[a] See Section 6.0 for the list of analytes within analytical groups.
[b] Per Project Procedures Manual Procedure III-B, Field QC Samples (DON 2015); see Procedure III-B, Section 5 for a summary of QC samples by project location, matrix, and analytical group.
[c] Per Project Procedures Manual Section II, *Data Validation Procedures* (DON 2015).
[d] As all monitoring locations have dedicated bladder pumps and dedicated bailers, no reusable sampling equipment is used; thus, equipment blank was collected as necessary.

In addition, unexpected detections of phthalate and PAH compounds were observed in the data set, and collection of extra field blanks and equipment blanks was added for PAHs and SVOCs beginning the week of March 7, 2022. Field blanks were collected by pouring decontamination water directly into the sample bottles, and equipment blanks were collected by pouring decontamination water over the water level indicator and collecting the rinsate into sample bottles.

8.3 Data Quality Assessment

The objective of data validation is to provide data of known quality for project decisions. Data quality is judged in terms of precision, accuracy, representativeness, comparability, completeness, and sensitivity. The analytical laboratory data for the groundwater sampling events were submitted

to a third-party data validator, ESI (Environmental Standards, Inc.) or EDS (Environmental Data Services, Ltd.), for data validation and assessment. Validated data for this reporting period that are pending will be provided in the next Quarterly RRR. The following summary includes results from previous reporting periods that completed full data validation during this reporting period.

8.3.1 Precision

Precision is defined as the reproducibility of replicate measurements. Precision is evaluated by the relative percent difference (RPD) of field duplicates (FD), LCS/LCSD, MS/MSD, and laboratory duplicate results. Field duplicate and MS/MSD samples were collected at a rate of approximately 10 percent of primary samples. Field duplicates were sent to the laboratory along with the primary samples.

The following exceptions to sample RPDs meeting the measurement performance criterion were reported during data validation:

- October 17 and November 11, 2022: Results for N, 1MN, and 2MN at RHP03 and RHP04A, TPH-d at RHP04A and RHP04B, and TPH-o at RHP04B were flagged as estimated (J) due to high RPDs between the LCS and LCS duplicate.
- November 7, 2022: Dissolved lead non-detect results for RHMW14-03 and RHMW13-05 were flagged with an estimated value (UJ), Total lead detected results for RHMW09, RHMW12A, RHMW19, and RHMW13-05 and dissolved lead detected results for RHMW16, RHMW09, RHMW12A, and RHMW19 were qualified as estimated with low bias (J-) due to significant negative instrument bias observed in the instrument and method blank.

8.3.2 Accuracy

Accuracy is defined as the degree of conformity of a measurement to a standard or true value. Accuracy is evaluated through measurement of the percent recovery (%R) of an analyte in a reference standard or spiked sample. Accuracy also encompasses the percent difference (%D) between the initial calibration verification and the continuing calibration verification. Accuracy limits for internal standards, surrogates, LCS, MS, and MSD samples are either prescribed by the DoD or established by the individual laboratory. The acceptance criteria for accuracy are dependent on the analytical method and based on historical laboratory or DoD data. The following data were outside QC limits:

- October 21, 2022: N, 1MN, and 2MN results for RHP02 were rejected (R) due to surrogate recoveries below the lowest acceptance limit.
- October 21 and November 19, 2022: Non-detect BTEX results for RHP01 and RHP02 were flagged as estimated (UJ) due to internal standard responses outside the acceptance range.
- November 8 and 14, 2022: Pyridine results for OWDFMW04A, OWDFMW04A FD, OWDFMW05A, OWDFMW07A, OWDFMW08A, OWDFMW08A FD, RHMW04,

RHMW04 FD, RHMW08, RHMW13-05, and RHMW15-05 were flagged to recommend exclusion of the data (R) since LCS/LCSD %Rs recovered lower than the lowest acceptance limit.

- November 11, 2022: Chloride and sulfate results for RHP04B were flagged as estimated with a low bias (J-) due to matrix spike recoveries below the acceptance limits.
- November 11–28, 2022: 4-nitrophenol results for multiple monitoring wells and Adit 3 Sump were flagged to recommend exclusion of the data (R) since LCS/LCSD %Rs recovered lower than the lowest acceptance limit.
- November 11 and 22, 2022: All SVOC acid results for OWDFMW08A FD and RHMW05 were flagged to recommend exclusion of the data (R) since surrogate %Rs recovered lower than the lowest acceptance limit.
- November 14, 2022: Chrysene MS/MSD %Rs for RHMW04 and RHMW04 FD recovered lower than the acceptance limit; non-detect results were flagged as estimated (UJ).
- November 15, 2022: N, 1MN, and 2MN results for RHP01 were flagged as estimated (UJ) due to low surrogate recoveries.
- November 18 and 19, 2022: Non-detect BTEX results for RHP04B and RHP02 were flagged as estimated (UJ) due to low surrogate recoveries.
- November 18, 19, 21, and 22, 2022: TPH-g surrogate %Rs for OWDFMW01, OWDFMW05A, OWDFMW07A; SVOC acid compounds for OWDFMW07A and RHMW13-05; and TPH-g for RHMW04, RHMW04 FD, and RHMW06 recovered lower than the acceptance limit; non-detect results were flagged as estimated (UJ).
- November 19, 2022: 4-nitrophenol and pyridine MS/MSD %Rs for RHMW08 recovered lower than the acceptance limit; non-detect results were flagged as estimated (UJ).
- November 22, 2022: All SVOC acid results for OWDFMW08A FD were flagged to recommend exclusion of the data (R) since surrogate %Rs recovered lower than the lowest acceptance limit.
- November 22, 2022: All dissolved lead results for Adit 3 Sump, RHMW01R, RHMW02, RHMW05, RHMW12A, RHMW13-05 %Rs recovered higher than the acceptance limit; detected results has been flagged estimated (J).
- November 22, 2022: TPH-g internal standard area counts for RHMW03, RHMW15-05, RHMW17, and RHMW2254-01 (bailer) recovered lower than the acceptance limit; non-detect results were flagged as estimated (UJ).
- November 30, 2022: 4-nitrophenol and 4,6-dinitro-2-methylphenol results for RHMW02, RHMW03, RHMW04, RHMW04 FD, and RHMW06 were flagged to recommend exclusion of the data (R) since LCS/LCSD %Rs recovered lower than the lowest acceptance limit.

- November 30, 2022: Base/neutral SVOC non-detect results for RHMW02 were flagged as estimated (UJ), and 4-chlorophenyl phenyl ether detected results were flagged as estimated low (J-) due to low surrogate %Rs

Absence of headspace ensured that results for TPH-g, full suite VOCs, lead scavengers, and methane were not subjected to VOC loss. During this reporting period, non-detect methane results for monitoring well OWDFMW07A was flagged as estimated (UJ), and detected results for OWDFMW05A was flagged as estimated low (J-) due to significant headspace (>6 millimeters).

Data associated with poor recoveries of QC samples, or high opening or closing continuing calibration verification (CCV) %Ds were flagged as not-detected (UJ) with an estimate value for two sampling events for TPH-g, along with multiple full list VOC and SVOC compounds:

- November 9, 19, and 22, 2022: Non-detect TPH-g results for RHP04B, RHP01, and RHP02 were flagged as estimated (UJ) due to CCV %Ds above the acceptance limit.
- November 11 and December 9, 2022: TOC results for RHP04B and NMW24 were flagged as estimated (J) due to CCV %Ds above the acceptance limit.
- November 18 and 22, 2022: TPH-g non-detect results were flagged with an estimated value (UJ) for OWDFMW01, OWDFMW05A, OWDFMW07A, RHMW04, RHMW04 FD, and RHMW12A.
- VOC compounds including 1,1,2,2-tetrachloroethane, 2-butanone, dichlorodifluoromethane, and trichlorofluoromethane were flagged with an estimated value (UJ) for multiple monitoring wells and Adit 3 Sump due to high CCV %Ds and decreasing instrument sensitivity.
- Multiple SVOC compounds were qualified with an estimated value (UJ) for multiple monitoring wells and Adit 3 Sump: 2,2'-oxybis(1-chloropropane), 3,3'-dichlorobenzidine, hexachlorocyclopentadiene, 2,4-dimethylphenol, 2,4-dinitrophenol, 4,6-dinitro-2-methylphenol, di-n-octyl phthalate, bis(2-ethylhexyl) phthalate, nitrobenzene, isophorone, and 4-nitrophenol.

Additionally, sample results from monitoring wells RHMW09, RHMW12A, RHMW13-05, RHMW14-03, RHMW16, and RHMW19 were recommended for exclusion due to very low %Rs or high CCV %Ds in associated QC samples for VOC compounds, such as dichlorodifluoromethane.

Additionally, sample results for multiple monitoring wells and Adit 3 Sump were recommended for exclusion due to very low %Rs or high CCV %Ds in associated QC samples for SVOC compounds 2,4-dinitrophenol and 4,6-dinitro-2-methylphenol.

SVOC compounds are subject to high variability, particularly if the instrument is contaminated with high-boiling-point compounds. Pyridine can also undergo loss during sample preparation. Additionally, compounds such as n-nitrosodimethylamine distribute poorly into the extraction

solvent, particularly with Method 3510. Poor recoveries may also indicate that the matrix is suppressing the signal.

No other accuracy concerns identified during validation affected the sample results. A summary table of SVOC results with validation qualifiers for groundwater samples collected during the current reporting period is provided in Appendix B.4.3.

8.3.3 Representativeness

Representativeness is the degree to which data accurately and precisely represent a characteristic of a population, parameter variations at a sampling point, or an environmental condition. Representativeness can be supported by using regulator-approved, industry-standard sampling and analysis protocols that were developed to address a specific data quality objective of the sampled medium.

During the NOI sampling rounds for this quarter:

- Groundwater samples were collected in accordance with procedures described in the DOH-approved AOC Statement of Work Sections 6 and 7, Work Plan/Scope of Work (DON 2017a) and the associated project Sampling and Analysis Plan and addenda (DON 2017b; 2017c; 2017d), including standardized sample collection methods identified in NAVFAC Pacific Environmental Restoration Program Project Procedure I-C-3, Monitoring Well Sampling (DON 2015):
  - This procedure outlines collection of groundwater samples from a specific depth directly beneath the water table using a low-flow pumping strategy. Samples consist generally of dissolved constituents within the aquifer; the samples will not collect LNAPL or compounds in the LNAPL/groundwater interface (if one existed).
  - Results from these samples represent groundwater from one depth, below the water table.
- Groundwater samples from wells that are screened across the water table were collected with a bailer, based on DOH's request:[1]
  - Sampling with a bailer was requested to collect water at the groundwater/air interface along with any potential LNAPL that may be present. Sampling with a bailer may introduce air and turbulence to the sample, which may volatilize VOCs in the groundwater matrix. The bailer technique is also less repeatable and therefore adds a degree of variability into the results, which may be less representative of actual conditions at the water table.
  - In addition, DOH requested no purging be associated with this method; therefore, the methodology is likely to be affected by any localized equilibrium within the well and filter pack, and the results may not represent water flowing through the aquifer.

[1] Email from L. Galvez, DOH-HEER, to S. Eng, Navy Region Hawaii; May 28, 2021.

– This methodology is contrary to the DOH TGM (DOH 2021c), which "recommends that low-flow purging and sampling approaches be utilized whenever feasible in order to improve the representativeness of the sample data."

Samples were collected at RHMW2254-01 using both a bailer and low-flow pump. The results are presented in Appendix B.4, and TPH-d and TPH-o data are summarized in Table 7. As shown in the table, both bailer and low-flow samples for this reporting period were not detected for TPH-d and TPH-o. Previous Quarterly RRRs with TPH-d and TPH-o detected results indicated that the bailer sampling methodology resulted in higher reported concentrations, particularly in the TPH-o analyses. The DOH TGM (DOH 2021c) states that the low-flow sampling results after purging are more "representative of water in the surrounding [aquifer] formation."

Table 7: Comparison of TPH-d and TPH-o Results at RHMW2254-01 – Bailer vs. Low-Flow Pump SOPs

Sample Date	TPH-d (µg/L)			TPH-o (µg/L)		
	Bailer	Low-Flow Pump	RPD (%)	Bailer	Low-Flow Pump	RPD (%)
11/22/2022	100 U	100 U	—	300 U	310 U	—

Notes:
Bold indicates detected results above the detection limit.

—	not calculable due to non-detect result
%	percent
µg/L	micrograms per liter
J	estimated concentration
N/A	not applicable
RPD	relative percent difference
SOP	standard operating procedure
U	not detected above the detection limit

During the delineation well sampling rounds for this quarter, groundwater samples were collected in accordance with standardized sample collection methods identified in NAVFAC Pacific Environmental Restoration Program Project Procedure I-C-3, *Monitoring Well Sampling* (DON 2015):

- This procedure outlines collection of groundwater samples from a specific depth directly beneath the water table using a low-flow pumping strategy. Samples consist generally of dissolved constituents within the aquifer; the samples will not collect LNAPL or compounds in the LNAPL/groundwater interface (if one existed). However, visual checks and oil/water interface measurements indicate that no LNAPL was present when these wells were sampled.
- Results from these samples represent groundwater from one depth, below the water table.

The sentinel well (NMW24) sampling was conducted using a bailer without purging the well, similar to the procedure used for NOI wells screened across the water table. The bailer technique

is less repeatable and therefore adds a degree of variability into the results, which may be less representative of actual conditions at the water table. Sampling without purging is likely to be affected by any localized equilibrium within the well and filter pack, and the results may not represent water flowing through the aquifer.

Representativeness is also evaluated through compliance with the method-recommended sample holding time and sample preservation methods and through the analysis of blank samples, including method blank, equipment blank, field blank, and trip blank samples (DoD 2021). All sample holding times, sample preservation, and any impacts of associated blank contamination have been evaluated in accordance with EPA SW-846 method recommendations and DoD *Quality Systems Manual Version 5.4* (DoD and DOE 2021) during validation. The following detected sampling results were reported below the limit of detection (LOD) and were qualified as not detected (U) at the LOD due to field, equipment, or trip blank contamination:

- Total xylene and o-xylene: Three collection events for OWDFMW01, OWDFMW04A, OWDFMW05A, OWDFMW08A, OWDFMW08A FD, RHMW04, RHMW04 FD, RHMW06, RHMW08, RHMW09, RHMW11-05, RHMW13-05, RHMW15-05 and RHMW19
- Chloromethane: One collection event for OWDFMW08A
- Total lead: Five collection events for OWDFMW05A, OWDFMW07A, RHMW01R, RHMW11-05, RHMW13-05, RHMW14-03, RHMW15-05, RHMW17, and RHMW2254-01 (bailer)
- Dissolved lead: One collection event for OWDFMW07A, OWDFMW08A, and RHMW15-05
- Total organic carbon: One collection event for OWDFMW01
- Trichloroethene: One collection event for RHMW06

The following detected results reported above the LOD and less than or equal to five times the blank contamination, were flagged as estimated, bias high (J+) due to field, equipment, or trip blank contamination:

- Total lead: Two collection events for OWDFMW04A, OWDFMW08A, and RHMW04
- Dissolved lead: One collection event for RHMW02

In addition, for one sampling event, total and dissolved lead detected results for RHMW09 were flagged as estimated, biased low (J-) due to a negative instrument bias observed in the instrument blank analyses.

Pending validation, detections in the field blanks and equipment blanks are summarized to aid in discussion of the analytical results. Field blank and equipment blank detections with final results are shown in Table 8.

Table 8: VOC/PAH/SVOC Field Blank and Equipment Blank Final Results

J estimated: the analyte was positively identified; the quantitation is an estimation
LB lab blank
ND not detected
µg/L microgram per Liter

All samples were associated with laboratory calibration, preparation, or extraction blanks. The following detected sampling result was reported below the LOD and were qualified as not detected (U) at the LOD due to laboratory calibration, preparation, or extraction blank contamination:

- Nitrate-nitrite: Results for the RHP04B field duplicate collected November 9, 2022 and the RHP04B primary sample collected November 11, 2022

The following detected sampling result reported above the LOD and less than or equal to five times the blank contamination was flagged as estimated with a high bias (J+) due to laboratory calibration, preparation, or extraction blank contamination:

- Nitrate-nitrite: Result for RHP04B collected November 9, 2022

The following sampling results were flagged as estimated for the specified methods due to samples being extracted or analyzed beyond the method-recommended holding times:

- November 7, 14, and 18, 2022: Non-detect results for TPH-d/o were qualified as estimated (UJ) for OWDFMW04A FD, RHMW11-05, and RHMW13-05 due to extraction beyond the 7-day holding time.
- November 9, 2022: Ferrous iron results for RHP04B and RHP04B field duplicate were flagged as estimated (J) due to analysis beyond the 7-day holding time.
- November 11, 2022: Non-detect TPH-g, TPH-d, TPH-o, and BTEX results for RHP03 were flagged as estimated (UJ) due to extraction or analysis beyond the 14-day holding time.
- November 14, 2022: The non-detect result for pentachlorophenol was qualified as estimated (UJ) for the RHMW19 sample due to extraction beyond the 7-day holding time to confirm a false positive due to laboratory cross contamination.
- November 16 and 22 and December 9, 2022: Non-detect TPH-d and TPH-o results for RHP04A, RHP02, and NMW24 were flagged as estimated (UJ) due to extraction beyond the 14-day holding time.
- November 18 and 19, 2022: Non-detect results for TPH-g was qualified as estimated (UJ) for OWDFMW01, OWDFMW05A, OWDFMW07A, and RHMW16 due to sample extraction occurring beyond the 14-day holding time.
- November 19–21, 2022: Non-detect results for 1,2,3-trichloropropane from Adit 3 Sump and ethylene dibromide from OWDFMW01, OWDFMW07A, RHMW04, RHMW06, RHMW08, RHMW19, and Adit 3 Sump were qualified as estimated (UJ) due to sample extraction occurring beyond the 14-day holding time.
- November 20, 2022: The non-detect THP-g result for RHP03 was flagged as estimated (UJ) due to analysis beyond the 14-day holding time.

- December 9, 2022: The nitrate result for NMW24 was flagged as estimated with a low bias (J-) due to analysis beyond the 48-hour holding time.

No other representativeness concerns were identified during validation of the sample results.

8.3.4 Completeness

Completeness is defined as the overall percentage of valid analytical results (including estimated results) compared to the total number of analytical results reported by the analytical laboratory.

Validated data provided during the reporting period were not rejected and did not cause a data gap for the sampling events. The completeness of the data (99 percent) met the 90 percent completeness goal.

8.3.5 Comparability

Comparability expresses the confidence with which one data set can be compared to another. Comparability can be related to accuracy and precision because these quantities are measures of data reliability. Data with acceptable precision and accuracy are considered comparable if collection techniques, analytical procedures, methods, and reporting are equivalent.

The laboratories used standard analytical methods for all analyses. In all cases, the detection limits and LODs attained were below the specified limits of quantitation (LOQs). Target analytes detected below the LOQs flagged (J) by the laboratory are considered estimated. The data presented can be compared to and evaluated against regulatory standards as required for this report.

8.3.6 Sensitivity

The LOQs are established by the laboratory based on the LODs or instrument detection limits and limits established for the various methods. The LOQs and LODs for samples may require adjustment by the laboratory due to matrix interference or when high levels of target analytes necessitate dilution before analysis. Matrix interference and sample dilutions decrease sensitivity and increase the LOQs/LODs. No results in this data set had increased LOQs or LODs that impacted sensitivity and data usability.

8.4 Conclusions

The precision, accuracy, representativeness, comparability, completeness, and sensitivity criteria are being evaluated by Environmental Standards, Inc. in Valley Forge, Pennsylvania, and Environmental Data Services, Ltd. in Pittsburgh, Pennsylvania, the project third-party data validators for NOI, delineation, and sentinel wells. Complete validation reports received to date are indexed in Appendix D.

Groundwater sample analysis and third-party data validation are ongoing and pending completion for a number of samples collected during this reporting period; these outstanding sample results

will be included in the next Quarterly RRR. Laboratory and field data quality will be fully assessed pending availability of additional laboratory and third-party data validation reports.

The third-party data assessment for the provided data concluded that all data generated during the sampling events reported herein are usable for the intended purpose with the limitations described above.

9.0 Analytical Results

Analytical results for soil vapor and groundwater samples collected during the current reporting period are presented below, along with the results of free product gauging and headspace measurements performed as part of the NOI groundwater sampling.

9.1 Soil Vapor Analytical Results

9.1.1 Below-Tank Sampling Locations

9.1.1.1 Field Measurements

AOC soil vapor measurements collected under the fuel storage tanks since January 2014 are charted in Appendix A.1, NOI soil vapor measurements are tabulated in Appendix A.2, and chromatograms for Summa canister samples collected under Tanks 15, 17, 18, and 20 are presented in Appendix A.3.

9.1.1.2 Fixed-Base Laboratory Measurements

Soil vapor analytical data reports for Summa canister samples collected underneath the fuel storage tanks are indexed in Appendix C. The following subsections present analytical results for soil vapor samples, including VOCs, carbon dioxide, oxygen, and methane. With the exception of SV18S and SV18D, laboratory results for below-tank SVMPs during this reporting period were consistent with recent monitoring periods, indicating that the impacts from the May 2021 Release have dissipated. The results from SV18S and SV18D are discussed in Section 9.1.1.3.

9.1.1.3 Results from SV18S and SV18D

On December 20, 2022 the PID readings at SV18S and SV18D were 54,890 parts per billion by volume (ppbv) and 21,220 ppbv, respectively, higher than any prior reading collected from these two locations since September 2021 (Figure 10). Tank 18 has only two SVMPs (i.e., there is no SV18M). Similar increases in PID readings were not noted at the SVMPs below Tanks 17, 20, or other tanks. As a result of the elevated PID readings, Summa canister samples were collected from SV18S and SV18D for laboratory analysis. For the six weekly monitoring events completed after December 20, 2022 and included in this report (i.e., December 27, 2022 to February 1, 2023), the PID readings for SV18S and SV8D ranged from 1,810 to 7,247 ppbv, within the range observed during the months prior to the elevated readings recorded on December 20, 2022.

Laboratory results for the December 20, 2022 SV18S and SV18D Summa canister samples were reviewed to determine whether these results suggest a new release of JP-5.

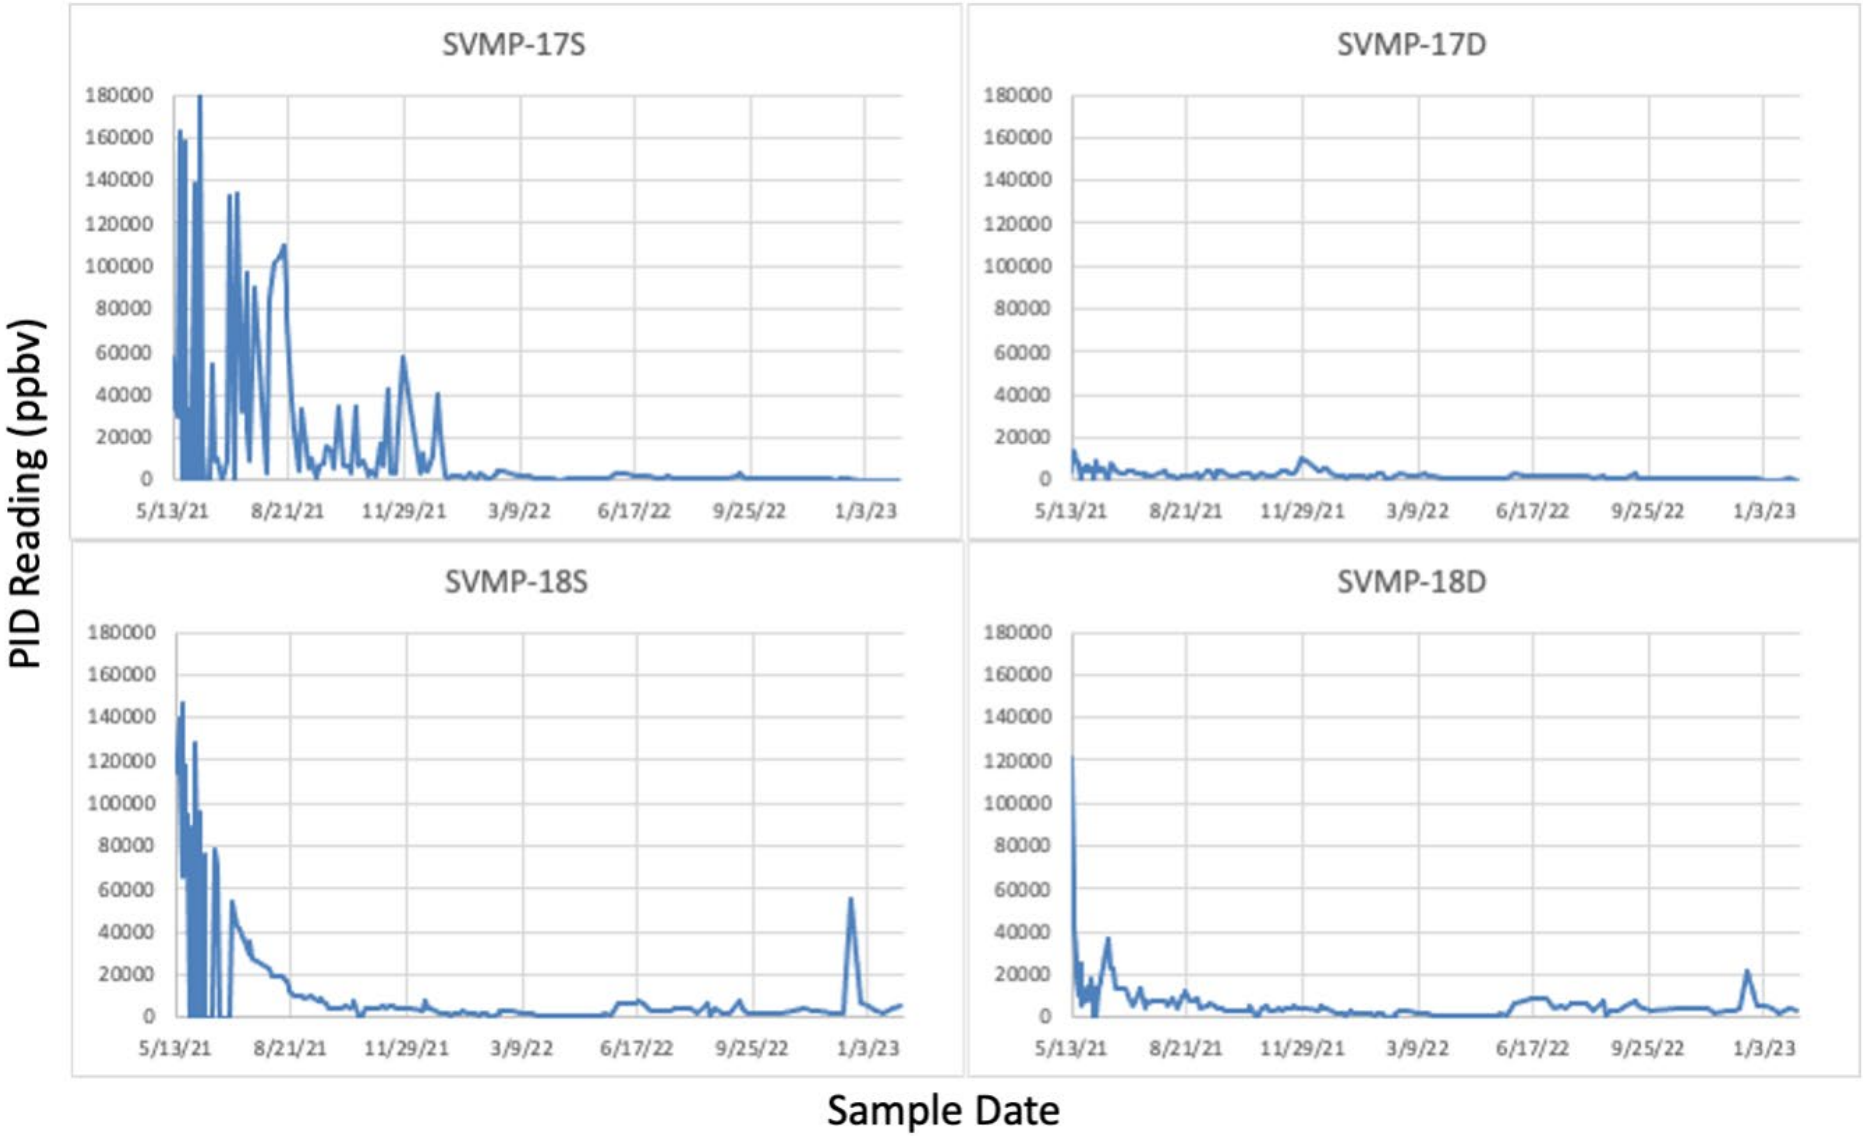

Figure 10: PID Readings Over Time from SV17S, 17D, 18S, and 18D

Factors Potentially Indicative of a New Release: Based on the laboratory results from samples collected shortly after the May 2021 Release, two factors may be reviewed to see if they suggest a new release of JP-5 fuel:

- **JP-5 Release Indicator Compounds:** As documented in the Quarterly RRRs submitted in 2021 and 2022, five individual petroleum constituents (4-ethyltoluene, ethylbenzene, total xylenes, 1,3,5-trimethylbenzene, and 1,2,4-trimethylbenzene) were most characteristic of the May 2021 JP-5 Release. Concentrations of these indicator compounds above 1,000 $\mu g/m^3$ were observed during the May and June 2021 sampling events in samples from SV17S, SV18S, and SV20M. If a new release of JP-5 occurred, then high concentrations (e.g., greater than 100 $\mu g/m^3$) of these five compounds would be expected in Summa canister samples collected after this new release occurred.
- **n-Alkane Peaks in FID Chromatograms:** The flame ionization detector (FID) chromatograms (obtained from the Method TO-3 analyses) for the samples collected shortly after the May 2021 Release exhibited distinct peaks associated with three n-alkanes (n-decane, n-undecane, and n-dodecane). These peaks became less prominent over time as the release weathered. Results from the USGS' Bemidji, Minnesota research site indicate that n-alkanes biodegrade in the environment more rapidly than other petroleum constituents in petroleum mixtures (Baedecker et al. 2018). The disappearance of the n-alkane peaks from the FID chromatograms from May 2021 to July 2022 was consistent with this research finding. If a new release of JP-5 occurred, then distinct n-alkane peaks would be expected in the FID chromatograms.

Evaluation of Summa Canister Sample Test Results: All laboratory results for the May 2021 NOI testing are available in the JBPHH Red Hill EDMS and have been provided to DOH. The following were reviewed to evaluate whether the increased PID readings observed on December 20, 2022 at the Tank 18 SVMPs were indicative of a new release.

- **JP-5 Release Indicator Compounds:** Table 9 displays results from analyses of samples collected shortly after the May 2021 Release (May and June 2021), 8 and 14 months after the May 2021 release (January and July 2022), and immediately before and after the elevated PID readings observed on December 20, 2022 (i.e., December 13 and 20, 2022 and January 10, 2023). The results from December 20, 2022 show an increase in four of the five release indicator compounds compared to December 13, 2022; however, concentrations of these compounds remained far lower than measured in the first 2 months after the May 2021 release. Specifically, PID readings from SVMP-18S were comparable on June 14, 2021 (40,567 ppb) and December 22, 2022 (54,890 ppbv), but the concentrations of the five release indicator compounds was approximately 5 times higher in the June 14, 2021 sample (collected 1 month after the May 2021 release) compared to the December 20, 2022 sample. On January 10, 2023, the PID readings and release indicator compound concentrations were similar to those measured on December 13, 2022 prior to the elevated PID readings recorded on December 20, 2022. If the increased PID

reading on December 20, 2022 was attributable to a new release of JP-5, then the concentrations of release indicator compounds measured on December 20, 2022 and January 10, 2023 would likely have been similar to or greater than those measured in June 2021. The release indicator compound results suggest that the increase in PID reading on December 20, 2022 was likely not due to a new release of JP-5.

Table 9: JP-5 Release Indicator Compound Results for SVMP-18S

Sample Event	PID Reading (ppbv)	Petroleum Constituent Concentration (µg/m^3)				
		4-Ethyl toluene	Ethyl benzene	Total xylenes	1,3,5-TMB	1,2,4-TMB
Prior Readings						
5/13/2021	120,000	400	210	1300	610	2200
6/14/2021	40,567	49	16	140	110	330
1/17/2022	2,945	<2	2.2	10	2	3.9
7/12/2022	3,110	<2	<1.7	<1.7	<2	3.3
Current Reporting Period Readings						
12/13/2022	2,521	<1.4	<1.6	<1.6	1.9	2.7
12/20/2022	54,890	<2.4	2.9	22	34	58
1/10/2023	3,582	<1.8	<1.6	<1.6	2.4	1.9

Notes:
TMB trimethylbenzene

- **n-Alkane Peaks in FID Chromatograms:** As shown on Figure 11, the FID chromatograms for the SVMP-18S samples collected in May and June 2021 and January 2022 all show distinct peaks for three n-alkanes (n-decane, n-undecane, and n-dodecane). For these three samples, these peaks clearly extend above baseline of unresolved compounds present in the sample. Although the peaks are clear in all three chromatograms, the height above baseline decreases over time from the May and June 2021 to January 2022 samples. This pattern is consistent with a fresh release of JP-5 fuel in May 2021 followed by weathering over time. For the July 2022, December 13 and December 20, 2022, and January 10, 2023 FID chromatograms, the n-decane, n-undecane, and n-dodecane peaks do not extend above the baseline of unresolved compounds present in the sample. This pattern is consistent with weathered JP-5 fuel where the n-alkanes have been largely depleted from the fuel as a result of biodegradation. If a new release of JP-5 fuel had occurred in December 2022, then prominent n-alkane peaks would be expected in the FID chromatogram for the sample collected on December 20, 2022. The absence of distinct peaks for n-decane, n-undecane, and n-dodecane in the FID chromatogram for the December 20, 2022 sample indicates that the increase in PID reading on December 20, 2022 was likely not due to a new release of JP-5.

In summary, based on available laboratory results, the elevated PID reading at SV18S and SV18D observed on December 20, 2022 do not appear to be attributable to a new release of JP-5.

9.1.2 Adit 3 Tunnel Sampling Locations

9.1.2.1 FIELD MEASUREMENTS

SVMPs in the Adit 3 Tunnel were monitored monthly during this reporting period, with additional out of frequency monitoring conducted after rainfall events of greater than 1 inch within a 24-hour period. Figure 9 shows the results of soil vapor monitoring from subslab and shallow SVMPs installed in the floor of the Adit 3 and Pearl Harbor Tunnels since December 17, 2021. The origin for the Adit 3 Tunnel SVMPs (A3) is taken at the eastern edge of the Water Pumping Station doorway; coordinates are in feet, are positive (+) to the west and negative (-) to the east. The origin for the Pearl Harbor Tunnel SVMPs (2S) is at the Adit 3 merge centerline, with coordinates taken positive (+) to the south.

As shown on Figure 9, the results showed fluctuations over time on top of an overall decrease in concentrations measured since the commencement of monitoring in December 2021. The monitoring results for the seven out-of-frequency monitoring events conducted in November and December 2022 and February 2023 are consistent with results from monthly events associated with periods of lower precipitation. These results suggest that rainfall events greater than 1 inch within a 24-hour period do not have a discernable impact on PID monitoring results at the Adit 3 SVMPs.

9.1.2.2 FIXED-BASE LABORATORY MEASUREMENTS

No samples for analysis at a fixed-base laboratory were collected from Adit 3 Tunnel SVMPs during this reporting period.

9.2 Groundwater Monitoring Well Free Product Gauging and Headspace Measurements

Free product gauging results and headspace measurements collected through February 3, 2023 are presented in Appendix B.2. Free product was not detected at any monitoring location during this reporting period.

9.3 Groundwater and Adit 3 Sump Water Analytical Results

Groundwater samples were analyzed for the parameters and methods described in Section 6.0. Appendix B.1 provides a summary of samples collected, laboratory analytical methods, and status of sample delivery group reports. The sampling events covered in this report include those occurring within the current reporting period for which Level II and Level IV data packages have been issued and validated. Appendix B.4 provides cumulative groundwater monitoring well results compared to the EALs for each analyte group. Additionally, TPH results collected during the reporting period are graphically displayed over time in Appendix B.4.5. Final Level II and IV analytical reports and data validation reports are indexed in Appendix D.

Sampling procedures and analyses conducted vary between sampling programs, as described in Sections 5.3.1 through 5.3.5; therefore, the analytical results are reported in Sections 9.3.1 through 9.3.4.

9.3.1 NOI Groundwater Analytical Results

Summary statistics for all NOI groundwater samples completing validation during the current reporting period are described below and provided in Table 10.

Three hydrocarbon ranges are being analyzed as COPCs, including gasoline, diesel, and oil range hydrocarbons, which are representative of gasoline, middle distillates (kerosene, jet, and diesel fuels), and heavy oils (motor oil), respectively.

9.3.1.1 TPH-g

TPH-g was not detected at any well during this reporting period. No EAL exceedances were reported.

9.3.1.2 TPH-d

EAL exceedances detected in monitoring well samples during the reporting period are summarized in Table 10, and TPH-d detections are depicted on Figure 12. Exceedances were reported at in-tunnel wells RHMW02 (which consistently exceeds EALs) and RHMW03. The maximum detected concentrations for TPH-d in RHMW02 and RHMW03 were 3,000 µg/L and 470 µg/L, respectively. TPH-d was detected at in-tunnel wells RHMW01R and RHMW05, outlying multilevel wells RHMW11-05 and RHMW15-05, and sentinel well NMW24. The detections in these well were below 100 µg/L except for RHMW01R, which was 340 µg/L.

As depicted in Appendix B.5, the sample from RHMW02 exhibited chromatographic profiles with peaks spanning the carbon range (C10–C24) characteristic of some dissolved components of jet fuel and a "hump" due to metabolites in the TPH-d range, which is consistent with JP-5 and jet fuels in general. The chromatographic fingerprints from the detects at RHMW01R can be considered impacted by potential metabolites; however, broad peaks and baseline rise extending into the TPH-o carbon ranges have been observed. The other wells with TPH-d detections do not have chromatographic profiles consistent with those observed in RHMW02 or expected from dissolved fuel components. For example, the RHMW03 exceedance exhibited broad peaks and baseline rise sporadically dispersed throughout the TPH-o carbon range and extended into the TPH-d carbon ranges.

Acronyms and Footnotes:

CAS-Chemical Abstracts Service

J-estimated: the analyte was positively identified; the quantitation is an estimation

ND-not detected

µg/L-microgram per Liter

%-percent

Note[1]: The minimum and maximum detected values are given for each analyte. If the analyte was not detected in any sample, "ND" is shown for minimum or maximum detected values.

Note[2]: If the minimum or maximum result value occurs at more than one location only the location of the first occurrence is given.

[a] Includes normal and field duplicate samples.

[b] Does not include sample results rejected by validation.

[c] Wells sampled during this reporting period include the following: OWDFMW01, OWDFMW04A, OWDFMW05A, OWDFMW07A, OWDFMW08A, RHMW01R, RHMW02, RHMW03, RHMW04, RHMW05, RHMW06, RHMW08, RHMW09, RHMW11-05, RHMW12A, RHMW13-05, RHMW14-03, RHMW15-05, RHMW16, RHMW17, RHMW19, RHMW2254-01, and NMW24. Statistics for NMW24 only include the first sample collected November 22, 2022 under the NOI groundwater monitoring program.

TPH-d Sample Results

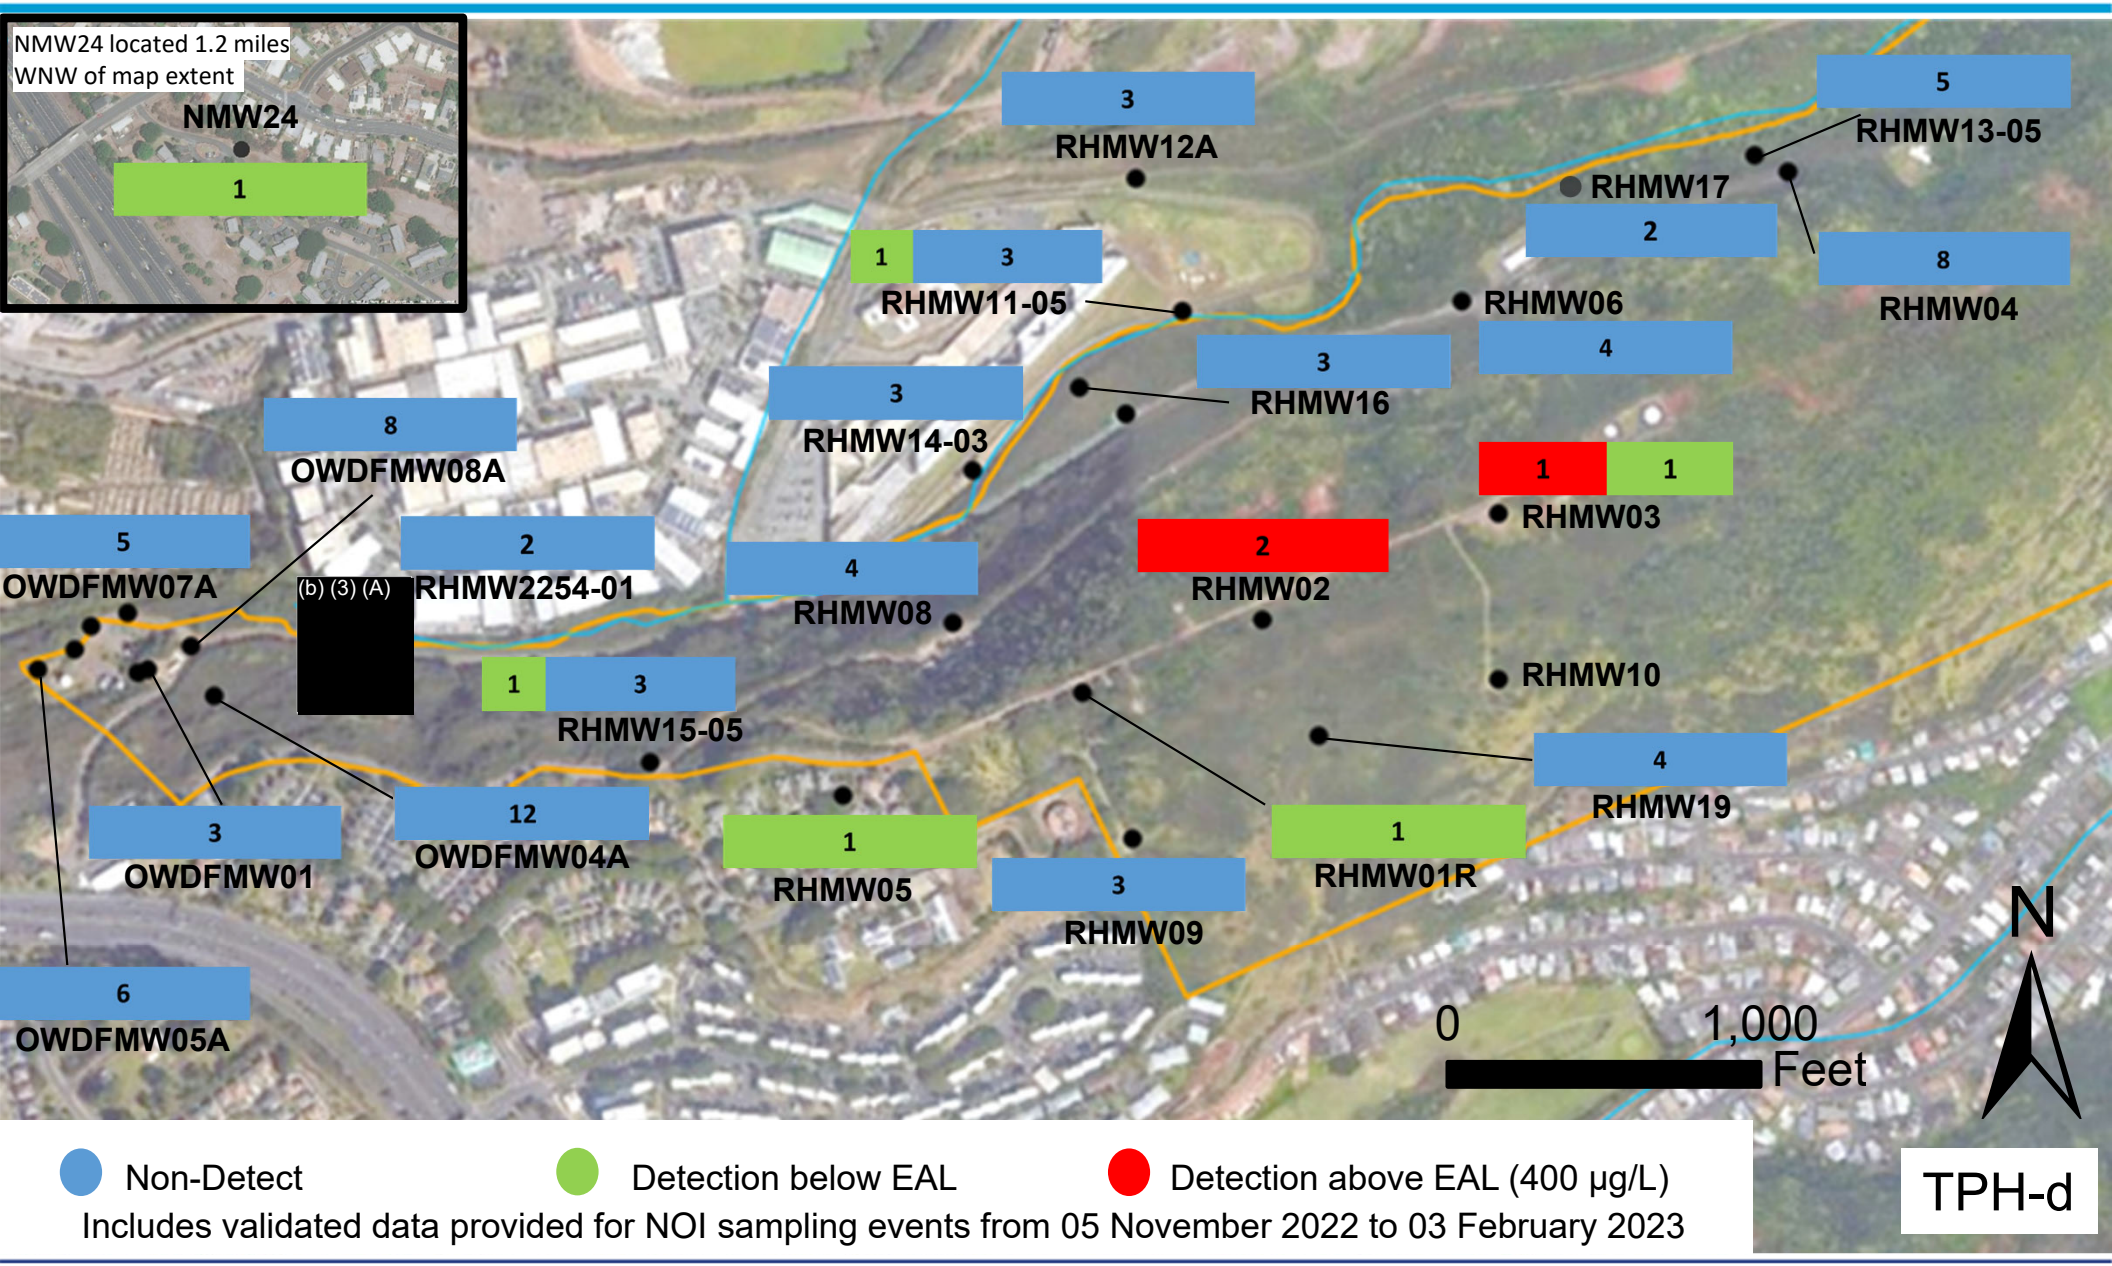

Figure 12: Summary of Groundwater Analytical Results for TPH-d

A summary of detected TPH-d sample concentrations from NOI monitored wells for the current reporting period is as follows:

- TPH-d concentrations at in-tunnel well RHMW02 and RHMW03 appear to be stable, with RHMW02 exhibiting historically consistent EAL exceedances, and RHMW03 sporadically exceeding the EAL.
- TPH-d concentrations at in-tunnel wells RHMW01R and RHMW05 appear to be stable and did not exceed the EAL.
- TPH-d was detected in one sample each at outlying wells RHMW11-05, RHMW15-05, and NMW24, but there were no detections in subsequent samples from the multilevel wells, and concentrations were all below the EAL. However, NMW24 had one detect in subsequent sampling events (see Section 9.3.3). Detections for all three wells were below 70 µg/L.
- TPH-d detections at RHMW2254-01 (Red Hill Shaft), which had consistent exceedances following the November 2021 Release, has had no EAL exceedances since March 2022 and low to no detections since then. TPH-d was not detected during this reporting period.

9.3.1.3 TPH-o

TPH-o EAL exceedances detected from monitoring wells during the reporting period are summarized in Table 10, and TPH-o detections are depicted on Figure 13. As shown on the figure:

- TPH-o was detected at in-tunnel wells RHMW01R, RHMW02, and RHMW05 during all sampling events; TPH-o concentrations remain stable.
- TPH-o was detected in one sample at sentinel well NMW24.
- As was the case in the previous reporting period, TPH-o was not detected in any other (besides NMW24) outlying well or at RHMW2254-01 during this reporting period.

One "exceedance" was reported at in-tunnel well RHMW03 (500 µg/L): the EAL for TPH-o is 500 µg/L. As depicted in Appendix B.5, the chromatographic fingerprint from RHMW03 exhibited broad peaks and baseline rise sporadically dispersed throughout the TPH-o carbon range and extended into the TPH-d carbon ranges; these are not consistent with the chromatographic profile seen in RHMW02 or recent fuel samples, and there is no clear indication that this TPH-o detection is related to a recent JP-5 release. RHMW03 has had TPH-o detections in the past; these may be associated with degradation of a heavier or older fuel source.

SGC performed on the groundwater extracts removed all the TPH-o concentration from most samples except for NMW24, indicating that TPH-o in the samples is composed of polar compounds, potentially including metabolites (i.e., heavily biodegraded and or weathered material). The material detected as TPH may also be unrelated to fuels and instead may be associated with naturally occurring organic matter or sampling or laboratory sample handling artifacts.

TPH-o Sample Results

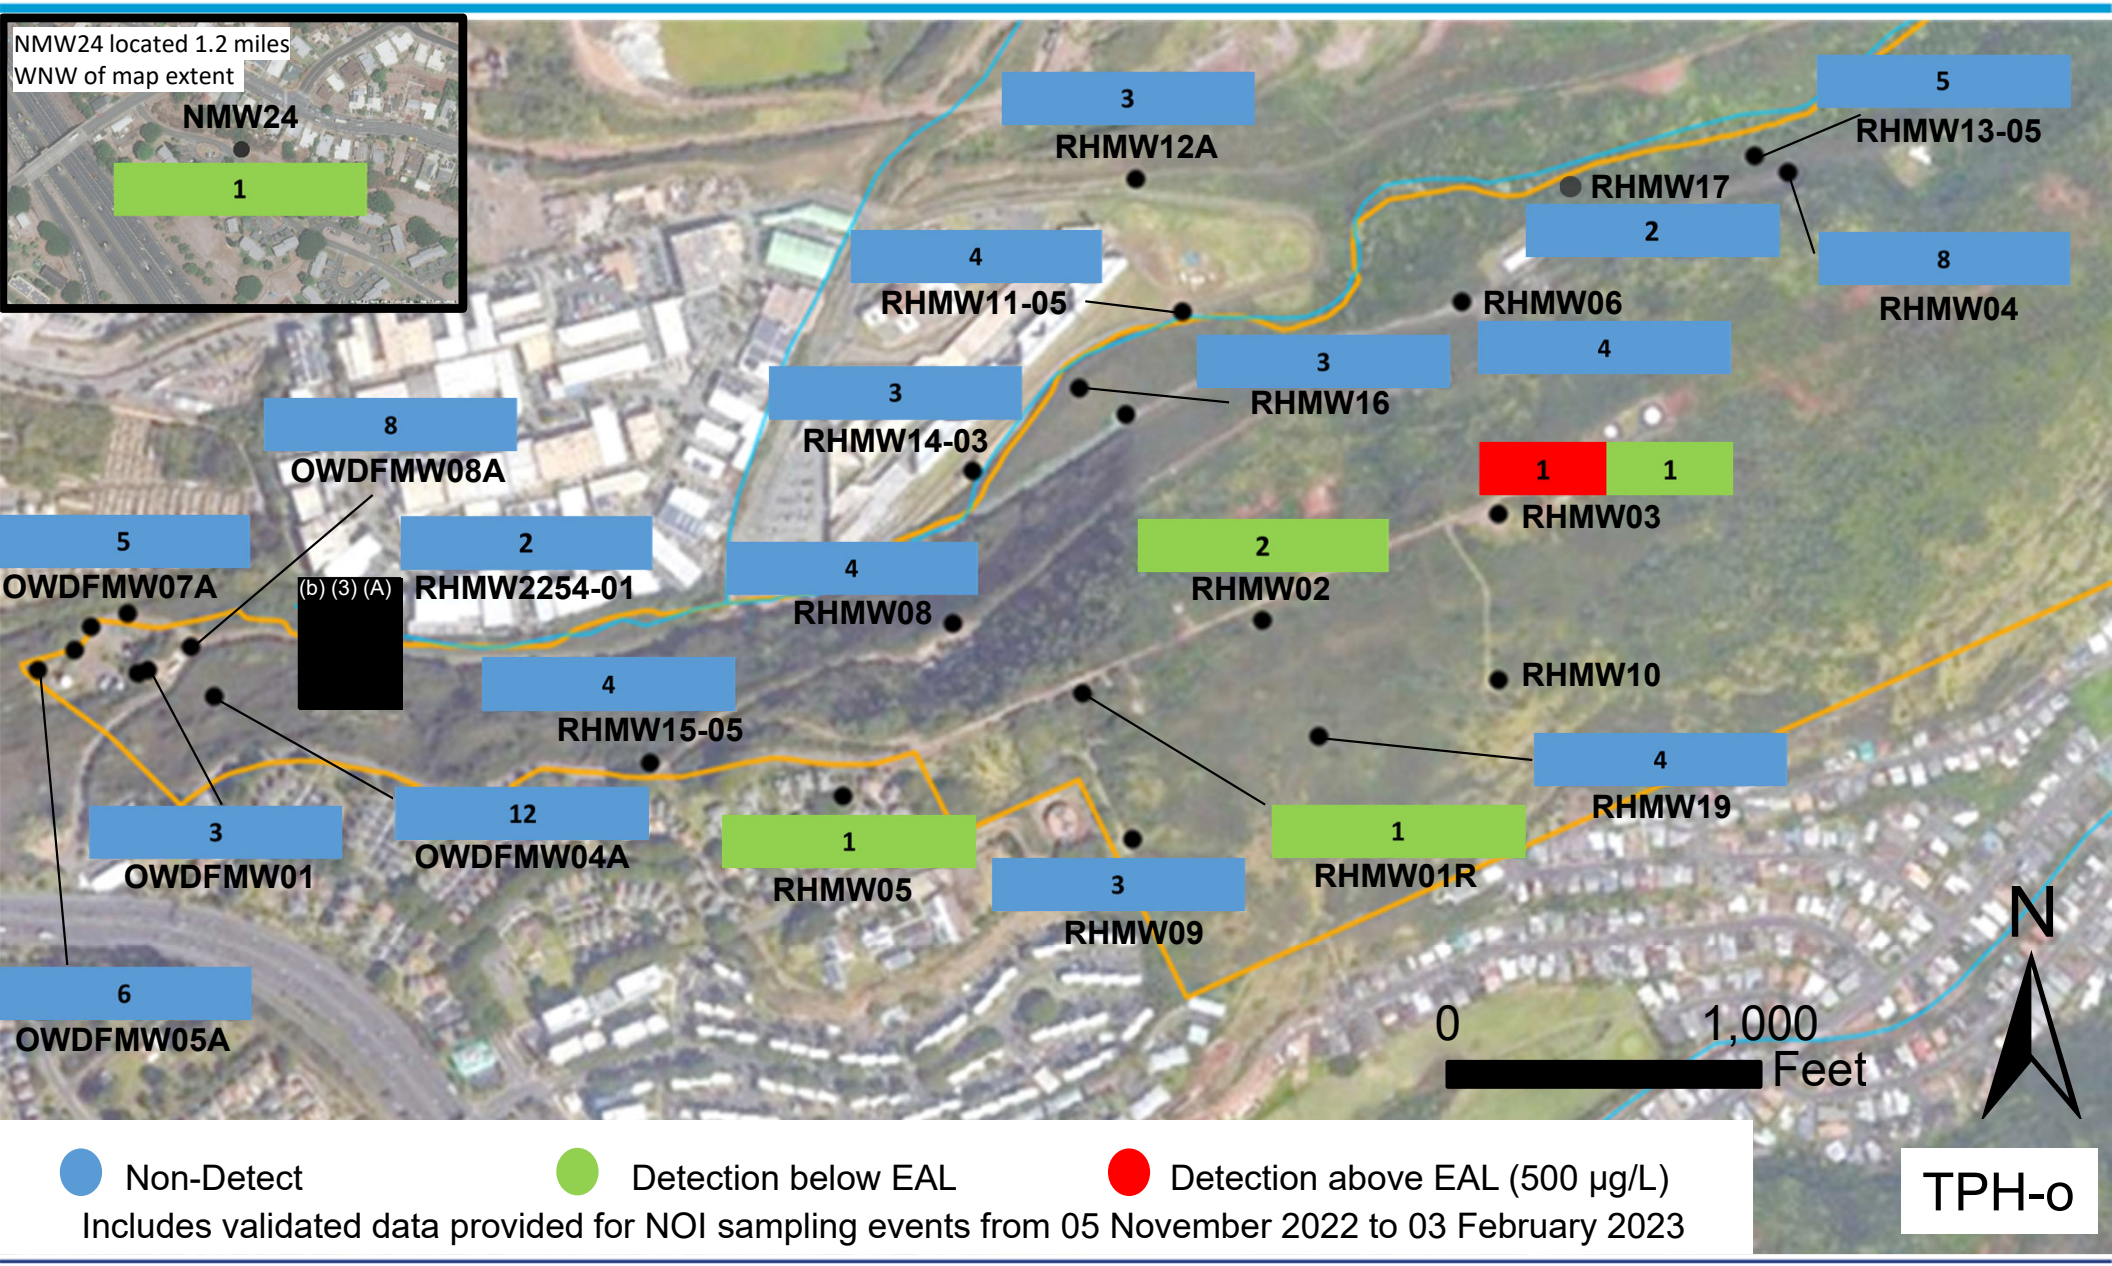

Figure 13: Summary of Groundwater Analytical Results for TPH-o

9.3.1.4 LEAD SCAVENGERS

1,2-dibromoethane was detected once at each outlying wells RHMW09, RHMW14-03, and NMW24 at low-level concentrations ranging from 0.005 J to 0.025 µg/L. 1,2-dichloroethane had one low-level detection, 0.047 J µg/L at RHMW17; 1,2-dichloroethane was not detected in any other well. All QC and analytical criteria were met, and these analytes were not detected in the method blanks. All low-level detects except for NMW24 were considered estimated (J-flagged) and may be attributed to instrumentation noise. There are no current onsite fuel sources for 1,2-dibromoethane or 1,2-dichloroethane, and there were no TPH detects for the wells with positively identified lead scavengers except for low-level TPH-d/o detects at NMW24, which is a newly constructed well and began monitoring in November 2022. NMW24 is located 1.2 miles northeast of the western portion of the Facility in a developed area of the town of ʻAiea. Lead scavengers were used in motor gasoline during leaded gasoline use (the United States banned use of lead in gasoline in in 1996), but only 1,2-dibromoethane was used in aviation gasoline. Fuels stored in the Facility in recent decades did not contain lead additives. Leaded fuels were last stored at the Facility in 1968 in Tanks 17 and 18 (Red Hill CSM report; DON 2019). The most common current use of 1,2-dichloroethane is in the production of vinyl chloride, which is used to make a variety of plastic and vinyl products including PVC pipes, furniture and automobile upholstery, wall coverings, housewares, and automobile parts. 1,2-dibromoethane is commonly used as a fumigant and may also be found naturally in the ocean in small amounts.

9.3.1.5 LEAD

Total lead was detected at low-level concentrations at all wells. Detected results did not exceed the EAL during the reporting period, and concentrations remained stable and consistent with historical ranges for all wells. The maximum concentrations for total and dissolved lead were at OWDFMW04A (2.9 µg/L and 0.65 µg/L, respectively).

9.3.1.6 BTEX

As was the case during the previous reporting period, no BTEX EAL exceedances were reported for any wells monitored during this reporting period.

One low-level detection of benzene was reported at in-tunnel well RHMW02 (0.033 J µg/L), but benzene was not detected in the following weekly sample collected on November 30, 2022. There have been four benzene detections out of 18 samples reported at this well since August 9, 2022.

Toluene was not detected in any well.

Ethylbenzene and xylene detections occurred at in-tunnel well RHMW02.

Current ethylbenzene and total xylene detections at RHMW02 are stable and consistent with historical detections indicative of a weathered LNAPL source, most likely attributable to historical releases and not to the January 2014, May 2021, or November 2021 Releases. Toluene is preferentially depleted under anaerobic conditions, which is occurring at RHMW02.

9.3.1.7 VOCs

One VOC EAL exceedance was reported at sentinel well NMW24 for bromodichloromethane, as shown in Table 10.

Additional detections below the EALs included trichloroethene at RHMW06, carbon tetrachloride, and chlorodibromomethane at OWDFMW04A, and bromodichloromethane and bromoform at sentinel well NMW24. Trichloroethene in RHMW06 was detected in 3 of 46 samples (including two duplicate samples), and chlorodibromomethane in OWDFMW04A was detected once out of 81 times (including 36 duplicate samples) since the inception of the NOI. All detects were flagged as estimated and may be attributed to instrumentation noise. Chlorodibromomethane at OWDFMW04A was not detected in prior and subsequent monitoring events. Trichloroethene, carbon tetrachloride, and chlorodibromomethane are not associated with fuel sources. Carbon tetrachloride has been consistently detected in low concentrations in OWDFMW04A only, since August 1, 2022, and concentrations were flagged as estimated. Low-level random detections are not unexpected from analysis of samples from many different sites at commercial laboratories. VOCs have been observed in laboratory, field, or equipment QC blanks, as summarized in Table 8.

Three trihalomethanes (THMs) were detected in sentinel well NMW24: bromoform (0.29 J µg/L), chlorodibromomethane (0.34 µg/L), and chloroform (0.11 J µg/L). THMs are disinfection by-products when chlorine or other disinfectants used to control microbial contaminants in drinking water react with naturally occurring organic and inorganic matter in water and may have been introduced if potable water was used during drilling or well development, especially since the well was completed recently, in November 2022.

Chloroform, chloromethane, or both were detected in 12 groundwater wells during multiple collection events. Chloroform was detected in all sampling events from OWDFMW04A and OWDFMW08A. These low-level VOC detects are consistent with historical data and investigations. As reported in the Red Hill CSM report (DON 2019), chloroform, chloromethane, and methyl ethyl ketone (MEK) were historically detected at RHMW01, RHMW03, and the outlying wells. The CSM report concluded that detections were not associated with the January 2014 Release and instead were associated with field or laboratory contamination, well construction, or maintenance (e.g., sampling equipment).

In addition, chloroform and chloromethane are not present in jet fuels and middle distillates. These compounds are typically used instead for the following operations:

- Chloroform is both a synthetic and a naturally occurring compound, although anthropogenic sources are responsible for most chloroform found in the environment. Chloroform is released into the environment as a result of its manufacture and use, its formation in the chlorination of drinking water and municipal and industrial waste water, and other water treatment processes involving chlorination. Under anaerobic conditions, some bacteria can dehalogenate carbon tetrachloride to release chloroform (ATSDR 1997).

- Chloromethane is both synthetic and naturally occurring. It is produced in the environment from rotting wood and fungus. Chloromethane is also used in products such as silicones and is formed from burning products like cigarettes or plastics (ATSDR 1998).

9.3.1.8 SVOCs

Samples were analyzed for the laboratory's full suite of SVOCs. The sampling events detailed below cover the current reporting period in which validated Level II and Level IV data packages have been completed. The data are summarized in Table 10 and below.

SVOC detections during this reporting period were consistent with historical investigations. Detected SVOCs were three phthalates: bis(2-ethylhexyl) phthalate, butyl benzyl phthalate, and dimethyl phthalate. SVOC results and specific impacted wells are summarized as follows:

- Bis(2-ethylhexyl) phthalate was detected at RHMW11-05 (4 µg/L) which exceeded the EAL (3 µg/L). Various phthalates, including bis(2-ethylhexyl) phthalate and dimethyl phthalate, were detected below the EALs at RHMW01, RHMW03, and outlying wells during previous sampling events; it was concluded that the detects were not associated with the fuel release and instead are likely associated with sampling equipment or laboratory contamination issues (DON 2019). Additionally, phthalates are prevalent in the environment because of their use in plastics such as PVC, which may be present in well construction materials.
- Dimethylphthalate was detected once at OWDFMW07A, which is the first detect at this well; however, dimethylphthalate was detected during previous sampling events from other in-tunnel and outlying wells. Detected results were below the EAL.
- Butylbenzylphthalate was reported in one sample from RHMW13-05 and has been reported a few times historically at other locations. No EAL has been established for butylbenzylphthalate.

Phthalates (bis(2-ethylhexyl) phthalate, dimethyl phthalate, and butylbenzylphthalate) are not commonly associated with fuel and are found mainly in solvents used as wetting agents and as plasticizers. The phthalate detections may also be indicators of sampling equipment or laboratory contamination issues, as supported by blank contamination and failing QC criteria. SVOCs have been observed in laboratory, field, or equipment QC blanks, as summarized in Table 8.

4-chlorophenyl phenyl ether was originally reported at RHMW02, but the laboratory has since confirmed this result was a false positive, and the report will be re-issued. Similarly, 2,6-dinitrotoluene was reported twice in OWDFMW05A, but the laboratory since confirmed these results as false positives, and the reports will be re-issued. The detection limit of the method is greater than the EAL, therefore these false positives were reported as exceeding the EALs.

9.3.1.9 PAHs

PAHs can be divided into two different categories: pyrogenic and non-pyrogenic (Figure 14).

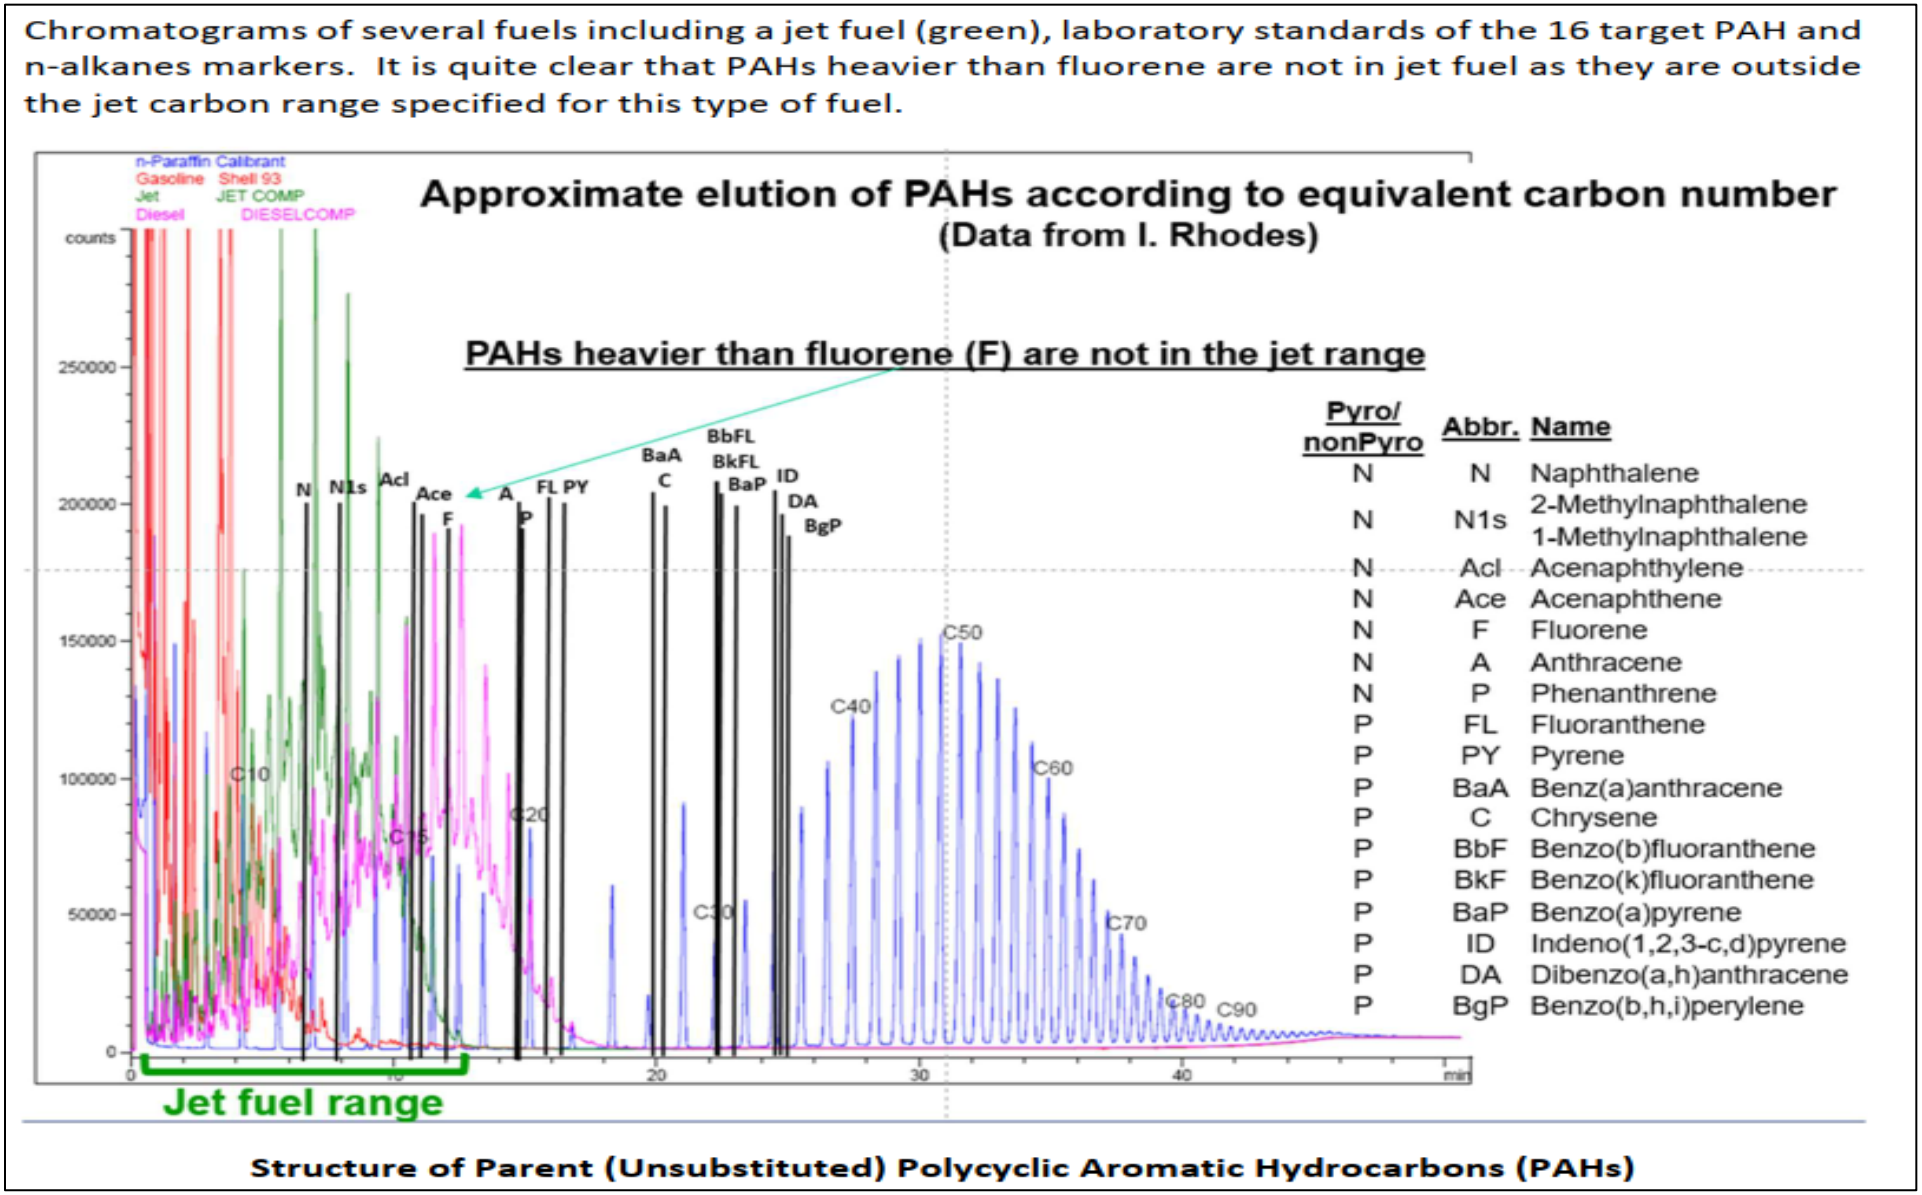

Figure 14: Approximate Elution of PAHs According to Equivalent Carbon Number

Pyrogenic PAHs, or heavy PAHs, are not found in fuels, but are commonly associated with combusted materials, along with burning or run-off. Pyrogenic PAHs are fluoranthene, pyrene, benz(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-c,d)anthracene, and benzo(b,h,i)perylene. PAHs that are heavier than naphthalenes, acenaphthene, acenaphthylene, and fluorene are removed from jet fuel sources during the distillation process.

Pyrogenic PAHs were detected at in-tunnel wells RHMW01R, RHMW02, RHMW03, and RHMW05 as well as at OWDFMW04A; these detections may be related to sources other than fuel stored at or released from the Facility. Benzo(a)anthracene concentrations exceeded the EAL once in RHMW03, RHMW05, and OWDFMW04A. Generally, the limit of detection of the method is greater than the EAL. This is the first exceedance for benzo(a)anthracene at RHMW03 and OWDFMW04A, and the second exceedance for RHMW05. PAHs have also been observed in laboratory, field, or equipment QC blanks, as summarized in Table 8, which calls into question the reliability or representativeness of these data.

Non-pyrogenic PAHs are commonly found in petroleum, including middle distillates such as JP-5. Non-pyrogenic PAHs that are present in kerosene or jet fuels include 1MN, 2MN, N, and, to lesser extents, acenaphthene, acenaphthylene, and fluorene. The detections that are consistent with PAHs found in jet fuels are summarized below.

Consistent with historical data, PAH COPCs (N, 1MN, and 2MN) were detected primarily at in-tunnel well RHMW02 during this reporting period. Naphthalenes were reported in two samples collected at RHMW02. RHMW02 had one sample with a reported concentration of 1MN above the EAL (13 µg/L). The concentration of N (26 µg/L) also exceeded the EAL in one sample from RHMW02. The EAL is 10 µg/L for 1MN and 17 µg/L for N.

No exceedance of any PAH EAL was reported at the other wells. PAH COPCs were detected at RHMW01R, RHMW05, and RHMW09 below the EALs. In addition to the PAH COPCs, other non-pyrogenic PAHs detected at RHMW01R, RHMW02, RHMW05, and OWDFMW04A include acenaphthene, acenaphthylene, fluorene, or phenanthrene. RHMW02 had consistent detects for acenaphthene and fluorene, while RHMW01R had consistent detects for acenaphthene. Acenaphthylene was detected during one collection event at RHMW02. Phenanthrene was also detected during one collection event at RHMW05 and OWDFMW04A. Non-pyrogenic PAHs detected during multiple sampling events at RHMW01R and RHMW02 appear stable.

9.3.2 Delineation Well Groundwater Analytical Results

Summary statistics for delineation well groundwater samples collected during the current reporting period are described below and provided in Table 11.

Table 11: Summary of Delineation Well Analytical Results for Current Reporting Period (11/5/2022 to 2/3/2023)

Acronyms and Footnotes:

CAS-Chemical Abstracts Service

J-estimated: the analyte was positively identified; the quantitation is an estimation. Minus (-) and plus (+) signs indicate probable bias, if known.

ND-not detected

µg/L-microgram per Liter

%-percent

Note[1]: The minimum and maximum detected values are given for each analyte. If the analyte was not detected in any sample, "ND" is shown for minimum or maximum detected values.

Note[2]: If the minimum or maximum result value occurs at more than one location only the location of the first occurrence is given.

[a] Includes normal and field duplicate samples.

[b] Does not include sample results rejected by validation.

[c] Wells sampled during this reporting period include the following: RHP01, RHP02, RHP03, RHP04A, and RHP04B.

The following detections were reported:

- TPH-d was detected below the LOD at RHP03 on November 18, 2022; however, the concentration (78 µg/L) did not exceed the EAL of 400 µg/L. No TPH-d was detected in subsequent RHP03 samples collected on November 20 and 23 and December 9, 2022.
- TPH-d below the LOD was detected sporadically (in 4 of 14 samples) at RHP04A, ranging from 68 to 81 µg/L. The concentrations did not exceed the EAL.
- TPH-d above the LOD was detected in each sample collected at RHP04B, which is screened at depths of approximately -143 to -163 ft msl, i.e., approximately 162 ft below the regional potentiometric surface, from November 9 through December 9, 2022. Concentrations ranged from 140 to 370 µg/L and did not exceed the EAL. SGC performed on the groundwater extracts removed the TPH-d, indicating that TPH-d in the samples is not associated with a fresh fuel release, but may is instead composed of polar compounds, potentially including metabolites (i.e., heavily biodegraded and or weathered material). The chromatographic profiles for RHP04B samples are not consistent with those expected from dissolved fuel components.
- TPH-o was detected below the LOD in RHP04B samples collected November 11, 16, 18, 21, and December 9, 2022. The concentrations ranged from 180 to 250 µg/L and did not exceed the EAL of 500 µg/L. The TPH-d was removed by SGC, indicating the TPH-o in the samples is not associated with a fresh fuel release, but is instead composed of polar compounds.
- Infrequent low-level detections (below the LOD) of PAH COPCs (N, 1-MN, and 2-MN) were reported in delineation well samples. In addition, concentrations of naphthalene above the LOD and of 1-MN, and 2-MN near or above the LOD were reported for RHP03 and RHP04A sampled on November 18, 2022. The concentrations do not exceed the EALs and no PAH COPCs were detected in subsequent samples collected on November 20, November 21, November 23, or December 9, 2022.

No TPH-d detections were reported at delineation wells RHP01 and RHP02 during this reporting period.

No BTEX EAL exceedances were reported at any delineation well during this reporting period.

The delineation well samples were analyzed for NAPs during the initial two to three sampling events after well completion. The analytes included alkalinity (total, bicarbonate, and carbonate), nitrate as nitrogen, nitrate-nitrite as nitrogen, chloride, sulfate, methane, ferrous iron, and TOC. The minimum and maximum concentrations and frequency of detection are summarized in Table 11.

9.3.3 Sentinel Well Groundwater Analytical Results

Summary statistics for sentinel well groundwater samples collected during the current reporting period are described below and provided in Table 12.

Table 12: Summary of Sentinel Well Analytical Results for Current Reporting Period (11/5/2022 to 2/3/2023)

Acronyms and Footnotes:

CAS-Chemical Abstracts Service

J-estimated: the analyte was positively identified; the quantitation is an estimation

ND-not detected

µg/L-microgram per Liter

%-percent

Note[1]: The minimum and maximum detected values are given for each analyte. If the analyte was not detected in any sample, "ND" is shown for minimum or maximum detected values.

Note[2]: If the minimum or maximum result value occurs at more than one location only the location of the first occurrence is given.

[a] Includes normal and field duplicate samples.

[b] Does not include sample results rejected by validation.

[c] The only well sampled during this reporting period was NMW24. Statistics do not include the first sample collected November 22, 2022 under the NOI groundwater monitoring program.

The following detections were reported:

- TPH-d at or below the LOD was detected in the sample collected December 1, 2022 at sentinel well NMW24. The concentration, 100 µg/L, did not exceed the EAL. The TPH-d was removed by SGC, indicating the TPH-d in the sample is composed of polar compounds.
- TPH-o was detected in the sample collected December 1, 2022 at sentinel well NMW24. The concentration, 190 µg/L, did not exceed the EAL. SGC removed the TPH-o to below detection in the December 1 sample.

No BTEX EAL detections were reported during this reporting period.

No PAH COPCs were detected in samples collected from sentinel well NMW24.

Samples from sentinel well NMW24 were analyzed for NAPs during each of the sampling events in this reporting period. The analytes included alkalinity (total, bicarbonate, and carbonate), nitrate as nitrogen, nitrate-nitrite as nitrogen, chloride, sulfate, methane, ferrous iron, and TOC. The minimum and maximum concentrations and frequency of detection are summarized in Table 12.

9.3.4 Adit 3 Sump Water Analytical Results

Summary statistics for Adit 3 Sump water samples collected during the current reporting period are described below and provided in Table 13. Appendix B.4 provides cumulative Adit 3 Sump monitoring results compared to the EALs for each analyte group. Additionally, TPH results collected during the reporting period are graphically displayed over time in Appendix B.4.

9.3.4.1 TPH-g

TPH-g was not detected at the Adit 3 Sump during this reporting period. As depicted in Appendix B.4.5, TPH-g concentrations have primarily continued to decrease to non-detect since the November 2021 Release, with the first occurrence of a non-detect sample collected on March 29, 2022.

9.3.4.2 TPH-d

In the weeks following the November 2021 Release, TPH-d exceedances were reported for every sampling event at Adit 3 Sump. During the previous reporting period, there were no exceedances, and the relatively low-level concentrations were decreasing. During the current reporting period, TPH-d was detected in two samples out of two sampling events at low concentrations (99 J and 120 µg/L).

J-estimated: the analyte was positively identified; the quantitation is an estimation

ND-not detected

µg/L-microgram per Liter

%-percent

Note[1]: The minimum and maximum detected values are given for each analyte. If the analyte was not detected in any sample, "ND" is shown for minimum or maximum detected values.

[a] Includes normal and field duplicate samples.

[b] Does not include sample results rejected by validation.

9.3.4.3 TPH-o

In the weeks following the November 2021 Release, TPH-o exceedances were reported for every sampling event at Adit 3 Sump, but concentrations have been decreasing since that time. During the previous reporting period, there were no exceedances, and relatively low-level concentrations were decreasing. During the current reporting period, TPH-o was not detected in any sample.

9.3.4.4 LEAD SCAVENGERS

As was the case during the previous reporting period, 1,2-dibromoethane and 1,2-dichloroethane were not detected at the Adit 3 Sump during this reporting period.

9.3.4.5 TOTAL AND DISSOLVED LEAD

Total lead was detected (1.9 and 1.8 µg/L) but did not exceed the EAL (5.6 µg/L) in all samples. Dissolved lead was detected (0.28 J and 0.32 J µg/L) below the EAL in all samples.

9.3.4.6 BTEX

Benzene, toluene, ethylbenzene and xylene were not detected at the Adit 3 Sump during this reporting period. As depicted in Appendix B.4.5, concentrations have continued to be stable and range from low-level, estimated concentrations to not-detected since the November 2021 Release.

9.3.4.7 VOCS

As depicted in Appendix B.4.5, sporadic low-level, estimated detections of chloroform and chloromethane have continued to be consistent, as was the case during the previous reporting period.

9.3.4.8 SVOCS

As was the case during the previous reporting period, no SVOCs were detected during this reporting period.

9.3.4.9 PAHS

As was the case during the previous reporting period, N, 1-MN, and 2-MN were not detected at Adit 3 Sump during this reporting period.

A pyrogenic PAH exceedance occurred for benzo(a)anthracene for one of two collection events; benzo(a)anthracene exceeded the EAL during the first collection event (0.049 µg/L, EAL 0.027 µg/L).

Four pyrogenic PAHs were detected for both collection events during the reporting period: benzo(a)anthracene, benzo(b)fluoranthene, fluoranthene, and pyrene. Five pyrogenic PAHs were detected for one collection event: benzo(a)pyrene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, and indeno(1,2,3-cd)pyrene.

One non-pyrogenic PAH, phenanthrene, was detected during one collection event, which may be due to contamination unrelated to site groundwater conditions.

PAHs have also been observed in laboratory, field, or equipment QC blanks, as summarized in Table 8.

10.0 Summary of Results and Extent and Magnitude of Contamination

This section summarizes the results presented in Section 9.0 and provides historical context for evaluating the impacts of the January 2014, May 2021, and November 2021 Releases.

10.1 Soil Vapor Impacts

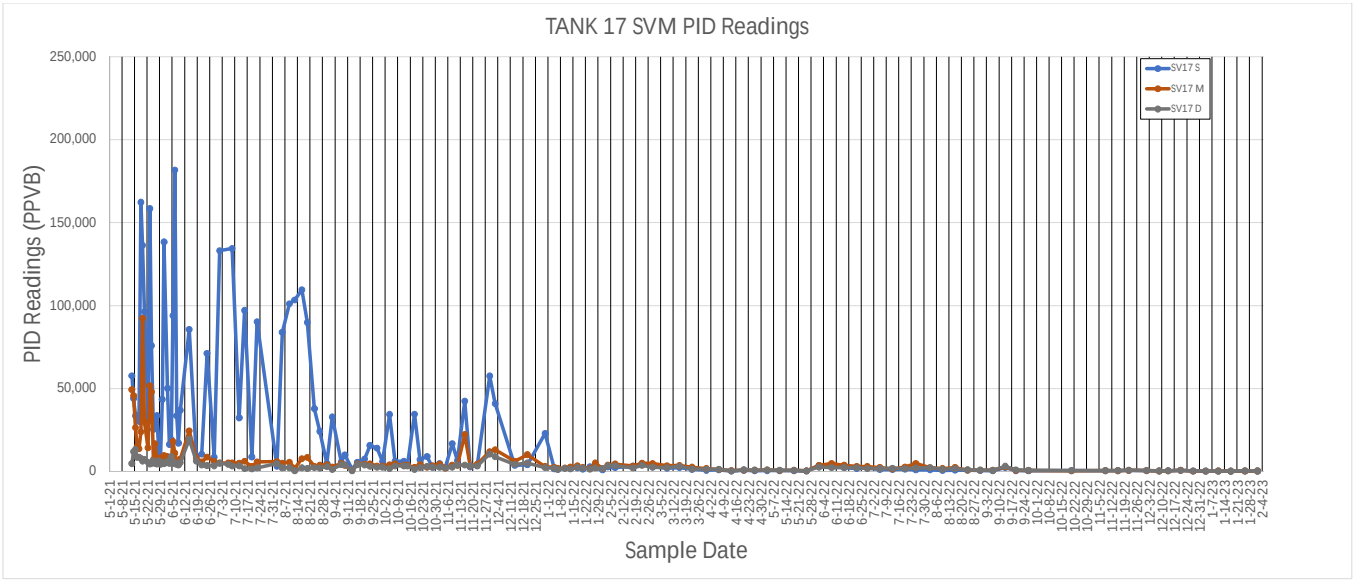
10.1.1 Below-Tank Monitoring Points

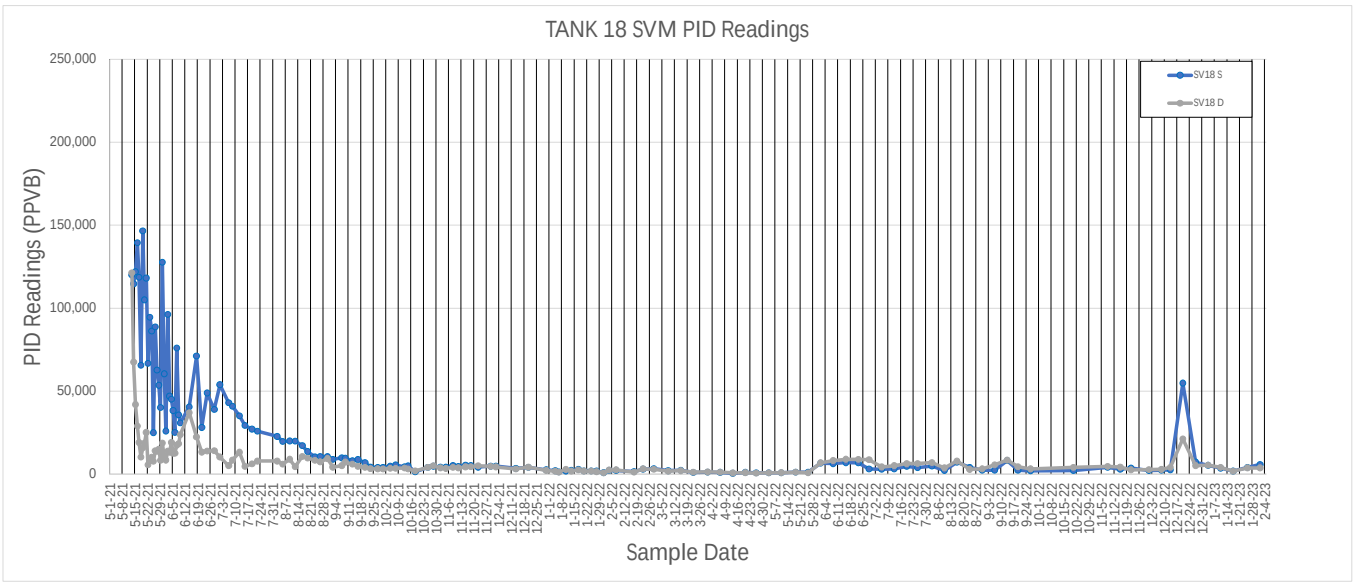
10.1.1.1 FIELD MEASUREMENTS

PID results over time for SVMPs at Tanks 17, 18, and 20 are presented on Figure 15 and summarized as follows:

- At Tank 17, the highest PID reading (181,733 ppbv) was recorded on June 6, 2021 at SV17S, and PID readings have significantly declined since that time.
- At Tank 18, the highest PID reading (146,667 ppbv) was recorded on May 19, 2021 at SV18S, and PID readings have significantly declined since that time.
- At Tank 20, the highest PID reading (232,667 ppbv) was recorded on May 13, 2021 at SV20M, and PID readings have significantly declined since that time.

On December 20, 2022, PID readings at SV18S (54,890 ppbv) and SV18D (21,220 ppbv) were elevated relative to recent prior readings (i.e., consistently less than 10,000 ppbv over the prior 6 months). However, PID readings at these two locations for the subsequent weekly monitoring events (i.e., December 27, 2022 to February 1, 2023) were within the range observed prior to December 20, 2023 (i.e., consistently less than 10,000 ppbv). As discussed in Section 9.1.1.3, the laboratory analytical results for samples collected from SV18S and 18D on December 20, 2022 do not indicate a new release of JP-5.





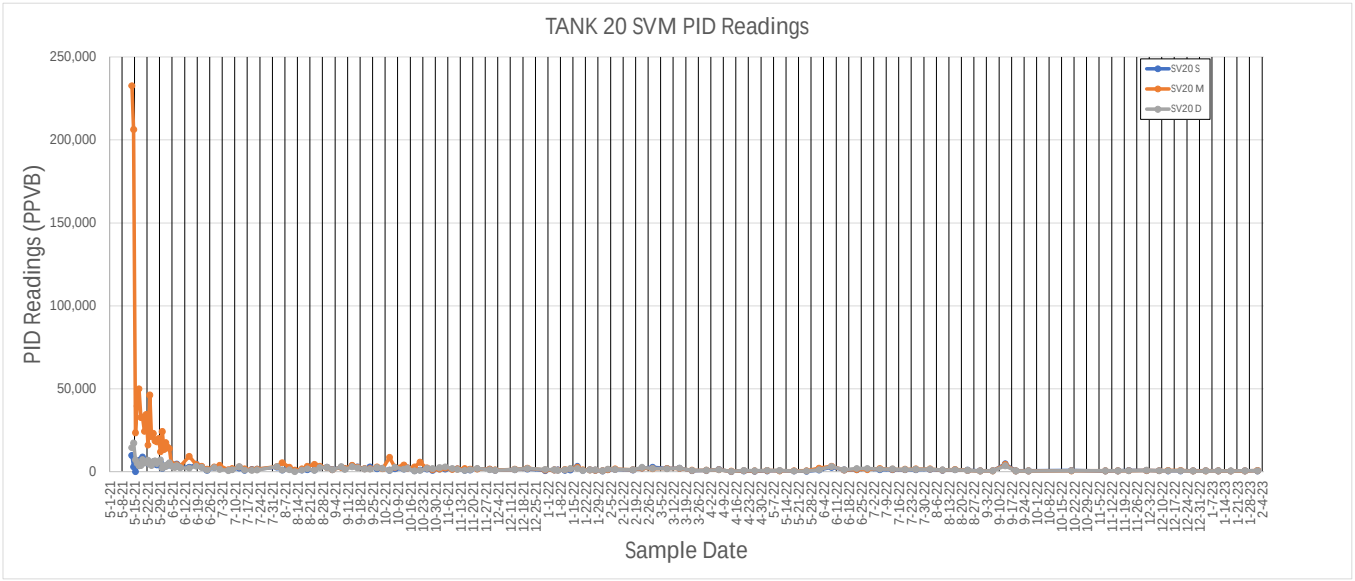


Figure 15: SVM PID Readings for Tanks 17, 18, and 20

10.1.1.2 FIXED-BASE LABORATORY SAMPLE RESULTS

As documented in prior reports (e.g., DON 2022i), Summa canister samples collected in 2021 and early 2022 and analyzed for total VOCs by Method TO-15 and Method TO-3 served to document weathering of the May 2021 release over time consistent with biodegradation and other weathering processes. Laboratory results over the current sampling period (i.e., November 2022 to January 2023) were similar to prior results and consistent with continued long-term biodegradation and weathering of the May 2021 Release.

On December 20, 2022, additional Summa canister samples were collected from SV18S and SV18D in response to elevated PID readings at those two locations on that day. As discussed in Section 9.1.1.3, the analytical results for these samples do not indicate a new release of JP-5.

*10.1.2 Adit 3 Tunnel Monitoring Location*s

The extent and magnitude of soil vapor impacts at Adit 3 Tunnel monitoring locations are described below.

At most SVMPs, the highest PID readings were recorded in December 2021 or January 2022 (Figure 9). PID readings have generally decreased over that time, consistent with LNAPL weathering and natural attenuation.

The results of subslab soil vapor monitoring from SVMPs installed in the floors of the Adit 3 and Pearl Harbor Tunnels indicate the following:

- In the first approximate 3-month period following the release, elevated PID readings were observed in the subslab from the release area west toward the Adit 3 portal (SVMP array A3).
- The area of elevated PID readings in the Adit 3 Tunnel east-southeast of the release area is delineated by low PID readings at SVMPs A3-400, A3-425, and A3-450, and southwest in the Pearl Harbor Tunnel by low PID readings at SVMPs 2S+200, 2S+225, 2S+250, 2S+275, and 2S+300.
- The local areas of soil vapor maxima during this reporting period were consistent with those previously reported:
  - Adit 3 Tunnel release area between A3-325 and A3-375
  - Upper Pearl Harbor Tunnel, just southwest of the merge, between S2+25 and S2+100
  - Between the Pearl Harbor Tunnel merge and the Water Pumping Station, between A3-100 and A3-150
  - Adit 3 Sump where fuel accumulated during the release, between A3+250 and A3+375
- Within the areas of local soil vapor maximum readings, PID readings decreased over time (since commencement of NOI PID monitoring in the tunnels in December 2021).

10.2 Groundwater Impacts

Table 10, Table 11, Table 12, and Table 13 present summary statistics for NOI, delineation well, sentinel well, and Adit 3 groundwater sampling results, respectively. Table 14 presents a summary of groundwater concentrations detected above the DOH EALs. Chloroform was the most commonly detected analyte. TPH-d and TPH-o were most often detected consistently at in-tunnel sampling locations. At least one groundwater sample had detected concentrations above the DOH EAL for one of the following compounds during this reporting period: TPH-d, TPH-o, bromodichloromethane, bis(2-ethylhexyl) phthalate, 1MN, N and benzo(a)anthracene. The vast majority of the analytes were not detected in any sample or infrequently detected. Additional details for each of these compounds are summarized below.

10.2.1 TPH-d

The overall frequency of TPH-d detections during this reporting period was 10%. TPH-d detections above the DOH EAL of 400 µg/L have been reported consistently at well RHMW02 since it was installed in 2005. There was one other detection above the EAL in RHMW03. Both wells are in-tunnel wells. No other wells reported exceedances of TPH-d.

The chromatographic fingerprint in RHMW02 resembles water-soluble components of jet fuel and metabolites from fuel biodegradation. Most of the TPH-d is removed by SGC (used to remove the polar material), indicating ongoing biodegradation and weathering of fuel in this location. The RHMW03 exceedance exhibited broad peaks and baseline rise sporadically dispersed throughout the TPH-d carbon range and extended into the TPH-d carbon ranges. All TPH was removed by SGC.

TPH-d below the DOH EAL was detected at in-tunnel wells RHMW01R and RHMW05, two outlying multilevel wells (RHMW11-05 and RHMW15-05), three delineation wells (RHP03, RHP04A, and RHP04B), and one sentinel well (NMW24). The detections in these wells were below 100 µg/L except for RHMW01R and RHP04B. SGC removed most or all the TPH-d concentrations from all these samples except for some of the TPH-d in RHMW01R, indicating that most or all the detected hydrocarbons are polar compounds or metabolites. This may be indicative (but not exclusively so) of biodegradation and weathering of fuels or may not be related to fuels and instead may be associated with naturally occurring organic matter or sample handling artifacts.

10.2.2 TPH-o

The overall frequency of TPH-o detection during this reporting period was 7.8%. TPH-o was detected at in-tunnel wells RHMW01R, RHMW02 and RHMW03 during this reporting period. These wells have had historical detections for TPH-o, and concentrations appear to be stable. Concentrations were below the DOH EAL of 500 µg/L except for one detection at RHMW03 (500 µg/L).

TPH-o was detected in one sample at sentinel well NMW24. The chromatogram from this well (Appendix B.5) is not consistent with fuels, dissolved components of fuels, or fuel metabolites.

Several of the method blanks had peaks that have hydrocarbon-like patterns, typically above carbon range C20, which may obscure interpretation of TPH-o chromatograms. A corrective action report was provided by Eurofins Seattle (included in the December 21, 2022 Quarterly RRR as Appendix E) providing further support that discrete peak patterns in the method blanks are contributing to the chromatographic pattern observed. However, this is an on-going issue that is not yet resolved.

SGC performed on the groundwater extracts removed the TPH-o concentration from all but one sample from NMW24, indicating either that TPH-o in most of these samples is composed of polar compounds or metabolites (i.e., heavily biodegraded/weathered material) or that the material detected as TPH may not be related to fuels.

10.2.3 Full Suite VOCs including BTEX

No BTEX EAL exceedances were reported for any wells monitored during this reporting period.

Toluene was not detected in any well. One low-level detection of benzene was reported at in-tunnel well RHMW02, but benzene was not detected in the following week. Current ethylbenzene and total xylene detections at RHMW02 are stable and consistent with historical detections indicative of a weathered LNAPL source prior to any recorded releases.

The only other types of VOCs detected are halogenated compounds not associated with fuels.

The only VOC EAL exceedance was reported for sentinel well NMW24 for bromodichloromethane. Three THMs were also detected in this well (bromoform, chlorodibromomethane, and chloroform). THMs are disinfection by-products when chlorine or other disinfectants used to control microbial contaminants in drinking water react with naturally occurring organic and inorganic matter in water. They may have been introduced if tap/potable water has been used during drilling or well development, especially since the well was completed November 2022.

Chloroform or chloromethane were detected in 12 groundwater wells during multiple collection events. These detections are consistent with historical investigations. As reported in the June 30, 2019 Red Hill CSM report (DON 2019), chloroform and chloromethane were historically detected,

and the report concluded that detects were not associated with a fuel release and instead were associated with field or laboratory contamination, well construction or maintenance, or historical or current activities at the site.

Trichloroethene was detected in RHMW06. Chlorodibromomethane and carbon tetrachloride were detected in OWDFMW04A. Carbon tetrachloride has been consistently detected at low concentrations at OWDFMW04A only since August 1, 2022, and concentrations were flagged as estimated.

None of these halogenated compounds are associated with fuels. Low-level random detections of these types of compounds are not unexpected from analysis of samples from many different sites at commercial laboratories. VOCs have been observed in laboratory, field, or equipment QC blanks, as summarized in Table 8.

10.2.4 Full Suite SVOCs

SVOC exceedance for bis(2-ethylhexyl) phthalate was reported during one monitoring event this reporting period at RHMW11-05; the compound was not detected during a subsequent monitoring event.

Other phthalates detected include butyl benzyl phthalate, diethyl phthalate and dimethyl phthalate. Phthalates are commonly found in solvents used as wetting agents and as plasticizers. They are not associated with fuels. As reported in the 2019 CSM report (DON 2019), various phthalates, including bis(2-ethylhexyl) phthalate and dimethyl phthalate, were historically detected during previous sampling events. The CSM report concluded that the detects were not associated with a fuel release and instead are associated with sampling equipment or laboratory contamination issues. The phthalate detections may also be indicators of sampling equipment or laboratory contamination issues, as supported by blank contamination and failing QC criteria.

Originally, 4-chlorophenyl phenyl ether was originally reported once at RHMW02, but the laboratory had since confirmed this result as a false positive, and the report will be re-issued. Similarly, 2,6-dinitrotoluene was reported twice in OWDFMW05A but the laboratory had since confirmed these results as false positives, and the report will be re-issued. The detection limit of the method is greater than the EAL, therefore these false positives were reported as exceeding EAL.

10.2.5 PAHs

Non-pyrogenic PAHs detected above the DOH EALs during this reporting period include exceedances for 1MN and N at RHMW02, which are consistent with historical data. Samples from RHMW02 also contain other non-pyrogenic PAHs (acenaphthene, acenaphthylene, and fluorene). This well is known to have been impacted by historical fuel releases.

Other non-pyrogenic PAHs were detected in samples from RHMW01R (1MN, 2MN, N, acenaphthene, and fluorene) and samples from RHMW05 and RHMW09 (1MN, 2MN and N) during this reporting period.

Pyrogenic PAHs were detected at in-tunnel wells RHMW01R, RHMW02, RHMW03, and RHMW05 and outlying well OWDFMW04A, which may be due to contamination unrelated to site groundwater conditions. Benzo(a)anthracene concentrations exceeded the EAL once in RHMW03, RHMW05, and OWDFMW04A, and were low-level, estimated detects. Generally, the limit of detection of the method is greater than the EAL. This is the first exceedance for benzo(a)anthracene at RHMW03 and OWDFMW04A, and the second exceedance at RHMW05. PAHs have also been observed in laboratory, field, or equipment QC blanks, as summarized in Table 8. Pyrogenic PAHs are not associated with fuels but are from combustion sources and/or lab artifacts associated with low-level analytical methods.

Non-pyrogenic PAHs detected during multiple sampling events at RHMW01R and RHMW02 appear stable.

10.2.6 Natural Attenuation Parameters

The delineation well samples were analyzed for NAPs during the initial two to three sampling events after well completion. The minimum and maximum concentrations and frequency of detection are summarized in Table 10. The absence of dissolved-phase COPCs coupled with the NAP results (e.g., low to no methane, low ferrous iron, and moderate [not low] levels of nitrate) indicate that the delineation wells have not been impacted by petroleum hydrocarbons, and no appreciable biodegradation is occurring in these locations.

10.2.7 Adit 3 Sump Water

Analytical results for Adit 3 Sump water samples are presented in Section 9.3.4. Table 13 presents summary statistics for the Adit 3 sampling results during the current reporting period. A pyrogenic PAH exceedance occurred for benzo(a)anthracene (0.049 µg/L, EAL 0.027 µg/L) during this reporting period.

TPH-g, TPH-o, VOCs, SVOCs, 1MN, 2MN, and N were not detected in any samples reported in this reporting period.

TPH-d was detected in two samples at low concentrations (99 J and 120 µg/L).

PAHs detected in one or two of the samples during this sampling period include benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene benzo(k)fluoranthene, chrysene, fluoranthene, indeno(1,2,3-cd)pyrene, phenanthrene, and pyrene. Pyrogenic PAHs are not associated with fuels and may be infiltrating into Adit 3 Sump from other sources such as urban deposition and runoff.

In the weeks following the November 2021 Release, TPH-d and TPH-o exceedances were reported for every sampling event at Adit 3 Sump. Currently, Adit 3 appears to be stable, and detections are representative of anthropogenic combustion sources.

11.0 Conclusions and Recommendations

11.1 Conclusions

Soil Vapor Impacts. As described in Section 9.1, the magnitude of soil vapor impacts associated with the fuel releases continue to decrease over time, consistent with natural attenuation and weathering of LNAPL in the environment.

Groundwater Impacts. Groundwater impacts primarily include elevated concentrations of TPH-d and TPH-o at in-tunnel sampling location RHMW02 and to a lesser extent at the other in-tunnel wells RHMW01R and RHMW03. Concentrations of all formerly elevated COPCs near Red Hill Shaft have decreased considerably since operation of skimmers, sorbents, and the Red Hill Shaft GAC treatment system commenced. There were no COPC detections at Red Hill Shaft (other than lead) during this reporting period. The only other compounds detected at Red Hill Shaft were chloroform and chloromethane, which are not associated with fuels.

Concentrations of TPH-d and TPH-o above the LOD at delineation well RHP04B and sentinel well NMW24 were detected during this reporting period; however, none exceed the EALs and the chromatographic profiles for the samples are not consistent with those expected from dissolved fuel components.

In general, contaminant concentrations appear to be declining (in most areas) or stable (near the tank farm) over time.

11.2 Recommendations and Planned Future Actions

Extensive sampling and monitoring activities in response to the fuel releases are ongoing. Data are being collected to:

- Evaluate the impact and extent of the releases to the environment.
- Evaluate the effectiveness of the Red Hill Shaft GAC pump and treat system in containing impacted groundwater and preventing additional migration of contaminants.
- Monitor potential future migration of contaminants and potential impacts to offsite receptors including existing and newly installed Navy wells and additional wells identified while working in coordination with the Honolulu BWS.
- Evaluate remedial alternatives and determine future remediation strategies.
- Conduct pilot testing as needed to evaluate remediation effectiveness and optimize remedial alternatives.

Release response actions for the vadose zone were performed in accordance with the *Preliminary Site Characterization Plan* (DON 2022a). The results of the in-tunnel investigation will be provided in a future report once investigation activities are completed and laboratory analytical reports have been finalized.

The Navy recommends continued soil vapor and groundwater sampling, site characterization at Adit 3, including installation of an additional deep SVMP, conducting initial site characterization activities at the CHT Tank area outside Adit 3, data gathering, and associated analyses in coordination with DOH. The Navy is also expanding the groundwater monitoring well network (including sentinel wells) as part of plume delineation efforts and to monitor groundwater quality between Red Hill and offsite water supply wells.

The Navy will finalize the following technical memorandum and closure report once comments are received from the Regulatory Agencies:

- *Technical Memorandum, Holding Tank and Leach Tank Characterization, November 2021 Pipeline Release;* November 2022
- *Draft Closure Report, Concrete Tank Removal;* January 2023

The Navy will continue site characterization efforts and implement pilot projects once the Regulatory Agencies review and approve the following WPs:

- *Site Characterization Plan Addendum – Collection, Hold, and Transfer Tank Overflow Site Characterization, November 2021 Release;* November 2022
- *Draft Shallow Soil Vapor Extraction and Air Sparging Work Plan; J*anuary 9, 2023
- *Draft Natural Source-Zone Depletion Work Plan;* February 23, 2023
- *Draft Deep Soil Vapor Extraction Work Plan;* February 27, 2023

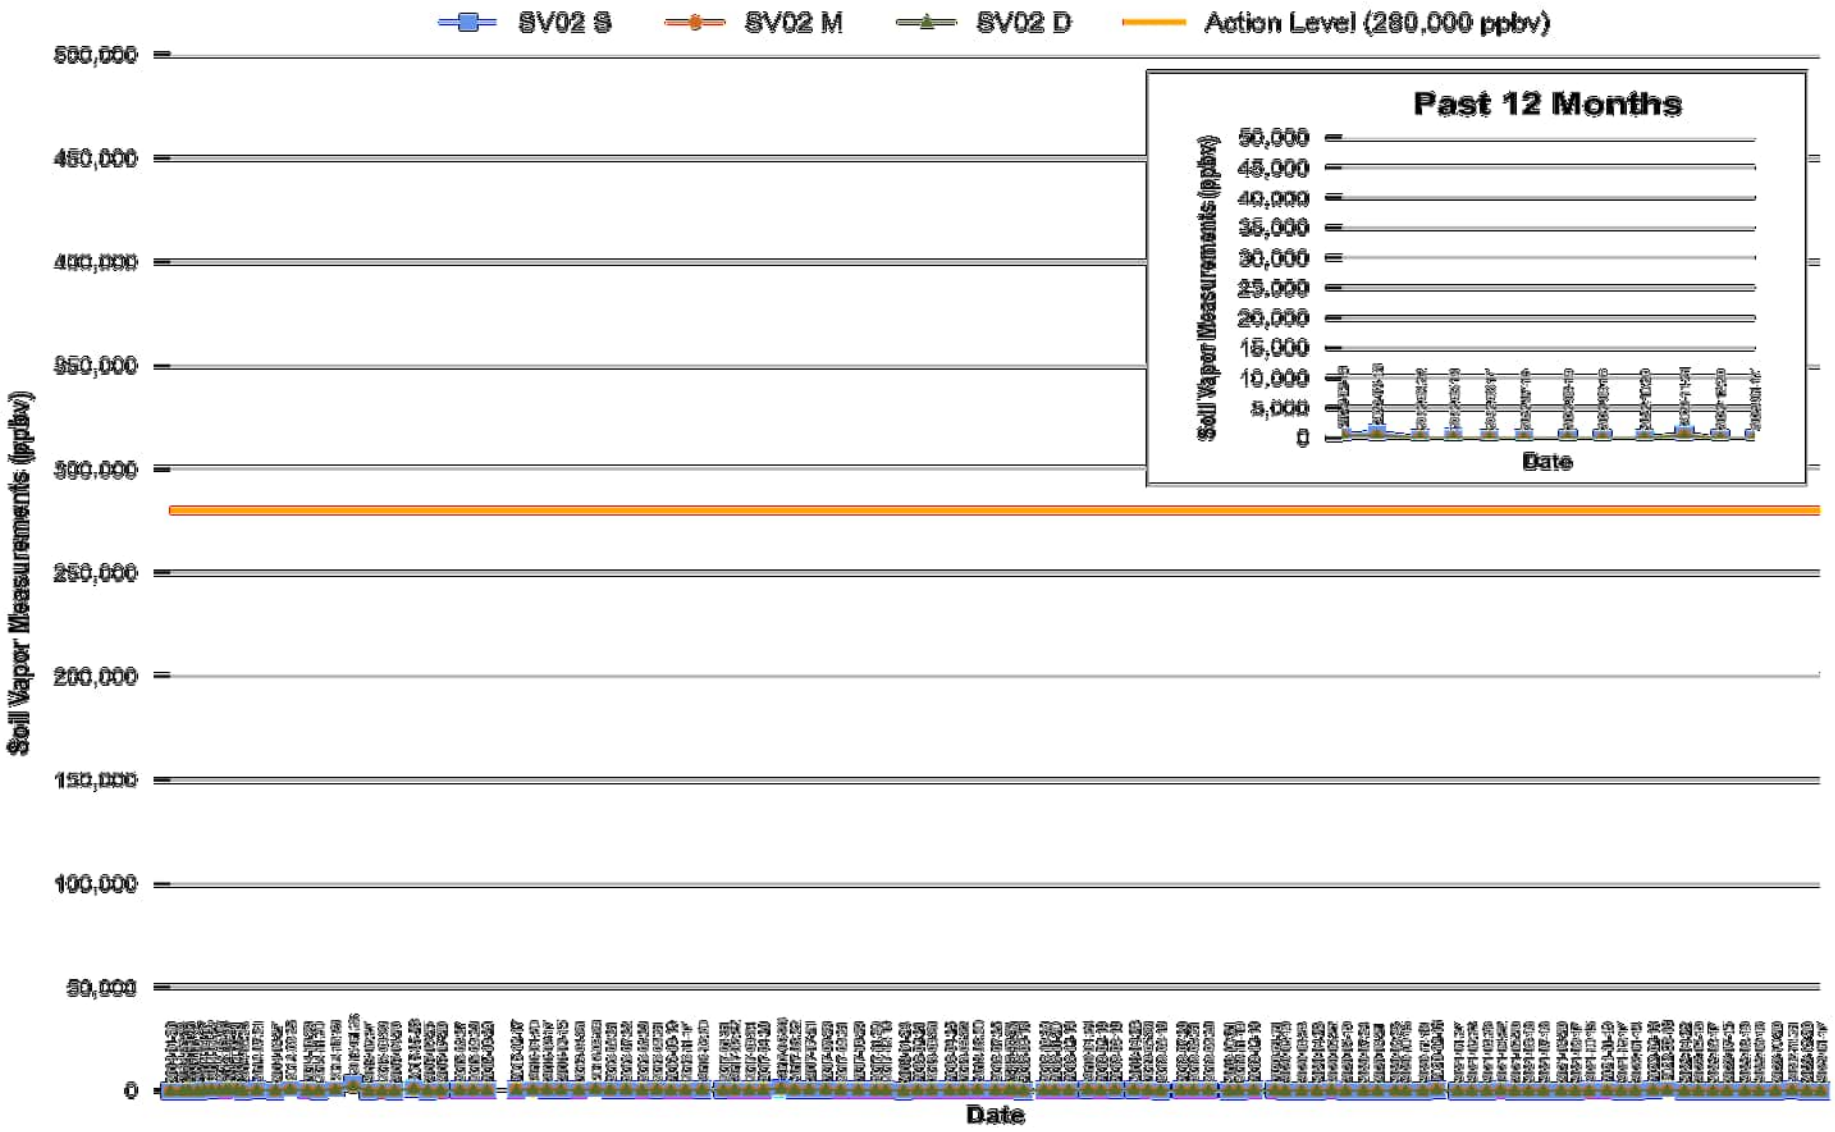
Soil Vapor Measurements (Jan 2014 Through Jan 2023)

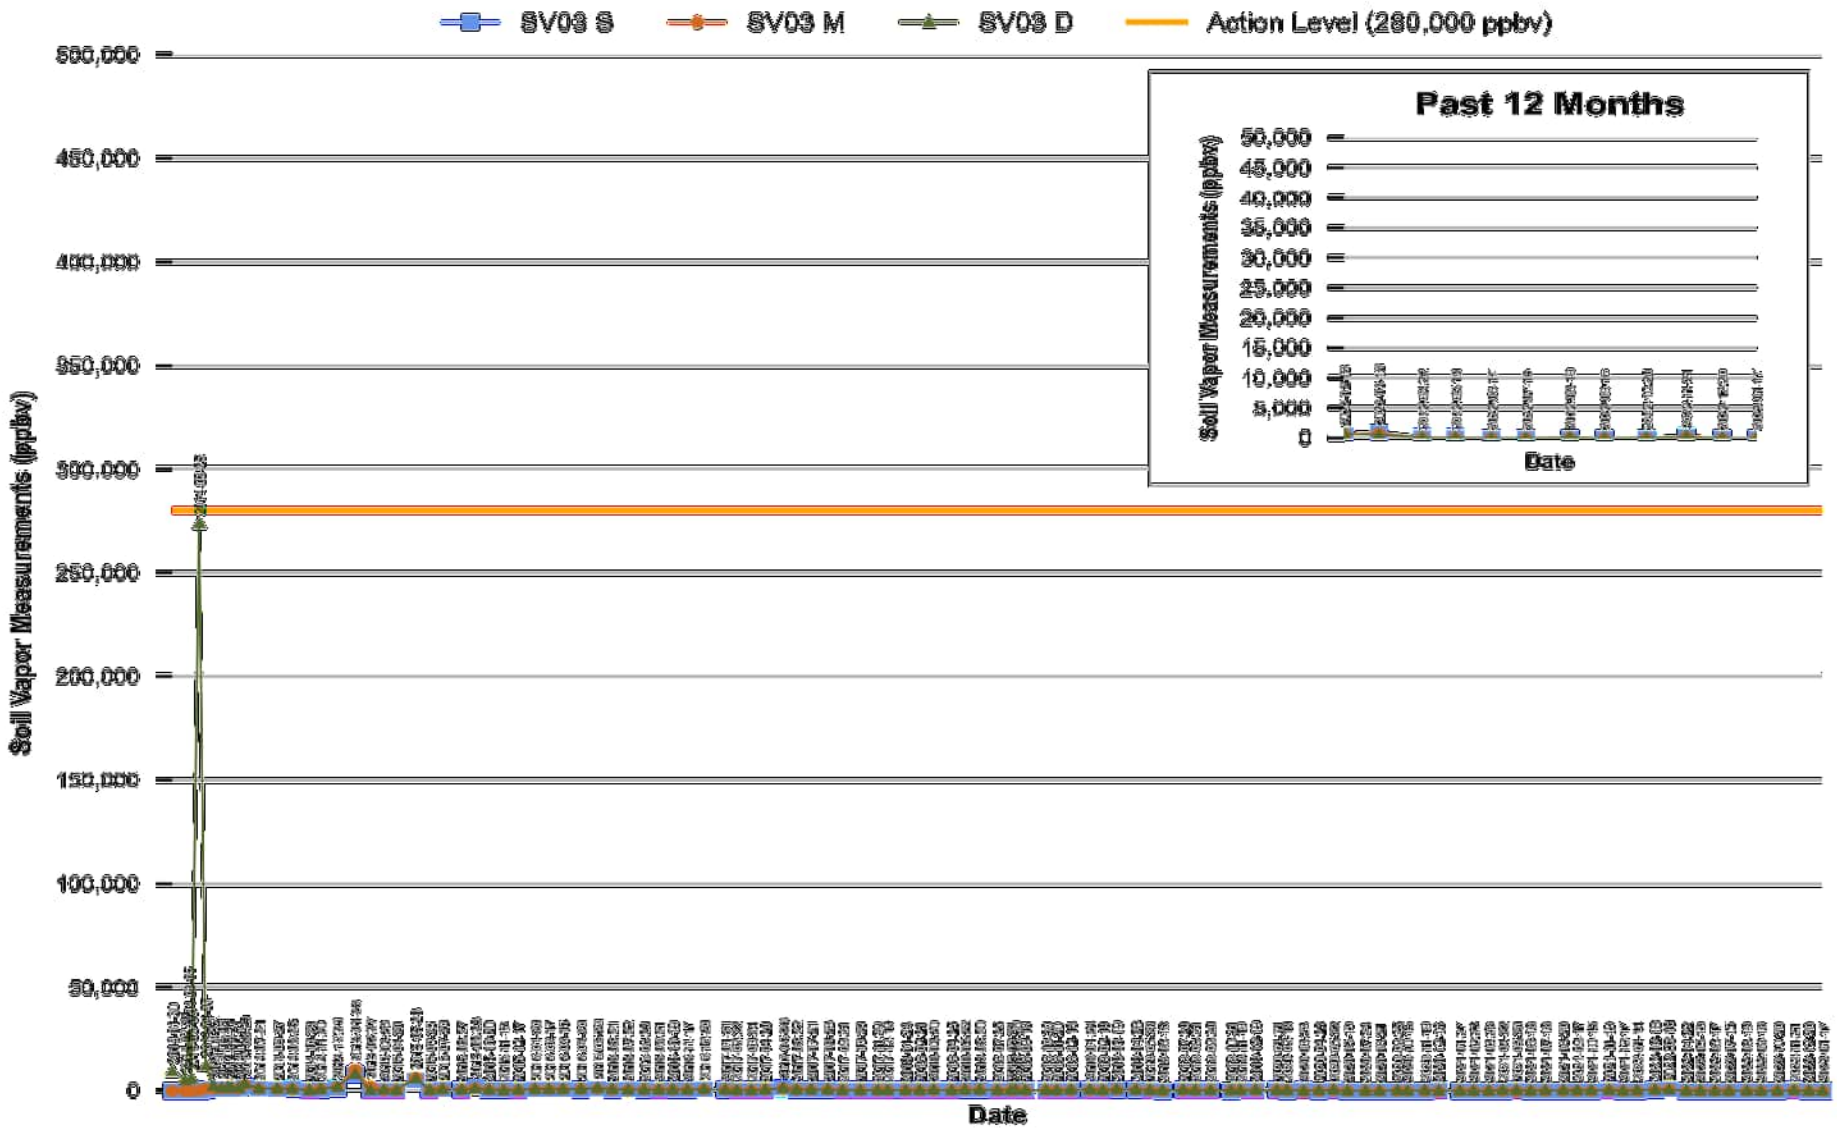


Notes (where applicable):
* "M/D" monitoring points were constructed to screen both middle & deep depth intervals along the respective underground storage tank.

F-24: Jet Fuel, Fuel Number 24
F-76: Marine Diesel, Fuel Number 76

JP-5: Jet Fuel, Propellant Number 5
ppbv: Parts Per Billion by Volume

Figure 2
Red Hill - Tank 03 (F-24)
Soil Vapor Measurements (Jan 2014 Through Jan 2023)

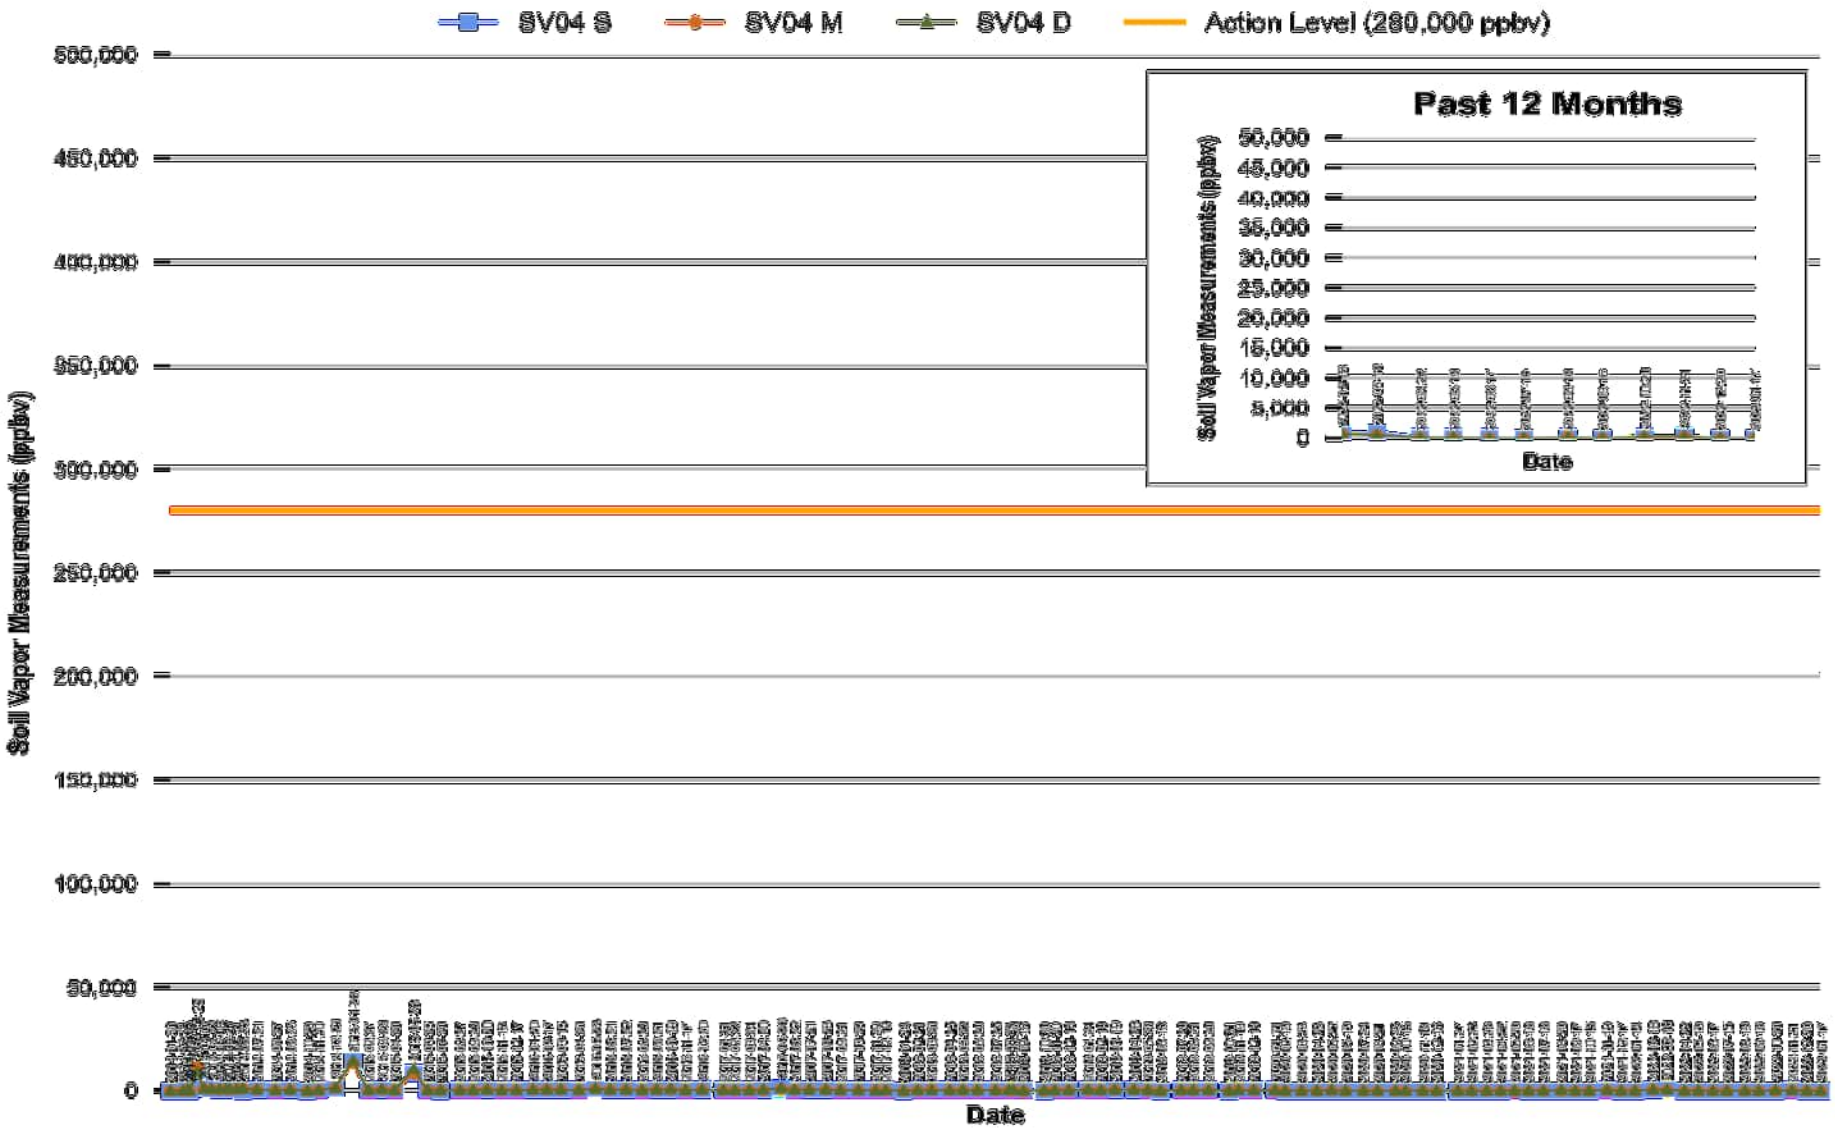


Notes (where applicable):
* "M/D" monitoring points were constructed to screen both middle & deep depth intervals along the respective underground storage tank.

F-24: Jet Fuel, Fuel Number 24
F-76: Marine Diesel, Fuel Number 76

JP-5: Jet Fuel, Propellant Number 5
ppbv: Parts Per Billion by Volume

Figure 3
Red Hill - Tank 04 (F-24)
Soil Vapor Measurements (Jan 2014 Through Jan 2023)

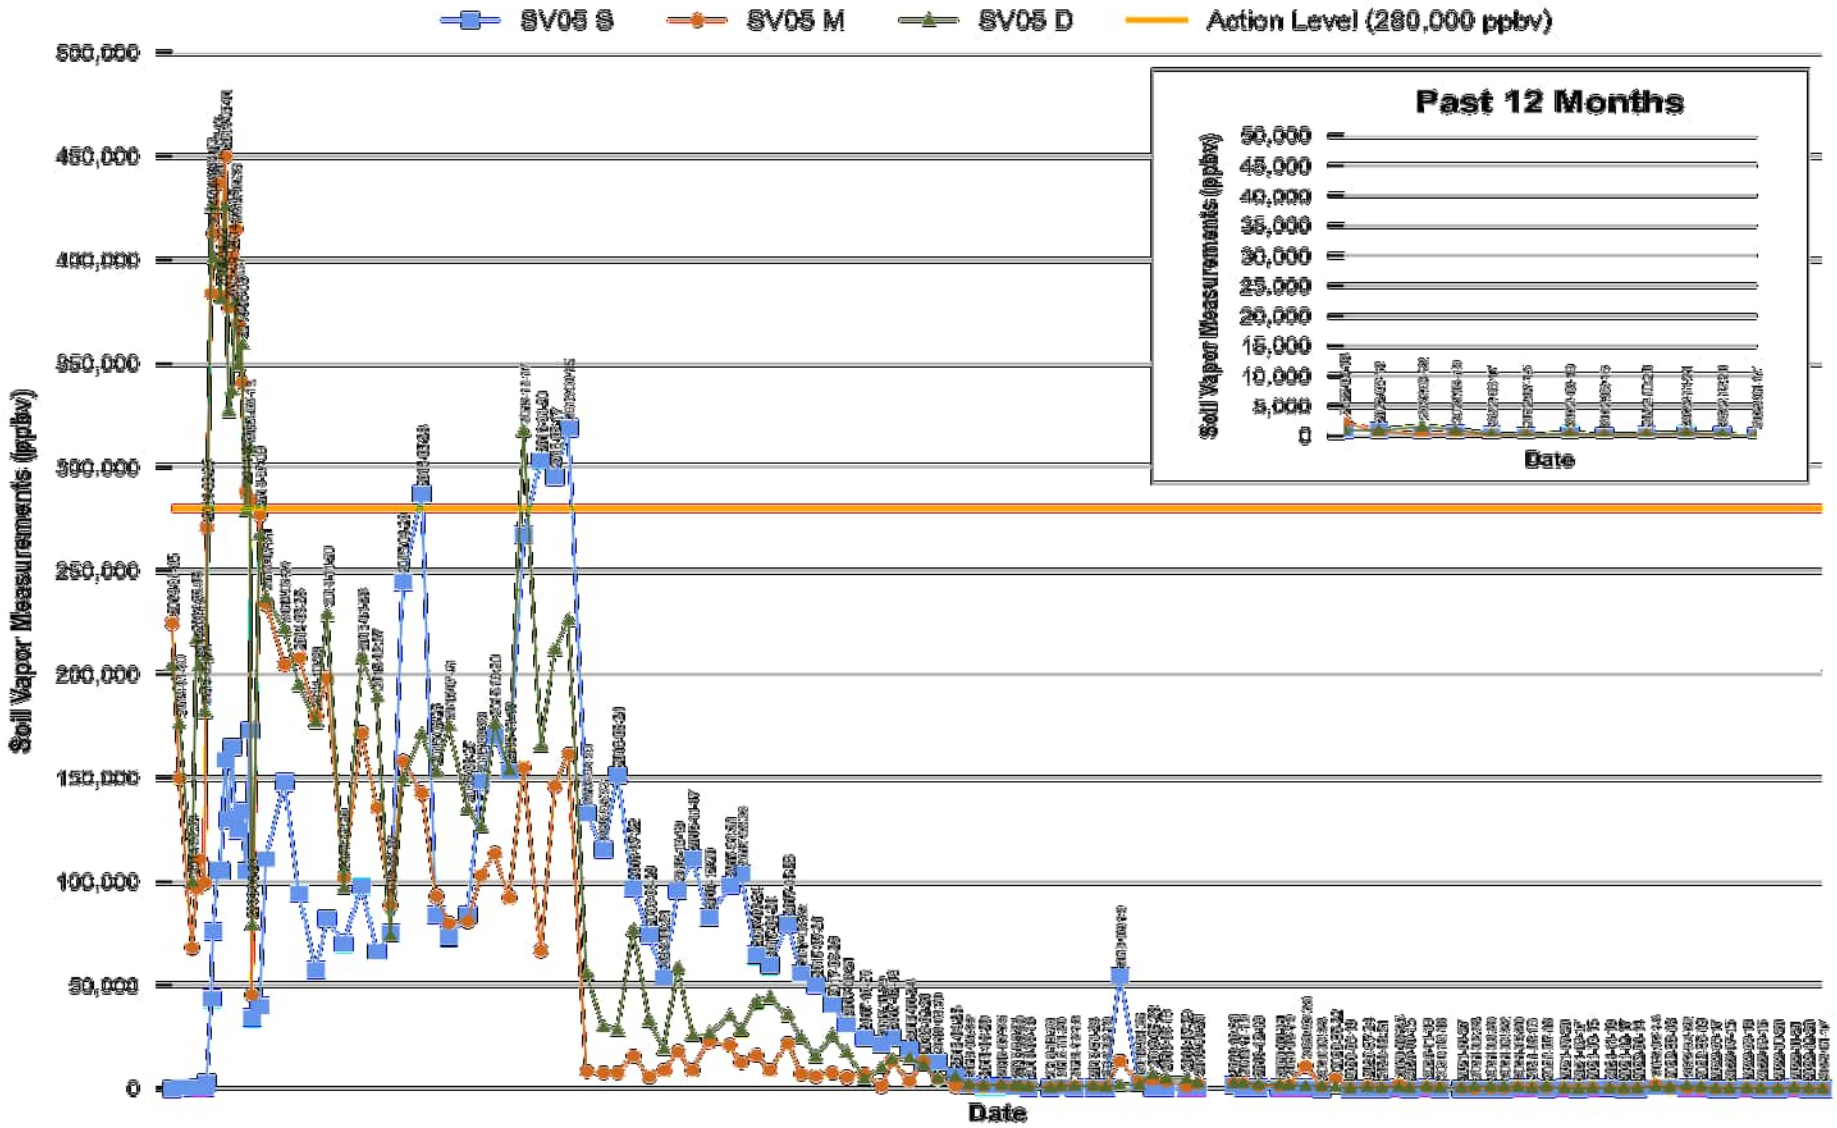


Notes (where applicable):
* "M/D" monitoring points were constructed to screen both middle & deep depth intervals along the respective underground storage tank.

F-24: Jet Fuel, Fuel Number 24
F-76: Marine Diesel, Fuel Number 76

JP-5: Jet Fuel, Propellant Number 5
ppbv: Parts Per Billion by Volume

Figure 4
Red Hill - Tank 05 (F-24)
Soil Vapor Measurements (Jan 2014 Through Jan 2023)

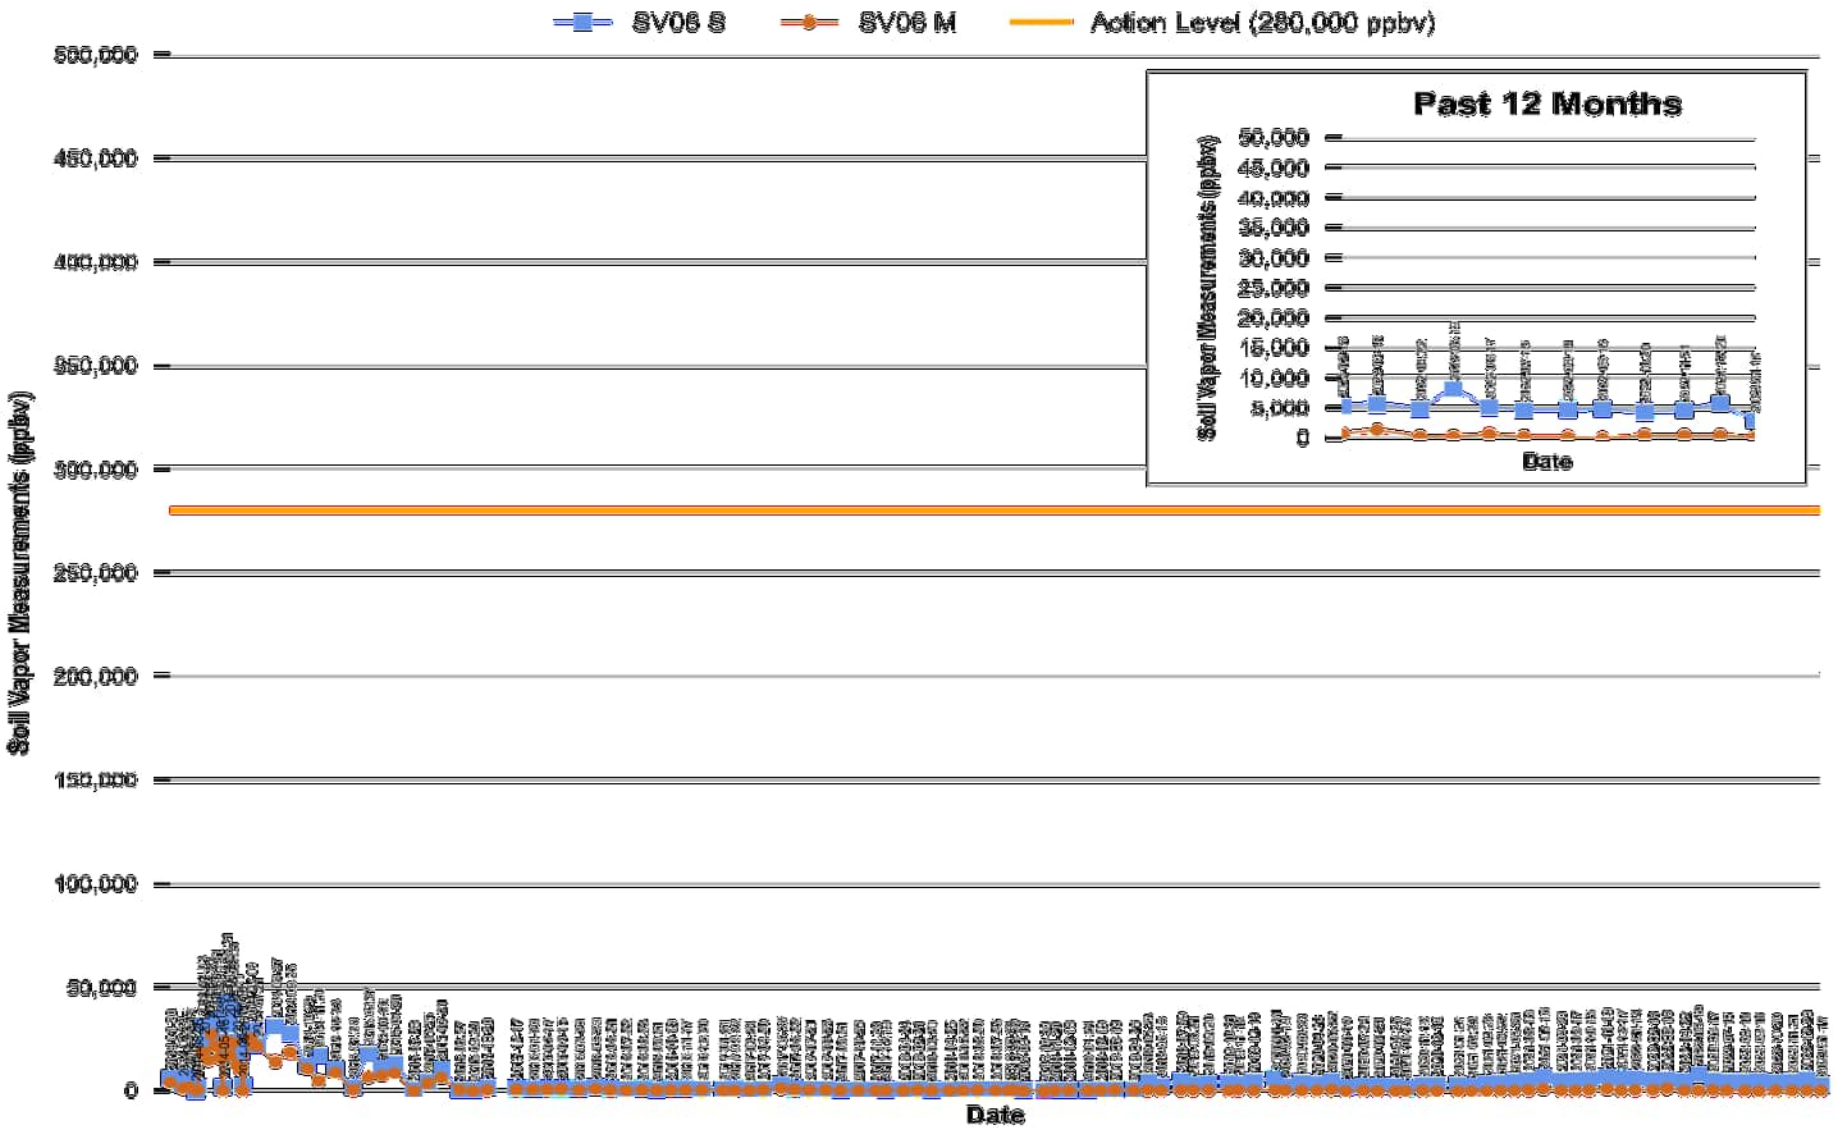


Notes (where applicable):
* "M/D" monitoring points were constructed to screen both middle & deep depth intervals along the respective underground storage tank.

F-24: Jet Fuel, Fuel Number 24
F-76: Marine Diesel, Fuel Number 76

JP-5: Jet Fuel, Propellant Number 5
ppbv: Parts Per Billion by Volume

Figure 5
Red Hill - Tank 06 (F-24)
Soil Vapor Measurements (Jan 2014 Through Jan 2023)

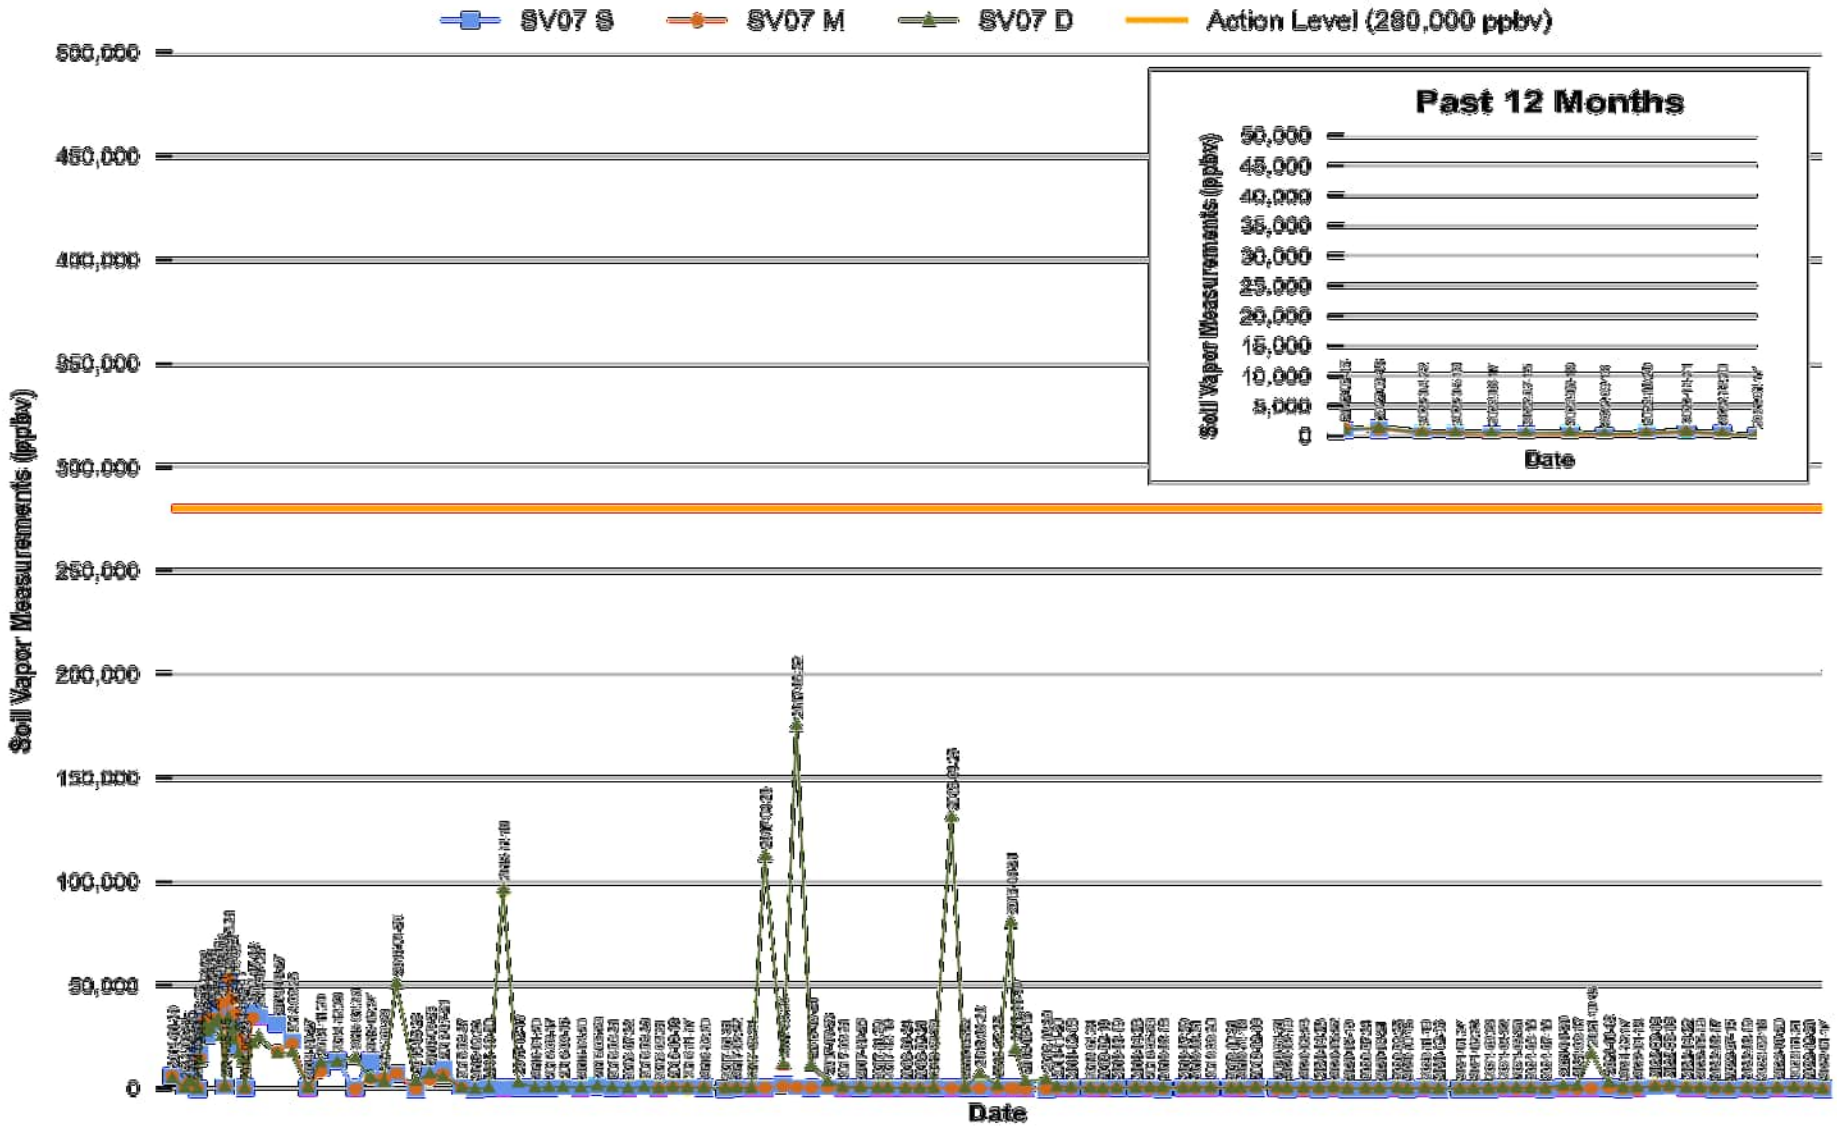


Notes (where applicable):
* "M/D" monitoring points were constructed to screen both middle & deep depth intervals along the respective underground storage tank.

F-24: Jet Fuel, Fuel Number 24
F-76: Marine Diesel, Fuel Number 76

JP-5: Jet Fuel, Propellant Number 5
ppbv: Parts Per Billion by Volume

Figure 6
Red Hill - Tank 07 (JP-5)
Soil Vapor Measurements (Jan 2014 Through Jan 2023)

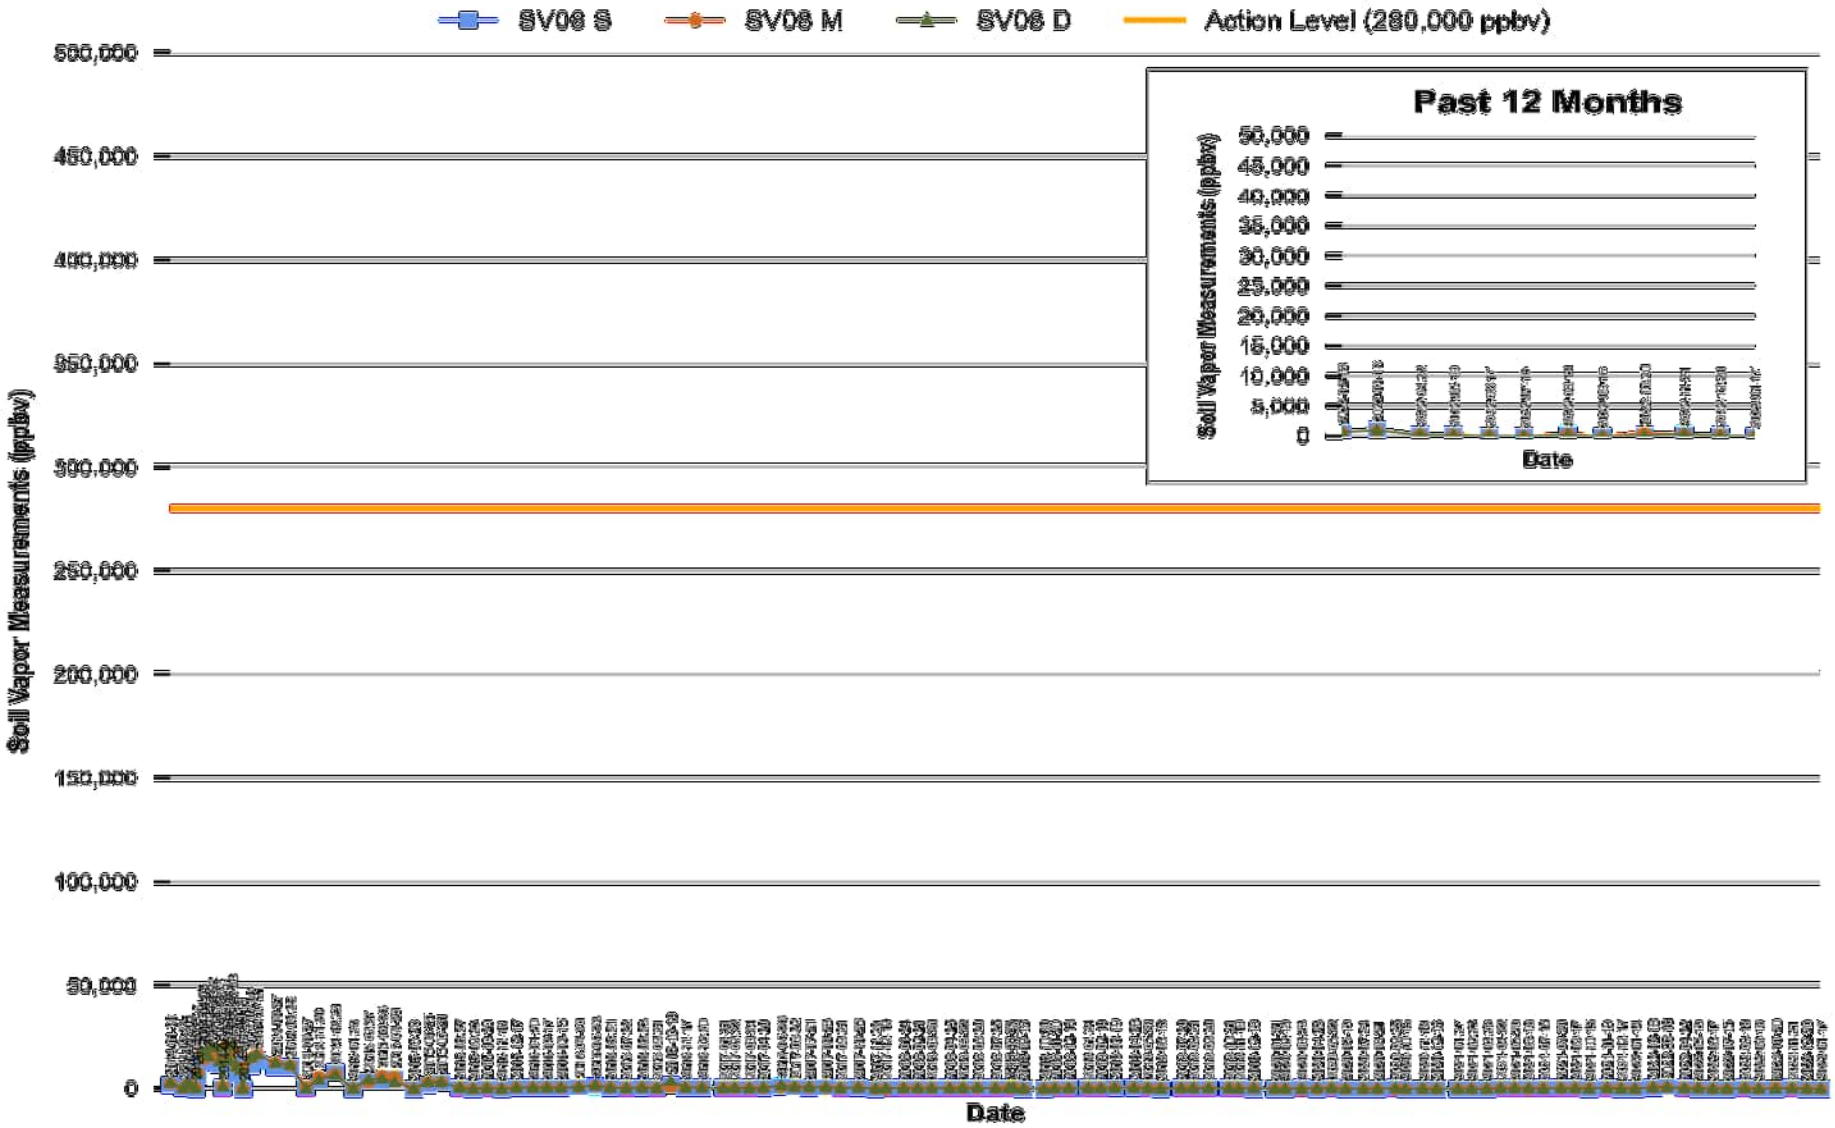


Notes (where applicable):
* "M/D" monitoring points were constructed to screen both middle & deep depth intervals along the respective underground storage tank.

F-24: Jet Fuel, Fuel Number 24
F-76: Marine Diesel, Fuel Number 76

JP-5: Jet Fuel, Propellant Number 5
ppbv: Parts Per Billion by Volume

Figure 7
Red Hill - Tank 08 (JP-5)
Soil Vapor Measurements (Jan 2014 Through Jan 2023)

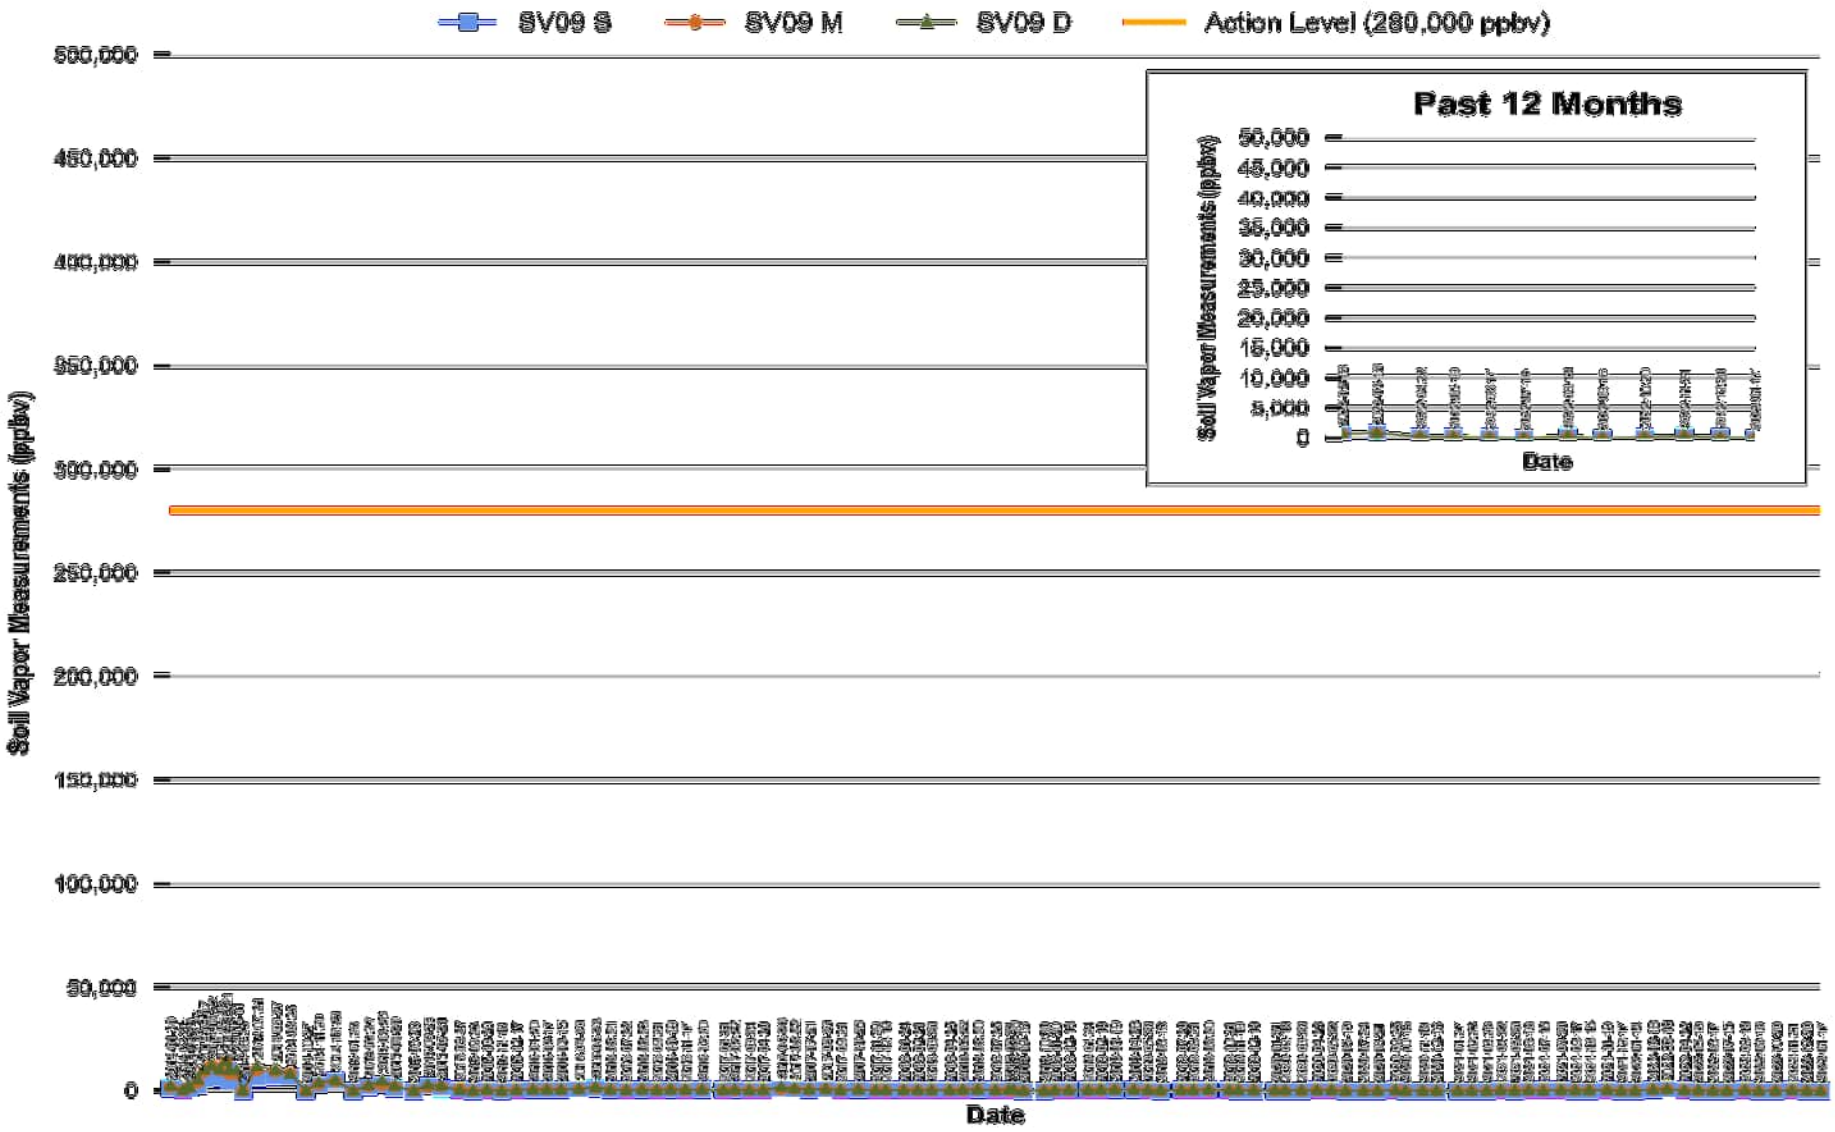


Notes (where applicable):
* "M/D" monitoring points were constructed to screen both middle & deep depth intervals along the respective underground storage tank.

F-24: Jet Fuel, Fuel Number 24
F-76: Marine Diesel, Fuel Number 76

JP-5: Jet Fuel, Propellant Number 5
ppbv: Parts Per Billion by Volume

Figure 8
Red Hill - Tank 09 (JP-5)
Soil Vapor Measurements (Jan 2014 Through Jan 2023)



Notes (where applicable):
* "M/D" monitoring points were constructed to screen both middle & deep depth intervals along the respective underground storage tank.

Notes:

[1] - "M/D" monitoring points were constructed to screen both middle & deep depth intervals along the respective underground storage tank.

[2] - Soil vapor concentration measured using a ppmv PID.

[3] - Epoxy coatings being applied in the area near Tank 17. Epoxy coating contain volatile organic compounds which can be detected by the monitoring equipment used to collect SVM samples.

[4] - ppmv PID experienced unanticipated malfunction as indicated by a failed calibration check. PID result based on a second ppbv PID suggests the value is between 50 ppm - 150 ppm.

[5] - Estimated value for SVMPs at tanks 2-10 and 20 - Calibration check at end of day read 11.12 ppb, observing an approximately 11% high bias reading.

* Air compressor used to clear obstruction prior to collecting sample

** - Estimated value - Calibration check observed an approximately 40% low bias reading.

*** - Estimated value - Inadvertent early termination of PID reading.

NC - Not collected

NC1 - Not collected due to tank maintenance

NC2 - Not collected due to obstruction in vapor line

NC3 - Not collected - monitoring vault potentially compromised by relaese. Replacing tubing and cleaning valves. Sampling to begin 14 May

NC4 - Not collected due to a broken valve/fitting. A replacement valve is being pursued.

NC5 - Not collected - not required by the DOH Transition Plan.

Soil vapor concentration readings are reported in parts per billion by volume (ppbv).

Notes:

[1] - "M/D" monitoring points were constructed to screen both middle & deep depth intervals along the respective underground storage tank.

[2] - Soil vapor concentration measured using a ppmv PID.

[3] - Epoxy coatings being applied in the area near Tank 17. Epoxy coating contain volatile organic compounds which can be detected by the monitoring equipment used to collect SVM samples.

[4] - Solvent odor from work occuring in the area near Tank 18 caused elevated background PID readings.

* Air compressor used to clear obstruction prior to collecting sample

** - Estimated value - Calibration check observed an approximately 40% low bias reading.

*** - Estimated value - Inadvertent early termination of PID reading.

NC - Not collected

NC1 - Not collected due to tank maintenance

NC2 - Not collected due to obstruction in vapor line

NC3 - Not collected - monitoring vault potentially compromised by relaese. Replacing tubing and cleaning valves. Sampling to begin 14 May

NC4 - Not collected due to a broken valve/fitting. A replacement valve is being pursued.

NC5 - Not collected - not required by the DOH Transition Plan.

Soil vapor concentration readings are reported in parts per billion by volume (ppbv).

Appendix B – Groundwater Results

Appendix B.1 – Summary of Analytical Program for Groundwater Samples Collected Between May 12, 2021 and February 3, 2023

Appendix B.2 – Summary of Free Product Gauging and Monitoring Well Headspace Measurements

Appendix B.2.1 – AOC Oil/Water Interface Measurements, January 2014 through January 2023

Appendix B.2.2 – Summary of NOI Free Product Gauging and Monitoring Well Headspace Measurements for the May 2021 Release from May 12 through November 24, 2021

Appendix B.2.3 – Summary of NOI and Delineation Well Free Product Gauging and Monitoring Well Headspace Measurements from November 28, 2021 through February 3, 2023

Appendix B.3 – Groundwater Parameters from May 10, 2021 through February 3, 2023

Appendix B.4 – Summary of Groundwater Analytical Results through February 3, 2023

Data Legend for Appendix B.4.1–B.4.4

Appendix B.4.1 – GW Analytical Table_TPH and Fuel-Related Compounds

Appendix B.4.2 – GW Analytical Table_BTEX_VOCS

Appendix B.4.3 – GW Analytical Table_SVOCs

Appendix B.4.4 – GW Analytical Table_PAH_SIMs

Appendix B.4.5 – TPH Charts

Appendix B.4.6 – Delineation Well Analytical Results

Appendix B.4.7 – Sentinel Well Analytical Results

Appendix B.5 – Groundwater Monitoring Chromatograms through February 3, 2023

Appendix B.6 – NOI Groundwater Sampling Plan

Appendix B.1 – Summary of Analytical Program for Groundwater Samples Collected Between May 12, 2021 and February 3, 2023

Event Name: RH NOI November 2022
Event ID: 40

Location	Field Sample ID	Sample Type	Sampling Date	Lab	SDG	Sampling Status	BNA SIM (BNASIME)	EDB DBPR12 (SW8011)	Lead (SW6020B)	Methane (RSK175)	SVOCs (SW8270E)	TOC EU (SW9060A)	TPH Diesel and Oil EU (SW8015D)	TPH Diesel and Oil Silica Gel EU (M8015D)	TPH Gasoline EU (SW8260)	VOCs (SW8260D)

Status	Color
Status Not Determined	
Scheduled for Analysis; Awaiting Field Data	
Chain of Custody Data Loaded and Certified; Awaiting Lab Data	
Laboratory Data Loaded and Certified; Awaiting Validation	
Validation Qualifiers Finalized; Awaiting Approval	
Approval Complete; Data In Production	

Matrix Name	Matrix
Drinking Water	WP
Ground Water	WG

Sampling Method	Code
Bailer	B
Grab	G
Low-Flow (Slow Purge) Groundwater Pumping	LF

Laboratory Name	Laboratory Code
Eurofins Environment Testing TestAmerica, Arvada, CO	EUTQ
Eurofins Environment Testing TestAmerica, Tacoma, WA	EUT2

Location Type	Code
Faucet/Tap	FW
Holding Pond/Lagoon	HP
Well	WL

Note: This event has missing samples in Event Management that are Field QC ONLY. Please refer to the Unplanned Field Samples report to view these samples.

Notes:
1 - Elevations updated based on Well Elevation Survey Report, Red Hill Bulk Fuel Storage Facility (DON 2018)
2 - Dedicated groundwater pump obstructing path of interface meter probe; Depth measured based on elevation of water when pump removed from well (RHMW05)
3 - Measurement taken at RHMW01 versus RHMW01R in error
January 2014 to August 2015, Measurements recorded by Environmental Science International from unless otherwise noted
From September 2015, Measurements recorded by Element Environmental, LLC
* - Measurements recorded by NAVFAC HI.
All units in feet (ft).
DTW (TOC) - depth to water from top of well casing
LNAPL - light non-aqueous phase liquid
or NT - measurement not taken
SWL - static water level

Appendix B.2.2 – Summary of NOI Free Product Gauging and Monitoring Well Headspace Measurements for the May 2021 Release from May 12 through November 24, 2021

DTW = Depth-to-water

ft = feet

ft btoc = feet below top of casing

NA = Not applicable

NM = No measurement taken, due to equipment installed in well.

ppmv = parts-per-million, volume

NC - Not collected

NC1 - Not collected due to headspace and fuel product gauging occurring only where groundwater sampling was being conducted.

NC2 - Not collected - monitoring well not being sampled for groundwater in the DOH Transition Plan.

NC3 - Fuel product gauging not conducted at RHMW01 per email correspondence from DOH on 7/27/2021

* - See next tab for continuation of results

[a] Ants around RHMW04. Team sprayed isopropyl alcohol in order to get ants off lid. Reading was high due to residual alcohol.

[b] Depth to water measurements are corrected for water level meter calibrations and horizontal well displacement, see correction factor tables for corrections factors and corrected values per water level meter and well. Solinst N-1 and Solinst N-2 water level corrections are forthcoming and will be included once available. Table includes depths taken by subcontractor Element. Depths recorded by Element do not hape water level meter corrections that can be applied. Well displacement corrections are applied to depths taken by Element. meters calibrated by USGS, calibrations published in the "Results from calibration of groundwater-level measuring tapes" letter dated January 24, 2020. RHMW02, RHMW03, and RHMW05 have well displacement corrections. RHMW01R well displacement

[c] measured with oil/water probe

Notes:

5/25/2021: Initial headspace reading at RHMW02 was unusually high. No signs of fuel product (sheen or odor) were observed during fuel product gauging. Returned to verify headspace reading and it was significantly lower, as shown in the second set of results.

5/27/2021: Initial headspace reading at RHMW02 was ~14.43 ppmv, but dropped to 0.156 ppmv. No fuel product measured.

6/6/2021: Immediate headspace reading was 3.316 ppmv, but dropped quickly to value recorded.

7/12/2021 Strong background chemical odor related to contractor work at Tank 13.

7/26/2021: Initial headspace reading was ~11.33 ppmv, but dropped quickly to 0.483 ppmv. No fuel product measured.

8/5/2021: Headspace and breathing zone PID readings taken at RHMW01 due to inadvertently being excluded on 8/2/2021.

8/9/2021: Initial headspace reading was ~22.35 ppm, but dropped quickly to value recorded.

8/16/2021: Initial headspace reading was 7.621 ppm, but dropped quickly to value recorded.

8/30/2021: Initial headspace reading was 5.032 ppm, but dropped to value recorded.

9/7/2021: Initial headspace reading at RHMW01R was 0.910 ppm, but dropped to value recorded. Initial headspace reading at RHMW02 was 4.521 ppm, but dropped to value recorded.

9/13/2021: Initial headspace reading at RHMW01R was ~14.1 ppm, but dropped to value recorded.

9/27/2021: Initial headspace reading at RHMW01R was 0.600 ppm, but dropped to value recorded. Initial headspace reading at RHMW02 was 5.806 ppm, with strong sulfur odor, but dropped to value recorded.

Additional Sampling 09/29/2021-10/04/2021

NA = Not applicable

NM = No measurement taken

NC - Not collected

Table B.2.3 NOI Notes:

*Well screen is submerged and does not span the water's surface, therefore free product will not be captured or observed.
Wells with submerged screens will have a one-time bailer sample collected to verfiy no free product at the waters surface.
1 - One-time bailer sample collected at OWDFMW01 on 1 Dec 21. No fuel product observed.
2- One-time bailer samples collected at RHMW12A and RHMW16 on 22 Dec 21. No fuel product observed.
Subsequent samples collected via low-flow method will be observed for free product during collection and will be noted.
**Westbay is a closed system and the sample port is not located at the water's surface, therefore free product will not be captured or observed.
Headspace is measured from Westbay wells for almost all cannister pulls. The highest reading measured for each sample is shown in this
Samples collected from Westbay wells will be observed for free product during collection and will be noted.
DTW = Depth-to-water
ft = feet
ft btoc = feet below top of casing
ppmv = parts-per-million, volume
NA = Not applicable
NM = No measurement taken, due to equipment installed in well.
NC = Not collected
NC1 = Not required in DOH Notice of Interest Letter of 24 Nov 21.
NC2 = PID was not functioning properly and no reading was obtained
NC3 = Westbay winch malfunctioned on August 3, 2022. No samples collected pending arrival of replacement winch.
NC-WL = Not collected while water level study underway in conjunction with the start up of Red Hill Shaft

Measurements were not collected during the weeks of 4/11/22, 4/18/22, 7/18/22, 7/25/22, 12/5/22, 12/12/22, 1/30/23 as LTM sampling was being
Measurements were not collected during the week of 10/10/22 due to unpacking event.

a: Intial reading recorded; however, subsequent follow up reading was <10ppm
b: Depth to water measured with an oil/water interface probe
c: Headspace reading was 0.0 ppm and bailer sample had no observable free product. During product gauging sensor alarmed; however, presence of small insects at the water surface in RHMW01R possibly interfered with sensor giving false reading.
d: Depth to water measurements are corrected from Solinst groundwater-level measuring tapes N-1 through N-6 using the USGS calibration results published in letters titled “Results from Calibration of Groundwater-Level Measuring Tapes” dated January 24, 2020 (N-1 and N-2) and December 14, 2022 (N 1, N-2, N-3, N-4, N 5 and N-6). Depth to water measurements are also corrected for horizontal well displacement derived from gyroscopic survey results for wells RHMW02 through RHMW06, RHMW08, RHMW09, and OWDFMW01 and are pending results for wells RHMW01R, RHMW12A, RHMW16, RHMW17, RHMW18, OWDFMW04A, OWDFMW05A, OWDFMW07A, and OWDFMW08A. Groundwater-level measuring tape and
e: Solinst N-3, N-4, N-5, and N-6 were introduced in March 2022, calibrated by the USGS in September 2022, and corrections applied for all
f: Detection signal (solid tone) from oil/water interface probe while product gauging at RHMW09. Headspace reading was 0.0 ppm and bailer sample had no observable free product, as shown in the associated fuel product gauging verification photos (Nov. 20 NOI FP Monitoring Photo_050922, PDF
g: Well entered into service after completion of well installation and development. First occurrence of NOI sampling
h: Runs 1-4 and 6 had consistent PID readings of 0.0 ppm. Run 5 had high reading (12ppm) on cannister 1 and when re-read all 4 cannisters on run 5
i: No observable product from oil/water interface probe or bailer water surface. Headspace VOCs = 0.0 ppm. Slight odor. Outside of bailer was slick and
j: Rental oil/water interface probes used while government-owned oil/water interface probes and water level meters N-1, N-2, N-3, N-4, N-5, and N-6 undergo calibration by USGS. A correction factor was determined by comparing with a government-owned meter and rental meter field measurements,
k: Headspace VOC reading 32.4 ppm. Initial measurement recorded, then PID re-zeroed in ambient air and subsequent reading still elevated. No odor

NC = Not collected

a: Depth to water measurements are corrected for water level meter calibrations and horizontal well displacement, see correction factor tables for corrections factors and corrected values per water level meter an well. Solinst N-1 and Solinst N-2 water level meters are calibrated by USGS, calibrations published in "Results from calibration of groundwater-level measuring tapes" letter dated January 24, 2020. Solinst water level meters N-1, N-2, N-3, N-4, N-5< and N-6 were calibrated by the USGS in a Septmeber 20 - 22 2022 event, calibrations publsihed in "Results from calibration of groundwater-level measuring tapes" letter dated December 14, 2022. Correction factors for N-1 and N-2 were updated beginning September 20th and measurements prior using the 2020 correction factors. Horizontal displacement correction factors are applied to wells RHMW02, RHMW03, RHMW04, RHMW05, RHMW06, RHMW08, RHMW09, and OWDFMW01. Horizontal displacement correction factors will be derived from the gyroscopic survey reports for RHMW01R,

Solinst water level meters N-1, N-2, N-3, N-4, N-5< and N-6 were calibrated by the USGS in a Septmeber 20 - 22 2022 event, calibrations publsihed in "Results from calibration of groundwater-level measuring tapes" letter dated December 14, 2022. Correction factors for N-1 and N-2 were updated beginning September 20th and measurements prior using the 2020 correction factors. Horizontal displacement correction factors are applied to wells RHMW02, RHMW03, RHMW04, RHMW05, RHMW06, RHMW08, RHMW09, and OWDFMW01. Horizontal displacement correction factors will be derived from the gyroscopic survey reports for RHMW01R,

DTW = Depth-to-water

ft = feet

ft btoc = feet below top of casing

ppmv = parts-per-million, volume

NA = Not applicable

NC = Not collected

a: Depth to water measurements are corrected for water level meter calibrations and horizontal well displacement, see correction factor tables for corrections factors and corrected values per water level meter and well. Solinst N-1 and Solinst N-2 water level meters are calibrated by USGS, calibrations published in "Results from calibration of groundwater-level measuring tapes" letter dated January 24, 2020. Solinst water level meters N-1, N-2, N-3, N-4, N-5< and N-6 were calibrated by the USGS in a Septmeber 20 - 22 2022 event, calibrations publsihed in "Results from calibration of groundwater-level measuring tapes" letter dated December 14, 2022. Correction factors for N-1 and N-2 were updated beginning September 20th and measurements prior using the 2020 correction factors. Horizontal displacement correction factors are applied to wells RHMW02, RHMW03, RHMW04, RHMW05, RHMW06, RHMW08, RHMW09, and OWDFMW01. Horizontal displacement correction factors will be derived from the gyroscopic survey reports for RHMW01R, RHMW12A, RHMW16, RHMW17, RHMW19, OWDFMW04A, OWDFMW05A, OWDFMW07A, and OWDFMW08A and will be applied when available.

D.O. = Dissolved Oxygen

g = Well entered into service after completion of well installation and development. First occurrence of NOI sampling

h= Calibration for specific conductivity corrupted. Calibration factor determined by comparing pre measurement value and expected value. Calibration factor applied to Specific Conductivty and TDS. Salinity recalculated based on the corrected conductivity value using the same calluclation as the AquaTroll, Method 2520A.

i = Issue with conductivity sensor affecting values derived from specific conductivity: TDS, Specific Conductivity, and Salinity

j = pH data corrupted due to issue with pH sensor calibration malfunction

k = pH data corrupted due to issue with pH sensor calibration malfunction, pH data reported as follows: RHMW04 = 4.59, RHMW06 = 4.14, RHMW08 = 4.83

NC1 = Not required in DOH Notice of Interest Letter of 24 Nov 21

NC3 = Not collected while awaiting replacement Westbay Controller

NC-WL = Not collected while water level study underway in conjunction with the start up of Red Hill Shaft

NR = Not recorded

ORP = Oxidation Reduction Potential

Sal = Salinity

Sp. Cond. = Specific Conductivity

TDS = Total Dissolved Solids

Temp = Temperature

Table B.3 NOI Notes:

Measurements were not collected during the weeks of 4/11/22, 4/18/22, 7/18/22, 7/25/22, 12/5/22, 12/12/22, 1/30/23 as LTM sampling was being conducted.

Measurements were not collected during the week of 10/10/22 due to unpacking event.

D.O. = Dissolved Oxygen

g = Well entered into service after completion of well installation and development. First occurrence of NOI sampling

h= Calibration for specific conductivity corrupted. Calibration factor determined by comparing pre measurement value and expected value. Calibration factor applied to Specific Conductivty and TDS. Salinity recalculated based on the corrected conductivity value using the same caluclation as the AquaTroll, Method 2520A.

i = Issue with conductivity sensor affecting values derived from specific conductivity: TDS, Specific Conductivity, and Salinity

j = pH data corrupted due to issue with pH sensor calibration malfunction

k = pH data corrupted due to issue with pH sensor calibration malfunction, pH data reported as follows: RHMW04 = 4.59, RHMW06 = 4.14, RHMW08 = 4.83

NC1 = Not required in DOH Notice of Interest Letter of 24 Nov 21

NC3 = Not collected while awaiting replacement Westbay Controller

NC-WL = Not collected while water level study underway in conjunction with the start up of Red Hill Shaft

NR = Not recorded due to equipment glitch

ORP = Oxidation Reduction Potential

Sal = Salinity

Sp. Cond. = Specific Conductivity

TDS = Total Dissolved Solids

Temp = Temperature

*AquaTroll experienced technical issues during sampling

Groundwater Sampling: Data Legend

Non-bold text indicates non-detected value
Bold text indicates detected value, but below the Environmental Action Level (EAL).
Bold and orange shaded text indicates exceeds the Department of Health Tier 1 EAL.
Green text indicates results have completed third-party validation.
— = not analyzed or not applicable
µg/L = microgram per liter (same as parts per billion)
B = Analyte detected in associated method blank
CAS = Chemical Abstracts Service
a = Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b = Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
c = Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed.
d = The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.
e = Sample extract was reanalyzed due to suspected carryover contamination from the LCSD. In-hold reanalysis indicates that the sample is non-detect. Reanalysis results reported.
f = [App. B.4.3] The lab confirmed detected concentrations of 4-chlorophenyl phenyl ether at RHMW02 or 2,6-dinitrotoluene at OWDFMW05A as a false positive and results are not detected. However, if results have already been validated and data loaded into EDMS, the data table reflects original results
D = Limit of Quantitation (LOQ) increased due to sample matrix.
J = estimated value
J- = estimated value, low bias
J+ = estimated value, high bias
J1 = estimated value due to discrepancies in meeting analyte-specific quality control criteria.
JM = estimated value, manually integrated
JMQ = estimated value, manually integrated with one or more quality control outside acceptance criteria
JQ = estimated value with one or more quality control outside of acceptance criteria
mg/L = milligram per liter
M = manually integrated
no. = number
Q = one or more quality control outside of acceptance criteria
QC = quality control
U = nondetect value
UM = nondetect value, manually integrated
UMQ = nondetect value, manually integrated with one or more quality control outside acceptance criteria
UQ = nondetect value with one or more quality control outside of acceptance criteria
S = A documented laboratory error occurred during extraction, which contributed to low surrogate recovery. The sample was re-extracted; extraction prep hold time was exceeded by 4.83 d
O = Diluted out
-O = The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T = Analyte detected in the associated trip blank
TB = trip blank. Do not count for total sample number. Only done for quality control purposes.
TPH-g = total petroleum hydrocarbons-gasoline range organics
TPH-d = total petroleum hydrocarbons-diesel range organics
TPH-o = total petroleum hydrocarbons-residual range
R = Exclusion of data recommended. The sample result was affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control
H = Sample was prepped or analyzed beyond the specified holding time

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:
1 - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

2 - Bailer method – sample without purging and from the top of the water column.

3 - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

4 - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

e = Sample extract was reanalyzed due to suspected carryover contamination from the LCSD. In-hold reanalysis indicates that the sample is non-detect. Reanalysis results reported.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:
1 - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

2 - Bailer method – sample without purging and from the top of the water column.

3 - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When t

4 - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

e = Sample extract was reanalyzed due to suspected carryover contamination from the LCSD. In-hold reanalysis indicates that the sample is non-detect. Reanalysis results reported.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"--" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-*O* - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screei

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screei

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screei
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screei

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"-" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screei

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:
[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.
[2] - Bailer method – sample without purging and from the top of the water column.
[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th
[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screei
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screei

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screei

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:
1 - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

2 - Bailer method – sample without purging and from the top of the water column.

3 - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

4 - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

e = Sample extract was reanalyzed due to suspected carryover contamination from the LCSD. In-hold reanalysis indicates that the sample is non-detect. Reanalysis results reported.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:
1 - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

2 - Bailer method – sample without purging and from the top of the water column.
3 - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When t
4 - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
e = Sample extract was reanalyzed due to suspected carryover contamination from the LCSD. In-hold reanalysis indicates that the sample is non-detect. Reanalysis results reported.
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:
1 - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

2 - Bailer method – sample without purging and from the top of the water column.

3 - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When t

4 - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

e = Sample extract was reanalyzed due to suspected carryover contamination from the LCSD. In-hold reanalysis indicates that the sample is non-detect. Reanalysis results reported.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:
1 - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

2 - Bailer method – sample without purging and from the top of the water column.
3 - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When t
4 - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a scree
a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.
b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.
B - Analyte detected in associated method blank
c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed
d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b
e = Sample extract was reanalyzed due to suspected carryover contamination from the LCSD. In-hold reanalysis indicates that the sample is non-detect. Reanalysis results reported.
D - Limit of Quatitation (LOQ) increased due to sample matrix
J - estimated value
U - nondetect value
ID - identification
O - Diluted out
-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample
T - Analyte detected in the associated trip blank
TPH-g - total petroleum hydrocarbons gasoline
TPH-d - total petroleum hydrocarbons diesel (JP-5)
TPH-o - total petroleum hydrocarbons oil/grease
"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When these non-fuel related compounds are reported in the sample results, the reported value is skewed high.

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screening criteria (EAL) for silica gel cleanup.

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed. The reanalysis was performed beyond the sample holding time. The reported results are suspected to be due to contamination unrelated to site groundwater conditions.

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to be due to contamination unrelated to site groundwater conditions.

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Red Hill Bulk Fuel Storage Facility

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable

Notes:

[1] - Low-flow method – sample with bladder pump, after purging and from approximately mid-screen.

[2] - Bailer method – sample without purging and from the top of the water column.

[3] - Silica Gel Cleanup is an EPA approved methodology (SW-846 Method 3630C) that separates fuel related compounds from non-fuel related or naturally-occurring compounds from the sample. When th

[4] - After the application of Silica Gel Cleanup, TPH-o levels are below the screening criteria (EAL). TPH-o detects heavy oils and greases. JP-5 is not a heavy oil or grease. DOH does not have a screer

a - Reanalyzed due to inconsistency with historic trends and suspected container switch. Reanalysis results were inconclusive and original results were reported.

b - Reanalyzed due to inconsistency with historic trend and suspected container switch. Reanalysis results reported.

B - Analyte detected in associated method blank

c - Extraction and analysis of another bottle collected from the same location during the same sampling event had no detections of PAHs. Therefore, detections of PAHs in this sample were not confirmed

d - The concentration of diethylphthalate reported in this sample is similar to concentrations detected in laboratory method blanks analyzed during the same general time period. The result is suspected to b

D - Limit of Quatitation (LOQ) increased due to sample matrix

J - estimated value

U - nondetect value

ID - identification

O - Diluted out

-O - The oil range hydrocarbons (SGT-C24-C40) result is not available as the analyte was diluted out due to the high concentration of DRO range analytes present in the sample

T - Analyte detected in the associated trip blank

TPH-g - total petroleum hydrocarbons gasoline

TPH-d - total petroleum hydrocarbons diesel (JP-5)

TPH-o - total petroleum hydrocarbons oil/grease

"–" - not applicable
